The lads and children have now returned from the pit, have undergone their ablutions, and swallowed whatever was in reach, generally contriving to obtain a substantial meal, if prepared for it. Unfortunately, some of the younger boys, who have scarcely become inured to the pit, experience a want of appetite and a revulsion to food, which nature usually overcomes after longer habit and presence in the mine. Instances, however, are not wanting in which the boy never becomes insusceptible of the noxious influences of the pit, and habitual nausea and eructation are superinduced. More than a dozen examples are now before me in the Report; and the frequency of the complaint from so many independent witnesses proves that it is not without foundation. Yet the boys will manage by some contrivance to secure a game at play, or a lounge in the lanes or fields, previously to their early retirement to rest. About nine o'clock fiddles begin to sound very inharmoniously; attempts at solos upon the flute to die away in the birth of the first note; meetings, for various purposes, to break up; and boys to become considerably less pugnacious and vociferous. These are the signs of a settlement for the night; and at ten or eleven o'clock nearly the whole collier village is quiet or snoring. Woe to the ill-starred stranger whose avocations may have detained him to this hour, or beyond it, if he attempt, unguided and unprotected, to thread his way for the first time through the unmitigated darkness of the pitmen's colony. Ten to one but he tumbles unawares into some old railway cutting (which, indeed, happened to myself), and there he is likely to remain for all the assistance that he can obtain from the colliers, whose first sleep would scarcely suffer disturbance from anything short of an explosion of carbureted hydrogen gas. So seldom are the remote pit villages trodden by the feet of strangers, that cuttings and embankments of abandoned railways are sometimes permitted to remain unfenced in the very centre of streets, in perfect consistency with the safety of the inhabitants, but to the imminent risk of the limbs of visitants, who have to grope their way at night, for the first time, through the unlighted neighbourhood.

This leads me to say a word upon the colliery villages. The houses of the pitmen are erected either by the proprietors of the colliery or by companies, who speculate in the building and letting of them to coal owners at from L.3 to L.4 per annum. It is requisite that the houses should not be distant from the pits, and they are therefore grouped round it as land can be obtained. The general appearance of a colliery village is that of two or three long rows, or a square, of low cottages, with frequent intervals. Before each set of cottages is erected a brick building for a common oven, and the loaves baked therein are certainly by no means diminutive. The back rows of the houses too frequently present a kind of central ridge formed by ash heaps and domestic superfluities, which is not only unsightly but sometimes offensive. There is seldom an efficient drainage in this quarter; and the whole arrangement is capable of great improvements. In the newer pit villages the appearance of matters is considerably ameliorated; and it is probable that the appellation of "Shiney Row," which is the phrase by which a colony of this kind is provincially known, arose from the neatness that has for some time characterised many new colliery villages.

So remarkable a dissimilitude as may be perpetually observed between the furniture and the houses themselves, is probably peculiar to the domiciles of the Northern pitmen. Amongst some hundreds of houses visited by me, there were but few that did not partially exhibit this contrast; and in many it was strikingly displayed by the presence of some article of furniture of a comparatively costly description. An eight day clock, a good chest of drawers, and a fine four-post bedstead, the last two often of mahogany, and sometimes of a very superior kind, were commonly to be noticed; for they are deemed indispensable by a decent newly-married couple, and are paid for by instalments. Costly furniture is, however, sometimes environed by despicable lumber, if not by actual uncleanliness.

The duties of a pitmen's wife are very numerous. The male portion of her family are a source of constant trouble to her, for some are going into the mine almost while the others are leaving. The hours of labour and rest not being the same for men and boys, the necessity of preparing numerous meals, at various and somewhat irregular periods of the day, is obviously entailed upon her; what between dinner for one, tea for another, washing and scrubbing materials for a third, and the cries of the child in the cradle, it is clear that she is not an idle personage. The constant exhibition of evacuated habiliments, either in the tub or on the drying line, proves that washing is almost a daily occupation. Although, however, the temptation to become a pitmen's wife does not seem to be great, yet it is sufficiently strong to allow of a frequency of early marriages. Intermarriage is usual amongst the collier population, whose clannishness is as much exhibited in this respect as in any other. From the comparatively high wages which children obtain, namely, from 10d. to 1s. 10d. per day, it is readily conceivable that they are considered as acquisitions to a pitman's fortune. Hence, what is regarded in civic society as by no means a desirable match—to

wit, a widow with a number of children—is looked upon in a contrary light by a pitman, who invariably casts his eye about to secure such a boon, provided only the children be boys. It was narrated to me, upon the authority of the late vicar of N——, that after a lamentable explosion in one of the mines, by which one poor mother of a large family was rendered a widow, a great competition for the hand of the same was expected, on account of the large proportion of boys who called her mother. One of the youngest of the pitmen, who presumed upon *his* good looks, and *her* kind looks, had been so very bold as actually to propose and pop the question at the very brink of the grave. He expected a very serious rebuke for his audacity and unseemly haste, and this he had nerved himself for; but he was taken quite aback, as he said, when the widow unhesitatingly declared her liking for the suitor, but only lamented that he was "too late" in his suit. A still more audacious youth had proposed at the commencement of the funeral procession, and was accepted!

The disagreeables appertaining to the labours of a collier are counterbalanced by the large wages he is in the habit of receiving. The hewer obtains at the rate of twenty shillings per week, and the use of his house, together with an allowance of coal. If the pit be not in full work at any period of the year, still a diminished pay is given. The pits are commonly worked for eleven days per fortnight, and the first-class pay of hewers is for full work 3s. 9d. per day; that of the strong lads, called "trams," or unaided propellers of the coal baskets, is 2s. 6d. to 2s. 2d. per day; that of the younger, "putters," or propellers, from 1s. 10d. to 1s. 6d. The drivers receive 1s. 3d. per day, and the little door-keepers, or "trappers," 10d.

These rates of pay are obviously such as fall to the lot of but few labourers; and did the pitmen possess habits of economy, they might have funds on which to fall back when incapacitated by age and the severity of their employments. Unfortunately, in most cases their economy consists in obtaining as many good things to eat and drink as their money will immediately purchase, and as many more as the shopkeeper will give them credit for; in short, although in the power of many to do so, the instances of pitmen having saved money from their earnings are rare, and if permanent infirmity overtake them, they are thrown upon the parish. It is, however, pleasing to have to add, that considerable improvements in the general habits of the colliers are visible to those who have known them for a series of years. A considerable amount of improvement is due to the efforts of the Methodists, and this all parties acknowledge.

It is generally affirmed that Northumberland is especially remarkable for the number and excellence of its schools; but to whatsoever extent this supposition may be correct, it can only have relation to the agricultural districts and the towns. Until lately, the colliers have possessed but few secular schools in their villages, and the same remark almost applies at present. There are certainly numerous Sunday schools in connexion with the various sects of Methodism, and to these much is owing; but they are neither organised, nor do they undertake to impart such an education as properly belongs to a day school. Some examples are now set, which, it is trusted, may prove beneficial and stimulating; but no one will deny that hitherto the children have been left pretty much to their parents and to themselves. Because pitmen have been found to be a somewhat suspicious and impracticable race, nearly all efforts to establish efficient schools have been relinquished. There are certainly some important exceptions, which are detailed in the Report before me; but in the great majority of instances, the establishment is set up by precisely the most unfit person to conduct it. If a pitman has the misfortune to lose an arm or leg, it would almost seem to have been concluded that he must simultaneously have acquired the skill to teach, and that the catastrophe which has incapacitated him for pit labour has conferred upon him a miraculous power of imparting knowledge. Hence it is no uncommon thing, upon entering a school in the neighbourhood of a coal-mine, to observe at the head of the establishment an evident sufferer from the calamities incident to the pit. It is true that the wooden leg is frequently made to serve various unexpected purposes, and that the remaining arm, even though it should be the left, possesses a remarkable vigour when the "strap" or instrument of correction is found necessary. I remember one schoolmaster in whom steel-hooks supplied the place of hands, and yet he was astonishingly *handy*. Persons, too, deformed from their birth, or unsuccessful in their trades, very commonly occupy this important office. As to what are called the night schools, under present circumstances boys can scarcely be expected to leave the pit for the school-room, or to remain awake there if they do. In some of these night schools, the tremendous fires in the close rooms would have induced me to prefer a well ventilated pit. With reference to the education of females and very young children, there are some dame schools in these villages, but they are liable to the same objections as the boys' schools; and the mistress was frequently found to be a personage whose current of kindliness was either actually frozen up or rapidly congealing.

Much remains to be said; but we must here terminate our remarks upon the Newcastle colliers and collieries. The source in which a detailed elucidation of the points we have touched upon may be found, has been indicated.* It is hoped that the readers of this Journal will have been interested in the information afforded respecting people and places so little known as northern pitmen and northern coal-pits.

PEDESTRIAN TOUR IN SWITZERLAND.

JUNGFRAU—GRINDELWALD—MEYRINGEN.

AUGUST 22.—Having spent the night at the inn of the Jungfrau, in our ascent of the Wengern Alp, we awakened soon after five, anxious to discover what sort of place we were in; but we might have well enough located ourselves, like the Irish milestone, "twenty miles from innywhere," for we were enwrapped by a dense white mist, which lay on us cold and clammy as if we could feel it with our hands. Having victualled ourselves, we started, and as we went along, it was evident that the mist was rarefying, for through occasional interstices we could see prodigious and mysterious-looking objects, sometimes seeming pure white, and sometimes jet black, scarcely caught by the eye, when the mist closed round them again, and baffled the anxious gaze. Oh! that that veil of mist would be lifted up like the curtain of a theatre, and let us behold the wondrous exhibition which we were sure nature had arranged behind it. At length, the mist did gradually and systematically remove itself, presenting black precipices and white coats of snow. The appearance could not but forcibly remind us of the description by Byron in his "Manfred," written on that very spot, when the bard had his eye on precisely the same scene.

> "The mists boil up along the glaciers: clouds
> Rise curling fast beneath me white and sulphury,
> Like foam from the roused ocean of deep hell."

When it was all opened up to us, we gazed upon the scene in the full consciousness and belief that the world had no grander landscape to spread before the admiring eye of man than that which was now laid open to us. Right opposite to us arose the mighty Jungfrau, visible from the summit to the base. Of this mountain, 13,748 feet above the level of the sea, the greater part of the surface on the side opposite to where we stood is one black perpendicular precipice. From the summit of this great wall, there stretch towards the mountain-top fields of everlasting snow, and wherever there is a shelf or indentation on the precipice, the snow lies; so that wherever the eye ranged over the wide surface, it encountered precipice or snow. The group of hills, some of which might be counted part of the Jungfrau, though they enjoyed separate names, stretched far away. These were the Monch, the Eiger, the Schrekhorn, and the Wetterhorn—all of the same character with the Jungfrau, with this difference, that their various summits are more narrow, and that they generally shoot up in slender, steeple-like precipices. Over all we could see the white peak of the Finster-aarhorn, the tallest of the group, measuring 14,070 feet above the sea-level. I had never, upon any previous occasion, beheld celebrated mountain scenery which did not at first sight somewhat disappoint my extravagant expectations; but in scanning these prodigious precipices with my eye, I acknowledged that they filled up all the space which my imagination contained for mountain grandeur.

Our position for a full view was most advantageous, as we were upwards of 6000 feet above the level of the sea. We continued to follow the mountain track, which, after ascending for a while, brought us downwards. We were not within the line of perpetual snow, but there were fields of it here and there in our route; and the broken fragments of rock and torn turf bore evidence to the force of the spring avalanches. We came, in the course of our descent, to a more striking illustration of them, in that shattered pine forest which Byron says "reminded" him of himself and his family. Many of the trees had been snapped clear through, like the masts of a ship in a sea-fight, while others were torn in pieces, or bent to the earth. Those which still stood were stunted hoary-looking things, which seemed to have spent their lives in anxiously fortifying themselves against avalanches, and their bark was covered by long green lichens, which went out in the wind like so many streamers. A fine contrast to these harsher features of the scene, was a patch or rather field of rhododendron, covered all over with crimson blossom. The air was filled with a confused and mysterious murmur, as of the various tongues of the mountain whispering to each other in the waterfall, or the wind, or the waving tree. As noon came on, and the sun acted on the snow, a louder voice was occasionally to be heard, even that of the avalanche, such as we had heard it last night. We heard many of these falls before we could see any of them; and at last, when the eye detected one in the act, the effect was far from being so striking as we would have expected, from the deep roar with which it reverberated among the precipices. Instead of a large portion of the snowy coating of the mountain being hurled into the glen, there descended down one of the many grooves or fissures in the face of the precipice a long narrow stream of broken snow, not unlike the fall of the Staubbach. So large were the features by which it was surrounded, that this descent of several tons' weight of matter down a perpendicular height of probably more than a thousand feet, seemed to be a trifle.

As we descended the east side of the Wengern Alp, we saw the valley of Grindelwald open before us. It did not seem far off, yet its village was but a mere dot in the landscape, and its forests seemed like brushwood. Looking at the two ravines made on either side of the Schrekhorn, between it and the Eiger on the one side and the Wetterhorn on the other, I observed certain bluish-white collections of matter—they were like mountain streams, but rather too white. I was sorry to admit it, but there was no mistaking, in the peculiar form of these, the far-famed glaciers of the Grindelwald, so often represented in pictures. It was provoking to have one's associations about clefts hundreds of feet deep, and tall icebergs, met by something which looked like the heap of snow that might be removed from the area of a respectable citizen's house; but there could be no doubt, that when we reached these glaciers, we would find yawning crevices and precipices of ice, and the fact was only an additional evidence of the gigantic scale of everything around us. When we came near the end of the descent, we met a few tourists, and among others the friends who had walked with us from Lucerne to Brientz. Their leisure had nearly expired, and they were regretting the being obliged to leave the land of mountains, after visiting the Staubbach.

As we descended into the vale of the Grindelwald, being in a country more accessible by the char roads from Unterseen than the rocky ascent we were leaving behind, we had again cause for observing the ingenious schemes employed by the peasantry to ease the pockets of tourists of their spare money. One of the plans consisted of a mock wrestling match; and this failing to attract our attention, we next were assaulted by a jingling noise, and on turning a corner of rock we beheld two women, dressed in what might be called opera cantonal costumes, performing on musical-glasses. The great staple employment of the valley, however, consists in the opening of the gates to the fences which are here and there run along to prevent the cattle from straying. The attendance of a guide might be supposed to give the traveller a security for the accomplishment of this operation, but we generally found two urchins to relieve him of the onerous task, and on more than one occasion we saw a rush made to shut the gate (which had been accidentally left open) before we reached it.*

We dined at Grindelwald, and though I often think that tourists might find something more interesting to describe than the precise composition of every meal they eat, I must describe this dinner. The waiter, when we ordered it, gave a doubtful look, and it was pretty evident that something concerning it was pressing on his mind. No hesitation was expressed, however, and measures were taken which seemed to announce that the meal was to proceed on a large scale. At length appeared the flustered and important face of the waiter, half hidden behind a large covered dish. The dish was set on the table, the cover removed with a flourish, which carried with it, as expressively as a flourish could do, the exclamation, "Now for it!"—and behold, at the bottom of the dish lay three small fishes, each about three and a half inches long! We lay back on our respective chairs, and fell into a fit of laughter; and surely we were entitled to do so. But we did not forget that the matter required to be handled in a practical manner, and instead of creating a storm, which might have been useful on such an emergency in the Strand, we proceeded to draw lots for this the first course. The second course consisted of three pieces of mutton chop, on precisely the same scale, and this was appropriated by lot cast between the remaining two of us. Finally came a cubical morsel of black beef-steak, which fell to the lot of the unsuccessful yet not least fortunate lot drawer. It was now time, we thought, to look the matter in the face, and we demanded if there were aught else to be had. Some little crabbed wild strawberries were produced, but that was not precisely the thing we wished. At last, by means of bread and scrapings of abandoned cold meat, we did manage to get enough for our wants, and were therewith content. It is fair to add, that however much the dinner was deficient in the requisites of a first-rate hotel, there was one feature in which the landlord seemed resolved not to fall below his caste—namely, the charge.

As we proposed to proceed as far as Meyringen before we halted for the night, we thought it as well to strike a bargain with our guide. The allowance for a guide, according to the tariff, is five francs a-day; but we found that there was more than one element to be taken into the calculation, and our friend maintained that for such a distance as we were travelling on that

* It is greatly to be deplored that such Reports are still mainly inaccessible to the public; and even more to be regretted that, to obtain one Report, we must purchase the whole series, at a price, in this instance, of L.1, 7s. Hence, Mr Leifchild's Report will, in fact, cost that sum. The last "Quarterly Review," with various periodicals and newspapers, have indeed epitomised it; but the mass of information which it contains is practically lost to the public, by whom, however, the cost of publication is defrayed.

* [The Swiss are not the sole practisers of schemes to ease tourists of cash. The traveller is exposed to similar devices in various parts of England and Scotland: we need only allude to the hosts of boys and girls in the Isle of Wight, at the Falls of Clyde, and wherever else a penny can be picked up by acting as conductors or gate-openers. Much of this semi-mendicancy is caused by the lavish way in which the English scatter their money while on holiday excursions.—*Ed. C. E. J.*]

day—thirty-six miles—his proper fee was fifteen francs. He was backed by the innkeepers, and very probably it was all according to law; but it is as well for travellers to know, that if five francs be a day's pay, it covers only a walk of twelve miles. Our first destination, before ascending the pass of the Great Scheideck, was to visit the upper glacier. As we neared it, our guide called at a sort of cottage, where it seems the keeper of the glacier resides, who forthwith appeared with a hatchet. I recollect having enjoyed a hearty laugh at the simplicity of a Cockney, who, intending to visit "the steep frowning glories of dark Loch-na-gar," asked if he would not find a cottage at the foot of the hill, with people in it who would show him to the top. The notion was taken from St Paul's and the Monument; but here it was realised on one of Nature's most untameable objects; and the glacier had literally its keeper, without whose sanction you can no more get access to it than you can get a seat at the theatre without the connivance of the box-keeper or some such official. To render it clear how any such appropriation could be successful, it is necessary to explain that this glacier is merely a tail, as it were, of a vast ocean of ice, which covers 200 square miles of the surface of these mountains; and that, as it descends through a very narrow and uneven valley, the masses of ice become shattered and tossed together, so as to present no even surface—nothing but a set of gigantic splinters heaped together, among which it is impossible to proceed for any distance, and on which one cannot enter except by steps cut in the ice by a hatchet. We thought that for his fifteen francs it was the duty of our guide to give us the necessary facilities, and we declined the service of him of the hatchet. I must confess to the folly of attempting to smuggle a stepping on the glacier; but the effort was ill-advised, and I tumbled flat on my back, happy that an eminence prevented the guide from seeing my fall. The step-maker seemed quite accustomed to such refusals; and so, carefully obliterating the notches he had cut, he bade us a cheerful good evening. Our guide had begun to grow a little crusty from our refusing to honour the various drafts he had been making on our patronage in favour of the gate-openers and others, and this proceeding completed our degradation in his eyes. He had hitherto made us civil answers, his affirmatives being "*Ya wohl, hérr,*" which may be translated, "Yes indeed, sir;" but he now suddenly sunk into a surly *ya*. A little civility brought back the *wohl*; but he never recovered the *herr* till it was jerked out of him, as it were, by the descent of his fifteen francs into his palm.

In vindication of our desertion of the glacier of the Grindelwald, we have to plead that we had larger designs on glaciers than it seemed likely we would here be able to execute; how far they were successful, the reader will hereafter have an opportunity of knowing. As we retired from its edge, where the ice was dirty and muddy, and ascended in front of it, we had a more full view of the expanse of the glacier. It improved on us prodigiously. We could see that far up the ice was bright and blue, that it was cleft by numerous crevices, and run up into numberless peaks. Our path lay north-east, over the pass of the Great Scheideck, which rose steeply above us. The top of the pass is 6700 feet above the sea, and as the afternoon sun beat hot upon us, it was warm work. Multitudes of large grasshoppers, about the size of kitty-wrens, were leaping about, and making the air alive with their chirruping. Astonished by their unwonted size, I wished to carry one of them home as a trophy of the Alps. It was not difficult to make the acquisition; but after I had crushed the creature to death, my heart misgave me for having ruthlessly extinguished so much happy and harmless vitality. The Wetterhorn, or peak of Storms, one of the great chain of precipice mountains, rises almost straight up from the pass—a wall of rock with snow above and in all its interstices. Here and there we crossed masses of snow which the monster had shaken from his sides in the earlier part of the year, a circumstance which showed how dangerous the pass must be at some seasons.

When we crossed the summit of the pass, the scene was materially changed. We had left the higher alps of snow and bare rock behind; and the hills before us, though lofty, were not so precipitous, and were covered with trees or other verdure. Looking at them as we passed by the side of a brawling torrent, and under the shade of lofty pines, the whole effect strikingly reminded us of the scenery of the north of Scotland, and it recalled to my mind summer evenings of old spent in wandering among the forests of Braemar. On the left, we came almost unexpectedly on one of the falls of the Reichenbach. The torrent, in its form and the character of the immediately surrounding scenery, reminded us of Foyers; and the grand proportions of the neighbouring mountains made it seem not much larger than that cataract. Not far from the fall we saw a rather elegant-looking small inn, to the door of which our guide marched up with the firm and unhesitating step of one who is performing precisely what is his duty. When we followed him to ask the meaning of this movement, we were met by a fashionably dressed young lady, who gave us a most courteous welcome. When it was explained to her that our sole motive for intruding on her premises was to recover possession of the person of our recreant guide, she expressed very strong surprise, assured us that, as a matter of course, all travellers towards Meyringen stayed in her inn all night, that it was far too late to proceed, &c. &c., and concluded by recommending the peculiar attractions of her waterfall. This part of her argument we answered somewhat in the spirit of competition, by telling her that we had as good a waterfall of our own at home (namely, the fall of Foyers); and she, not to be wanting in courtesy, rejoined that she had heard of it (a statement we doubted), and that it was (professionally speaking) well reported of. Our British obstinacy was all this time rising within us, in the form of a resolution not to be "done;" and we carried off our guide in triumph, notwithstanding that he was, or pretended to be, somewhat fatigued.

The vale of Meyringen, or, as it is otherwise termed, of Hasli, presented to us a lovely prospect in the stillness of the evening. It lay more than 2000 feet beneath us when we first caught a glimpse of it. It is a plain, verdant with forest and pasture, and dotted with villages; while on either side the mountains rise steep and abrupt like walls. It seemed but a narrow vale at first, but as we descended its dimensions widened to our view, till at last night shut out the spectacle. In the gloom, we approached another of the falls of the Reichenbach. The great white mass glimmered fearfully and mysteriously through the darkness, and its sullen roar was the more awfully distinct that the rest of nature was silent. A weary way was the latter part of the descent to Meyringen. The path is renowned for its steepness, and as it is laid with large stones, its descent is like going down a ruined stair 2000 feet long. It was a singular contrast to the darkness, and the cataracts, and the rocks, to find ourselves in a large and swarming hotel brilliantly lighted up, and with a multitude of lively people seated at supper.

BIOGRAPHIC SKETCHES.

MADAME D'ARBLAY.

Frances Burney, by marriage Madame D'Arblay, was born at Lynn-Regis in Norfolk, on the 13th of June 1752. At that period her father, Dr Charles Burney, a man of very superior attainments, filled the comparatively humble office of organist to the burgh, having accepted of it in the hope of regaining his health, injured by his ardent and laborious prosecution of the study and practice of musical composition in the metropolis. In childhood, Frances Burney showed a marked backwardness in learning her letters, and even at eight years of age was unable to read. But, though common onlookers called her in consequence "the little dunce," an under-current of shrewd observation and lively invention occasionally gleamed through her natural shyness, which led her intelligent mother to stand out against the general opinion, and to say frequently that "she had no fear about Fanny." When with her young companions, and unembarrassed by the presence of strangers, the child would at times display her latent powers of imagination, by imitating such actors as she chanced to have seen, and composing long speeches for them; or she would get up dramatic scenes purely of her own invention. Many readers will remember that another lady of distinguished literary talent, Miss Landon, first showed her abilities by similar exercises of the fancy among the playmates of her youth.

In the year 1760, Dr Burney returned to London with invigorated health, and renewed the acquaintance which he had previously formed with many of the eminent literary men of the age. His daughter Fanny, who at length, at the age of ten, acquired the arts of reading and writing, was soon able to make sharp and shrewd observations on the scenes around her. It is remarkable that she showed a turn for scribbling some years before she began to read with any great diligence, proving that her perceptive faculties were naturally acute in no ordinary degree, while that reflective turn of mind which finds its chief food in books did not so markedly characterise her. As circumstances fell out, she was left in a great measure to educate herself. Her mother died soon after the family removed from Norfolk to London; and when Esther and Susan, her elder and younger sisters, were sent for two years to a Parisian school, Dr Burney did not deem it right that his second daughter should go with them, because she displayed so much affection for her maternal grandmother, a Roman Catholic, that he was afraid of her there becoming attached to the religion of that beloved relative. Frances remained at home, accordingly, and was left in a great measure to her own exertions for self-improvement. Her chief spur lay in her unbounded love for her father, who, though he could not spare time to superintend her educational pursuits, was yet able to give hints which were of great service, these being always regarded by his daughter as laws. As her sister Susan well remarked, on her return from Paris, "sense, sensibility, bashfulness (diffidence before society), and even a degree of prudery," became the chief characteristics of Frances Burney, under the course of training described.

Society was, in many respects, the main school in which Miss Frances Burney's observant powers found the means of development. Her father, who took for his second wife a lady of great merit and amiability, was so highly esteemed as to gather around him a circle of friends, whose intimacy could not but be most improving to his children, and among whom may be mentioned David Garrick, Dr Hawkesworth, the poets Armstrong and Mason, Sir Robert Strange, and Barry the painter. Dr Burney also numbered Samuel Johnson and the Thrales among his friends. The mind of Miss Burney was not idle while mixing in the society of these and other parties, and she continued secretly and perseveringly to expend her whole leisure time in writing tales and such-like short pieces, her sister Susan being her sole confidant in this employment. But her mother-in-law began to suspect the truth, and took occasion so seriously, though without any direct personal application, to condemn the scribbling mania in young women, that the poor incipient authoress, at the call of duty, made a bonfire of her compositions, her sister Susan standing weeping by all the while. But the propensity to stain paper is not so easily repressed, and Miss Burney, after her pen had for a time lain dormant, though her brain remained busy with the task of composition, set down on paper the story of "Evelina, or a Young Lady's Entrance into the World." She completed at first only the first two of the four volumes, and with great secrecy, her pursuance of such a task being known but to her brother and sisters. An application was then made to Dodsley, and afterwards to Lowndes, the publishers, and the latter undertook to issue it when finished. Before that time, however, Miss Burney deemed it right to tell her father of the matter. "Seizing, therefore, an opportunity when her father was bidding her a kind farewell, preparatory to a Chesington visit, she avowed to him, with many blushes, 'her secret little work, and her odd inclination to see it in print;' adding, that her brother Charles would transact the affair with a bookseller at a distance, so that her name could never transpire, and only intreating that he would not himself ask to see the manuscript. 'His amazement was even surpassed by his amusement; and his laugh was so gay, that, revived by its cheering sound, she lost all her fears and embarrassment, and heartily joined in it, though somewhat at the expense of her new author-like dignity.' Dr Burney thought her project as innocent as it was whimsical; and kindly embracing her, enjoined her to be careful in guarding her own *incognita*, and then dropped the subject without even asking the name of her book."

A diary, commenced after the publication of "Evelina" in January 1778, informs us minutely of the feelings of the authoress when her novel met decisively with the approbation of the world. There is something very pleasing in her expressions of delight when she records the praises of her beloved father. He declared it to be one of the best novels which he knew; and in reality the work certainly approaches more closely in wit and humour to those of Fielding and Smollett than any other novel of its day, while it stands incomparably above these models themselves in purity. But though the account of Miss Burney's feelings, when informed of the approval of her father, be sufficiently pleasing, we must say that even the youth of the writer, and the intended confinement of her diary to the eyes of her sisters, cannot make us look with toleration on all the butterings and flutterings, shiverings and quiverings, blushings and flushings, set down relative to Miss Burney's state of authorship in the diary—ultimately arranged by herself, by the way, for the world's eye, and recently published. The entire three volumes, now before us, are stuffed with what this one said, and that one wrote, about Miss Burney's novels, while all the time the diarist is prettily disclaiming all sense of merit, and affecting to believe one-half of such commendations to be fudge. This sort of thing is carried to an extent, in short, which nearly blinds one to the real humour and tact for observation discernible in many of the pictures of society given by the fair diarist. To prove our words, let us open a page at random. It is page 64, vol. i., and the first sentence that there meets the eye is one from the lips of Dr Johnson, with whom, as well as with Mrs Thrale, Miss Burney became very intimate. "I am too proud now to eat [of mutton,]" says the doctor; "sitting by Miss Burney makes me very proud to-day." Turn over a leaf of the diary, and lo! again says the doctor, alluding to a lady having called for a pint of ale, "Madame Duval could not have done a grosser thing." Madame Duval being a character in "Evelina," our authoress here diarises: "Oh, how every body laughed! and to be sure I did not glow at all, nor munch fast, nor look on my plate, nor lose any part of my usual composure!" Sometimes Miss Burney punished her vanity by these affectations. For example, "a gentleman," says she, "inquiring for my father, was asked into the parlour. The then inhabitants were only my mother and me. In entered a square old gentleman, well-wigged, formal, grave, and important. He seated himself. My mother asked if he had any message for my father? 'No, none.' Then he regarded me with a certain dry kind of attention for some time; after which, turning suddenly to my mother, he demanded, 'Pray, ma'am, is this your daughter?' 'Yes, sir.' 'Oh! this is Evelina, is it?' 'No, sir,' cried I, staring at him, and glad none of you were in the way to say Yes. 'No?' repeated he, incredulous; 'is not your name Evelina, ma'am?' 'Dear, no, sir,' again quoth I, staring harder. 'Ma'am,' cried he, drily, 'I beg your pardon! I had understood your name was Evelina.' And soon after, he went away. When he put down his card, who should it prove but Dr Franklin!" Miss Burney would have liked well enough to be personally known to Dr Franklin as the authoress of "Evelina."

Betwixt 1778 and 1786, at which latter period a

great change took place in Miss Burney's situation by her becoming Mistress of the Robes to the Queen, the authoress of "Evelina" added the novel of "Cecilia" to the number of her works, and sustained her credit by it in the literary world. Her time in the interval was spent chiefly in literary society, and the most interesting parts of the diary refer to Samuel Johnson, Mrs Thrale, Burke, Seward, and Boswell. A specimen of her anecdotes may be here given; and firstly, let us give a sample of Dr Johnson's domineering disposition, and the way in which he made all bow to him. "Mrs Burney had on a very pretty linen jacket and coat, and was going to church; but Dr Johnson, who, I suppose, did not like her in a jacket, saw something was the matter, and so found fault with the linen; and he looked and peered, and then said, 'Why, madam, this wont do! you must not go to church so!' So away went poor Mrs Burney and changed her gown! And when she had done so, he did not like it, but he did not know why; so he told her she should not wear a black hat and cloak in summer. Oh, how he did bother poor Mrs Burney; and himself too, for if the things had been put on to his mind, he would have taken no notice of them." Again, for the other side of the picture. "At tea-time the subject turned upon the domestic economy of Dr Johnson's own household. Mrs Thrale has often acquainted me that his house is quite filled and overrun with all sorts of strange creatures, whom he admits for mere charity, and because nobody else will admit then—for his charity is unbounded, or, rather, bounded only by his circumstances. Mrs Thrale—'And pray, who is clerk of your kitchen, sir?' Dr Johnson—'Why, madam, I am afraid there is none; a general anarchy prevails in my kitchen, as I am told by Mr Levat, who says it is not now what it used to be!' 'Mr Levat, I suppose, sir, has the office of keeping the hospital in health; for he is an apothecary.' 'Levat, madam, is a brutal fellow, but I have a good regard for him; for his brutality is in his manners, not his mind.' 'But pray, sir, who is the Poll you talk of? She that you used to abet in her quarrels with Mrs Williams, and call out, 'At her again, Poll! Never flinch, Poll!'' 'Why, I took to Poll very well at first, but she wont do upon a nearer examination.' 'How came she among you, sir?' 'Why, I don't rightly remember, but we could spare her very well from us. Poll is a stupid slut; I had some hopes of her at first; but when I talked to her tightly and closely, I could make nothing of her; she was wiggle-waggle, and I could never persuade her to be categorical. I wish Miss Burney would come among us; if she would only give us a week, we should furnish her with ample materials for a new scene in her next work.'"

Miss Burney began her attendance at court in July or August 1786. Kind though George III. and Queen Charlotte ever were to her, the situation of Mistress of the Royal Robes was rendered very disagreeable by the German women about the queen, and, above all, by the stiff etiquette practised at court. Our space will not permit us to enter on the scenes which Miss Burney witnessed in her court place, but we may point attention to these as among the most amusing things in her journal. We learn from them that the system of rigid, unbending ceremony prevalent in palaces, which wearies out the souls and bodies alike of the chamber grooms and other attendants, is not less fatiguing, in reality, to the royal parties in whose honour it is maintained, and that their lives are but one long yawn. Such, at least, was the case with the third George and his queen; and such must ever be most especially the case where the royal personages, like them, are good dull folks, of exemplary life.

At the end of five years, Miss Burney's spirits and health fairly sunk under her "honourable" office, and she was forced to quit it. Shortly afterwards, she became acquainted with Count Alexander Piochard D'Arblay, an emigrant artillery officer of France, and an attachment took place, which terminated in their union in 1793. Led by this event to take an interest in the French refugees, she drew up some "Reflections relative to the Emigrant Clergy of France," and published the essay for their benefit. Another production from her pen was a tragedy entitled "Edwy and Elgitha," produced at Drury Lane in 1795. It attracted no attention, though her ordinary style of literary composition was most certainly dramatic in no ordinary degree, as her novels and memoirs prove beyond question. So obvious was this quality of her genius, indeed, that Sheridan and others had long before endeavoured to direct her attention to the stage. Some incomplete pieces, however, were the only result. Her reputation as the first novelist of the time seems not to have been affected by the mediocre success of her tragedy, since, in 1796, a new novel from her pen, styled "Camilla," received subscriptions to the amount of *three thousand guineas*. When we consider that she got but twenty pounds for "Evelina," a novel of far greater merit, the dependence of literary earnings upon the repute of the author becomes strikingly apparent. With the proceeds from her novel, which her husband's position rendered not unimportant, Madame D'Arblay built a neat villa or hermitage, which she called "Camilla Cottage," and in which she spent her days in quiet, until the peace of 1802 attracted her husband to Paris. Madame D'Arblay accompanied him, and, contrary to intention, found herself obliged to remain there, M. D'Arblay having been led to form connexions with Napoleon which he afterwards could not in honour retract from. The Russian campaign of 1812 gave the subject of our memoir an opportunity of returning to England, where her husband joined her, and remained till the close of his life in 1818.

Two additional works, "The Wanderer," a novel published in 1814, and "Memoirs of Dr Burney," issued in 1832, were the fruit of Madame D'Arblay's leisure hours, subsequently to her return to England. For the first of these works she received L.1500, though it was less esteemed, and, indeed, possessed much less merit, than any of her earlier novels; the last of them, though marked by blemishes similar to those of her posthumously published "Diary," and bearing some tokens, moreover, of the natural decline of the author's powers, contains many interesting anecdotes relative to the eminent parties with whom Dr Burney associated. For some years after her return to England, Madame D'Arblay had the pleasure of witnessing the high estimation in which her brothers Admiral James Burney, and Dr Charles Burney, the celebrated Greek scholar, were held; and she also enjoyed the society of her son, the Rev. Alexander D'Arblay, curate of Camden Town Chapel. He died, however, in 1837, and his mother did not long survive him. She breathed her last at Bath, on the 6th of January 1840, in her eighty-eighth year.

Madame D'Arblay was almost the last, if not the very last, surviving link betwixt the present age of literature and that of Johnson and Goldsmith. She was undoubtedly a woman of fine talents, and her novels of "Evelina" and "Cecilia" are among the few of the old school which reward perusal, and merit preservation. They hold a middle place betwixt those of Richardson and Fielding, having much of the pure sentiment of the former combined with no slight degree of the wit and humour of the latter novelist. If just, as we believe it to be, this view of the matter places Madame D'Arblay in no mean rank among the novelists of Britain.

LIEBIG'S ANIMAL CHEMISTRY.

RATHER more than twelve months ago,* we presented a brief analysis of one of the greatest works of modern times—"Organic Chemistry in its Application to Agriculture and Physiology," by Dr Justus Liebig, Professor of Chemistry in the University of Giessen, a small town in Germany. The work had been presented in the form of a report to the British Association at its meeting in 1840, and purported to be only the first of a series of treatises completing the subject. At the late meeting of the association at Manchester, the learned doctor presented the second part of his great undertaking, through the medium of Dr Lyon Playfair; and from the report of proceedings on the occasion, the country has already acquired an idea of what constitutes the subject matter of this new addition to Liebig's views of organic chemistry. As we consider this a highly important branch of scientific inquiry, with which it is proper the people should be made acquainted, we propose to give an outline of the professor's discoveries and observations, drawn from a more accurate source than the rough notes of the newspaper reporters. We take Liebig's report as lately published in the form of an octavo volume, and endeavour to present the same kind of analysis of its contents as we did of the preceding.†

The first work referred to the chemistry of vegetable life; that is, the character of those elementary bodies which went to the formation of vegetables, as, for example, gases and the component parts of manures; the present refers to the chemistry of animal organisation, including the principles of vitality, assimilation, nutrition, heat, consumption of parts, secretion, and other conditions of animal existence. Thus, an extensive series of phenomena is treated of, and questions raised of the greatest importance in physiological science. The learned investigator commences with the subject of vitality—"a certain remarkable force, the source of growth, of increase of mass, and of reproduction, or of supply of the matter consumed; a force in a state of rest."

"The increase of mass in a plant," he proceeds to say, "is determined by the occurrence of a decomposition which takes place in certain parts of the plant under the influence of light and heat. In the vital process, as it goes on in vegetables, it is exclusively inorganic matter which undergoes this decomposition; and if, with the most distinguished mineralogists, we consider atmospherical air and certain other gases as minerals, it may be said that the vital process in vegetables accomplishes the transformation of mineral substances into an organism endued with life—that the mineral becomes part of an organ possessing vital force.

The increase of mass in a living plant implies that certain component parts of its nourishment become component parts of the plant; and a comparison of the chemical composition of the plant with that of its nourishment makes known to us, with positive certainty, which of the component parts of the latter have been assimilated, and which have been rejected.

The observations of vegetable physiologists and the researches of chemists have mutually contributed to establish the fact, that the growth and development of vegetables depend on the elimination of oxygen, which is separated from the other component parts of their nourishment. In contradistinction to vegetable life, the life of animals exhibits itself in the continual absorption of the oxygen of the air, and its combination with certain component parts of the animal body. While no part of an organised being can serve as food to vegetables, until, by the processes of putrefaction and decay, it has assumed the form of inorganic matter, the animal organism requires, for its support and development, highly organised atoms. The food of all animals, in all circumstances, consists of parts of organisms."

Then, with respect to the faculty of locomotion—"Everything in the animal organism to which the name of *motion* can be applied, proceeds from the nervous apparatus. The phenomena of motion in vegetables, the circulation of the sap, for example, observed in many of the characeæ, and the closing of flowers and leaves, depend on physical and mechanical causes. A plant is destitute of nerves. Heat and light are the remote causes of motion in vegetables; but in animals we recognise in the nervous apparatus a source of power, capable of renewing itself at every moment of their existence.

While the assimilation of food in vegetables, and the whole process of their formation, are dependent on certain external influences which produce motion, the development of the animal organism is, to a certain extent, independent of these external influences, just because the animal body can produce within itself that source of motion which is indispensable to the vital process.

Assimilation, or the process of formation and growth—in other words, the passage of matter from a state of motion to that of rest—goes on in the same way in animals and in vegetables. In both, the same cause determines the increase of mass. This constitutes the true vegetative life which is carried on without consciousness.

The activity of vegetative life manifests itself in vegetables with the aid of external influences; in animals, by means of influences produced within their organism. Digestion, circulation, secretion, are no doubt under the influence of the nervous system; but the force which gives to the germ, the leaf, and the radical fibres of the vegetable the same wonderful properties, is the same as that residing in the secreting membranes and glands of animals, and which enables every animal organ to perform its own proper function. It is only the source of motion that differs in the two great classes of organised beings."

Passing over some observations on the insufficiency of all theory without a close examination of facts, the author goes on to state that all increase to the body is carried on through the agency of deposits from the blood. His remarks on this transformation are startling:—"All the parts of the animal body are produced from a peculiar fluid, circulating in its organism by virtue of an influence residing in every cell, in every organ, or part of an organ. Physiology teaches that all parts of the body were originally blood, or that at least they were brought to the growing organs by means of this fluid. The most ordinary experience further shows, that at each moment of life, in the animal organism, a continued change of matter, more or less accelerated, is going on; that a part of the structure is transformed into unorganised matter, loses its condition of life, and must be again renewed. Physiology has sufficiently decisive grounds for the opinion that every motion, every manifestation of force, is the result of a transformation of the structure or of its substance; that every conception, every mental affection, is followed by changes in the chemical nature of the secreted fluids; that every thought, every sensation, is accompanied by a change in the composition of the substance of the brain."

Vitality is a consequence of the action of certain transformations; we can discover the laws which govern the transformation, but we can never learn what life—the ultimate result—actually is. In such inquiries, "Wonders surround us on every side. The formation of a crystal, of an octahedron, is not less incomprehensible than the production of a leaf or of a muscular fibre; and the production of vermilion from mercury and sulphur is as much an enigma as the formation of an eye from the substance of the blood.

The first conditions of animal life are nutritious matters and oxygen, introduced into the system. At every moment of his life, man is taking oxygen into his system, by means of the organs of respiration; no pause is observable while life continues.

The observations of physiologists have shown that the body of an adult man, supplied with sufficient food, has neither increased nor diminished in weight at the end of twenty-four hours; yet the quantity of oxygen taken into the system during this period is very considerable.

* No. 485, May 15, 1841.

† Animal Chemistry, or Organic Chemistry in its Applications to Physiology, by Justus Liebig. Edited by W. Gregory, Professor of Medicine, Aberdeen. London: Taylor and Walton, Upper Gower Street. 1842.

According to the experiments of Lavoisier, an adult man takes into his system, from the atmosphere, in one year, 746 pounds—according to Menzies, 837 pounds—of oxygen; yet we find his weight, at the beginning and end of the year, either quite the same, or differing, one way or the other, by at most a few pounds.

What, it may be asked, has become of the enormous weight of oxygen thus introduced, in the course of a year, into the human system?

This question may be answered satisfactorily: no part of this oxygen remains in the system, but it is given out again in the form of a compound of carbon or of hydrogen.

The carbon and hydrogen of certain parts of the body have entered into combination with the oxygen introduced through the lungs and through the skin, and have been given out in the forms of carbonic acid gas and the vapour of water.

At every moment, with every expiration, certain quantities of its elements separate from the animal organism, after having entered into combination, within the body, with the oxygen of the atmosphere.

If we assume, with Lavoisier and Séguin, in order to obtain a foundation for our calculation, that an adult man receives into his system daily 32½ ounces (46,037 cubic inches = 15,661 grains, French weight) of oxygen, and that the weight of the whole mass of his blood, of which 80 per cent. is water, is 24 pounds, it then appears, from the known composition of the blood, that in order to convert the whole of its carbon and hydrogen into carbonic acid and water, 64,103 grains of oxygen are required. This quantity will be taken into the system of an adult in four days five hours.

Whether this oxygen enters into combination with the elements of the blood, or with other parts of the body containing carbon and hydrogen, in either case the conclusion is inevitable, that the body of a man who daily takes into the system 32½ ounces of oxygen must receive daily, in the shape of nourishment, as much carbon and hydrogen as would suffice to supply 24 pounds of blood with these elements; it being presupposed that the weight of the body remains unchanged, and that it retains its normal condition as to health. This supply is furnished in the food."

It appears that a man, taking moderate exercise in the open air, requires 37 ounces of oxygen daily. Since no part of this large supply of oxygen "taken into the system is again given off in any other form but that of a compound of carbon or hydrogen—since, further, the carbon and hydrogen given off are replaced by carbon and hydrogen supplied in the food—it is clear that the amount of nourishment required by the animal body must be in a direct ratio to the quantity of oxygen taken into the system.

Two animals, which in equal times take up by means of the lungs and skin unequal quantities of oxygen, consume quantities of the same nourishment which are unequal in the same ratio.

The consumption of oxygen in equal times may be expressed by the number of respirations; it is clear that, in the same individual, the quantity of nourishment required must vary with the force and number of the respirations.

A child, in whom the organs of respiration are naturally very active, requires food oftener than an adult, and bears hunger less easily. A bird, deprived of food, dies on the third day; while a serpent, with its sluggish respiration, can live without food three months and longer. The number of respirations is smaller in a state of rest than during exercise or work. The quantity of food necessary in both conditions must vary in the same ratio. An excess of food is incompatible with deficiency in respired oxygen, that is, with deficient exercise; just as violent exercise, which implies an increased supply of food, is incompatible with weak digestive organs. In either case the health suffers. But the quantity of oxygen inspired is also affected by the temperature and density of the atmosphere.

The capacity of the chest in an animal is a constant quantity. At every respiration a quantity of air enters, the volume of which may be considered as uniform; but its weight, and consequently that of the oxygen it contains, is not constant. Air is expanded by heat, and contracted by cold, and therefore equal volumes of hot and cold air contain unequal weights of oxygen. In summer, moreover, atmospherical air contains aqueous vapour, while in winter it is dry; the space occupied by vapour in the warm air is filled up by air itself in winter; that is, it contains, for the same volume, more oxygen in winter than in summer.

In summer and in winter, at the pole and at the equator, we respire an equal volume of air; the cold air is warmed during respiration, and acquires the temperature of the body. To introduce into the lungs a given volume of oxygen, less expenditure of force is necessary in winter than in summer; and for the same expenditure, more oxygen is inspired in winter.

It is obvious, that in an equal number of respirations we consume more oxygen at the level of the sea than on a mountain. The quantity both of oxygen inspired, and of carbonic acid expired, must therefore vary with the height of the barometer.

The oxygen taken into the system is given out again in the same forms, whether in summer or in winter; hence we expire more carbon in cold weather, and when the barometer is high, than we do in warm weather; and we must consume more or less carbon in our food in the same proportion; in Sweden more than in Sicily; and in our more temperate climate a full eighth more in winter than in summer.

Even when we consume equal weights of food in cold and warm countries, infinite wisdom has so arranged, that the articles of food in different climates are most unequal in the proportion of carbon they contain. The fruits on which the natives of the south prefer to feed do not, in the fresh state, contain more than 12 per cent. of carbon, while the bacon and train oil used by the inhabitants of the arctic regions contain from 66 to 80 per cent. of carbon.

It is no difficult matter, in warm climates, to study moderation in eating, and men can bear hunger for a long time under the equator; but cold and hunger united very soon exhaust the body.

The mutual action between the elements of the food and the oxygen conveyed by the circulation of the blood to every part of the body is *the source of animal heat.*"

The author proceeds to show how food is the fuel that is constantly required to feed the animal heat; and his observations on this and other interesting parts of his subject will engage our attention in a concluding notice of his work.

THE PLEASURE SEEKER.

[From BIZARRE FABLES, a small and amusing work which we lately recommended to notice.]

AT the close of a sultry day in August, when the sunlight was slowly fading from the sky, and yielding to the mild splendour of the full harvest moon; when the refreshing coolness and delicious calmness of the evening invited all who had sound limbs to walk the earth, and all who had sound lungs to breathe the air; at this time, and in a spot surrounded by the most beautiful scenery in England, a young man lighted his lamp, closely shut his window, drew the curtain, and, opening a book, sat down at the table to read.

This young man did not consider himself mad—neither was he considered so by others. Let me, then, account for these mad proceedings.

Some three months before, he had been conveyed to the cottage where he now resided, in so wretched a state of health that life could hardly be said to inspirit him. By quiet, fresh air, and simple fare, he had been restored nearly to perfect convalescence; but langour and dejection still remained—the residue of the utter mental and bodily prostration which had so lately passed away.

Walter Everett, the invalid, was by profession a Thinker, and had brought on his illness by the exercise of his profession. He had committed the double sin of overworking the brain, and underworking every other bodily organ, and the penance he suffered was severe in proportion. Reading and meditation carried to excess are as destructive, and quite as foolish, as other modes of dissipation.

On this particular evening, for the first time since his illness, he resolved to study as of old. The brightly-burning lamp, the shining white page, again were before him, and all his former feeling of subdued enthusiasm came back with the familiar appearances. The shaken nerves, the dim eyes, were forgotten; and the study which had made them so was remembered only for the benefits it could yield.

But was there no one near to mark this rash self-will, and gently to remonstrate? Lucy, who had sympathised with him in sickness and recovery—who had attended on and cheered him like a ministering angel—was near. She no sooner witnessed the closing of the window, the lighting of the lamp, and the opening of the book, than she stole softly behind his chair, and bringing her pretty face over his shoulder, looked on the page with a playful, scornful air. "What is this, Walter?" said she; "philosophy? nonsense! Shut up your philosophy: we want none this evening."

"And why not this evening, dear Lucy?"

"Because I am determined that you shall not bring on a return of your illness," replied Lucy. "You have not studied now for six months, and you must begin this evening, forsooth! I'll not allow it."

"You are peremptory, Lucy!" said Walter, with a smile.

"Peremptory!" exclaimed Lucy; "yes, it is enough to make any one peremptory. Tell me," continued she demurely, "have you not often declared that the great object of existence to a rational being is the discovery of the means of producing pleasure and the means of producing pain—the adoption of the first, and the rejection of the last; moreover, that a pleasure which is evidently inferior to another pleasure, or which is necessarily mixed up with, or followed by, a greater pain, should be avoided, and that only enjoyed which is in its nature of the highest and purest. Have you not declared all this, and more than this; a great deal more than I can either remember or understand?"

"Granted!" replied Walter, laughing. "Proceed, most philosophical madam!"

"Then, most unphilosophical sir," exclaimed Lucy, "I charge you with acting against your own doctrine. You have done so habitually, and, undeterred by experience, you wish to do so now."

"Ha, Lucy!" exclaimed Walter; "that is a serious charge, indeed! Explain, my dear girl, explain!"

"I will," said Lucy; "and undertake to convert you before I finish my discourse. A pleasure is not to be enjoyed, you say, which is evidently inferior to another pleasure, or which is necessarily mixed up with, or followed by, a greater pain. Now, what caused your illness, pray? Why, your violation of both these maxims. You secluded yourself eternally to read, as if reading were the highest pleasure in the world; and you read with such infatuated eagerness as to ruin your health. Was *this* conduct worthy of a rational being?"

"I plead guilty to the second count of your indictment," said Walter, "but not to the first. I *did* read to excess, I own; but reading itself is, certainly, to use your own words, a pleasure in its nature of the highest and purest."

"Wait a little," said Lucy, "I have not half done with you yet. I maintain that you injured your mental more than your bodily health, and have actually rendered yourself incapable of distinguishing between the different degrees of pleasure. You have read until you can relish nothing but reading. Your highest pleasure has become—the consideration of the means to arrive at pleasure. You have chased a desired thing so long, that you prefer the chase to the possession of the object chased. I accuse you of being a mere pleasure-seeker, a self-denying pleasure-seeker, who, with what he seeks within his grasp, seizes it not at once, but vainly schemes how to seize it in the cleverest way; or how to seize something else more distant, and therefore more attractive. You do not take the best, you know, but must first ascertain that it is the best existing. Whilst common mortals are enjoying, you are reasoning about enjoyment."

"Go on, Lucy!" said Walter, smiling, but faintly.

Lucy continued:—"You have worn out your eyes, bent your shoulders, and confused your brain, by thinking, and the study of others' thinking. And for what? To be confuted by an untaught girl—even by your own poor Lucy! Ah! my dear philosopher, be advised. Do what I tell you, and you will never do wrong!"

"And what is that, Lucy?" inquired Walter. "Pronounce, my pretty instructress, for pupil I must call you no longer."

"Thus stands the case," said Lucy, deliberately—"you have been laid up ill in this cottage for three months, and are now much recovered. The pleasure which I recommend to you, then, is—the enjoyment of this charming evening. It is a pleasure great in itself, and one that will be followed by no atoning pain. You should walk out, if circumstances allowed it; but this I do not recommend, because you are weak, and the injury caused by walking might be greater than the benefit."

"Logically put!" exclaimed Walter. "Say on, wisest of thy sex!"

"Well," continued Lucy, "what is the inference? The evening air being good for you, and you being unable to go out at the door to meet it, the rational course is, that it should come in at the window to meet you. In other words, you must be careless and happy, instead of meditative and miserable. Here are two chairs by the window. You will sit in one, and I will sit in the other; the casement shall be opened, and the book shall be shut; the lamp shall be put out, and the moonlight shall be let in. Instead of looking on wearying letters, you shall look on trees, and grass, and flowers; and you shall talk love to me, and not think philosophy to yourself. Is it agreed, Walter?"

"No, no, Lucy!" exclaimed Walter; "you have painted the picture very temptingly, but I cannot realise it. We will not sit in the chairs by the window; the casement shall not be opened; the lamp shall not be put out; I will not look on trees, and grass, and flowers; and, hardest yet, I will not talk of love."

"What do you bet that all these things will not come to pass?" said Lucy, with an arch look.

"Bet!" exclaimed Walter; "I am *sure* they will not!"

"But what do you bet?" repeated Lucy, pertinaciously.

"Oh, anything!" said Walter, "anything! and I will give as long odds as you like. Against this embroidered note-book of yours, I will stake—let me see, what shall it be?—a first-rate double-action Errard harp; will that do? It is a most magnanimous bet, considering that I am quite determined to win."

"Done!" said Lucy; and "Done!" said Walter.

The word had scarcely passed his lips, when Lucy, with a sudden and violent expiration, extinguished the lamp; with a turn of her finger she closed the book; and when he started from his seat, angry and astonished at this conduct, she threw her arms round his neck, and pulled him gently towards the window.

Here was the Gordian knot most ridiculously and ingloriously cut at once. It was impudent! it was unbearable! Walter struggled to release himself, and uttered various unpleasing exclamations of rage and defiance. But he could not hurt those tender arms; and a silvery laugh was so catching, and a charming and dearly-loved girl so irresistible, that he fairly gave in, yielded himself to his fate, and joined in the laugh with right good will. Lucy placed him in one chair by the window; then she drew the curtain, opened the casement, and sat herself down in the other chair. The moonlight streamed in and displayed the trees, and grass, and flowers without.

Whether Walter talked love to Lucy, I know not; but I suspect that the wager was won in every particular, as Lucy certainly retained her note-book, and

was shortly afterwards presented with a first-rate double-action Errard harp.

MORAL.—When pleasure hovers about your dwelling, open your casement in welcome; for it is most shy and capricious, and never fails to resent any sign of inhospitality.

CIRCUMSTANTIAL EVIDENCE.

CASE OF HARRISON AND THE PERRYS.

In the interesting collection of papers made by Harley, Earl of Oxford, and well known under the title of "The Harleian Miscellany," a pamphlet, of date September 1676, is found, containing an account of the mysterious disappearance of a man denominated William Harrison, and the unhappy consequences that resulted therefrom. The narrative is authenticated by the name of the writer, Sir Thomas Overbury, nephew to the ill-fated gentleman of the same designation, who was so barbarously assassinated in the year 1613. We here abridge the details of the affair of Harrison, which were derived by Sir Thomas from minute inquiries made on the scene of the occurrence.

William Harrison was steward to Viscountess Campden of Campden, in Gloucestershire. On Thursday the 16th of August 1660, he left Campden to walk on foot to Charringworth, about two miles distant, in order there to receive his lady's rents. Harrison was a man of about seventy years of age, yet hale and healthy, and had been accustomed frequently to take similar journeys. On the evening mentioned, however, he did not return at the usual time, and Mrs Harrison, between eight and nine o'clock that evening, sent her servant John Perry to meet his master on the way from Charringworth; but neither Mr Harrison nor his servant John Perry returning that night, the next morning early, Edward Harrison (William's son) went towards Charringworth to inquire after his father. On the way, meeting Perry coming thence, and being informed by him that his father was not there, they went together to Ebrington, a village between Charringworth and Campden, where they were told by one Daniel that Mr Harrison had called at his house the evening before, in his return from Charringworth, but did not stay. Then they went to Paxford, about half a mile thence, where hearing nothing of Mr Harrison, they returned towards Campden; and on the way, learning that a hat, a band, and comb, had been taken up in the highway between Ebrington and Campden, by a poor woman then working in the field, they sought her out, and with her found the hat, band, and comb, which they knew to be Mr Harrison's; and being brought by the woman to the place where she found the same, they there searched for Mr Harrison, supposing he had been murdered, the hat and comb being hacked and cut, and the band bloody; but nothing more could be there found. The news hereof coming to Campden so alarmed the town, that men, women, and children hastened in multitudes to search for Mr Harrison's supposed dead body, but all in vain.

Mrs Harrison's fears for her husband were now much increased; and the circumstance of Perry being sent out the evening before to meet his master, and not returning that night, caused a suspicion that he had robbed and murdered him. Perry was the next day brought before a justice of peace; and being examined concerning his master's absence, and his own staying out on the night when he went to meet Mr Harrison, he made a rambling statement relative to his fears of travelling in the dark, which had led him to sleep in the hen-roost, he said, till the moon rose, after which he went towards Charringworth, but, in consequence of a mist, was obliged to lie down under a hedge, and did not get to the village till the morning came. He only heard then that his master had been there, and had received twenty-three pounds on the previous day. Four persons who had seen Perry confirmed his account of his own movements on the night and morning in question.

Notwithstanding this account which Perry gave of his staying out that night, it was not thought fit to discharge him till further inquiries were made after Mr Harrison; and accordingly he continued in custody at Campden, sometimes in an inn there, and sometimes in the common prison, from Saturday the 18th of August to the Friday following, during which time he was again examined at Campden by the aforesaid justice of peace, but confessed nothing more than before, nor at that time could any further discovery be made what was become of Mr Harrison. But it hath been said, that, during his restraint at Campden, he told some, who pressed him to confess what he knew concerning his master, that a tinker had killed him; and to others, that a gentleman's servant of the neighbourhood had robbed and murdered him; while to others, again, he told that Mr Harrison was murdered and hid in a bean-rick in Campden. But there search was in vain made for him.

At length Perry mentioned that were he again carried before the justice, he would discover to that gentleman what he would discover to nobody else. And thereupon he was (Friday, August the 24th) again brought before the justice of peace, who first examined him, and asked him whether he would yet confess what was become of his master? He answered, "Mr Harrison was murdered, but not by him." The justice of the peace then told him, that if he knew his master to be murdered, he knew likewise by whom it was done. He acknowledged he did; and being urged to confess what he knew concerning it, affirmed, "That it was his mother and his brother that had murdered his master." The justice of peace then advised him to consider what he said, telling him that he feared he might be guilty of his master's death, and that he should not draw more innocent blood upon his head; for what he now charged his mother and brother with might cost them their lives; but he affirming he spoke nothing but the truth, and that if he were immediately to die he would justify it, the justice desired him to declare how and when they did it.

John Perry then stated, that his mother and brother had long urged him to steal money for them; and that at length, on the evening when his mistress sent him to meet his master, he met his brother in the street, and consented to aid him in robbing and murdering Mr Harrison. They watched the latter accordingly, and the brother, after being joined by the mother, attacked him; at which he (John) told his brother he hoped he would not kill his master; who replied, "Peace, peace; you're a fool," and so strangled him. This done, the brother took a bag of money out of his pocket, and threw it into his mother's lap; and then he and his brother carried his master's dead body into the garden adjoining to the Conygree, where they consulted what to do with it, and at length agreed to throw it into the great sink, by Wallington's Mill, behind the garden; and being asked whether it was there, John Perry further said he knew not, for that he left it in the garden, and his mother and brother said they would throw it in there; and if it were not there, he knew not where it was, for that he returned no more to them, but went to the court-gate which goes into the town, where he met with John Pierce, with whom he went into the field, and again returned with him to his master's gate; after which he went into the hen-roost, where he lay till twelve o'clock that night, but slept not; and having, when he came from his mother and brother, brought with him his master's hat-band and comb, which he laid on the hen-roost, he carried the said hat-band and comb, and threw them, after he had given them three or four cuts with his knife, in the highway, where they were afterwards found. And being asked what he intended by so doing, he said he did it that it might be believed his master had been there robbed and murdered; and having thus disposed of his hat-band and comb, he went towards Charringworth, &c., as hath been related.

Upon this confession and accusation, the justice of peace ordered the apprehension of Joan and Richard Perry, the mother and brother of John Perry, and for searching the sink where Mr Harrison's body was said to be thrown; which was accordingly done, but nothing of him could be there found. The fish-pools in Campden were likewise drawn and searched, but nothing could be found.

Saturday, August the 25th, Joan and Richard Perry, together with John Perry, were brought before the justice of peace, who acquainting the said Joan and Richard with what John had laid to their charge, they denied all, with many imprecations on themselves if they were in the least guilty of anything of which they were accused. But John, on the other side, affirmed, to their faces, that he had spoken nothing but the truth, and that they had murdered his master; further telling them, that he could never be at quiet for them since he came into his master's service, being continually followed by them to help them to money, which they told him he might do by giving them notice when his master went to receive his lady's rents; and that he, meeting his brother Richard in Campden town the Thursday morning his master went to Charringworth, told him whither he was going, and upon what errand. Richard confessed he met his brother that morning, and spoke with him, but nothing passed between them to that purpose; and both he and his mother told John he was a villain to accuse them wrongfully as he had done. But John, on the other side, affirmed that he had spoken nothing but the truth, and would justify it to his death.

The morrow being Sunday, they remained at Campden, where the minister of the place, designing to speak to them (if possible to persuade them to repentance, and a farther confession), they were brought to church; and in their way thither, passing by Richard's house, two of his children meeting him, he took the lesser in his arm, leading the other in his hand, when suddenly *both their noses fell a-bleeding*, which was looked upon as ominous.

At the next assizes, held in the spring following, John, Joan, and Richard Perry were tried by the then judge of assize, Sir Robert Hyde, knight, upon the indictment of murder, and pleaded thereunto, severally, not guilty; and when John's confession before the justice was proved *viva voce* by several witnesses who heard the same, he told them he was then mad, and knew not what he said. The other two, Richard and Joan Perry, said they were wholly innocent, and that they knew nothing of Mr Harrison's death, or what was become of him; Richard also said that his brother had accused others as well as him of having murdered his master; which the judge bidding him prove, he said that most of those that had given evidence against him knew it; but naming none, not any one spoke to it, and so the jury found them all three guilty.

Some few days after, being brought to the place of their execution, which was on Broadway Hill, within sight of Campden, the mother (being reputed a witch, and to have so bewitched the sons, that they could confess nothing while she lived) was executed first. After which, Richard, being upon the ladder, professed, as he had done all along, that he was wholly innocent of the fact for which he was then to die; and did with great earnestness beg and beseech his brother, for the satisfaction of the whole world and his own conscience, to declare what he knew concerning him; but John, with a dogged and surly carriage, told the people he was not obliged to confess to them. Yet, immediately before his death, he said that he knew nothing of his master's death, nor what was become of him, but that they might hereafter possibly hear.

Such, nearly, in his own uncurtailed language, is the statement of Sir Thomas Overbury relative to the fate of the Perrys. Unhappily, the assertions of John Perry, whatever might be his motives for making them, were proved to be utterly false, when it was too late to rectify the error, by the return of William Harrison to Campden, about two years after his disappearance. His written statement to Sir Thomas Overbury accounted for his mysterious removal in the following manner:—"On my return home [from Charringworth to Campden, he means], I met among Ebrington furzes one horseman, who said, 'Art thou there?' and I, fearing he would have rid over me, struck his horse over the nose; whereupon he struck at me with his sword several blows, and run it into my side, while I, with my little cane, made my defence as well as I could. At last another came behind me, and run me in the thigh, laid hold on the collar of my doublet, and drew me to a hedge near that place, where a third party joined them. They did not take my money, but mounted me behind one of them, drew my arms about his middle, and fastened my wrists together with something that had a spring-lock to it, as I conceived, by hearing it give a snap as they put it on; then they threw a great cloak over me, and carried me away."

In this manner, according to the statement of the old man, his captors hurried him along, incapable of resisting through the severity of his wounds, until, on Sunday morning, "they brought me (he says) to a place by the sea-side, called Deal, where they laid me down on the ground; and one of them staying by me, the other two walked a little off, to *meet a man*, with whom they talked; and in their discourse I heard them mention *seven pounds*, after which they went away together, and about half an hour after returned. The man, whose name, as I after heard, was Wrenshaw, said he feared I would die before he could get me on board. Then presently they put me into a boat, and carried me on ship board, where my wounds were dressed."

Harrison recovered slowly from his wounds on board, and, after a time, was put into a Turkish vessel, as if by arrangement, and was taken to Smyrna, where he was sold as a slave. "It was my chance to be chosen by a grave physician of eighty-seven years of age, who lived near to Smyrna, who had formerly been in England, and knew Crowland in Lincolnshire, which he preferred before all other places in England."

For a year and some months Harrison remained here, decently treated, and moderately worked, by his master. That personage was at length seized with a mortal illness, and, before his decease, told Harrison that he was free to look after himself. Possessed of a silver bowl, he got secretly on board of a vessel bound for Lisbon, by bribing two sailors with it; and when in the Portuguese capital, found some Englishmen, who procured him a passage to England.

The deplorable end of the three Perrys, and the strange nature of this whole story, caused much speculation to be exercised on the subject. Notwithstanding the excellent character ever borne by William Harrison, many had "hard thoughts" of the old man, but suspicion could fix upon no reason, of the slightest plausibility, for a voluntary disappearance. One conjecture *was* made, to which some probability attached; and this was, that Harrison's own *son* was the author of his abduction. "Some believe," says Sir Thomas Overbury, "that the hopes of the stewardship, which the young man afterwards, by the Lord Campden's favour, enjoyed, might induce him to contrive his father's removal; and this they are the more confirmed in by his *misbehaviour in the office*." Sir Thomas, however, a man of good heart, thinks that the son would not, in case of personal guilt, have prosecuted the Perrys so bitterly as he did, nor have procured the suspension of John Perry in chains, at a spot where he could daily see the body. But as such violence to a father presupposes a spirit of the most wicked order, we fear that the conduct of young Harrison to the Perrys only rendered the presumption greater of his being the criminal party in the first instance. He, alone, as has been said, appeared to have any interest in the commission of such an act.

The conduct of John Perry in some measure justifies the extremity to which the law proceeded against himself, his brother, and his mother. Whether his behaviour sprung from motives of revenge, or was the result of insanity, it is impossible now to say. Happily, now-a-days, the production of the body would be demanded by the law in the absence of direct ocular testimony, ere criminality should be decisively assumed.

The hope which Sir Thomas Overbury expresses, that in due time light would be thrown on the dark portions of this story, was never fulfilled.

SWISS WATCHMAKERS.

From Mr Adam Thomson (25, New Bond Street, London), a gentleman known as the writer of a useful treatise on Time and Time-keepers, we have received a letter, in which we are charged with injustice in lately speaking of the watchmaking trade of Neuchatel.

"Speaking of Swiss watchmakers, you say, 'They are untaxed, live in a simple manner, possess a finer taste, and, from their temperateness of living, have a greater delicacy of hand than the generality of English workmen.' That the Swiss are untaxed, that their tithes are voluntary, and that they live in a simple manner, is true, but the latter part of your remark is incorrect. The French excel us in taste, from having had the advantage of a national school of design; and the Swiss watch, in size and appearance, is but a copy of that of the French. In England, when utility was preferred to ornament, there was never sufficient demand to encourage the manufacture of mere toys. In the reign of George IV., our aristocracy first set the fashion which has now descended to all grades, the greater cheapness of the foreign production having increased the demand. Have these futile ornaments ever advanced science or bettered the condition of mankind? What country first gave the mariner a machine to guide him in his uncertain way? Have not the labours of Graham, Harrison, Arnold, Earnshaw, and Mudge, past members of this now sinking art in England, done more for science and commerce than all the makers of handsome and curious watches in Europe?

The Swiss workman cultivates his own acre of land, and feels himself of some importance in his native country; and it is true that the man who has to struggle with poverty can scarcely attain such a moral dignity; but English watchmakers, as a class, are remarkable for their 'temperateness of living,' their industry and intellect; their 'nimble fingers' ply their vocation as industriously as those you describe, and sometimes (so pressing are their necessities) even on that day which a kind Providence set apart as much for bodily relaxation as for mental improvement.

With regard to your assertion, that English workmen have less 'delicacy of hand,' I can only say that, in an extensive connexion with both French and Swiss watchmakers (some of whom were not unwilling to arrogate to themselves a little more than their due), I never met one who even hinted at such a distinction; on the contrary, they admit that their best watches are those which most resemble the English, and that our inventions and improvements are adopted in their best manufacture. Watchmaking is essentially English, deriving its principles from the researches of Newton, Hooke, Harrison, and Graham. Why, then, is this branch of industry leaving us? Not from want of 'delicacy of hand,' but because the English mechanic, to procure the bare necessaries of life, requires at least 35 per cent. more for his labour than his foreign competitor.

As your article cannot fail in having a prejudicial effect on a suffering but deserving class of men, I trust you will endeavour to correct that part at least wherein superior skill is attributed to foreign workmen. There is already a preference for foreign watches, if not by the considerate, by a large portion of the higher classes of our community. This once-boasted manufacture of England is nearly ruined, and thousands of valuable mechanics (from the nature of their occupation, meek and patient men) quietly meet their fate, being unable to sell their productions at the same price as those who are more fortunately situated. I would, however, ask, If this manufacture, so truly English, is to disappear, will not the same cause destroy others even more valuable to the country? If trade were free, the English workman would seek no favour; his intellect and energy would soon better his condition."

To this temperate and well-meant communication, the writer of the article in question can only express his regret that anything which he said, in reference to English watchmakers, should have given offence, or be construed into a means of injury to their interests. As a class, we are most willing to allow that British watchmakers have done much for practical science, are in many respects worthy of Mr Thomson's encomiums, and that they possess a skill not reached by continental imitators. Still, we may be permitted to ask, why they suffer themselves to be cut out of that large and increasing branch of business, which consists in the manufacture of small watches similar to those of Geneva. These watches may be little better than toys, but if people are set on buying them, surely it would be a wise policy to meet the demand. Mr Thomson declares that it is not from any lack of delicacy of hand, but dearth of provisions, that the English workman cannot compete in this manufacture. We entertain serious doubts on the latter point. A skilled Swiss workman will make 8s. or 9s. per week of wages; but an English artisan of the same class, we believe, will make from 16s. to 20s. This addition of wages is much more than 35 per cent. additional on the cost of food; and our conviction is, that with all our social drawbacks, an English workman, if steady and enjoying regular employment, is placed in a condition, and has chances of advancement, far above the Swiss. Our opinion is, that the prosperity of the Swiss handicraftsmen is less owing to cheapness of food than to an exceedingly simple mode of living. They seem to exist happily on a mere trifle, and make up for local disadvantages by sheer industry, a species of economy which we should say was allied to penury, and the absence of all restrictions on trade and commerce. In a late newspaper we find the following paragraph, purporting to be an extract from the Athenæum. It is possibly an exaggeration, and we only introduce it to show that others have taken a severer view of this question than we have done.

"I do not know a more interesting sight than to visit the watchmaking districts [of Switzerland]. A great deal of the work is done in the mountains; and nearly all the rough work is done there by women, the finer work by men. The wages earned are very low, considering the nature of the work; but the fact is that there is no scarcity of that skill and sobriety, and steadiness of hand and eye, essential to this class of work. There is no monopoly of capacity for it, as there is in London. It is highly-paid work there, and the English watch-workmen possess the means of indulging in drink, not unfrequently without enough of moral principle and intelligence to resist the temptation. It is sometimes the case that they get into difficulties before their work is done, pawn their lathe and tools, and finish and spoil it with inferior instruments. Drink soon impairs the nerves, and they lose their steadiness of hand. There is, therefore, a constant scarcity of first-rate hands in London. This is not the case in Switzerland; the moral and primitive habits of the people extend the sobriety essential to the perfection of the art over the whole community. It is in-door work, and suits them during the long continuance of weather too inclement in the mountains to permit of open air occupation. It is surprising how few are the tools, and how delicate the use of them by the artisan peasantry who carry on this manufacture in Switzerland. Carouges and Geneva are the great marts of the trade, and thence work is given out to the surrounding villagers; they must work hard to earn two francs a-day, and the majority do not average more than 30 sols (15d)."

THE THAMES TUNNEL.

The tunnel has now completely reached across the river—a distance of 1200 feet; and the projector and engineer had the gratification, a short time since, of being the first who walked from bank to bank, to the shaft on the London side. Those shafts on both sides of the river which are intended for foot passengers are really grand things. They are a succession of staircases going round a vast circular excavation, between seventy and eighty feet deep, and when they shall be all lighted with gas, will be among the most extraordinary parts of the whole structure. Even now, they strongly realise the poetic conception of the descent into the caverns of the Egyptian mysteries; and the view of the interior, nearly a quarter of a mile in extent, lighted with a long succession of melancholy flames, would probably have suggested to a Greek the image of an entrance into Tartarus. The expense of the stone bridge is enormous. Waterloo Bridge cost upwards of a million—London bridge about as much more. Westminster and Blackfriars Bridges, which were built at a cheaper rate and in cheaper times, so constantly demand repairs, that they probably have cost more than either of the modern ones; but the tunnel has the advantage of giving a passage from side to side of the Thames, where, from the breadth of the river, a stone bridge would have probably cost nearer two millions than one, and where no bridge could be thrown across without blocking up the most important part of the Thames, that portion which may be called the great wet dock of London. Yet the expense of the whole has not amounted to more than L.400,000; and even this is to be remembered as an expense greatly increased by the utter novelty of the experiment, by difficulties unforeseen in the commencement, by several irruptions of the river, by the dearness of workmen's wages, arising from the peculiar peril and singular nature of the labour connected with an undertaking carried on at all hours, and wholly by artificial light. All this, too, in constant hazard of an influx of the river, and the various difficulties belonging to working in a mine. The weight of a vast body of water above, acting alike during summer and winter, which at any moment might break in, and against whose incursions it was as necessary to fortify the outside of the tunnel as the interior, added greatly to the difficulties of the undertaking. The original object of the tunnel was to convey cattle, passengers, and general traffic from the rich counties on the Kent side, to that great mercantile region of the metropolis, the London and East and West Indian Docks. How far this will be now effected, is a question which remains to be decided by experience. There can be no doubt that if the traffic be not impeded by the fear of passing under the river, it must be immense. The convenience of escaping the long circuit up to London Bridge, which, from the various obstructions in the streets, and the general difficulty of passing through the most crowded portion of the city, must now occupy many hours, would obviously direct the whole current of the traffic into the tunnel. Hitherto, no expedient has been adopted to shorten the passage of the traffic; and the contrivance by which 1200 clear feet are substituted for at least three miles of the most incumbered thoroughfares imaginable, must be adopted as a matter of palpable advantage. Still, there may be difficulties in the way, which practice only can exhibit. But any fear of the structure itself we should regard as altogether visionary. The building of the tunnel seems as solid as a rock. During the whole period from its commencement, we have not heard a single instance of its giving way, vast as the pressure was from above, and trying as were the damps, the ground springs, and the extreme difficulty of building under water. At this moment the roof is obviously as free from damp as the roof of St Pauls! and unless an earthquake should burst it, the whole fabric seems much more likely to last than were it exposed to the diversities of temperature, the heats and frosts, above ground.—*Blackwood's Magazine.*

[We fear that some of the above calculations respecting the *utility* of the tunnel are overdrawn. There can be no doubt that by the transit through the tunnel a long circuit will be saved to vehicles and passengers, but will they take advantage of it? They will, certainly, if the passage be free, but, judging from the effects of a toll on Waterloo and Southwark bridges, if the passage be taxed, even in a trifling amount, it will in all likelihood be avoided. We present on next column a glowing eulogy on Brunel, the planner of the tunnel, which has been sent to us by Miss Camilla Toulmin, a lady of rising literary reputation.]

ON THE COMPLETION OF THE THAMES TUNNEL.

BY CAMILLA TOULMIN.

Joy to thee, brave Brunel!—thy task is done,
Th' immortal wreath of fame is nobly won!
Not thine the warrior's stain'd and tear-dew'd crown,
Thou hast a loftier and more pure renown.
Joy to thee, brave Brunel!—thou hast been tried
By the *world's ordeal*, and success hath dried
The well-springs of Distrust, whose waters deep
Engulf such precious things—or coldly steep
The heart of genius, until warped aside,
Or piecemeal rotted, by that ebon tide,
Its might and majesty alike are past:
But thine, Brunel, was of too stern a cast;
Though round thee long had flowed those turbid waves,
Bearing upon their crests the ready glaives
Of ignorance—the bitter taunt and jest
That folly, in its mischievous unrest,
Seizes with vacant laugh, and blindly flings
At dazzling genius on her soaring wings.
And yet, methinks, Distrust's dark icy stream
Did to thy noble heart through long years seem
More fearful than old Father Thames that roll'd
In loud defiance o'er thee; who, controll'd
By the strong spell of science, meekly now
Learns in obedience to thy will to flow!
Oh! how much greater art thou, brave Brunel!
Than Persia's king, who, as old histories tell,
Came with his millions, and but strove in vain
With all his might one rebel wave to chain.
Was there a mind like thine in all his train?
And do not at such thoughts quick mem'ries throng,
Worthy a nobler bard and loftier song,
To tell how dark those wild and barbarous ages,
When warrior's deeds fill'd up the historian's pages?
Now doth at least a twilight dawn; men pay
With fame's bright garlands, not alone who slay,
But them who save and serve. Joy, brave Brunel!
The new "world's wonder" is achieved, and well
By its own self is thy great soul repaid;
And yet wert thou *as great*, ere yet arrayed
With the world's halo, that success has cast
Around thee (for mankind *are* just at last);
Thou wert as great when this "world's wonder" dwelt
Yet unembodied in the mind that felt
Its power to do and dare. Did it then rise
In grand perfection to thy spirit's eyes,
Conceived one moment and matured the next
(As Wisdom's goddess in the heathen text,
Sprung forth all armed from the Thunderer's brain)?
Or was it link by link, the perfect chain
Of thy so wonderful design was wrought
In the mind's mazes of most tangled thought?
Whiche'er, it matters not, for then, as now,
As great thou wert, the thoughtful feel and know;
When thou didst take a lesson from the worm
The strange secureness of thy work to form,
And show the precept men are slow to learn—
Nought God has made is low enough to spurn;
That loftiest science most acutely feels
How vast the lore great Nature's law reveals.
Thou wert *as great*—yea, *greatest* in those years
Of silent grief and watching, when dark fears,
Methinks, must oft have dimm'd or hidden quite
The cheering rays of hope's exceeding light.
The seven years! in which no workman's stroke
Those arches' mute forgetful echoes woke.
But hark! they have a tongue again, and dwell
No more in "cold obstruction"—brave Brunel!
Unquench'd by the dull flood of those long years,
Thy spirit's fire more purely bright appears;
And like a chain electric, runs through all
The busy crew who gathered at thy call;
Teaching them well to understand they shared
The glory of all that which thou hadst dared.
And didst thou life to wood and iron yield,
When thou didst sway thy ever trusty "shield?"*
Joy to thee, great Brunel! thy task is done,
The immortal wreath of fame is nobly won!
Her clarion sounds, and thy name is the note
That echoes catch, and round the world doth float;
And this *is* guerdon worthy even thee;
Ambition's dream made rich reality.
But is there not a joy more deep—intense,
The triumph of thy work's own recompense?
Doth not *this* give to nature's beauteous face
Some added charm or once unheeded grace?
Surely more bright each earthly thing appears
Than in the night of those long struggling years.
Joy to thee, brave Brunel!—I do not know
From the dull common crowd that thoughtful brow,
Where Mind hath fixed her starry diadem;
Yet wilt thou not my lowly verse condemn,
Or spurn the homage I but feebly pay:
And so, ere closes quite my humble lay,
One heartfelt prayer—one farewell chord shall swell,
God bless thee ever, great and brave Brunel!

London, *June* 1842.

* "This mighty instrument—one in idea and object, but consisting of twelve separate parts or divisions, each containing three cells, one above the other—is thus used:—We will suppose that the work being finished in its rear, an advance is desired, and that the divisions are in their usual position, the alternate ones a little before the others. These last have now to be moved. The men in their cells pull down the top poling-board, one of those small defences with which the entire front of the shield is covered, and immediately cut away the ground for about six inches. That done, the poling-board is replaced, and the one below removed, and so on till the entire space in front of these divisions has been excavated to the depth of six inches. Each of the divisions is now advanced by the application of two screws, one at its head and one at its foot, which, resting against the finished brick-work, and turned, impel it forward into the vacant space. The other set of divisions then advance. As the miners are at work at one end of the cells, so the bricklayers are no less actively employed at the other forming the brick walls of the top, sides, and bottom, the superincumbent earth of the top being still held up by the shield till the bricklayers have finished. This is but a rude description of an engine almost as remarkable for its elaborate organisation as for its vast strength. Beneath those great iron ribs a kind of mechanical soul really seems to have been created. It has its shoes and its legs, and uses them, too, with good effect. It raises and depresses its head at pleasure; it presents invincible buttresses in its front to whatever danger may there threaten, and, when the danger is past, again opens its breast for the further advances of the indefatigable host."—"*London*;" *article*, "*The Thames Tunnel.*"

SANATORY CONDITION OF THE LABOURING POPULATION.

MR CHADWICK, secretary to the Poor-Law Commissioners, has just produced a work of a most remarkable nature, under the form of a Report on the Sanatory Condition of the Labouring Population, and on the Means of its Improvement. It is a work which *must* attract considerable attention, for it gives the first clear light we have had on a subject in which much interest is involved, and which has hitherto been left in a great measure to conjecture. It is an overpowering collection of facts respecting the way in which the labouring classes live, and the remediable evils which press upon them; showing distinctly how much their comfort, their health, and even their morality, are affected by circumstances purely physical and local—such as drainage, the supply of water, and the arrangements of their dwellings. We take the earliest opportunity of presenting a summary of the contents of this extraordinary volume.

Mr Chadwick sets out with some general facts and observations with regard to the amount of mortality in England and Wales from various classes of diseases, and, showing that the deaths from endemic, epidemic, and contagious ailments (the great proportion of which are proved to be *preventible*), are above 56,000 per annum, or about a sixth part of the whole, startles us with the remark, that "the effect is as if the whole county of Westmoreland, or the whole county of Huntingdon, were entirely depopulated annually, and were only occupied again by the growth of a new and feeble population, living under the fears of a similar visitation." Typhus alone, which has a preference for victims in the vigour of life, slaughters more annually than fell on the allies' side at the battle of Waterloo. The evidence, he adds, almost wholly "points to one particular, namely, atmospheric impurity, occasioned by means within the control of legislation, as the main cause of the ravages of epidemic, endemic, and contagious diseases." We may remark, that this is an opinion widely entertained, there being only one prevalent notion at all differing from it, and that is, the view which attributes these diseases mainly to deficient food. The fact we believe to be, that deficient food is only a predisposing cause. In a pure atmosphere, it is comparatively inoperative for such ends; but where to deficient food is added impure air, extensive disease is inevitable.

The report is divided into sections referring to different departments of the subject. The first, on the general condition of the residences of the labouring classes where disease is most prevalent, shows that both in country and town a vast proportion of the labouring class live in very wretched dwellings, where health is not to be expected. We have already heard a good deal of the huddled, damp, and dirty dwellings of this class in large cities; but we have scarcely been prepared to learn that rural villages, which look pleasing from without, and even the detached cottages of the agricultural labourers, are in many instances as destitute of the elements of health, their precincts being full of stagnating filth, while, within, there are damp floors, from which feculent exhalations are constantly rising, and far too narrow accommodations for sleeping. We hear, for instance, of a cottage well situated, and clean externally, but where the sleeping room for six persons measures six feet by ten—consequence, *five cases of typhus fever*. Colerne, on the Great Western Road, is a pretty-looking village, delightfully situated on a hill; but, entered, is found to be undrained, ruinous, and filthy, and occupied by a squalid population—consequence, *scarlet and typhus fever never absent from it*. It is surprising that even such a town as Windsor is full of nuisances, tending to have the most fatal effects upon health—one open drain in particular, on the banks of which the demon of typhus may be said to sit. Throughout the whole county of Northumberland, the residences of the agricultural labourers are mere hovels, like those which used to abound in the Scottish Highlands.

In his classification, Mr Chadwick next proceeds to detail the "public arrangements external to the residences by which the sanatory condition of the labouring population is affected." He shows how general in towns is the deficiency of drains, either for the moisture from the firmament, or the refuse of the population; and establishes by ample evidence the immediate connexion of that condition with the unhealthiness of the inhabitants. For example, says Dr Howard of Manchester, "of the 182 patients admitted into the temporary fever hospital in Balloon Street, 135 at least came from unpaved or otherwise filthy streets." Most of the streets of Leeds are "paved by owners, or partly paved, or are totally unpaved, with the surfaces broken in every direction, and ashes and filth of every description accumulated upon them." In the report on this town, it is remarked, that the additions made of late years to the manufacturing towns of England have been "made without regard to either the personal comfort of the inhabitants or the necessities which congregation requires. To build the greatest number of cottages on the smallest allowable space, seems to have been the original view of the speculators, and the having the houses up and tenanted the utmost of their desires." It would appear, that with respect to removal of refuse, the metropolis is not much less defective than the provincial towns or villages. Of this one grand cause seems to be, that the value of the refuse is not sufficient to pay the expense of cartage. Mr Chadwick adduces a variety of evidence to show the superiority of a self-acting mode of cleansing over every other. He would have this done by flooding everything into proper sewers, and sending it out by iron pipes into the country for irrigation, using steam power to raise the stream where necessary. Thus natural river channels would be kept pure, and an immense saving effected. *The refuse of London would twice pay the expense of water for the inhabitants!* Indeed, the economy of this plan of cleansing is precisely the same as that of bringing water in pipes, instead of sending carts for it. And how great the economy is in the latter instance, is well seen in a calculation by our reporter, that, when a labourer pays 5s. per annum for a pipe of water in his house, he gets 135 pailfuls for a penny farthing. How many penny farthings must he lose in time and labour, which are the same as money, if he or his wife have to carry those 135 pailfuls even so much as two hundred yards! An increase of the supply of water in towns, and its more general introduction into the houses of the labouring classes, are objects which he holds in view as tending much to the improvement of public health.

The third section of the report, "Circumstances, chiefly in the internal economy and bad ventilation of places of work, workmen's lodging-houses, dwellings, and domestic habits affecting the health of the labouring classes," is the most elaborate and perhaps the most important of the whole. It occupies above fifty pages. It is difficult in our small space to give a tolerable view of what is itself a highly condensed summary. Mr Chadwick begins with some evidence as to the condition of tailors' workshops in London, and their effects in deteriorating the health and morals of the men. In a small chamber, heated to a high temperature, and kept very close, a great number of these men squat upon the floor, as close as they can well sit. The want of fresh air produces a great depression of the energies, and gin is drank to support them. It takes twelve hours to do the work of ten; improvident habits are formed; health gives way; and a London journeyman tailor is "done" at fifty. As a contrast to this, the country tailors are generally healthy men, noted for their skill and agility in village sports. The whole of this evil is to be traced to the want of proper ventilation in workshops, a mere fault of arrangement, which could be remedied, for one containing fifty workmen, at the expense of perhaps a day's wages of the whole. We can add, from our own knowledge, that this improvement was lately effected, at a mere trifle of expense, in the workshop of Messrs Lockhart, clothiers, Glasgow, by the conducting of a metal tube from the ceiling of the room to the furnace used for heating the irons. Already, a marked change in comfort is experienced, and we cannot doubt that an equally great improvement in the health of the men will soon be ascertained. Mr Chadwick, keeping in view the loss of one or two hours' work to each man from bad ventilation in the London workshops, and considering what this would come to in twenty years, says—"The subscriptions to the benevolent institution for the relief of the aged and infirm tailors, by individual masters in the metropolis, appear to be large and liberal, and amount to upwards of L.11,000; yet it is to be observed, that if they or the men had been aware of the effects of vitiated atmospheres on the constitution and general strength, and of the means of ventilation, the practicable gain of money from the gain of labour by that sanatory measure could not have been less in one large shop, employing 200 men, than L.100,000. Independently of subscriptions of the whole trade, it would, during their working period of life, have been sufficient, with the enjoyment of greater health and comfort by every workman during the time of work, to have purchased him an annuity of L.1 per week for comfortable and respectable self-support during a period of superannuation, commencing soon after fifty years of age."

The same consequences from deficient ventilation in working-rooms affect the milliners of the metropolis. "It is not doubted by medical witnesses, that in this class of cases, as in the case of tailors, one-third at least of the healthful duration of adult life will be found to have been destroyed by the ignorance of the want of ventilation."

The miners of Durham and Northumberland, when working at a considerable distance from home, have to sleep in temporary lodging-rooms, which are dreadfully over-crowded, and where the air is consequently vitiated to a great extent. They are thought to be more damaged by this than by their work itself. Of 212 deaths of miners in the unions of Cumberland and Westmoreland in 1839, 52 were from consumption.

There is great reason to suppose that, in what are considered as deleterious occupations, much of the bad effects ascribed to the occupation is in reality a consequence of domestic circumstances. "Between different sets of workmen who work at the same descriptions of work during the same hours, and in the same town, but in well or in ill-ventilated factories, a marked difference in the personal condition and general health of the workpeople has been perceived. Great differences are perceptible in the general personal condition of persons working during the same hours in cotton-mills in town and in cotton-mills in rural districts, where they have not only a purer atmosphere,

but commonly larger and more commodious places of abode. The factory superintendants generally state that the workers in the country mills are distinguishable at sight by their more healthy appearance, and by the increased proportions amongst them who have florid complexions. Very lately, the attention of the Austrian government was called to the labour of the persons working in the cotton-factories in the neighbourhood of Vienna. One half, perhaps, of the mills are of the ordinary construction of the cotton-mills in England of from thirty to forty years' date, and they work on the average as much as fifteen hours per diem. But it appears that the houses in which the workers live belong to the capitalists who own the mills, many of whom have displayed a desire to insure, as far as the state of the private residences can insure, the comfort of those whom they employ, and they have accordingly built for them a superior description of tenements. It is stated that the result of the inquiry conducted by the government physicians was, that the average health enjoyed by the workers in those mills is greater than that of any other class of workpeople in the neighbourhood where the mills are situated, and where the general condition of the population is deemed good; the difference in the general health of the two classes (indicated by the proportion of deaths—of 1 in 27 of the general population, and 1 in 31 of the manufacturing population) was ascribed to the difference of the residences."

There is a great accumulation of evidence as to the demoralising effects of the promiscuous use of sleeping apartments amongst the labouring population. Not only are the whole members of one family, young and old, male and female, crowded into one small room, perhaps into one bed, but strangers are often brought into this unseemly association, to the utter destruction of all delicacy, and the absolute corruption of many individuals. This over-crowding is not always a consequence of poverty. Workmen with ample wages are often found submitting to it, to save the merest trifle of rent, which they could well afford. In the course of the inquiry, the effects of an inferior construction of dwelling-house, independent of any over-crowding, were often traced. "A gentleman who has observed closely the condition of the workpeople in the south of Cheshire and the north of Lancashire—men of similar race and education, working at the same description of work, namely, as cotton-spinners, mill hands, and earning nearly the same amount of wages—states that the workmen of the north of Lancashire are obviously inferior to those in the south of Cheshire in health and habits of personal cleanliness and general condition. The difference is traced mainly to the circumstance, that the labourers in the north of Lancashire inhabit stone houses of a description that absorb moisture, the dampness of which affects the health, and causes personal uncleanliness, induced by the difficulty of keeping a clean house." Thus physical seems inseparable from moral deterioration. "The close pent-up air of their abodes," says Mr Chadwick, "has undoubtedly a depressing effect on the nervous energies, and this, again, with the uneducated, and, indeed, with many of the educated workpeople, has an effect on the moral habits by acting as a strong and often irresistible provocative to the use of fermented liquors and ardent spirits. Much may be due to the incitement of association of greater numbers of people; but it is a common fact, that the same workpeople indulge more in drink when living in the close courts and lanes of the town than when living in the country, and that the residence in the different places is attended with a difference of effects similar to those described in respect to the tailors working in crowded rooms in towns and the tailors working separately or in the country. The workpeople who have fallen into habits of drinking strenuously allege the impossibility of avoiding the practice in such places; they do, however, drink in greater quantities in such places, and give increased effect to the noxious miasma by which they are surrounded." Everything is against a people so circumstanced; even the butcher-meat which they buy is sooner tainted than elsewhere, helping to make them live, as it were, from hand to mouth.

Where local and physical circumstances exert so powerful an influence in depraving the taste and moral sense, the common efforts of benevolence do no good, but often rather harm, by affording additional means of intemperance. A journeyman tailor at Bath had never possessed any furniture in his house. Many persons, learning this part of his case only, sent him household articles, which were immediately converted into liquor. This man had L.3 a-week of wages! Sir Charles Shaw, superintendant of police at Manchester, found in a lodging-house there an apartment full of drunken wretches sleeping on the bare floor, with bricks for pillows, and another set who had straw: the former simply preferred paying for gin to paying for straw. The Rev. Whitwell Elwin "found a journeyman painter whose bed was without blankets, whose room was without furniture, who was destitute of even the ordinary utensils of civilised life, whose floor was covered with worse filth than that of the streets. I found this man at dinner with a roast loin of pork stuffed with onions, a Yorkshire pudding, a large jug of ale, cheese, and a salad. I will undertake to say that half the gentlemen of Bath did not sit down on that Sunday to so good a dinner."

Domestic mismanagement is made out to be a predisposing cause of disease. Dr Baker, referring to Derby, places amongst the causes of sickness "the want of domestic comforts, a want which the wages they earn would, in many instances, enable them to remove, if their means were not, as too often happens, expended viciously or improvidently. It is with regret that I speak unfavourably of the poor, whilst my whole aim, in this communication, has been to awaken a sympathy towards those sufferings of which I have been so often a witness. But several years' experience of the habits of the poor, derived from my situation as an hospital physician, and backed by the additional evidence I have obtained by acting for three years as a guardian of the poor in this large town, has, I am sorry to say, served but to confirm me in the opinion I have just now expressed." The committee of medical men at Birmingham give it as their deliberate opinion, that drunkenness prevails most there amongst the workmen earning the highest wages. On this subject we are supplied with a rich illustration from the sanatory report of Mr Mott, in the following form:—

CONTRAST IN THE ECONOMY OF FAMILIES.

1. Cellar in Wellington Court, Chorlton-upon-Medlock; a man, his wife, and seven children; income per week, L.1, 11s.; rent 1s. 6d. per week; three beds for seven, in a dark unventilated back room, bed-covering of the meanest and scantiest kind—the man and wife occupying the front room as a sleeping-room for themselves, in which the whole family take their food and spend their leisure time; here the family in a filthy destitute state, with an income averaging 3s. 5½d. each per week, four being children under 11 years of age.	1. In a dwelling-house in Chorlton Union, containing one sitting-room and two bed-rooms; a man, his wife, and three children; rent 2s. 6d. per week; income per week, 12s. 6d., being an average of 2s. 6d. per week for each person. Here, with a sickly man, the house presented an appearance of comfort in every part, as also the bedding was in good order.
2. Cellar in York Street, Chorlton-upon-Medlock; a man — a hand-loom weaver — his wife and family (one daughter married, with her husband, forms part of the family), comprising altogether seven persons; income L.2, 7s., or 6s. 8½d. per head; rent 2s. Here, with the largest amount of income, the family occupy two filthy damp unwholesome cellars, one of which is a back place without pavement or flooring of any kind, occupied by the loom of the family, and used as a sleeping-room for the married couple and single daughter.	2. In a dwelling-house, Stove Street, one sitting-room, one kitchen, and two bed-rooms; rent 4s. per week. A poor widow, with a daughter also a widow, with ten children, making together 13 in family; income L.1, 6s. per week, averaging 2s. per head per week. Here there is every appearance of cleanliness and comfort.
3. J. S., of Carr Bank (labourer), wages 12s. per week; a wife, and one child aged 15; he is a drunken disorderly fellow, and very much in debt.	3. George Hall, of Carr Bank (labourer), wages 10s. per week; has reared ten children; he is in comfortable circumstances.
4. W. H. of Oakamoore, (wire-drawer), wages L.1 per week; he has a wife and five children; he is in debt, and his family is shamefully neglected.	4. John Hammonds, of Woodhead (collier), wages 18s. per week; has six children to support; he is a steady man, and saving money.
5. G. L., of Kingsley (boatman), wages 18s. per week, with a wife and seven children; his family are in a miserable condition.	5. George Mosley, of Kingsley (collier), wages 18s. per week; he has a wife and seven children; he is saving money.
6. J. B., of Cheadle (collier), wages 18s. per week; wife and three children; his house is in a filthy state, and the furniture not worth 10s.	6. William Faulkner, of Tean (tape-weaver), wages 18s. per week; supports his wife and seven children without assistance.
7. W. W., of Kingsley (boatman), wages 18s. per week; wife and three children; he is a drunken, disorderly fellow, and his family entirely destitute.	7. Charles Rushton, of Lightwoodfields, wages 14s. per week; he supports his wife and five children in credit.
8. R. B., of Cheadle (labourer), wages 12s. per week; wife and five children in miserable circumstances; not a bed to lie on.	8. William Sargeant, of Lightwoodfields (labourer), wages 13s. a-week; he has a wife and six children, whom he supports comfortably.
9. T. B., of Tean (labourer), wages 14s. per week; his wife earns 7s. per week; five children; he is very much in debt; home neglected.	9. William Box, of Tean (tape-weaver), wages 18s. or 20s. per week; supports his wife in bad health, and five children.
10. T. J., of Tean (blacksmith), wages 18s. per week; his wife earns 7s. per week; three children; he is very much in debt, and his family grossly neglected.	10. Ralph Faulkner, of Tean (tape-weaver), wages 18s. or 20s. per week; supports a wife and five children, three of whom are deaf and dumb.

The above report, of course, refers to ordinary times. It shows most luminously how much the labouring-classes have the comfort of their lives in their own hands. Mr Wood of Dundee reports—"There are many families among the working-classes who are in the receipt of from 15s. to 22s. per week, who are insufficiently clothed, and irregularly and poorly fed, and whose houses, as well as their persons, appear filthy, disorderly, and uncomfortable. There are other families among them, containing the same number of persons, whose incomes average from 10s. to 14s. a-week, who are neatly, cleanly, and sufficiently clothed, regularly and suitably fed, and whose houses appear orderly and comfortable. The former class care little for the physical comfort, and far less for the intellectual, moral, and religious education of their children; in many cases, indeed, they neglect the education of their offspring when it is offered to them gratuitously; and in place of sending them to school, where they might be fitted for the duties and disappointments of life, they send them, at a very early age, to some employment where they will earn the poor pittance of 1s. 6d. to 3s. a-week. The latter class, on the contrary, are most anxious to give their children a good education; they study to obtain it for them by every means in their power, and they pay for it most cheerfully. The former class, again, grasp at every benefit which the charitable institutions of the place have provided for the poor. When, for example, medical attendance is given them gratuitously, they not unfrequently despise and refuse it, unless medicines are given them gratuitously also; whereas the latter description of families are not only ready and willing to pay for medicines when prescribed to them, but they generally manifest much gratitude, and very often present their medical attendant with a small fee.

Now, it is among the former class of families where, generally, there appears to me to be a deficiency of wholesome food and of warm clothing, where contagious febrile diseases are most commonly found, and from whence they are most extensively propagated. Fever is no doubt found among the latter more frugal and therefore better conditioned families, but seldom of that malignant contagious character which it invariably assumes among the other class of families. Here, then, we have on the one hand filth, destitution, and disease, associated with good wages; and on the other, cleanliness, comfort, and comparative good health, in connexion with wages which are much lower. The difference in the amount of their incomes does not account for the difference in the amount of comfort which is found existing among the working-classes. The statements just made make known the fact, that above a certain amount, say 12s. or 14s. of weekly income, wages *alone*, without intelligence and good habits, contribute nothing towards the comfort, health, and independence of the working population." We may add, that we have heard precisely the same account of his workmen given by a Dundee manufacturer. The satire of the knife-grinder is but too extensively applicable.

We must here, for the present, take leave of Mr Chadwick. We shall take up his instructive volume again in a succeeding number.

PEDESTRIAN TOUR IN SWITZERLAND.

MEYRINGEN—CATARACT OF HANDECK—HOSPICE OF THE GRIMSEL.

AUGUST 23.—The inn at Meyringen, where we slept, was alive at five o'clock, and several parties were at breakfast preparatory to their several tours. We took a survey of the vale of Hasli, which hitherto we had only seen in the gloom of evening. It is wide and flat, and fruitful, with rich green fields and venerable wood, through which peep many cottage roofs, and a slender church spire. If one could keep his eye resting solely on the surface of the plain, he might imagine himself in an English village; but the frame of rock and mountain in which the landscape is imbedded, soon dissolves the vision. The spot is remarkable even in Switzerland, from the multitude of huge cataracts which are visible from it. High above all, and holding communion, as it were, with the clouds, is the white mass of the mighty Reichenbach; and every here and there some rocky crevice wells forth a cascade that would make the fortune of a British watering-place. As there appears no visible outlet from the valley, one is apt to feel as if, like a tub at a fountain, it must soon become full of water; nor has such a calamity been, in a modified form, entirely unprecedented. As the torrents carry with them quantities of mud and stone, their narrow orifices sometimes become choked; a lake is thus formed behind the barrier, which, when increased to a certain extent, bursts through it, and sends down a torrent of water and mud on poor Meyringen.

Revolving in our minds the philosophy of the employment of guides, we came to the conclusion, that it was an infringement on the liberty of the subject not to be tolerated except in very urgent circumstances. The paths we had hitherto traversed, we believed we would have been able to follow unaided with great ease; indeed, one of our motives for employing a guide was the protection it might afford us from the importunities of others. We were now about to tread a wilder path, where the real services of a pilot might be more necessary, but, on the other hand, it was one in which we would be less liable to meet with importunity; so we made up our minds to trust to our own resources. Like skilful generals, we thought it expedient to let the enemy see that these resources were not to be despised, and accordingly we resolved to start like men who knew what they were about, and where they were going. Our destination being the pass of the Grimsel, we took its bearing (which we found to be south-east by south) on Keller's map, and adjusted it to our position with a pocket compass. We were not quite sure that we were correct, but we knew that everything depended on the air of decision we assumed; and so fortified, we marched forth. We had not walked many paces in our pride of skill, when what appeared the whole establishment of the inn, accompanied by our ex-guide, came clattering after us to tell us we had gone the wrong way. This was humiliating, but it did not render absolutely necessary a forfeiture of liberty; we were still able to shake off our tormentor, and with a few directions to assist us, we took the right way.

At the upper end of the vale, we came to a minor

eminence called the Kirchet, which we mounted by a zig-zag path leading through pleasant forests of pine, rich in underwood and wild flowers. We then descended on the river Aar, which cuts its way right through the centre of this hill. Of all the wild glacier torrents we had yet seen, this was the most relentless and ruffian-like. Attempts had been made to keep its torrent within bounds by moles or broad pier-like walls, made of gigantic blocks of granite. It was wonderful how human industry could rear such works in such a spot. A great city might have been proud of running such bulwarks out to sea, for the protection of her costly fleets. But the Aar had paid no respect to this wonder of enterprise. In many places its iron clasps were wrenched as if they had been straw, and the great blocks of granite were scattered like gravel along the margin of the perpetually foaming and roaring river. We were now in the vale of upper Hasli, smaller, more sterile, and more rocky than its namesake below, and singularly secluded in its aspect. After commencing the ascent of the pass, we lost sight of almost all vestiges of inhabitancy, though we did not immediately escape from the persecution of guides offering their services; and so deep an impression had their importunity made upon our minds, that when we had got within the wild precincts of the gorge, and were amusing ourselves with shouting aloud to the winds and waters, we suddenly stopped with the reflection, that it was a dangerous experiment, that we were in a sort of enemy's country, where we knew not what ambuscade might start up, and that we must avoid exposing ourselves to the risk of calling forth some persecutor in the wilderness.

We had repeatedly to cross the Aar by aërial-looking stone bridges, the parapets of which curved to the semicircle of the arch. This form of bridge is generally to be found spanning the torrents of mountainous regions, and though it be not much respected by the engineers who carry turnpikes over the sedgy rivers of England, it is adapted with great skill to its own locality. No parapet-wall could for a moment hold out against the Aar, when swollen by the melted snows, and those arches have the best chance which present the smallest surface to the current. In the previous parts of our tour, our views of precipices had been somewhat distant, but now we were among them, and had an opportunity of experiencing the terrible sublimity of one of the higher alpine passes. The path was narrow and broken, fit only, as it seemed to us, for pedestrians; but we were told that the sure-footed mule could be trusted on it. I should not have felt comfortable, however, on the back of any mule or other animal, however high its character, on such a road. It was in some places the narrowest possible groove in the face of the rock, which sunk below us like a straight wall to the edge of the hungry torrent, and curved over our heads far into the heavens. I reflected here on the grave statement of Cornelius Nepos, that Hannibal levelled a path for himself across the Alps, by shattering the heated rocks with cold vinegar; and it occurred to me, that if he had been able to accomplish the levelling of such a pass as this, the contract for the vinegar must have been a prodigious job to some great house in Carthage.

Our expectation was raised to a high pitch of excitement as we neared the fall of Handeck, which is reckoned the second in point of grandeur in Europe, Terni being the first. As one approaches a waterfall, the ear generally listens greedily for the first indication of its hollow rumbling; but it seemed useless to listen on this occasion, for the river, bellowing at our feet, filled the ear nearly full with its own roaring; yet we did at last hear a sound that rose even over this, and through the foliage of the trees we caught a glimpse of the white foam of the cataract. To obtain a view from below, we required to scramble along a narrow ledge of rock, rendered slimy by the spray from the fall. The level from which it afforded us a view might be about half way up the fall, which it enabled us to see in full perfection. From this spot, however, we had no view of the abyss into which it precipitates itself—not the least interesting feature of a cataract; and so we delayed not to mount to a higher level. The time and trouble of the ascent showed us how considerable was the height of the fall, but we had no means of precisely estimating it. At the top we found a wooden bridge, from which we could look straight into the gulf. The effect from this point was different from what I had seen in any other waterfall. The water, instead of descending in a compact mass, and throwing up a cloud of foam, seemed, as it were, broken into pieces, which, dispersed through the dark gaping pit, absorbed the sight before it could penetrate to the bottom. It was thus that, gazing downwards, we could not see whence the stream came, nor whither it went, but merely that the great pit we stood above was a caldron, where a chaos of waters was tossed about and tortured by some unseen agency. A waterfall has its pulsations, and here they were visible in such a partial separation of the particles as enabled the eye to see for a moment farther into the darkness of the gulf. The sun was shining bright among the waters; and as we shifted our position from time to time, its effects were visible in diversified groups of little rainbows, which gambolled about in all their finery on the surface of the broken waters. It is a strange feature in the Handeck, that a smaller cataract falls into it at right angles, just where it shoots from the brow of the rock. This is of itself no contemptible cascade, for it descends in a fine smooth sheet of water, casting forth a prodigious quantity of foam; but it is lost in the close vicinity of Handeck. The singular effect produced by the latter must be owing to the vast quantity of the water in proportion to the breadth of the stream. Though I had very insufficient data for coming to any conclusion on the subject, I could not help being of opinion, that the Aar at this spot conveys as large a body of water as the Tay at Perth.

There is a small inn at Handeck, where we took some refreshment. There was an item in the charge which we could not exactly comprehend; and while the landlord with his Swiss German was endeavouring to make it very plain to us, a young foreigner who was, like ourselves, a guest, volunteered an explanation in these words—"That is the water, for you have seen fall." We could not but thank the gentleman for his kindness: to show how much we appreciated it, we acknowledged ourselves satisfied; and it was not until we had gone on our way meditating, that it occurred to us how our host had made the cataract of Handeck an item in his bill.

The character of the scenery changed soon after we had left the fall. The trees, in place of the lofty pines that had been waving over our heads, were flat, gnarled, and stunted, with trunks covered over with lichens of every colour. We encountered, too, sundry patches of snow of considerable size, and one of them made a mound across the bottom of the defile, the Aar plunging into it, and disappearing for a time beneath it as if making an attempt to assuage, in the midst of this cooling mass, the fierceness of its career. The perilousness of the path attracted our attention at this point. It passed over a shelf of granite at an acute angle, worn smooth by avalanches. Notches were cut here and there for the feet, but they offered apparently a slender means of advancement.

As we ascended still farther, the gnarled pines dwindled away at last, and we had nothing about us but granite rock, turf, and snow. In this class of scenery we found the hospice of the Grimsel, a large strong built granite house, with a multitude of very small windows. It stood on the margin of a black lake, and it had nothing to show in the way of pleasure-ground besides the said lake, abundance of snow, and a like quantity of granite; it was undoubtedly the most dreary spot I had ever seen. When we presented ourselves at the door, the landlord, a sturdy massive man, who looked as if he had been hewn out of the granite rocks he was surrounded by, shook our hands warmly with his large horny fist, and in German pronounced a sort of solemn benediction, and a congratulation on our having escaped the dangers of the pass. The house, though to English travellers it is purely an inn, is nominally a religious house of refuge for wayfarers, and the landlord wished to support its reputation. We arrived about four o'clock, and it was with some difficulty that we prevailed on ourselves to pass the afternoon at the hospice, instead of crossing the pass, and taking our chance on the other side. After having secured our means of accommodation, we wandered about, each individually taking his chance of what nature might throw in his path in this wild spot. I was anxious to obtain the best possible view, and therefore I climbed the ascent in front of the hospice for some hundred feet. I contemplated reaching the summit, but found that would be impossible before nightfall.* I therefore sat down under the shadow of a large stone, lit my pipe, and, as its fumes gradually ascended, contemplated the scene around me. The sun was setting from the valleys, but every peak of rock was still bathed in his warm evening rays, and here and there the snow that either clung to the sides of the higher peaks, or lay in valleys not too deep to be visited by the departing sun, displayed a rich pink colour, which I had never before seen equalled in transparency and brilliancy. Far beneath me stood the hospice, on the brink of its dark lake, which lay as black as a drop of ink. The sun had left the hospice and its lake, but the atmosphere around them was singularly clear; and if it had not been for the material diminution of every object, I could not have believed that I had risen some eight hundred feet above the spot. While thus looking forth in meditative mood, a priest marched out from the hospice, accompanied by a number of boys dressed in white blouses. They walked down—a set of pigmies, as they seemed to me—to the edge of the dark pool, and having there amused themselves for a short time, marched back again. I expected to meet this priest and his flock as constituent members of the establishment of the hospice on my return, but I saw nought of them, and it was a mystery to me where they could be hidden.

A table d'hôte is held at the hospice every evening at 7 o'clock, constituting a fashionable dinner for the English, and a supper for the continentals. Between thirty and forty of us sat down together; men of many nations and languages, and evidently all pedestrians—for there was a certain air of rough handling about all of us, and there did not appear in the neighbourhood of the hospice a single mule, the only means by which any one could have been conveyed to the spot. Though the guide-books speak slightingly of the fare afforded to the traveller in this lofty place of entertainment, I am bound to say that the meal laid before us was both abundant and choice. The peculiar structure of the place was strikingly exhibited as we retired to our sleeping apartments; it is that of an hospital, each bed-room being a ward, separated only by a deal board from the next one. We heard that a servant remains in the house all winter, to attend to those who cross the pass at that season. What a life for a human being to lead! The Bell Rock Lighthouse would be a gay residence in comparison, being excited by an occasional shipwreck. The servant has for companions on his dreary watch a couple of the majestic dogs known as the St Bernard's breed. It is impossible to look on these animals without feeling something approaching to veneration both for their physical and moral qualities. They are not, however, it must be admitted, very engaging animals; they do not positively repel attention, but they receive it with a calm and dignified abstraction, as if they chose to convey to the mind of the stranger an impression, that their duties are too serious to admit of the interchange of trifling courtesies.

* [The Grimsel is a lofty pass on the Bernese Alps, admitting travellers from the central part of Switzerland into the valley of the Rhone on the south. Murray, in his admirable Hand-Book, gives the following anecdote respecting this dismal wilderness:—"During the campaign of 1799, the Austrians actually encamped for some time upon the top of the Grimsel, and during their stay gutted the hospice, using every morsel of wood-work for fuel. Every attempt of the French general Lecourbe to dislodge them failed, when a peasant of Guttanen, named Nägeli, offered to conduct a detachment by a circuitous path, known only to himself, to the rear of the Austrian position, on condition that the mountain he was about to cross should be given to him as his reward. This being agreed to, a party, commanded by General Gadin, led by Nägeli over the Doltithorn and the glaciers of Ghelman, fell upon the Austrians unawares, from a point above that which they occupied. They were seized with a panic, and fled at once—many in the direction of the glacier of Aar, where escape was hopeless; and those who were not shot by the French perished in the rents and chasms, where human bones, rusty arms, and tattered clothes, are even now met with, and attest their miserable fate. The guide of the French did not profit by his barren mountain, remaining as poor as before he became possessed of it, but it has since been called after him, Nägeli's Grätli."]

THE FLOWER-GIRL OF MADRID.

A LATE INCIDENT.

THE unhappy state of Spain—that land where ardent feeling makes every disagreement, personal or political, assume an aggravated and embittered form—drove many of the inhabitants, within these few past years, to the neighbouring territory of France. In Bordeaux alone, as many as twenty thousand Spaniards fixed their residence during the struggles betwixt the Carlists and Christinos. The natives and the strangers managed, on the whole, to do very well together; and many permanent connexions were formed in consequence of their being associated in one place, by the accidents of fortune and war.

In 1834, the Countess de Villa Fuente came to live in Bordeaux. It was known that she came from Madrid; but few or none seemed to be acquainted with her private history, or with the causes of her exile. No one accompanied her, with the exception of an infant boy, on whom she lavished the most tender cares, and in reference to whom the character of a widow was very generally assigned to her, despite of her youth and unimpaired beauty. She appeared rich, and kept up a handsome establishment, so that the best society of Bordeaux was open to her at all times. But though not shunning company altogether, she lived on the whole in a retired manner, and the most uncharitable could attach no impropriety to her name, although she was a single and unprotected woman, and though more than one suitor fluttered around her and sought her good graces.

Such was the state of matters during the first three years of her stay in Bordeaux. At the end of that time, the countess, without any known cause, assumed all the outward marks of deep mourning, and threw her establishment into the same sable colours. Within a month or two afterwards, it was noticed by observant eyes that she seemed to distinguish more than usually a certain Monsieur Longpré, a wealthy gentleman of Bordeaux, who had pursued her with unabated ardour for three years, in spite of all her reserve, and even her coldness. The alteration in her manner to him was sufficiently pointed to lead people to conclude, that he would prove the happy man in due time. But his own thoughts about the matter were very unsettled, as the following words from his lips will partly prove. Seizing an occasion to press his suit, when the countess allowed him the honour of an interview, he broke forth at length in half-reproachful tones—"Inesilla, why prolong this state of suspense, so torturing to me? Unless I deceive myself, you favour me above others around you; yes, you love me. I own I have this happy belief. What, then, causes your hesitation, since you are a widow and free? Is it not so? If you are moved by any feelings respecting your child, you know that I love him, and for your sake will love him always."

The countess, at these words, rose from her seat, walked to where her guitar lay, and ran heedlessly over its strings for a few moments. She then turned to the little boy who was playing near her, and said to him, "Juanito! Juanito! go and drive your humming-top elsewhere; the noise gives me a headache." The boy came and sought a caress, and then ran cheerfully away. After his departure, there was a pause for a minute or two, which the countess broke in upon by saying, "Let us talk, M. Longpré, on a subject different from the last. This guitar has reminded me of Spain—of Madrid—and of Manuela, a poor girl there. Her story is an interesting one;

listen, and I will tell it to you—that is, if you choose to hear it." Though the lover was by no means pleased at this evasion of the subject which he had so much at heart, there was so much of grave sweetness in the tones with which the countess made the request, that he at once expressed his willingness to hear the story.

"There lived at Madrid, five years ago," began the countess, "a merchant named Moralès, whose fortune was so considerable, that his only daughter was deemed one of the best matches in the city. Dolorès, as she was called, joined to her pecuniary advantages a countenance and form which the young men of Madrid declared to be of superior beauty. A cavalier, the flower of the noble youths of Spain, saw and loved her. I will spare you, my friend, an account of all the concerts and serenades by which Don Miguel sought to excite a reciprocal passion in the heart of Dolorès. Young, noble, accomplished, and rich, he soon made the desired impression, and, no obstacles being interposed, he was received in the house of Moralès as an accepted suitor. Like others of her race and sex, Dolorès was jealous of possessing love where she gave love; and again and again, to please her, Don Miguel vowed that the daughter of Moralès was the only woman who had ever touched his heart, and that she should be his last love, as she was his first. The marriage-day of the happy pair was fixed; it came; and before the priest and her friends, Dolorès gave her hand to Don Miguel.

A ball followed in the evening. It was yet early, when Dolorès, overpowered by the warmth of the dancing-rooms, and agitated by the all-important event of the day, retired for a few minutes with some of her female friends, in order to rest herself and calm her spirits. She was still seated in her chamber with her companions, when a footstep was heard at the door of the apartment. 'You cannot enter—do not enter, Don Miguel!' cried one or two of the ladies, starting up from the easy postures into which, fatigued by the dance, they had thrown themselves. They conceived that Don Miguel had missed Dolorès from the dance, and had come to inquire after her. But when, in spite of their exclamation, the door of the chamber was opened, they beheld—not Don Miguel, but Manuela, the flower-girl.

Manuela, the flower-girl, was so remarkable for her beauty and handsome figure, that few who were in the habit of walking on the Prado were unacquainted with her by name and appearance. But when she entered the chamber of Dolorès on the marriage-evening of the latter, very unlike her usual aspect was that presented by the flower-girl. Her long black hair hung in disorder around her pale face, and her dark eyes flamed with feverish excitement. She bore before her, by a strap, her flower-basket, in which lay, bedded upon flowers, an infant of two months old.

'Where is the bride?' demanded Manuela, hoarsely, as soon as she entered.

'Manuela!' cried Dolorès, trembling she knew not why, yet endeavouring to seem at ease, 'I am the bride; and you shall bear my bouquets to court.'

'*You* the bride?' exclaimed Manuela, who knew and was known to Dolorès; 'is it you whom he is to marry?'

'Whom he is to marry, Manuela?' answered Dolorès; 'say whom he *has* married! Hath not Don Miguel sent you—sent you to strew our nuptial way with flowers?'

'The traitor!' cried Manuela. 'Behold that infant! it is his—it is mine—it is ours!' The tears of the flower-girl here burst forth in torrents; but she checked them, and continued—'Ah! if you knew all his treachery—all his wickedness. I—a poor girl—sought to avoid him; but he married me—yes, he married me, and the marriage was a false one! I discovered his deceit; but he came to my father, and to my mother, and he calmed them by renewing all his protestations and his promises. It is two months since my child was born; he was with me then, but I knew not, though I know now, that it was but to deceive me the more fully. He already loved you—already.'

Here the poor flower-girl fell down in an exhausted state. She was tenderly cared for by the agitated bride and her friends, and recovered somewhat her strength. 'Only to-day, about two hours since, I learnt that Don Miguel was to wed another. Then I thought, in my madness, of killing him; but I grew more calm. Poor child! what would have become of him—his father killed—his mother *poisoned!*' The fainting condition of the flower-girl explained her words. She had not avenged herself on Don Miguel—but, unable to live, she had taken poison. 'Take my child,' said she to the bride, as she grew momentarily weaker; 'protect him, watch over him, be a mother to him. If you can still love Don Miguel after his cruel abandonment of his child and me, the poor flower-girl shall not be in your way. But, oh! promise, to a dying mother, that you will take care of her child!'

Dolorès had rather signed than spoken the desired promise, when a knock was heard at the chamber-door. Dolorès instantly caused it to be fastened within. The knocks were then repeated, and the voice of Don Miguel was heard desiring admittance. 'You cannot enter,' answered one of the women. The bridegroom addressed himself to Dolorès, and, seeming to believe her ill, besought admittance. The passionate words of affection which he poured out for the ear of the bride fell unheeded. Dolorès hung over the dying flower-girl. 'Manuela,' cried she, 'this child shall never be parted from me while I live. Manuela! Manuela!' continued she in tones of the deepest sympathy, 'live for your child and Don Miguel—he shall be restored to you; mine he is not, and never shall be! Ah, help! she dies!'

While Dolorès was thus engaged, Don Miguel continued to press for admittance; and by this time, either through the noise, or by reason of the bride's absence, a whisper had gone through the mansion that something was amiss. Moralès, with a number of the party, left the ball-room, and came to the door of his daughter's chamber. 'My child,' cried he, 'it is I. Open to me; if anything be amiss, let your father be with you. Open to me.'

On hearing her father's voice, Dolorès, who was tenderly wiping the foam from the convulsed lips of Manuela, roused herself, and gave orders for the opening of the chamber-door. 'Let all enter,' she said firmly. Her command was obeyed; and the first person who rushed forward was Don Miguel. What was his amazement and horror, when, upon the bridal-bed of Dolorès, he saw the pale countenance of one but too well known to him. Manuela had not yet expired. At the instant of his advance, she opened her eyes, and a flash of fire shot across their enfeebled lustre. She slowly raised her finger, and directing it towards him, she said, 'Miserable man, I pardon thee! But beware of my father—*he will kill thee!*' As she spoke, Manuela sank backwards, and died almost instantly in the arms of Dolorès.

The dying woman, her words, and the sight of the infant, formed but too full an explanation of this scene to all who had entered the chamber. Conscience-struck, at least for the moment, Don Miguel fled from the spot. The affair made a great noise in Madrid, but none could condole with Dolorès on the subject, as, on the morning after the event, she had quitted Madrid with the child of Manuela. She fled. Can you guess who she was, and whither she fled?"

"I can—I see her before me!"

"You are right. I fled, in the first instance, with the child of Manuela to a convent, where my father visited me, and where we concerted measures to prevent the assertion by Don Miguel of those marital rights, which worlds would not have tempted me now to concede. It was deemed best that I should go to France. I did so, and was never molested by Don Miguel while he lived: but within the past year the words of Manuela were fulfilled. Her betrayer fell by the hand of her father.

Now, M. Longpré," continued the countess, "you wish me to be your wife. I—I own I esteem—I love you; but my heart trembles at the recollection of the past, for believe not that I escaped without suffering. Assure me on this point, and my hand is yours. I well believe that you would not insult me by paying addresses while bound by other legal engagements; but assure me that none can renew in your case the death-scene of Manuela—that the vows paid to me are not violations of the actual though unacknowledged rights of any other—and I am willingly, gladly yours."

M. Longpré, need we say, eagerly gave the assurance required. Nor did he deceive her. When their marriage-day came, as it soon did, the happiness of Dolorès suffered no alloy from the cause which she had long feared, and her marriage-day afforded only a specimen of the uninterrupted felicity of many after years.

OCCASIONAL NOTES.

THE BANK-NOTE SYSTEM OF AMERICA.

We have lately seen a very remarkable document, received by a friend from New York. It is a large octavo sheet of sixteen pages, each page containing three closely-printed columns, and is entitled, "Day's New York Bank-Note List, and Counterfeit Detector:" it purports to have been established in 1819, being the oldest paper of the kind, and to be published once a fortnight. The copy shown to us is of the date September 16, 1841. The matter of the sheet consists of lists of banks in the various states of the Union; the whole, according to a rough calculation, amounting to about twelve hundred in number; and along with the name of each of these banks is given the current value of its notes, and a short description of the forgeries upon them. In some cases, only the name of a bank is given, along with a single word, or two fractional figures, significant of the value of, or discount on, its paper: thus—

"Merchant's Bank, Norwich, ... ⅜;"

but, more commonly, to the name of the bank is appended a list of forgeries upon its different notes. Sometimes a bank appears to be exposed to not fewer than twelve different kinds of forgeries of its notes; the average is not less than six, and, multiplying the 1200 banks by this number, we find that there is not fewer than 7200 *varieties* of forged bank-notes in circulation. How many notes of each variety are issued, we are presented with no means of judging. To meet this seemingly universal depreciation and forgery, the sheet we allude to is published. It may be considered an indispensable pocket-companion for every individual carrying on business, and also every workman—a kind of dictionary, which requires to be consulted on almost every occasion that a note is presented in payment or exchange.

The necessity for such a remembrancer becomes very evident when we look down the long lists of forgeries. A common means of detection pointed out, is the inferior execution of the spurious notes and the wrong spelling of names. Take the following extract as an example, referring to a 1 dollar note:—

"Union Bank of New York—New York ..... par. 1 dollar, letter A, dated Oct. 1, 1840. Cashier's name, Daniel Ebbetts, is not spelled right, one *t* being omitted. The figure of Washington on the vignette on the right is tall, and the eyes small, and the *one* in the centre of note badly done."

Or, the following of a 20 dollar note on the same bank:

"20 dollars, letter A, payable to H. Cott, dated Oct. 1, 1840. May be detected by the names of the engravers—in the genuine, Caesleur, Durand, Burton, and Edmonds; in the counterfeit, Edmonds is spelt Edmons."

The following, among several others, is given under the head Cattskill Bank:—

"10 dollars, dated Nov. 1, 1836., lett. A, signed H. Hill, cash. Thos. B. Cooke, pres., purporting to be engraved by Cardu, Durand, Austin, and Edmonds—a very close imitation of the genuine. The engraving is rather coarser, note larger, paper thicker, and the margins are broader—the cashier's name a *fac simile*—president's not so good."

There are many hundreds of notices of the above kind; and a not less frequent description of forgeries seems to be the alteration of certain words or figures on genuine notes, so as to make them pass for larger sums than those for which they were actually issued. The following are examples of this ingenious roguery. The first is the alteration of 5 into 50 on the notes of the Delaware and Hudson Canal Company:—

"50 dollars altered from 5 dollars—easily detected if you observe the insertion of the word *fifty* in place of the word *five*—the former word being also smaller than the word dollars, with which it should correspond."

The following is under the head "Mechanics' Banking Association:"—

"5 dollars altered from 2 dollars. The vignette of the true 5 dollars is a group of four human beings and a lion—in the 2 dollars, and of course in the altered 5 dollars, a single figure of Ceres.

20 dollars altered from 3 dollars, so well done as to pass with some of the city brokers. These altered notes can readily be detected by holding up the bill to the light. The bank has issued no such denomination."

Another species of fraud consists in altering the name of a broken bank into the name of a solvent one; and the number of places of the same name favours the deception. For instance, there are perhaps a dozen places with the names of Franklin and Monroe, and unless the state, or some other local distinction, be added, it is difficult to know which Franklin or Monroe is meant. The Monroe Bank, Rochester, has, it appears, suffered from this cause. Under the head of that bank the following occurs:—

"Bills of the broken bank of Monroe, *Michigan*, have been so altered as to resemble this bank. Hold up the bills to the light, and you will readily detect the cheat."

There is a similar fraud on the Commercial Bank of Baltimore—

"5 dollars struck from the old 5 dollars on the Commercial Bank of New York having been issued. The word New-York has been extracted, and Baltimore substituted in its place."

What a state of commercial affairs and moral depravity does all this disclose!

NATIONAL ANTIQUITIES.

The "Literary Gazette"—a paper which seems ever ready to encourage improvements connected with taste—has the following in a late number:—

"In the House of Commons on Monday evening, Mr Wyse gave notice of a motion for next session of Parliament, to which we most earnestly wish the utmost success. It is to pray her Majesty to direct the establishment, under efficient management and control, and on a scale commensurate with the dignity of the country, of a National Museum for the reception and preservation of objects connected with the History and Antiquities of the British Islands. Thousands of interesting specimens of British, Celtic, Roman, Danish, and other antiquities, would be contributed from private possessions and collections. The Society of Antiquaries might find a proper place for the reception of many curious matters now buried in its narrow and confused repositories. All similar things hereafter recovered from the bowels of the earth or ancient buildings would at once be taken to their fitting home, and be preserved for ever. Even from foreign parts we might expect the return of objects belonging to our isle in days of old; and, in short, we should have a national museum worthy of the prince and the people."

To these propositions there can be no reasonable objection; but we beg to state what we think is a very general opinion, that the establishment of great museums in London—as this one, we suppose, is to be—is not the only way of promoting national improvement. If the preservation of objects of antiquity be of use, we should, by all means, recommend that means be adopted by the nation at large to preserve, *on the spots where they rest*, all architectural or archaiological remains calculated to throw light on past manners or history. Within this category might be included the preservation of town-crosses, watch-towers, fragments of city and Roman walls, feudal keeps and castles, abbeys and cathedrals, bridges of ancient construction, Druidic stones and tumuli, cairns, &c., all, in as far as such could be accomplished at a moderate expense, and consistently with modern convenience. We trust that antiquarian societies, wherever established, will make a move at the proper time on this subject. Civic authorities, with their usual disregard of taste, have seldom had any respect for antiquities, however curious; and as, in a number of places, they

have removed town-crosses for no rational purpose, we should hope that the restoration of these interesting and ornamental objects will not be lost sight of.

THE USE OF THE TERM ESQUIRE.

Till a recent period, this term was affixed to the names of men of birth and professional persons only. Men of inferior importance had Mr prefixed to their names, and thus a distinction between the two classes was kept up. Now it is quite customary to add "Esq." to the names of the better class of tradesmen, when they are addressed as private persons. It is a trifle, yet it might have been better if the old rule had been adhered to; for, in the first place, the extension of the term is grammatically wrong, seeing that it is only applicable to men entitled to bear arms; and in the second, if there is any honour in the appellation, it is right that the superior class should have it, in which case it would serve as one of the incentives which work upon the ambition of the mercantile classes, prompting them to the industry which leads to honours.

It appears, however, that the tendency of honourable terms is ever, like that of glaciers, downward. In the seventeenth century, in Scotland, the term Mr was reserved for clergymen, barristers, and other persons of consequence, while the mercantile classes only had their naked names. Mr then came down to the mercantile classes, from whom it is now going to the better class of working men. So, also, Sir, which originally signified a lord (*sihor*, Gothic), has gradually descended till it is applied to nearly every reputable person.

APPLAUDING MACHINE.

When attending public dinners, at which the staple business generally consists in giving and receiving toasts, we have often thought it would be a great improvement if a machine were invented to applaud, and thus save the company from the very arduous duty of "giving the honours." It might be advantageous if the machine could be made to utter a few set terms, such as "Once, twice, thrice, hurrah—hurrah!" with a thundering sound to resemble a clapping of hands at each of the intervals, or to give the equally common terms—"Hip, hip, hurrah!" Any way would do, and, indeed, the machine would be invaluable, if it only gave such sounds as clapping of hands, ruffing on the table, and the hurrahing, the speaking part being left to the performance of the toast-master. As the company at a public entertainment is usually called on to give the honours perhaps not fewer than twenty times in the course of an evening, the work is rather fatiguing in warm weather, independently of the tiresomeness of going through the same performance so frequently. An applauding machine appears to us, therefore, to be a decided "desideratum," and we hope the hint will not be lost on the active geniuses of the age who are looking about for objects on which to employ their talents. The machine could not fail "to pay," as it might be patented, and licenses sold for its use. No company, surely, would grudge ten shillings being added to the bill for the loan of a good applauding apparatus.

"OTHER PEOPLE."

I REMEMBER once to have heard the following story.

In a certain northern town lived a worthy man who had an only son. This son was universally set down by the townsfolk as an idiot: the father called him *weak*. One morning as his father sat in his study busily employed, Jamie rushed in, and stood with his face glowing, his hands working, his feet uneasily moving backwards and forwards, and every gesture evincing that he had something important to communicate, and was too nervous to communicate it.

"Well, Jamie," said his father, encouragingly, "what is it?"

"I want something, father," answered Jamie.

"Well, Jamie, and what is it you want?"

"I want a dog, father," answered Jamie.

"A dog!" exclaimed the astonished parent; "and what can you want with a dog?"

"I just want it," said Jamie, twirling his thumbs, and looking down.

"But what for?" again asked his father.

"Well, I don't exactly know," replied Jamie, still twirling his thumbs; "but I want it."

"Tell me what you want with a dog, and you shall have one," said the father; "but I certainly should not like to trust you, unless you show that you have some object in view."

"Everybody in our town keeps a dog but me!" cried Jamie, indignantly, and beginning to whimper. "There's Sandy Donaldson, and Willie Allison, and Rob Gordon, and Wattie Campbell, *all* keep dogs! Other people keep dogs, and why mayn't *I* keep a dog too?"

It was impossible to resist laughing at, or granting a request backed by so exquisite a reason. The father had his joke, and Jamie had his dog; but within a week Jamie was laid up with a lacerated leg, and began to doubt whether the pleasure of keeping a dog compensated for the pain inflicted by the said dog's occasionally taking it into his head to bite his master.

Now, dear reader, perhaps you may laugh at this story of an idiot in a northern town; and, having done so, let us try to extract something useful from it, and ask ourselves whether there be not many idiots in other towns, northern, southern, eastern, and western, who would despise the simplicity of Jamie, and yet who do the very same thing themselves; who pay as much deference to the foolish doings of "other people;" who, like him, keep a dog merely because their friends and neighbours keep dogs; and who, like him, get well bitten for their pains. Yes; the mass of mankind is made up of "Jamies;" and Jamie's town may represent the world.

Old Potts gives, once every year, a grand party of seventy people, with chandeliers, a quadrille band, ices, and champagne. Why he did so, I could never conceive, as he is a merry widower, free from family cares, and, above all things, partial to a quiet rubber. On a late festive occasion, as I stood fixed tightly in a doorway, the master of the revels came towards me through the throng, looking exceedingly uncomfortable, and wiping his forehead with a huge white mouchoir.

"Ah!" exclaimed he, noticing me in the throng. "Hot work. Isn't it? I'm as tired as if I had been walking twenty miles."

"It is very kind of you to take so much trouble on account of your friends," said I, feeling that I ought to say something, and not knowing exactly what to say.

"Ah!" said Potts, bending towards me in a confidential manner; "I hate these crowds, my dear young friend—I hate them! Nothing like a snug party of six or eight!"

"Then why ask sixty or eighty?" said I, reciprocating the tone of confidence.

"Ah, my dear young friend," said Potts, shaking his head; "*you* don't understand these things. By and by, when you keep house, you'll know better. I invite a crowd, now and then, and cram my small rooms, because it's the custom—because it's the custom—nothing more! Other people do so, you know, and not to be singular, so must *I*!"

The neighbourhood of —— Square is thrown into a constant fever of excitement by the incessant pianoforte practice of Miss Isabella Hawkins, the youngest and the most musical of four sisters. I made a morning call there the other day, and was ushered into the drawing-room, where I found Miss Isabella alone, and hard at work on the "Mosé in Egitto" fantasia of Thalberg. It was a trying situation; and I thought it better, under the circumstances, to hope that I had not interrupted practice—to beg that she would proceed—that there was nothing I was fonder of than music. Accordingly, she favoured me with the entire fantasia from beginning to end—from the first mysterious whisper to the final spirit-stirring bang. I heard it without wincing, and at the conclusion was profuse in compliments and thanks, as in duty bound: the only qualification to my pleasure being a fear that the fatigue had been too much for her.

"Why, it *is* a great exertion," said she, leaning back in a state of palpitation; "particularly as I don't like music. Of all things on earth, I detest pianoforte practice most."

"*You* not like music?" exclaimed I; "you who play so delightfully?"

It was the genteel thing to say this, you know; but the fact is, she plays but tolerably—misses half the notes, and "fudges" the other half. Still, she insists on playing Thalberg, and her friends are expected to listen.

"I assure you I care nothing for music," she repeated; "and as for the piano, I hate it—I hate the very sight of it!"—and she looked quite viciously at the poor instrument

"I wonder that you practise so hard then?" said I, innocently.

"Mamma makes me!" said Isabella, with great animation—"mamma makes me, or I never would touch it from year's end to year's end! Oh, you can't think how cross she is if I don't practise every morning; and nothing under three hours will do. I'm sure *I* wish the piano in the fire! But what's the use of wishing? Other people practise, she says; so must *I*!"

Smith is a merchant, and deals in spices and currants, and raisins, and matters of that sort. Smith's life is very mercantile and stupid. He leaves his house at Brixton Hill every morning by a quarter past eight, and arrives at his counting-house in the city by a little past nine. Here he toils until the evening, and then, riding home again, he eats a hearty dinner, and tries to digest it until bed-time. Of course, no constitution can stand this irrationality, and Smith is often very ill, and never at all well. "But, then," as he says, "how is it to be avoided? The physician tells me to apply less to business, to take more exercise, to indulge in relaxation of mind; sir, it can't be done. I must be at my desk by nine, and remain there till six; and it would never do for me to lose time by walking. If I flagged for an instant, my connection would go. Other people overwork themselves, and so must *I*!"

One night last week I was returning from a lecture, when I was startled by a groan close to me. I directed my eyes towards the spot whence the sound appeared to proceed, and discerned, by the light of a neighbouring gas-lamp, a man lying at full length in the gutter. He had put his hat under his head for a pillow, and was snoring with such vehemence as to endanger the repose of every inhabitant of the street. I was willing to give him the chance of securing a better resting-place, and therefore shook him by the shoulder. This only succeeded in rousing him partially. He drew a long sigh, rolled over on his other side, and muttered drowsily, "More gin!"

It would have been inhuman in the extreme to allow him to lie there. I once more, therefore, applied myself to the pleasing task of benevolence, and administered a kind but smart kick, which was so far effective that the inebriated individual opened his eyes, sat up in the gutter, and stared around him with an air of bewilderment.

"Come, get up," said I, "or you'll find this bed rather too damp for your rheumatism! You'll kill yourself!"

"What's the matter? Who are you?" exclaimed the inebriated individual, rubbing his eyes, and not yet capable of appreciating the exact condition of affairs.

"Never mind who I am," said I. "Get up, unless you want to end your days in a gutter. How came you to be in this state, you dissipated character?"

"Why, master," exclaimed the man, "what's the odds of getting up? It's a good enough place to sleep in. You an't one of them temperance set, I 'spose, as wants us to live on bread and water. A drop of gin can't hurt nobody! Besides, you should do as the rest of the world does—that's what I always say! Other people drinks—and, in course, *I* may!"

Now, tell me, reader, is not the mass of mankind made up of "Jamies;" and may not Jamie's town represent the world.

THUROT, THE NAVAL PARTISAN.

FRANCOIS THUROT, an adventurer of the Paul Jones class, whose career presents some remarkable points of interest, was born in the year 1727, at Nuits, in Burgundy. According to the best accounts, his paternal grandfather was an Irishman of the name of Farrell, a captain in the Irish army of James II., and one of the exiles who followed that monarch's fallen fortunes. While attached to the establishment of James at St Germains, Captain Farrell gained the affections of Mademoiselle Thurot, niece to a member of the Parliament of Paris, and wedded her, to the great indignation of her relatives. The latter discountenanced the pair in every way; and it was only on the decease of both that their son was adopted by his mother's friends, and received their family name of Thurot. In the course of his mature years, this individual was three times married, and his second wife brought him the son whose history we are about to relate. She died in giving the child birth; and while he was being carried to the font, the mother was receiving the last offices of humanity in the adjoining place of sepulture. An incident of some importance to the boy at a future period, was the consequence of this somewhat striking circumstance. It was customary at that time for ladies of rank to go to the churches about Christmas, and offer themselves as sponsors for any of the children that might be brought there for baptism, with the charitable view of doing some good to them in their after lives. One Madame Tallard offered in this way to be sponsor for young Thurot; and being led to inquire into the cause of his father's obvious and unusual grief, she was so much moved by what she heard as to make the boy a handsome present, and to promise to do something for him in succeeding years. The promise, it will be found, was not forgotten.

The English memoir-writers say that all these things took place at Boulogne, but the French Biographical Dictionary informs us that the Thurot family were at this time resident in Burgundy, and that Francois was sent by his father to the Jesuit school of Dijon, in order to learn the art of surgery. We are also told, by the same authority, that the boy showed an unconquerable passion for adventure, and military or rather naval affairs, and that he ran off, when about fifteen years old, to the seaport of Dunkirk. Either at the latter place, or at Boulogne, he appears to have become acquainted with one Farrell, an Irishman, who followed the profession of a smuggler. The name of Farrell led to an acquaintance between this man and young Thurot, in consequence of which the latter was induced to make a voyage to Ireland, being told that the O'Farrells were still a flourishing house in Connaught, and that he might there get into the way of advancing his fortunes. After voyaging as far as the Isle of Man with his Irish cousin, the high-spirited lad took some offence at his conductor, and chose to stay on the island behind the vessel. "The world was now before him where to choose;" and his first thought was to enter on board of any vessel that came in the way. But none touched at the time at the island, and Thurot was glad to earn his bread by becoming servant to a gentleman from Anglesey, of the same disreputable profession with Mr Farrell. The Anglesey smuggler was indeed old in the trade of "run-

ning goods," and, taking a fancy for the handsome, active French youth, employed him in various commissions betwixt Man and the Anglesey coasts. Here Thurot learned the English tongue, and acquired that strong taste for naval adventure which characterised him through life, as well as that skill and experience in contraband trading no less characteristic of his after years. Growing wearied of his position, Thurot seized an opportunity afforded to him of visiting Dublin, probably having some curiosity about his Irish relations. Being furnished, at his arrival, with only eleven shillings, he soon fell, as may be imagined, into a state of distress, and found himself obliged to enter the family of Lord B——, in the capacity of valet. The handsome Frenchman, however, excited some unpleasant suspicions in that family, and was forced to shift into that of another nobleman, who dwelt in a country situation by the sea-side. For a time Thurot was here occupied in rural sports; and entering into them with his usual energy, acquired much celebrity for activity, skill, and utility as a caterer for amusement to his master and friends. But numerous smugglers frequented that portion of the coast; and, ere long, our hero involved himself deeply with these people, among whom his dexterity and experience speedily raised him to be a leader. His generosity in distributing teas, brandies, and stuffs of value, among his friends and favourites, at length betrayed him, and his smuggling associates were watched by the revenue officers. Several laden boats were taken; but Thurot, who had gone on board of one, contrived to escape with it, and made his way to Scotland. His share of the saved cargo amounted to one hundred and fifty pounds; and with this sum he made a figure for a short time in Edinburgh. Ultimately, a gentleman of French extraction met with him, and was induced to give or get for him the mastership of the sloop Annie, with which Thurot went to London on an honest commercial trip. But the sloop was accidentally burned on the Thames, and its late master was again left without regular employment.

For the next four years (betwixt 1748 and 1752), Thurot passed frequently betwixt London and France, having devoted himself to his old employment of smuggling. In 1752, he went to reside at Boulogne, and continued in the same line. By his daring, skill, and success, as well as by the extraordinary generosity and humaneness of character which he displayed, he had now made himself the king of the smugglers. His boats ran an immense quantity of goods between the French and English coasts, usually succeeding in carrying out and in nearly L.20,000 worth annually. English and French revenue-coasters might sometimes seize a cargo; but in vain did they attempt to capture or check Thurot in his expeditions. The French writers also say that he was a bold and most successful privateer. At length the French government ordered the president of the province to take up all persons suspected of smuggling at Boulogne, and Thurot had the ill luck to be one of the first seized. He was carried to Dunkirk, and evidence was gathered against him sufficient to convict him capitally; but now the sponsorship of Madame Tallard proved his safeguard. The president just mentioned was the son of that lady, and he was induced so to exert himself that the life of her godson Thurot was spared.

This seeming check in the roving career of Thurot was, in reality, the means of advancing him to honours and rank far above his wildest hopes; and he had ever shown a spirit of ambition that soared above his ordinary employments. The president Tallard had represented, it is probable, the possibility of his being made a highly useful man to his country. He was sent for to Paris; and being examined respecting the smuggling trade, he gave such proofs of his skill, experience, and daring in naval matters, that the government resolved to employ him in the event of a renewal of the war with England. The war did break out in 1755, immediately afterwards, and Thurot received the command of a sloop of war. But this was an instrument too petty for his views, and he asked and obtained leave to join the privateers of Dunkirk. It was at this time that, by his brilliant exploits, the subject of our memoir made his name truly terrible to the merchants of Britain. He took many ships, and deeply injured their commerce in the channel. Attracted by his increasing celebrity as a naval partisan, the French court again sent for him in 1757, and he was nominated to the command of the frigate Friponne. In this he continued so to distinguish himself that Marshal Belleisle got him appointed to the command of a little squadron of two frigates and two corvettes, and he was sent to the northern seas to intercept a large convoy of British merchantmen from Archangel. Thurot had now means somewhat commensurate with his abilities and comprehensive views. After taking nearly ten merchantmen, and cruising a long time, he fell in with four English vessels of war, two of them larger than his own, and an obstinate engagement ensued, in which Thurot was the victor. He subsequently took to Christiansand, in Norway, not fewer than fourteen captured ships. He issued thence again, approached the Scottish coasts, and took one brig of eighteen guns, with a number of large merchantmen, and returned to the port of Dunkirk, after a restless and brilliant course of two years. The British were deemed so completely masters of the seas, and it was so unusual for French captains to meet them on anything like terms of equality, much less of superiority, that Thurot, at this time (1758) but a man of thirty years of age, was received almost with triumphal honours at the French court, and became the lion of the hour. Seeing every other seaman baffled by the enemy, the government turned to Thurot as to an anchor of hope, and sought his advice on the conduct of their naval affairs. Like Paul Jones in later days, he was impressed by a knowledge of the unfortified state of the coasts and towns of Britain; and, like him also, he boldly counselled a descent on the island. The advice was taken. Intending to act on several points at once, the government gave Thurot five frigates, of 168 guns in all, with a complement of 700 sailors and 1270 soldiers, to attack the Irish coasts. The British ships, with the aid of winds and weather, ultimately defeated the other parts of the scheme, but the indefatigable Thurot vindicated his repute to a certain extent in the fulfilment of his own task. No longer a contraband trader or unauthorised privateer, but an honoured servant of his country, he sailed from Dunkirk in October 1759, and got safe to Ostend. But in attempting to pass around the north of Britain, the channel being avoided as filled with British ships, the French frigates were met by a terrible storm, and one of them was so much injured as to require being sent home. At length the squadron reached the Derry coast, but ere they could land, were again driven to sea, and another ship was permanently separated from the number. Thurot's men had now begun to suffer greatly from fatigue and want of provisions, and the other captains intreated him to return to France; but he was unsubdued in spirit, and firmly refused. In order to procure refreshments, he anchored, on the 16th of February, off Islay, and, being able to enforce his will, obtained supplies, for which, however, to his honour, he paid punctually, and even most liberally. The state of his men, after only four months of the sea, may be guessed from the fact, that, on getting ashore, they ate grass with avidity. Here, too, Thurot heard of the failure of the rest of the invading squadron; but still he persisted in his course, and, with his scanty stores, moved for Carrickfergus, determined at least to wipe so far away, by one retaliative descent, the memory of some of the many similar insults inflicted by Britain on France. On the 21st, he anchored in Carrickfergus Bay, and, about three in the afternoon, landed his soldiery, now reduced to about 600 men, along with 200 or 300 sailors. Carrickfergus was then surrounded by an old and ruinous wall, and its castle by one equally old and ruinous. The place was garrisoned with four companies of men, but they were poorly furnished with ammunition. Therefore, though the commandant, Captain Jennings, made a defence, Thurot soon forced the gates and entered the town. He then marched along the streets, keeping up a fire with the garrison, which was retreating to the castle. Here an incident took place which shows the humane character of the assailing party. A little child, in thoughtless play, ran between the combatants, when a French officer started forward, and, taking up the child tenderly, carried it to the next door, which chanced to be the paternal one. Unfortunately, the gallant man exposed himself too much, and was shot. Thurot continued to press on the castle after the garrison had entered, and quickly compelled them to capitulate.

Master of the town, he now demanded supplies of stores, which the magistrates most imprudently hesitated to comply with. In consequence, the town was plundered, Thurot telling them that the fault was their own. After taking what he could, the French commander, satisfied with what he had done to sustain his character, resolved immediately to quit the coast. But the career of the brave adventurer was drawing near its close. The news of has descent had spread; and ere he could leave Carrickfergus Bay, three British frigates, under Captain Elliott, had arrived to encounter him. Nothing daunted, however, Thurot prepared for action; nor could the issue of the contest have been, with any certainty, pronounced beforehand. The vessels were equal in numbers on both sides; and though the French crews were more numerous, they and their ships were in a very worn-out condition, while the British seamen were unspent by toil, and their vessels a little heavier in metal than the others. The engagement commenced with great spirit on both sides. Thurot maintained his character for seamanship and courage, and fought without flinching or retrograding one inch. The well-manned guns of the British covered his decks with dead bodies; a shot struck his own ship under water, and the sea rose high in the hold; yet still Thurot struggled for a chance of victory. Its sun smiled not then upon him. He was not destined, however, to become the captive of a mortal enemy: he fell dead amid his companions on the deck; and, after a contest of an hour and a half in all, the French ships became the prize of the British.

Thus perished, in the prime of manhood, a man of whom his national enemies had learned to think with esteem and respect. "The public (says the "Annual Register" for 1760, the year following the event above related) lamented the death of the brave Thurot, who, even while he commanded a privateer, fought less for plunder than honour; whose behaviour was on all occasions full of humanity and generosity; and whose undaunted courage raised him to rank and merited distinction. His death secured the glory he always sought."

Our readers will see a striking resemblance betwixt the career of Thurot and that of Paul Jones, as well as between the characters of the two men. They exhibited skill, courage, and humanity, in no ordinary degree; and both evidently possessed those characteristics which go to the composition of the Nelsons and the Napiers. Large opportunities for proving their endowments were not granted to either—for our country we may perhaps say happily so, since they were her enemies.

LIEBIG'S ANIMAL CHEMISTRY.*

SECOND NOTICE.

Our author having discussed the source of animal heat, which consists in the mutual action between the elements of the food and the oxygen conveyed by the circulation of the blood to every part of the body, proceeds to show how the heat of the body is sustained in correspondence with the surrounding atmosphere. It is remarkable that the heat of the blood is the same in the arctic regions as at the equator; and to account for this fact, he states that whatever heat is lost by radiation in cold climates, is restored within the body with great rapidity. There is a compensating process, and the compensation takes place more rapidly in winter than in summer, more at the pole than the equator.

Liebig here describes the nice adjustment between the temperature of the atmosphere, the appetite for food, and the support of an equable heat in the body. Every body knows from experience that nothing so effectually keeps out cold as good eating; but few are acquainted with the precise philosophic reason for this. "In order to keep up in the furnace [of the body] a constant temperature, we must vary the supply of fuel according to the external temperature, that is, according to the supply of oxygen. In the animal body the food is the fuel; with a proper supply of oxygen we obtain the heat given out during its oxidation or combustion. In winter, when we take exercise in a cold atmosphere, and when, consequently, the amount of inspired oxygen increases, the necessity for food containing carbon and hydrogen increases in the same ratio; and by gratifying the appetite thus excited, we obtain the most efficient protection against the most piercing cold. A starving man is soon frozen to death; and every one knows that the animals of prey in the arctic regions far exceed in voracity those of the torrid zone.

In cold and temperate climates, the air, which incessantly strives to consume the body, urges man to laborious efforts in order to furnish the means of resistance to its action, while, in hot climates, the necessity of labour to provide food is far less urgent. Our clothing is merely an equivalent for a certain amount of food. The more warmly we are clothed, the less urgent becomes the appetite for food, because the loss of heat by cooling, and consequently the amount of heat to be supplied by the food, is diminished.

If we were to go naked, like certain savage tribes, or if in hunting or fishing we were exposed to the same degree of cold as the Samoiedes, we should be able with ease to consume 10 lbs. of flesh, and perhaps a dozen of tallow candles into the bargain, daily, as warmly-clad travellers have related with astonishment of these people. We should then also be able to take the same quantity of brandy or train oil without bad effects, because the carbon and hydrogen of these substances would only suffice to keep up the equilibrium between the external temperature and that of our bodies."

It now, therefore, appears to be a natural law that the quantity of food must be strictly regulated by the degree of cold in which we are placed, just as if we should require to regulate the brilliancy of a lamp by the degree of darkness to be overcome.

"No isolated fact," proceeds our author, "can affect the truth of this natural law. Without temporary or permanent injury to health, the Neapolitan cannot take more carbon and hydrogen in the shape of food than he expires as carbonic acid and water; and the Esquimaux cannot expire more carbon and hydrogen than he takes into the system as food, unless in a state of disease or of starvation. Let us examine these states a little more closely. The Englishman in Jamaica sees with regret the disappearance of his appetite, previously a source of frequently recurring enjoyment; and he succeeds, by the use of Cayenne pepper and the most powerful stimulants, in enabling himself to take as much food as he was accustomed to eat at home. But the whole of the carbon thus introduced into the system is not consumed; the temperature of the air is too high, and the oppressive heat does not allow him to increase the number of respirations by active exercise, and thus to proportion the waste to the amount of food taken; disease of some kind, therefore, ensues.

On the other hand, England sends her sick, whose diseased digestive organs have, in a greater or less degree, lost the power of bringing the food into that state in which it is best adapted for oxidation, and

* Animal Chemistry, or Organic Chemistry in its Applications to Physiology, by Justus Liebig. Edited by W. Gregory, Professor of Medicine, Aberdeen. London: Taylor and Walton, Upper Gower Street. 1842.

therefore furnish less resistance to the oxidising agency of the atmosphere than is required in their native climate, to southern regions, where the amount of inspired oxygen is diminished in so great a proportion; and the result, an improvement in the health, is obvious. The diseased organs of digestion have sufficient power to place the diminished amount of food in equilibrium with the inspired oxygen; in the colder climate, the organs of respiration themselves would have been consumed in furnishing the necessary resistance to the action of the atmospheric oxygen. In our climate, hepatic diseases, or those arising from excess of carbon, prevail in summer; in winter, pulmonic diseases, or those arising from excess of oxygen, are more frequent. The cooling of the body, by whatever cause it may be produced, increases the amount of food necessary. The mere exposure to the open air, in a carriage or on the deck of a ship, by increasing radiation and vaporisation, increases the loss of heat, and compels us to eat more than usual."

Suppose that a person expires less carbonic acid, and otherwise loses less material, than the oxygen he absorbs, then disease commences; he becomes loaded with fat. Now, begin to starve this person, and he will lose the fat he has accumulated. Go on starving him, and he will lose the muscular fibre. He is gradually consumed by the action of the atmosphere. "Towards the end, the particles of the brain begin to undergo the process of oxidation, and delirium, mania, and death, close the scene; that is to say, all resistance to the oxidising power of the atmospheric oxygen ceases, and the chemical process of eremacausis, or decay, commences, in which every part of the body, the bones excepted, enters into combination with oxygen. The time which is required to cause death by starvation depends on the amount of fat in the body, on the degree of exercise, as in labour or exertion of any kind, on the temperature of the air, and, finally, on the presence or absence of water. Through the skin and lungs there escapes a certain quantity of water; and as the presence of water is essential to the continuance of the vital motions, its dissipation hastens death. Cases have occurred in which a full supply of water being accessible to the sufferer, death has not occurred till after the lapse of twenty days. In one case, life was sustained in this way for the period of sixty days.

In all chronic diseases death is produced by the same cause, namely, the chemical action of the atmosphere. When those substances are wanting whose function in the organism is to support the process of respiration; when the diseased organs are incapable of performing their proper function of producing these substances; when they have lost the power of transforming the food into that shape in which it may, by entering into combination with the oxygen of the air, protect the system from its influence—then the substance of the organs themselves, the fat of the body, the substance of the muscles, the nerves, and the brain, are unavoidably consumed. The true cause of death in these cases is the respiratory process, that is, the action of the atmosphere. A deficiency of food, and a want of power to convert the food into a part of the organism, are both, equally, a want of resistance; and this is the negative cause of the cessation of the vital process. The flame is extinguished, because the oil is consumed; and it is the oxygen of the air which has consumed it.

Respiration is the falling weight, the bent spring, which keeps the clock in motion; the inspirations and expirations are the strokes of the pendulum which regulate it. In our ordinary time-pieces, we know with mathematical accuracy the effect produced on their rate of going by changes in the length of the pendulum or in the external temperature. Few, however, have a clear conception of the influence of air and temperature on the health of the human body; and yet the research into the conditions necessary to keep it in the normal state is not more difficult than in the case of a clock."

Our author next adverts to the metamorphosis of food into animal tissues, particularly in the young, and to the peculiar modifications of the food in carnivorous and graminivorous creatures. Milk, he observes, is precisely the kind of food which affords a superabundance of oxygen to increase the bulk of the young mammalia. "The continued increase of mass, or growth, and the free and unimpeded development of the organs in the young animal, are dependent on the presence of foreign substances, which, in the nutritive process, have no other function than to protect the newly formed organs from the action of the oxygen. It is the elements of these substances which unite with the oxygen; the organs themselves could not do so without being consumed; that is, growth, or increase of mass in the body, the consumption of oxygen remaining the same, would be utterly impossible. The preceding considerations leave no doubt as to the purpose for which nature has added to the food of the young of carnivorous mammalia substances devoid of nitrogen, which their organism cannot employ for nutrition, strictly so called, that is, for the production of blood; substances which may be entirely dispensed with in their nourishment in the adult state. In the young of carnivorous birds, the want of all motion is an obvious cause of diminished waste in the organised parts; hence, milk is not provided for them."

He now brings his views to bear on man's social condition. We have space for only a few passages. "A nation of hunters, on a limited space, is utterly incapable of increasing its numbers beyond a certain point, which is soon attained. The carbon necessary for respiration must be obtained from the animals, of which only a limited number can live on the space supposed. These animals collect from plants the constituents of their organs and of their blood, and yield them, in turn, to the savages who live by the chase alone. They, again, receive this food unaccompanied by those compounds, destitute of nitrogen, which, during the life of the animals, served to support the respiratory process. In such men, confined to an animal diet, it is the carbon of the flesh and of the blood which must take the place of starch and sugar. But 15 lbs. of flesh contain not more carbon than 4 lbs. of starch; and while the savage with one animal and an equal weight of starch could maintain life and health for a certain number of days, he would be compelled, if confined to flesh, in order to procure the carbon necessary for respiration, during the same time, to consume five such animals.

It is easy to see, from these considerations, how close the connexion is between agriculture and the multiplication of the human species. The cultivation of our crops has ultimately no other object than the production of a maximum of those substances which are adapted for assimilation and respiration, in the smallest possible space. Grain and other nutritious vegetables yield us, not only in starch, sugar, and gum, the carbon which protects our organs from the action of oxygen, and produces in the organism the heat which is essential to life, but also, in the form of vegetable fibrine, albumen, and caseine, our blood, from which the other parts of our body are developed.

Man, when confined to animal food, respires, like the carnivora, at the expense of the matters produced by the metamorphosis of organised tissues; and just as the lion, tiger, and hyæna, in the cages of a menagerie, are compelled to accelerate the waste of the organised tissues by incessant motion, in order to furnish the matter necessary for respiration, so the savage, for the very same object, is forced to make the most laborious exertions, and go through a vast amount of muscular exercise. He is compelled to consume force merely in order to supply matter for respiration.

Cultivation is the economy of force. Science teaches us the simplest means of obtaining the greatest effect with the smallest expenditure of power, and with given means to produce a maximum of force. The unprofitable exertion of power, the waste of force in agriculture, in other branches of industry, in science, or in social economy, is characteristic of the savage state or of the want of cultivation."

We have now, we think, presented a sufficiently ample review of the able work before us, leaving, however, much to be examined by the reader on the subjects of animal motion, theory of disease, and other departments of this extensive subject. We may afterwards advert to Liebig's views on the theory of disease, but meanwhile recommend the work to the patient study of all who take delight in philosophic investigation.

THE SHAKSPEARE HOAX.

ALLUSIONS being often made to the Shakspeare or rather Ireland forgeries, while the generation familiar with them is nearly passed away, it becomes in some measure necessary, for the sake of the general reader of the present day, that an account of that extraordinary imposture should be presented.

Mr Samuel Ireland, who became deeply mixed up with the "Shakspeare Forgeries," was a person of excellent private character, and of some eminence in the world of letters, being the author of various antiquarian and topographical works, published about the end of last century. He was particularly distinguished among his friends for his devotion to the memory of Shakspeare. The slightest scrap of ancient writing, referring even indirectly to that great name, was to Samuel Ireland a treasure of priceless worth, and an autograph of the bard himself was a thing meriting almost the reverence of idolatry. Unfortunately, however, only two or three scraps of Shakspeare's writing had descended to posterity, the signature of his will being the most certainly authentic of these. In such circumstances, the delight and triumph of Mr Ireland may be imagined, when, in 1795, his own son, Samuel William Henry Ireland, a lad of eighteen years of age, not only announced his discovery of a deed bearing the *sign-manual of William Shakspeare*, but at the same time placed that very deed in his father's hands. The father was almost beside himself, in fact, with joy, and called around him, on the instant, all the antiquaries and Shakspearian enthusiasts of London, in order to astonish them with his prize. The relic, which purported to be a mortgage-deed betwixt Shakspeare and one Michael Fraser and his wife, was viewed with such rapturous and soul-engrossing veneration, that only after the lapse of several days did some individual grow calm enough to inquire where the document had been found. Young Ireland, the discoverer, was at that time in the office of a conveyancer, but deeds of such antiquity were not likely, it was apparent, to have existed there. Accordingly, when referred to, the young man assigned a different source to the precious relic. He had become acquainted, he said, with a gentleman of ancient family, who had permitted a search to be made among his numerous family papers, and there (said the youth) had the deed been found. The gentleman had presented it to the fortunate discoverer, but, being a very retiring and diffident person, and knowing the stir which would be made about the matter, he had bound the other solemnly to the concealment of the giver's name. This statement of young Ireland, in place of meeting with discredit, was most readily swallowed, and even threw a deeper interest over the affair; and the cry of all enthusiastic antiquaries was for more—more signatures—more deeds! The Honourable Mr Byng, Sir Frederick Eden, and a great number of other literary amateurs, unanimously declared, that, where this one deed had been found, the identical mass of papers beyond doubt existed which had been long sought for in vain by the commentators on Shakspeare.

Young Ireland, urged on all hands to continue his researches, ere long gratified the expectations of the curious by producing, one after another, "Shakspeare's Profession of Faith," a "Letter to Lord Southampton," a "Letter to Anne *Hatherwaye*" (the poet's wife), "Five Poetical Stanzas" to the same lady, a "Letter to Queen Elizabeth," and several notes of hand and other minor documents, all of them apparently either in Shakspeare's own hand-writing or signed by him. These documents were laid before the first antiquaries and men of letters of the day, and were received by all, with the exception of a very few persons, without suspicion. Not even the production of a "Deed of gift to *William Henry Ireland*," described as the friend of the poet, and as having saved his life on the river Thames, brought any discredit on these wonderful discoveries, though certainly the production of such a deed, with such names, was a pretty sharp trial of the *swallow* of the antiquarian world. Among the noted men who saw and implicitly believed in the authenticity of the Shakspeare papers, Dr Samuel Parr may be mentioned in the first place. The doctor drew up and signed a certificate, stating that "the undersigned had inspected the Shakspeare papers, and were convinced of their authenticity." The name of Parr was followed by those of Herbert Croft, the Earl of Lauderdale, Valpy, and many others. James Boswell was among the subscribers; and "previous to signing his name, he *fell upon his knees*, and in a tone of enthusiasm, thanked Heaven that he had lived to witness this discovery, and exclaimed, that he could *now die in peace!*" Sir Isaac Heard, Garter King at Arms, Jonathan Hewlett, translator of the Old Temple Records, and several of the principal English heralds—men accustomed to minute examinations of ancient documents—were also among the vouchers for the antiquity of the Shakspeare papers. But perhaps the most remarkable name in the list was that of John Pinkerton, the historian and antiquary, whose experience in antique writings may be held to have exceeded that of any other man of his day. It is needless to go farther into the list, after mentioning such names as these. The strange truth respecting these papers must now be told. Can the reader hear without wonder and amaze, that the papers under notice, asserted to be *two hundred* years old, had been fabricated, in most instances, not many *hours* previous to their production before the eyes of these experienced and admiring antiquaries! And they had been fabricated, moreover, by a lad of eighteen, totally unskilled beforehand in the art of copying ancient writing!

According to the confessions of young Ireland, which were published in 1805, his original motive for the execution of these forgeries was simply to give pleasure to his father. He had long sought for an autograph of Shakspeare to present to the latter, and being unable to find one, at length bethought him, in an evil hour, of producing a spurious copy. He did so, and his father was rendered happy. In departing thus far from the straight path, the young man foresaw none of the consequences which really followed. He conceived, he says, that his father would be pleased, and "there an end." But the inquiries made compelled him to fabricate a story regarding their source; and the demand for farther Shakspearian relics led him on, according to the common law in morals, from lie to lie, and from the production of paper after paper, until he had coiled around himself a mesh of deceit which he might well tremble at the thought of unweaving. How could he venture to confess his forgeries, after having led such men as Joseph Warton and Samuel Parr to commit themselves by the most extravagant eulogies of the pseudo-Shakspearian compositions! "We have many fine things," said one of these individuals, "in our church service, and our litany abounds in beauties; but *here*, sir, *here* is a man who has distanced us all." This said of the hurried composition of a smart lad of eighteen! Parr afterwards tried to back out of the scrape into which he had fallen; but he was undeniably, and grossly, and egregiously deceived at the outset of the affair. Our faith in taste and criticism receives a sad shock from such circumstances as these.

Pushed and pushing onwards in his course, young Ireland at length announced the discovery not only of the manuscript originals of many of Shakspeare's Plays, but also of a new and hitherto unknown one, with the title of "Vortigern and Rowena." A new drama by Shakspeare! The literary world was wild with expectation. And all the while, according to his own account, the youth of eighteen, who had ventured upon this daring announcement, had not penned one line of the promised piece, and, indeed, had never

written a verse in his life. The announcement of the play brought out an attack from Malone, one of the few who denounced the Ireland papers as forgeries, although it is to be feared that he was actuated more by a bitter jealousy of the invaders of his province of collector of Shakspeariana than by any other motive. He warned the public not to be imposed upon by the spurious play, as he was just about to prove the whole affair a tissue of forgeries. The elder Ireland defended the authenticity of the papers in a pamphlet. The play was written, and shown to antiquaries, and, even then, criticism continued completely at fault. The great theatres were both eager for the play, and Drury Lane was the successful competitor, Sheridan being then at its head. James Henry Pye, the Poet-Laureat, and Sir James Bland Burgess, contended for the honour of writing a prologue to the piece, and the baronet carried the day; while another literary amateur wrote an epilogue. The 2d of April, 1796, was the day appointed for the representation, and all London looked with eagerness to the event.

But there was one man who knew Shakspeare too well to be gulled like others around him, and that man was essential to the success of the pseudo-Shakspearian play. John Kemble did take upon him the part of Vortigern, but he took it at the command of his superiors, and did not hesitate to call the whole a downright forgery. The author, in a published edition of the play, ascribes to John Kemble's contempt of his part the consequences that followed the representation. A house, crowded to excess, met to listen to the piece, and all, says the author, went on well, until John Kemble came to the line,

"And when this solemn mockery is o'er,"

which he pronounced (says the author still) in so pointedly scornful a manner, that an irrepressible clamour commenced in the house, and settled for ever the fate of Vortigern.

The truth seems to be, that, whatever might be the case with critics and antiquaries, the *public* were not in this case to be hoaxed. They knew the mettle of their illustrious and enduring favourite too well to be deceived, and their award decisively closed the Ireland humbug. The eyes of the learned few were opened by the plain common-sense of the illiterate many, and all men cried out against the impudent forgery. Poor Samuel Ireland suffered grievously in character; and it was to protect his father, the son says, that he came forward and made a full confession. The consequence of his misdeeds, he further says, was a life of voluntary yet painful exile, and the endurance of all manner of obloquy, for years in succession. The doom was certainly not altogether undeserved.

We have now had enough of this sad affair, which certainly forms one of the most curious instances in literary history, of critical judgment thoroughly at fault. In this respect, it gives a lesson at once amusing and instructive. But it is unnecessary to dwell on the *morale* of the affair, which is so obvious that it may be safely left to the reader's own reflections.

SCOTLAND: A SONG.

The hills of my country are mantled with snow,
Yet, oh! I but love them the more;
More noble they seem in the sun's setting glow,
Than all that the vales of the Southron can show,
When gay with the summer's whole store.

Though brighter the landscape, and blander the air,
In climes that look straight to the sun,
The dearest enjoyments of home are not there,
The chat and the laugh by the hearth's cheering glare,
When day and its labours are done.

And thus, like the snow-covered hills of their land,
Its sons may seem rugged and rude,
Yet gentler in heart is each man of the band,
More kindly in feeling, more open in hand,
Than all whom the tropics include.

T. S.

ENGLISH SAILORS.

Voltaire has the merit of having discovered the cause of the superiority of English sailors at sea. The natives of the south of Europe navigate smooth seas, those of the north are frozen up during winter, but the English seas are open all the year, and are navigated in long, dark, stormy nights, when nothing but great skill and incessant exertion can preserve the vessel. Hence arises a degree of confidence in their sailors, which is almost incredible: the greater the danger, the greater is their activity; instead of shrinking from toil, every man is at his post. Having no faith in miracles for their deliverance, they almost work miracles to deliver themselves; and instead of preparing for death, strain every sinew to avoid it. Added to this confidence, they have also in war that which arises from constant success. The English sailor feels that he is master of the sea. Whatever he sees is to do him homage. He is always on the look-out, not with the fear of an enemy before his eyes, but, like a strong pirate, with the hope of gain: and when going into action with an equal or even superior force, he calculates his profits as certainly as if the enemy were already taken. "There," said the master of a frigate, when the captain did not choose to engage a superior French force, because he had a convoy in charge, "there," said he, with a groan, "there's seven hundred pounds lost to me for ever!" As for fear, it is not in their nature. One of these men went to see a juggler exhibit his tricks: there happened to be a quantity of gunpowder in the apartment underneath, which took fire and blew up the house. The sailor was thrown into a garden behind, where he fell without being hurt. He stretched his arms and legs, got up, shook himself, rubbed his eyes, and then cried out—conceiving what had happened to be only part of the performance, and perfectly willing to go through the whole—"Well, I wonder what the fellow intends to do next."—*Flowers of Anecdote.*

[The merit of Voltaire's views on this subject will scarcely bear investigation. More probably, the intrepidity of the English sailor is simply a result of physical organisation: he belongs to a race possessing great mental activity and power, and favoured by local circumstances, this has made him what he is. If Voltaire had taken a trip to the Highlands, he would have seen a Celtic population seated on the shores of stormy seas, yet possessing no taste for maritime pursuits. An enlightened philosophy teaches that situation and circumstances are of little use when the native qualifications of mind are defective. Voltaire knew nothing of this philosophy.]

GOOD FOR EVIL.

Juan de Esquivel, the first governor of Jamaica, was sent by Diego Columbus, son of the great Columbus, in 1509, with about seventy men, to enforce his claim to the government. He was one of the few Castilians who, amidst all the horrors of bloodshed and infectious rapine, were distinguished for generosity and humanity. One eminent instance of this is related by Herrera. About the time that he sailed from Hispaniola, to take possession of his new government of Jamaica, his competitor, Ojeda, was on the eve of his departure to the continent. Ojeda violently opposed the intended expedition of Esquivel, and publicly threatened that if he should find him at Jamaica, he would hang him up as a rebel. Ojeda in his voyage was shipwrecked on the coast of Cuba, and in danger of perishing for want of food. He implored succour from the very man whose destruction he had meditated. Esquivel, thus acquainted with the sufferings of his enemy, sent an officer to conduct him to Jamaica, received him with the tenderest sympathy, treated him with kindness, and provided him with the means of a speedy and safe conveyance to Hispaniola. How truly might it be said, that under him "the ravages of conquest were restrained within the limits of humanity!" It is pleasing to add, that Ojeda was not ungrateful to his benefactor.—*From a Scrap-Book.*

ENJOYMENTS.

Under this head we have to consider what it is difficult to define in reference to people in general. Our physical as well as our mental tastes are almost as different as our faces and figures. Each is ready to exclaim, "It is a matter of surprise to me that Mr A. can find so much enjoyment in business—eternal business—night, noon, and morning." Again, Mr A. says, "Well, I wonder how Mr B. can continue to live in what he calls a round of pleasure and amusement." Each sees the mote in his brother's eye, but observes not the beam in his own; in other words, is tolerant of his own folly only. Change or variety appears to be desired by all, unless by those labouring under a species of monomania. The traveller by occupation sighs for rest; while he, doomed to drudge in the same locality, longs for the freedom of a loose leg and change of scene.

In truth, enjoyment is quite a relative idea, depending upon a host of contingencies, such as age, temperament, peculiarities, &c. The influence of age or period of life needs not a reference to the sacred Scriptures to prove its well-known effects.

In childhood, manhood, and old age, we make a retrospect tête-à-tête with experience, not at all complimentary to the preceding stage; and although we may cast a "longing lingering look" on boyhood's days, owing to the pleasures they then afforded, yet still we do often regret that so much time was idly spent. The objects of ambition or avarice—unlike the straws and rattles of childhood, or the finely gilded toys of the emulation of riper years—are persistent besetting delusions to the very last—even on a death-bed.

The conqueror still sighs after fame—darling fame—that "nerved his arm and steeled his sword." The miser hugs his money-bags, and petitions Death to spare him yet a little until he receive some valuable post-obits. We have heard a great deal of how valueless the things of this world appear to the dying man; but we have too often seen the reverse, to give assent to this assertion as the rule, which forms but the mere exception; men generally die as they have lived—"the ruling passion strong in death."

On the subject of enjoyments, we can only say that each individual must determine upon what he likes best in this respect, and act accordingly. The man who pays most attention to the culture and discipline of his mind is laying the true and firm foundation for such a taste as will lead him to seek for enjoyment in moral and intellectual pursuits—those that leave no sting behind. Remember that the pleasures of the sensualist and of the voluptuary perish in the very enjoyment.—*Hayden's Physiology for the Public.*

TO PRESERVE FLOWERS FRESH.

It is now eighteen years ago since we first saw, in the drawing-room of a gentleman now no more, in the hot dry weather of the dog-days, flowers preserved day after day in all their freshness by the following simple contrivance:—A flat dish of porcelain had water poured into it. In the water a vase of flowers was set; over the whole a bell-glass was placed with its rim in the water. This was a "Ward's case" in principle, although different in its construction. The air that surrounded the flowers being confined beneath the bell-glass, was constantly moist with the water that rose into it in the form of vapour. As fast as the water was condensed, it ran down the sides of the bell-glass back into the dish; and if means had been taken to enclose the water on the outside of the bell-glass, so as to prevent its evaporating into the air of the sitting-room, the atmosphere around the flowers would have remained continually damp. What is the explanation of this? Do the flowers feed on the viewless vapour that surrounds them? Perhaps they do; but the great cause of their preserving their freshness is to be sought in another fact. When flowers are brought into a sitting-room, they fade because of the dryness of the air. The air of a sitting-room is usually something drier than that of the garden, and always much more so than that of a good greenhouse or stove. Flowers when gathered, are cut off from the supply of moisture collected for them by their roots, and their mutilated stems are far from having so great a power of sucking up fluids as the roots have. If, then, with diminished powers of feeding, they are exposed to augmented perspiration, as is the case in a dry sitting-room, it is evident that the balance of gain on the one hand by the roots, and of loss on the other hand by their whole surface, cannot be maintained. The result can only be their destruction. Now, to place them in a damp atmosphere is to restore this balance; because, if their power of sucking by their wounded ends is diminished, so is their power of perspiring; for a damp atmosphere will rob them of no water—hence they maintain their freshness. The only difference between plants in a "Ward's case" and flowers in the little apparatus just described is this—that the former is intended for plants to grow in for a considerable space of time, while the latter is merely for their preservation for a few days; and that the air which surrounds the flowers is always charged with the same quantity of vapour, will vary with the circumstances, and at the will of him who has the management of it. We recommend those who love to see plenty of fresh flowers in their sitting-rooms in dry weather to procure it. The experiment can be tried by inserting a tumbler over a rose-bud in a saucer of water. —*Gardeners' Chronicle.*

CRIME DURING THE FAIR WEEK IN GLASGOW.

We are gratified to observe from a report in a newspaper, the "Scotch Reformers' Gazette," that the number of offences—such as drunkenness, disorderly conduct, and assaults—committed in Glasgow during a certain week in July, called the "fair week," is on the decline. In the fair week of 1841, the number of persons charged with offences at the police court was 404, and in 1842 it was only 241. Our authority observes on this subject, "It thus appears that there is a great diminution in the extent of crime, and we are glad also to find that the most heinous offences have been much lessened—there being but few of those brutal and savage assaults now committed that were formerly so common. We must, in common justice, attribute much of this desirable change, both as to the number and character of offences, to the beneficial influence of the temperance movement, to dull trade, and to the more enlightened conduct of our lower native population towards their Irish brethren. But we would also give the credit that is due to the judicious police regulations now in force. We believe that, in addition to the moral influence just spoken of, the improvement is attributable to the preventive nature of our present system of police, by which the peace and good order of our community, even at such striking times as 'the fair,' have been effectually preserved."

VARIOUS ASPECTS OF CAPTAINS OF THE NAVY.

It is well known to the world at large that some captains of the Royal Navy possess three distinct natures. The first is called their "manner afloat," which signifies a certain harshness of address when speaking to those under their command. The second is styled "their duty," which they put on in the most obsequious form when receiving orders or notice from superiors. The third is their "shore-going habit," in which they array themselves with a certain carelessness, meant to represent an honest, open-hearted, frank, though blunt good nature, a ready smile and an apparent cordial friendship for all; that is, for all who are beyond their power, and do not care one sixpence for their rank and epaulettes, and who fancy (poor deluded creatures!) that a captain on shore and a captain on his own quarter-deck are one and the same person. They who think thus know little about the matter. Not that I mean that this is a universal character. There are many perfect gentlemen, many of the kindest hearts that ever beat, high in rank in our service. But even these are forced to alter their manners when in command. While there are some, as I have above described, whose real nature is tyranny, and whose urbanity on shore is a mere matter of masquerade.—*Continental Literary Journal.*

IMPROVED BOARDING-SCHOOLS.

Fathers of families in England occasionally apply to us for information respecting boarding-schools for boys in Scotland, "which we can recommend as being conducted on an improved routine of instruction, and at a moderate charge." We regret that we are seldom able to answer such inquiries satisfactorily. We could point out one or two good boarding-schools, but only for boys of a high class, and also two or three good public schools, but these are in large towns, and therefore not the thing required. What is wanted, as far as we can understand, is a boarding-school in some healthy country place, at which boys would be taught not only the elementary but those advanced branches of instruction which improved views of education suggest; such, for example, as the laws of matter and motion, mechanics, hydrostatics, optics, electricity, astronomy, geography, geology, chemistry, zoology, botany, physiology, political economy, history, and so on; also instruction in classical and modern languages for those who wished to go that length. The whole routine, with board, and proper moral and religious instruction, to be given at from L.30 to L.40 per annum. If there has already been established any such boarding-school on a respectable footing, we shall be glad to hear of it, and, if satisfied, to recommend it to public support.

NUMBER 554. SATURDAY, SEPTEMBER 10, 1842. PRICE 1½d.

EXTRAVAGANCIES OF THE DRAMA.

OUR social institutions, customs, manners, and amusements, are characterised, beyond question, by a great many features and peculiarities, which the force of habit alone prevents us from viewing with ridicule, if not from repressing as gross outrages upon common sense. This is a trite enough observation, it must be confessed; yet the marvel is, that often as it is made in reference to a variety of subjects of greater or lesser consequence, our eyes are never the nearer being opened, and we are still contented to exercise our vision through the dulling and deceiving film of habit and conventionalism. Perhaps the operation of these influences is nowhere more observable than in the case of our dramatic and scenic exhibitions. Things are said, done, and shown in our theatres, which, when one examines them without the spectacles of custom on one's nose, appear certainly very strange and ridiculous; and the more particularly do they appear in such lights when one remembers the pretensions of the stage to "hold the mirror up to nature," and show "the very age and body of the time, its form and pressure." Professed imitations are there habitually given of characters too absurd to have ever had prototypes in human nature, and language is put into their mouths such as man never spoke in real life; while people look on, and listen, and applaud, simply, to all seeming, because their grandsires did so before them. For proof of this, take note of the Irishmen and Scotsmen of the stage, or the creations of fancy on which, from time immemorial, it has been the good pleasure of dramatic writers to bestow these designations. As regards speech, dress, manners, and other characteristics, these creations no more resemble the Irishmen and Scotsmen of real life, past or present, than the latter are like to the natives of Dahomey or Ashantee in the colour of their skins. Shakspeare began this series of ridiculous misrepresentations in the Captain Macmorris and Captain Jamy of his "Henry V.;" but for him there is excuse in the comparative ignorance which prevailed in his time relative to Ireland and Scotland. Imitating his faults when they could not imitate his beauties, dramatic writers have never since produced play or farce (as Carleton remarks in reference to his own countrymen) "in which, when an Irishman is introduced, he is not drawn as a broad grotesque blunderer, every sentence he speaks involving a bull, and every act the result of headlong folly, or cool but unstudied effrontery. I do not remember an instance in which he acts upon the stage any other part than that of the buffoon of the piece, uttering language which, wherever it may have been found, was at all events never heard in Ireland, unless upon the boards of a theatre. The Captain O'Cutters, O'Blunders, and Dennis Bulgrudderies, of the English stage, never had existence except in the imagination of those who were as ignorant of the Irish people as they were of their language and feelings. Even Sheridan was forced to pander to this erroneous estimate and distorted conception of our character; for, after all, Sir Lucius O'Trigger was *his* Irishman, but not Ireland's Irishman." Mr Carleton forcibly exposes the long-lived absurdity of imputing to the Irish any special propensity to bulls or blunders, and shows that the foundation of that idea lay simply in the imperfect comprehension which the Irish long had, and have even yet, of the English language.

In reference to the Irishman of the drama, the truth seems to be, that, a buffoon being a necessary character for many of the purposes of the stage, our dramatists have deemed it proper to call such creations of their fancy by the generic title of *Irishman;* and a name rejoicing in the prefix of O', with a plentiful scattering of *ochs, sowls, be-aisy's,* and blunders in their talk, has had the effect of causing the strange personations of this class pervading our plays, to be received as genuine sons of Erin all the world over, by one generation after another. There might have been little else than folly merely in our so long tolerating the application of the Irishman's name in this way, had it been understood that the appellation was but a useful conventional one for a class of characters which the stage requires; but this has not been the case. The ridicule which was solely due to the creature of the dramatist's invention, was transferred to the real members of that community whose national name was so misused. "It passed (says Mr Carleton) from the stage into the recesses of private life, wrought itself into the feelings till it became a prejudice, and the Irishman was consequently looked upon and treated as a being made up of absurdity and cunning—a compound of knave and fool, fit only to be punished for his knavery or laughed at for his folly." This is certainly nothing more than the truth. The stage, hitherto at least, has been one of the chief instruments by which national character has been appreciated; and from the senseless reception of the stage-pictures of Irish character as genuine, a depreciatory feeling towards the actual Irish people has been long fostered in the sister country. Many a worthy man must have suffered, for instance, both in interests and feelings, from the stigma conveyed in the term "fortune-hunter," which the drama has been the chief means of fixing upon the children of the "emerald isle."

The professed representations of Scottish character and Scottish scenery and peculiarities on the stage, afford matter for laughter chiefly. We have heard it asserted, that very worthy people in London have the firm belief that the citizens of Edinburgh wear the *kilt* universally, and that, on visiting England, they assume certain nameless articles of dress merely as a mark of respect for the more civilised tastes of the south. Whether this be the London belief or not, certain it is that the stage, as far as Scottish matters are concerned, is practically conducted on that principle. To pourtray a Scottish scene there, a most unsparing allowance of mountain, rock, wood, and waterfall, must be made; and these natural features, to distinguish them from the same kind of scenery elsewhere, require simply to be on a monstrous scale. The painter, apparently, must keep in his mind's eye the "steep-frowning glories of dark Loch-na-gar," the written model of a Scottish scene to an English mind. Then, again, every living thing introduced into such a scene—man, woman, and child—must be clothed in tartans. The *women* must have plaids, mantles, and snoods of that material; and the *men,* be they kings, chiefs, caterans, or cow-herds, must figure in tartan coats and kilts, and also display hose and buckled shoes, with blue bonnets and swingeing feathers therein. It is almost needless to say further, that a dirk and purse are also essential to the Scot of the stage; and moreover, and above all, a *claymore* of fearful length and strength, with which a "terrific combat," as the bills have it, is always effected amid the hills and cataracts aforesaid. The "terrific combat" is an element of the Scoto-scenic exhibition never to be omitted.

The good people who swallow these things as characteristic of Scotland proper, are much in need of being set right in their ideas. On the streets of London, tartans and kilts are as common a sight as in Edinburgh. Tourists must know this, but apparently nobody else does. As for dirks and claymores, we can assure our southern friends that the terrific fighters of the stage have no prototypes among Scotsmen. A gully-knife, fit only to slice a skim-milk cheese, constitutes the most deadly weapon which we have ever seen in the hands of the ploughman or shepherd of the Scottish dales.

Then, what a language do the approved Scotsmen of the stage emit, and what forms and names do they bear! Speaking through the nose seems to be deemed essentially characteristic of Scotsmen. A lumbering animal with a shock head of red-hair, which he scratches perpetually, enters on the stage, and pours forth, in a great measure through the organ mentioned, a gibberish composed chiefly of *oichs, hoichs, tow's, ta'e,* and *mon's,* and is deemed by his admiring auditory the veritable Scot. Twenty other personages may be on the scene, equally Scottish in name and position with this single party, but they speak their best English, and are not deemed the true specimens of Caledonia. Now, we humbly assure our southern readers that all Scotsmen are not red-haired, and that in our talk we have no peculiar fancy for snivelling. As little are we aware of the existence of any persons called Mac-Screws or Mac-Sawneys among us, as certain dramas would imply. Nor do we even believe that, leaving what is more especially called Scotland for the most remote nooks of the Highlands, we shall there find any such personages, figures, names, or modes of talk. We shall find Gaelic spoken in some places, and in others a form of Scotch or English; but that chaotic mixture of these tongues which prevails on the stage, is the proper dialect of no district or spot with which we are acquainted. It is a curious truth, indeed, that in those parts of the Highlands where the original Gaelic has been superseded, a dialect of the English tongue is spoken excelling in purity any to be found in most of the provinces, or perhaps even the metropolis of England. Such is the case at Inverary, for instance, and partly at and around Inverness.

Scottish readers may think it a work of supererogation for us thus seriously to deny that the shock-headed, scratching, grunting, fighting animal in tartan, is a fair specimen of the general population of Scotland; but in reality the belief that such is the case is widely spread among our southern neighbours, and even among the respectably educated of them. Artists, who should and *do* know better, have fostered the notion by sticking men in kilts into all their pictures of Scottish scenery, even where these have reference to the banks of the Tweed or the Clyde, or other spots which never were trodden by limbs adorned with such a species of dress. The stage, we repeat, aided by paintings, has been instrumental in giving Englishmen most ridiculous ideas of Scotland. Not conceiving it possible, we suppose, that men who wore kilts could possess any of the luxurious inventions of civilisation, a respectable London merchant lately asked a friend of ours if we had *gas* in Edinburgh; and he exhibited a most humiliating degree of surprise on learning that we had actually advanced so far in practical science as to manufacture and use that article.

As in the case of the conventional Irishman and Scotsman of the stage, so is it with its Frenchmen, its Italians, its Spaniards, its Germans, its negroes, and others. They are not human beings of varied character, such as Shakspeare introduced into his plays when he laid the scenes abroad. They are respectively but reiterations of one character, which it has pleased dramatists to constitute the stage-model of an entire national community. For example, the Frenchman introduced into the English drama is uni-

versally but the shrugging, monkey-looking Canton of "The Clandestine Marriage," or the Monsieur Morbleu of "Monsieur Tonson," dished up over and over again, with no difference in essentials, though thrown, it may be, into situations varied in some little degree. See one stage-Frenchman, and you see all. Is nature thus limited in her power of varying character, with a great nation to work upon! Surely the mirror is not held up to her here.

Classes of men have the same kind of conventional representatives on the stage as nations have. See one sailor, and you see all that the modern drama ever shows to you of that class. When a tar is promised to you in any piece, you may feel assured of beholding a man with blue jacket, white trousers, straw hat, pigtail, and buckles, who dances a hornpipe, chews tobacco, mouths a host of boisterous sentences relative to the honour of old England, bans the French, and garnishes his dialogue with a most multitudinous amount of "avasts," "lubbers," "swabs," "what cheers," and good set phrases of the like kidney. Now, though all the sailors that ever sailed the salt seas were marked by these features of exterior and manners, surely the drama should present something more than mere outward forms, in order to hold up the mirror to nature, and show vice and virtue their own image. As things are managed at present, dramatic authors seem to hold that they accomplish all when they give little more than externals, according with the set rules and practices of the stage established by their predecessors. Variety of character is never dreamed of, apparently; though, being men, sailors must vary in a thousand respects like other men. Even as regards their characteristic manners, it is absurd to suppose that they are all as much alike as peas or pigeons' eggs. Nor can every Jack be disposed to dance hornpipes everlastingly, in season and out of season.

Sailors form but a specimen of the sort of class-conventionalisms to which we allude. If a lawyer, a country squire, a barber, an auctioneer, a village-mayor, or almost any professional or official person whatever, appear in the list of personages in a modern drama, any one who has the slightest acquaintance with such matters may prognosticate with certainty what the dress, manners, mode of speech, and other peculiarities, will be in every individual case. They will all be found in accordance with the conventional stage rules, in each instance specially laid down and provided. And to augment the sameness resulting from this state of things, the actual *representers of character* upon the stage have become moulded and modelled, upon similar principles, into certain forms, unchanging and unchangeable. Histrionic companies, now-a-days, are for the most part composed of individuals who have trained themselves, not to the personation of such varied characters as nature presents, but to perform each a stated species of character, out of which they cannot step for the lives of them. In every company, for example, there is a performer who plays the dandy or puppy parts, and can play nothing else. There is your enacter of mysterious bandits and Blue-beard counts. There is your old-man-obstinate performer, or one who represents hot-headed admirals and hard-hearted fathers. There is your old-man-virtuous, or he who plays distressed merchants and ancient faithful servitors; your knowing valet; your comic Irishman; and so on. So completely does an actor belong to one part, and one part to him, that it is common to say such an actor is a "capital villain," a "first-rate scoundrel." The lady-performers are arranged in like manner into the old-woman-tragic and old-woman-comic; the young-woman-sentimental, and young-woman-chambermaidish; and so on. The confinement of performers thus to one walk, though it may have been originally caused by the adherence of dramatic writers to set conventional rules, reacts upon the efforts of these in turn, and increases the mischief. Seeing the manner in which histrionic companies are usually arranged, the modern dramatist looks not to nature for his conceptions. He draws every character and arranges every phrase exactly as he thinks they will best suit the people who are to represent and utter them. He writes a part for the puppy-performer, a part for old-obstinate, a part for old-virtuous, a part for knowing-valet, parts for miss-sentimental, miss-chambermaidish, old-woman-comic, and the rest, the thread of a plot which ties the whole together being a matter of extremely little moment in his eyes.

The dramatist is certain of some measure of success, by taking this direct and secure way of bringing out the powers of each individual performer. But though he may thus far have acted prudently, as histrionic matters at present stand, the end of this entire system is, that our dramatic pieces have become, more and more completely, but a hashing up of the same things over again. We find in them endless old admirals (performed by the old-men-obstinate), who speak like barking dogs, quarrel with everybody, and always have nephews or nieces whom they want to marry to some hateful or hated person or another. As all must end well at last, we find these ancient blockheads usually wheeling round at the last moment, without the shadow of a reason, and giving their consent to the identical match which they have all along opposed. Such a personage uniformly concludes with a "Well, you young dog, I suppose you must have her. So, take my blessing"—and hereupon he pulls out his white handkerchief, and snivels considerably. There are, so far as we have observed, no beings in human nature resembling these old-obstinates. As great a libel upon youthful humanity is the lover-gentleman of such pieces, who can do little else than exclaim, "Adorable Julia!" and cane his servant (the knowing valet)—for which latter act, by the way, the valet in real life would assuredly either knock his master down, or summon him before the police-magistrate, or perhaps do both. The "adorable Julias" of the light modern drama, again, are intolerable pieces of insipidity, without enough of intellect to sew the A B C upon a sampler. They can but lisp perpetually "Pa" and "Ma," and "Dear Charles;" and they speak of elopements for life as they would do of taking a morning walk. Can anybody feel a rational interest in the fate of such bib-and-tucker heroines as these, or have any wish but to see them well chastised by their governesses, and sent to bed supperless?

We must not dwell too long on these points, however, and must trust it to the reader himself to make a more extended application of the preceding hints. But there is one other point to which we would advert before closing these observations on dramatic matters. While following not, or incapable of following, our elder dramatists in their vivid and varied depicting of actual, living, breathing human nature, many modern dramatists seem to think that they attain to the style, at least, of the Augustan age of the English drama, by interlarding their attempts plentifully with such phrases as "i' faith," "marry," "my masters," and the like. These things have accordingly become a part of the laughable conventionalisms of the stage. We may perhaps best make the reader understand us here by throwing a few of these stereotype phrases into a sort of speech for the nonce. Suppose a gentleman, or say nobleman, to behold another approaching, into whose eyes he wishes to throw a little pulverulent matter. He will then probably speak—on the stage of course—after the following sort. The stock phrases are in italics:—

> "*Ha! can I trust mine eyes?* No!—yes! 'Tis he!
> Now must I smooth my tongue.—*But hush! he comes.*
> (*To the other*).
> Ha! *by the mass*, it glads me to the core, sir,
> To note how *excellent well* thou bear'st thine years.
> *Marry*, my good lord, *i' th'* olden days,
> I *do remember me*, thou look'dst it bravely;
> And yet, *i' faith*, methinks old grandsire Time
> That *comes me* rudely in to pluck men's beards,
> And plant *you* white hairs where *your* black have been,
> Hath scarcely touched thy *honourable* visage.
> Nay, never shake thy head—*gentle, my lord.*
> *Go to, man;* by *this light*, I say, 'tis so.
> *My masters*, judge ye, *an* I speak not truly.
> Note well this, *worthy sir! By'r lady*, friends,
> He is my junior but by some few years,
> And mark the difference between us now.
> *S'blood*, that *same* wielder *o' the* crooked scythe
> Hath used me vilely. *A'* brought us to the light
> *A'most* at once; and *lo! you here*, my masters,
> How plain his marks on me, while on my friend
> His hand hath fall'n as soft as even dew.
> Well, *there be* some well used, and others not.
> *Afore me*, an it go not nigh to anger one.

And so on. Such phrases as these, with a broken line now and then, with breaches in rhythm, and a few words thickly consonanted (such as "foul-mouth'dst" and the like), plentifully bestrew the more ambitious dramas of the present day. The constructors of them think not of the quality of the metal; the antique setting seems to be all in all.

In conclusion—is there not to be found in the prevalence of these dramatic conventionalisms a partial reason, at least, for the declension of the stage from its high position in past days? Educated spectators, and they are now numerous, cannot but distinguish the artificial and unnatural cast of the scenes and characters presented to them, and therefore fail to take that interest in the spectacle, or in the fates of the personages represented, which it is essential to excite; and when the more intelligent classes lose their liking and respect for the drama, others must soon adopt the same views. Shakspeare and Jonson ranged human nature in search of new, proper, and varied subjects for the stage. Modern dramatists seem to have but a set number of puppet figures, which they shake together, as it were, in a bag, and present in the slightly-varied positions assumed by them, without changing, however, one iota of their aspect or attire, much less of their intrinsic characters.

SANATORY CONDITION OF THE LABOURING POPULATION.

SECOND ARTICLE.

THE fourth section of Mr Chadwick's remarkable work adverts to the "comparative chances of life in different classes of the community." This is a subject which has already been investigated, to very curious results, by M. Villermé of Paris. Inquiries amongst ourselves come to precisely the same effect, namely, that the severity of the pressure of disease and mortality is generally in proportion to the poorness of circumstances. The difference is much greater than could well be believed, except upon the most powerful evidence. Mr Chadwick states, that in some districts of a city the deaths are only 1 for every 57 of the population annually, while in other districts of the same city they are 1 for every 28, being more than twice the former amount. He has with great industry collected a series of returns from different manufacturing towns and districts in England, showing the average age of the individuals deceased within a certain time of three classes of society, namely—1. Gentry and professional persons; 2. Tradesmen and their families; and 3. Labourers, mechanics, and servants; from which it invariably appears that the average age of the first class is much above that of the two others, and that the average age of the second class is much above that of the third. In Truro, for the three classes respectively, it is 40, 33, and 25 years; in Leeds, 44, 27, and 19; in Liverpool, 35, 22, and 15; in Whitechapel, 45, 27, and 22; in Kensington, 44, 29, and 26—the two last exhibiting, it will be observed, a more favourable average to the third class in a city district occupied by the upper ranks, than in a mean district—an effect probably, in part, of the good condition in which the servants of the upper classes are kept. When we go into a simply rural district, where the third class is mainly composed of agricultural labourers, we find the return for that class much more favourable than in dense manufacturing cities. For instance, in Rutlandshire, the numbers respectively are 52, 41, and 38—the last class thus showing better chance of life than the second does in any of the places above mentioned. This is a very instructive fact, particularly when we bear in mind that the wages of the agricultural labourers of Rutlandshire average barely *one-half* of the wages of the third class in the large manufacturing towns. Mr Chadwick has had maps of Leeds and of Bethnal Green parish constructed, to show, by comparative depth of colouring, the liability of various districts to contagious disease and cholera; and the deep colours are invariably upon the dense mean districts occupied by the humbler classes. He requested from the medical authorities of Aberdeen a similar map of that city, desiring at the same time that they would distinguish the streets occupied by the different grades of society. "They returned a map so marked as to disease, but stated that it had been thought unnecessary to distinguish the streets inhabited by the different orders of society, as that was done with sufficient accuracy by the different tints representing the degrees of intensity of the prevalence of fever."

"An impression is often prevalent," says Mr Chadwick, "that a heavy mortality is an unavoidable condition of all large towns, and of a town population in general. It has, however, been shown that groups of cottages on a high hill, exposed to the most salubrious breezes, when cleanliness is neglected, are often the nests of fever and disease as intense as the most crowded districts. The mortuary returns of particular districts prove that a high degree of mortality does not invariably belong to the population of all towns, and probably not necessarily to any, even where the population is engaged in manufactures. The proportion of deaths appears in some of the suburbs of the metropolis (as at Hackney), and of Manchester and Leeds, to be lower than amongst the highest

classes in two of the agricultural counties." It is also to be remarked that, in some generally unhealthy districts of towns, there are streets of a better class, and *vice versa*; and it has been found, when minute inquiry was made, that these exceptions showed the respective differences of mortality which were to be expected. Mr Elwin, reporting from Bath, says, "The average [age] among the labourers was greatly diminished by the returns from some notorious courts, and raised again to a still higher proportion by districts which appertained rather to the country than the town." This gentleman found the average for a good district depressed by a colony of shoemakers. "My attention," he says, "was called to this circumstance by the clerk incidentally remarking that more shoemakers were married at his office, and were uniformly more dirty and ill-dressed, than any other class of persons. The proneness to marriage or concubinage in proportion to the degradation of the parties is notorious, and I anticipated from the fact an abundant offspring, afterwards to be carried off by premature disease. Accordingly, I went with this view through several of the registers, and the result was, that, while the average of death amongst the families of labourers and artisans in general was [1 in] 24 and 25, that of shoemakers was [1 in] 14."

It would be a very erroneous inference from the above facts, that, of equal numbers of *grown persons* of the three classes, the chance of life was in the proportions indicated. It is upon the young and infantine that the weight of adverse physical circumstances chiefly falls. In Manchester, of 1000 children born, 570 die before they complete the fifth year of their age. In 1840, of the children in their first year, 23 per cent., or nearly a fourth, perished. It appears as a general fact, that more than half of the children of the working classes die before they are five years old, and only one-fourth of the children of the gentry. Such seems to be the case wherever there is a large mortality; and it is also found as invariably that, where there is a large mortality, there is a *still greater fecundity*, always keeping up society at its full number, or even increasing it. In Manchester, where the deaths are 1 in 28 annually, the births are 1 to 26: in Rutlandshire, where the deaths are only 1 in 52, the births are 1 to 33. Even marriages are more numerous where the deaths are greatest. The city of Geneva has had an accurate system of registration for three centuries. In that time, it has slowly increased its population from 13,000 to 27,000. To persons not accustomed to inquiries of this kind, it would appear rather strange, that, although the population of Geneva has always been increasing more and more rapidly, the proportions of marriages and births have been constantly decreasing. The fact is, that the population has increased, not by a greater number of births, but by a smaller number of deaths: the expectation of life of a child at birth is now 45 years; but in the seventeenth century it was only 13.

Mr Chadwick remarks—"An impression of an undefined optimism is frequently entertained by persons who are aware of the wretched condition of a large portion of the labouring population; and this impression is more frequently entertained than expressed, as the ground of inaction for the relief of the prevalent misery from disease, that its ravages form the natural or positive check, or, as Dr Short terms it, a 'terrible corrective,' to the pressure of population on the means of subsistence. In the most crowded districts which have been the subject of the present inquiry, the facts do not justify this impression; they show that the theory is inapplicable to the present circumstances of the population. How erroneous the inferences are in their unrestrained generality, which assume that the poverty or the privation which is sometimes the consequence is always the cause of the disease, will have been seen from such evidence as that adduced from Glasgow and Spitalfields, proving that the greater proportion of those attacked by disease are in full work at the time; and the evidence from the fever hospitals, that the greatest proportion of the patients are received in high bodily condition. If wages be taken as the test of the means of subsistence, it may be asked, how are such facts to be reconciled as these, that at a time when wages in Manchester were 10s. per head weekly on all employed in the manufactories, including children or young persons in the average, so that, if three or four members of a family were employed, the wages of a family would be 30s. or 40s. weekly, the average chances of life to all of the labouring-classes were only 17 years; whilst in the whole of Rutlandshire, where the wages were certainly not one-half that amount, we find the mean chances of life to every individual of the lowest class were 38 years? Or, to take another instance, that whilst in Leeds, where, according to Mr Baker's report, the wages of the families of the worst-conditioned workers were upwards of L.1, 1s. per week, and the chances of life amongst the whole labouring population of the borough were only 19 years; whilst in the county of Wilts, where the labourer's family would not receive much more than half that amount of wages in money, and perhaps not two-thirds of money's worth in money and produce together, we find the average chances of life to the labouring classes 32 years?" The population of Guanaxuato, in Mexico, where the deaths are 1 in 20 annually, and the births 1 in 16, is sunk in filth, vice, and misery. Mr Chadwick conceives that it resembles "the wretched population of the worst parts of Glasgow, Edinburgh, London, and Bath, and the lodging-houses throughout the country." He adds—"Seeing that the banana (with the plantain or maize) is the chief food of the inferior Mexican populace, their degraded condition has been ascribed to the fertility of that plant, as the degradation of a large proportion of our population has been ascribed to the use of the potato; whereas a closer examination would have shown the fact of large classes living industriously and virtuously chiefly on simple food, and preferring saving money to better living; and that, if a high and various meat diet were the cause of health, industry, and morality, those virtues should stand highest amongst the population of the lodging-houses, for more meat and varied food is consumed in those abodes of pestilence than amongst the industrious population of the village. In Manchester, where we have seen that the chances of life are only 17 years, the proportions and varieties of meat consumed by the labouring classes are as their greater amount of wages, compared with the meat consumed by the labouring classes in Rutlandshire, whose mean chances of life are 38 years. But I apprehend that the superior health in Rutlandshire is as little ascribable to their simpler food, as the greater amount of disease amidst the town population is ascribable to the greater proportion of meat which is there consumed. It is probable, indeed, that the standard of vitality in Rutlandshire might be raised still higher by improvements in the quality of their food. There are abundant reasons to render it desirable that the food of the population should be varied; but it is shown that banishing the potato, or discouraging its use, or introducing any other food, will not banish disease."

The fifth section of the report is on the "pecuniary burdens created by the neglect of sanatory measures;" but it has a somewhat wider application. It must be sufficiently obvious as a general fact, that it is better, other circumstances being equal, to have a population in which there is a just and natural proportion of all ages, than one containing a great proportion of the young and unproductive classes, or of widows, orphans, and other dependants on the bounty of the rest, which is the kind of population inevitably resulting where there is a great mortality, and its attendant, a rapid reproduction. Mr Chadwick enters into a variety of statements showing the actual burden thrown on the poor-rates in England in consequence of the premature deaths of working men. The evidence is of a striking nature; but we cannot well follow it in all its intricacies. To many the pecuniary part of the question will be of less interest than another which he adverts to in this section. Much is represented by the single remark, that in the ten registration districts of Leeds, while the mortality prevalent in them varies coincidently with their physical condition, "*the recklessness and immorality, as shown in the proportion of illegitimate births, increases in a greater proportion than the mortality.*" After giving some tables, showing the proportion of men of experience and staid habits in a healthy population, he goes on to remark to what an extent the young predominate in Manchester and some other physically unfavourable districts. It was found, on some occasions of turbulence in that town, that the turbulent were the young exclusively: the mature were peaceable, and disposed to repress the turbulent, but they were a feeble minority, in consequence of the thinning of their numbers by premature deaths. In strikes, the young generally lead, overbearing all the social influence of their seniors. In London mobs, it is also observed that the great majority are young.

It has been found that, in recruiting in one of the physically depressed districts, a smaller proportion of those who enlist proves fit for service. In the metropolitan police, of the candidates who come forward for admission, it is rare that one from Whitechapel or Spitalfields is found suitable. The criminal classes are generally stunted in stature and of inferior strength. "I might adduce," says Mr Chadwick, "the evidence of the teachers of the pauper children at Norwood, to show that a deteriorated physical condition does in fact greatly increase the difficulty of moral and intellectual cultivation. The intellects of the children of such inferior physical organisation are torpid; it is comparatively difficult to gain their attention, or to sustain it; it requires much labour to irradiate the countenance with intelligence, and the irradiation is apt to be transient. As a class, they are comparatively irritable and bad tempered. The most experienced and zealous teachers are gladdened by the sight of well-grown healthy children, which presents to them better promise that their labours will be less difficult and more lasting and successful. On one occasion a comparison was made between the progress of two sets of children in Glasgow, the one set taken from the wynds, and placed under the care of one of the most skilful and successful infant schoolmasters, the other a set of children from a more healthy town district, and of a better physical condition, placed under the care of a pupil of the master who had charge of the children from the wynds. After a trial for a sufficient time, the more experienced master acknowledged the comparative inferiority of his pupils, and his inability to keep them up to the pace of the better bodily conditioned children.

The facts indicated will suffice to show the importance of the moral and political considerations, namely, that the noxious physical agencies depress the health and bodily condition of the population, and act as obstacles to education and to moral culture; that in abridging the duration of the adult life of the working-classes, they check the growth of productive skill, and abridge the amount of social experience and steady moral habits in the community; that they substitute for a population that accumulates and preserves instruction and is steadily progressive, a population that is young, inexperienced, ignorant, credulous, irritable, passionate, and dangerous, having a perpetual tendency to moral as well as physical deterioration."

It is necessary to guard against an impression very apt to be formed from the fact of the higher chances of life being found amongst the upper classes, namely, that expensive modes of living are essential to health. This is by no means the case. The probability rather is, that the higher classes are comparatively healthy, not in consequence, but in spite of, expensive modes of living, which too often involve indulgence in what is positively deleterious. The working classes in the great seats of manufactures have far more rich, varied, and stimulating diet than the rural labourers, yet they have been shown to be much less healthy. The diet in prisons is very light; yet it is matter of common observation amongst the medical persons superintending them, that the health of the inmates is generally much higher than that of almost any part of the surrounding population. "Notwithstanding the depressing influence of imprisonment, the effect of cleanliness, dryness, better ventilation, temperance, and simple food, is almost sufficient to prevent disease arising within the prison, and to put the prisoners in a better working condition at the termination than at the commencement of their imprisonment. At the Glasgow bridewell, the prisoners are weighed at their entry and at their discharge, and it is found that, on the average, they gain in weight by their imprisonment." Mr Chadwick might have added, what we ascertained and stated in this paper a few years ago,* that the mortality in the Edinburgh Charity Workhouse, where the diet is light, was strikingly less than in the Manchester workhouse, where it is comparatively rich and substantial. Indeed, it appears plain, from an ample variety of facts collected in modern times, that the medical authorities which preach slenderness of diet as best for health are in the right; and that what is strictly called *want*, the evil so much held up to dread and pity by the poets, should in reality be assigned but a secondary rank amongst the ills which afflict human kind. It may be that Mr Chadwick ascribes too much importance to the physical conditions on which his report throws so much light—we incline to believe that he does—but it seems impossible to doubt that to a very great extent, to an extent far beyond what would be supposed at all probable even by those who have their eyes open to such investigations, the comfort and happiness of our community are affected unfavourably by mere misarrangements as to health which are capable of remedy.

How the remedy is to be applied, we shall see in a subsequent article.

AN INCIDENT AT BOULOGNE.

The custom which our fashionable Englishmen have of flying to the coast of France, when debts and the like mishaps render their own country somewhat too hot to hold them comfortably, causes Boulogne and other towns forming the chief places of rendezvous on such occasions, to present, for the most part, a strangely assorted society, and to witness, at times, very curious scenes. We do not precisely ask our readers to believe the following romantic story in all its details, though there is nothing very improbable in any part of them.

Sir George Tindal was a young baronet of good English family, who came to Boulogne a few years ago, under rather peculiar circumstances. He had been left very young with command of a good patrimonial estate, but had given way so far to the fashionable follies of the young in high life, as to allow nearly the whole of it to fly away on the turf as fast as race-horses could carry it. He had still good expectations, however. A maternal relative, a merchant, and one of the richest in the metropolis, was likely, in the due course of things, to leave Sir George his fortune, as his nearest heir. He was fond of the young man, but had been greatly and perilously alienated by the conduct and reverses of the latter. It was while meditating on this subject that an idea struck the nearly ruined baronet. "How successful," thought he, "my uncle has been by his speculations in the funds! Might not I have a chance that way, also? Might not I cast in my poor remnant of means into that great lottery, and pull out a prize? I may as well try it: all that I have now is scarcely worth thinking twice about. I shall try at least."

Poor Sir George! He forgot that though some

* Inquiries respecting Food, Nos. 366 and 368.

seas may be deep, there are others which cannot be sounded at all; that however deep one may be in the mire, there is a chance of getting deeper. He *did* venture his all in the stocks. He was successful once, and even twice. Getting inspirited by his good fortune, he thought he had but to venture further and win more. Alas! he was a novice, merely, in the hands of veteran gamblers. Some of the very worst members of the body who speculate in these matters got him into their hands; and knowing well what his expectations were, and where they lay, they led him on by a nibble or two, until, by a series of ruses, considered not infamous only on such a field of transactions, they at length got him placed under a load of debt which even all his uncle's means would with difficulty lighten. Holding him bound by signatures and bonds, they then waited coolly for his accession to his prospective inheritance, knowing well that the same prospect would keep their victim also within reach of their grasp at any time.

Sir George wandered about town for some months after these mishaps, like a man with a rope around his neck. During that time he had many reasonings with himself on an important point. This point affected his whole prospective fortunes. The young baronet was naturally possessed of good sense; he was well educated, and it may be said that his heart was good, and his intentions fair towards all men, under ordinary circumstances; but his course of life, and the associations he had formed, had relaxed his moral principles. This acquired defect came now into play. The point which he canvassed with himself was, whether or not, after having most distinctly ascertained that he had been the dupe of his creditors, his engagements with them were binding upon him. His good sense said yes, for they had acted within the law; his sense of honour said the same, for they had his bonds; "but then," said other internal arguers, "they got these by base means, and they have not lost a shilling by me. The article *experience* was what my folly bought from them at the price of a fair fortune, and with it came no penny out of their pockets. Besides, if I pay these harpies, I shall be beggared." The end of the whole was, that the uncle of Sir George died; the young baronet was left heir; and within a few hours almost after being put in possession of his fortune, which was the portable one of an old monied hoarder, the young baronet was on his way with it to Boulogne. The creditors stormed and vowed revenge; but they at first knew not whither he might fly, and there are great difficulties attending the recovery of money from creditors on the continent in any case.

Sir George fixed himself in a small country house near Boulogne. He had been able to carry thither a sufficiency for permanent maintenance — above twenty thousand pounds, nearly the amount of his funded embarrassments, after what he called "fair debts" were privately settled. He lived for some time in great seclusion, only occasionally appearing in public. The society which he then met was not of a character to trouble itself much about what he had done, or was doing, or was about to do, so long as he maintained a fashionable appearance and a gentlemanly deportment. So Sir George led a very quiet and undisturbed existence for a time, always excepting some little twinges from a sense of violated honour, until love, the universal busy-body, came in the way to overthrow the runaway's repose. A lady made her appearance in Boulogne, bearing the name and style of the Baroness d'Estival. Report said that she was an English woman by birth, and the widow of a foreign noble; and she was young, beautiful, and reputed rich. Ere long, such attractions brought all the danglers of dangling Boulogne into subjection to the baroness; and among the rest, our baronet saw and admired the lady. For a time, however, he was undistinguished by her, nor did he make any marked advances on his own part. An accident brought round an eclaircissement. By a peculiar piece of awkwardness, as it seemed, on the part of her servant, the caleche of the baroness was nearly overturned near Sir George's door. The young baronet sprung out; and the lady appearing faint and terrified, he intreated her to alight for a few moments. She complied. It was the hour of lunch, and they lunched together. Sir George begged her to view his garden, and they walked together. When the lady was at last about to depart, Sir George begged leave to take the reins out of the hands of the awkward servant, and escort her home in person. The result of all was, that the baronet became an established visitant of the baroness; and having declared his passion, received an answer which left him much to hope, while at the same time it promised nothing positive.

Sir George could not be long acquainted with the fair baroness without discovering that she had one remarkable and somewhat eccentric taste. She was distractedly fond of angling, a perfect female Walton. She had hired for the season a large yawl, something between a fishing-boat and a yacht, and every morning, when the weather was good, she rose with the sun to amuse herself off the coast with the rod. "I cannot comprehend the pleasure you take in this occupation," said Sir George to her one day. "It is a charming recreation," answered she gaily; "and, besides, my physicians have recommended to me to take as much air and exercise at sea as possible. I acquired the taste through this cause. It is sometimes dull, to be sure, for the sailors and my servants are no company. But I have been pressed by a certain gallant major, and a certain warlike colonel, to permit them to bear me company, and I think I must really consent some day." How could a lover forbear to intreat permission to occupy the place of these rival suitors? Sir George could not. He begged and sued, and the fair lady gave her consent that he should accompany her next morning on one of her odd excursions to sea.

The day proved beautiful, and the pair went aboard at sunrise. They sailed, however, far out to sea, and along the coast, ere any desire for fishing was shown by the lady. The water was not favourable, she said, at one place, and then she declared that she had no fancy, on this morning, for the exercise. Sir George was rather pleased with this disinclination, which was owing, he flattered himself, to her being absorbed by his own conversation; and she, on her part, seemed only to think of charming him by sweet discourse. At length a slight shower fell, and the baroness asked her lover to enter a small rude cabin, where a glass of wine and cake were offered to him. Here the pair sat, hour after hour, the lady enchanting her lover with talk that caused him to forget all but her present self. At length, he pulled out his watch and started up. "What!" cried he, "the day is far advanced, and I don't think they have ever put about!" The wind, too, was blowing nearly direct from the coast. "Come, madam, if you fish at all today, it is surely time to begin."

The answer startled the poor baronet. "I *have* angled," said she quietly; "and, what is more, I have caught my fish." "What mean you?" cried Sir George. "What fish have you caught?" "Twenty thousand pounds," answered the lady, with coolness. Sir George grew pale, and stept hurriedly on deck. "Distraction!" cried he, as soon as he had looked around. "Put about instantly, pilot; that is Margate!—we are off England!" "Exactly so, Sir George," said the lady at his back. He turned round and looked at her. "Your purpose, then, is to take me" —— "To London, Sir George," said the lady, interrupting him with calmness, though a gratified flush was on her cheek. Sir George turned to the sailors. "My purse!" said he; "twenty-five louis for you, if you put about for Boulogne!" "Twenty-five louis!" said the lady, disdainfully, "when twenty thousand pounds are in the other scale!" "Barbarous, treacherous woman!" cried the infuriated baronet, as he looked around, with an eye that threatened peril to all, if he had but had the means to inflict it; but the baroness gave a signal, and in an instant his arms were pinned to his side by two pair of brawny arms. The baronet struggled, but in vain; a cord was produced, and he was only saved from the ignominy of being bound, by giving his assurance that he would remain in quiet durance in the cabin. It seemed to him that he had nothing for it but to submit.

Sir George, reduced to this condition, looked with indignation at his captor. She had checked the sailors for harshness in their usage of him; but otherwise she expressed no visible emotion. "Betrayed by you!" said the captive, "you whom I loved so much!" "You loved me!" "Yes; well you knew it!" answered Sir George. "Since you are an adventuress, cruel woman, would not my whole fortune, with my hand, have better paid you than a miserable hire?" The lady spoke not in reply, and Sir George also held a scornful silence from that moment, until he landed in the Thames. He was here put into the hands of the sailors, and conducted to an hotel, on giving his solemn promise that he would not attempt to escape. Believing all to be lost in any case, he was glad to be relieved from the confinement of a jail, though it might be but till his creditors were warned of his capture.

It was night when this landing in the Thames took place. Sir George spent a wretched night, moaning over that fate which his conscience told him was not unmerited. In the morning he drew up an act, briefly giving up all to his creditors. He had scarcely finished this when a visiter was announced. It was his betrayer, the baroness. "Wretched woman, what seek you?" said he sternly. "Is not *your* task done? I have now to do with others." "With none but me," said the lady in a low voice, and with a timidity of manner most unlike her previous deportment. "What do you mean, madam?" asked Sir George. "I am your sole creditor," said the lady; and she placed in his hands some papers, which he at once saw to be his own redeemed bonds. He looked up in amazement. "You had a cousin once, Sir George," said the lady, with her eyes on the floor. "I had—Anne Fulton," said Sir George; "we were playmates in childhood." "She went abroad, when a child, with her family?" continued the lady. "She did," said the baronet; "and, I have heard, was married to a very wealthy planter in the island where they settled. It pained me to hear it, for we loved each other even when infants." "She wedded against her will," continued the lady; "for she, too, remembered old days. She is now a widow." A light had been gradually breaking upon Sir George's mind. He started hastily forward, and took hold of the lady's hand, almost throwing himself at her feet. "You are" —— "I am your cousin Anne," said the lady.

It is needless to carry our tale beyond the point when the imagination of the reader can do all that remains to be done. The lady had returned to England a rich widow; had learned the situation and embarrassments of her well-remembered cousin; had seen him at Boulogne; had contrived the overturn at his door, and made his acquaintance. She had only thought of the fishing scheme through a spice of romance in her temperament, and that she might get him to England, where she might have his debts paid. They wedded, and lived happily, like all lovers in stories; and we wish all were as true as the present one.

DEPLORATIONS ON A DOMESTIC EVIL.

The world has been torn by the contending claims of rival razor-strops; why has British genius never been applied to the production of some equally ready and sure means of sharpening carving-knives? The happiness of domestic life depends to a degree, far beyond what could have been previously supposed, on the good serviceable condition of this article of conveniency. That famous conjunction of grievances, a smoky house and a scolding wife, is not complete without a blunt carving-knife. It is an evil which every one possessing that important essential, meat to carve, must have felt to be among the most frequently occurring, and in quality one of the most vexing, which he has ever known.

In a state of collapse from hunger, you hear the announcement of dinner. You pass with ill-maintained deliberation to the table where the viands are spread. You think to be satisfied without delay; but, lo! you find your carving-knife totally disqualified for its duty. You have to wait ten minutes in an agony of appetite and vexation till some hurried and imperfect remedy has been applied, after which you once more try to carve, and perhaps now partially succeed. But the thwarting and delay have put you out of humour with yourself, your dinner, and your wife; and that food which was designed to comfort and sustain you, is deprived of one-half of its value. Ten to one you don't get into a tolerable conceit with the general frame of things in this world for the whole evening.

Or I shall suppose you entertaining a choice selection of your friends at dinner. The broad sirloin is before you. Almost everybody eats beef, for the veal has been discovered to be a little underdone. The demand is incessant. You are told that Mrs S. will trouble you; that Miss D. wishes a slice rather rare; that Mr T. is waiting; and much more to the like purpose. But it seems that wait they must, all of them. The knife is in its usually inept condition. Your attempts to penetrate the crisp cartilage at the top prove all in vain. You toil, you struggle, you groan in secret. You try a common knife, without in the least improving the case. A steel is brought, and you hastily endeavour to give a tithe of that sharpness which ought to have been deliberately conferred by the powers of the scullery in the course of the morning. But you have been disconcerted and heated, and your hand has become unsteady. The consequence is, that the slices which you send away are rude and ungainly masses, quite unworthy of your skill and experience as a carver; and the dinner is eaten half cold, which might have been eaten warm. All the time, you are compelled, by the tyrannical laws of society, to maintain a smiling and cheerful front, while secretly mortified to the last degree.

A blunt carving-knife is sufficient to give a fatal turn to the whole current of a life. An amiable youth, of retiring manners, loved a young lady who was thought to be pretty equally balanced between him and a rival somewhat his senior. One day it was contrived by a benevolent hostess that he was placed next the fair damsel at dinner. He was asked to carve a fowl opposite to him, and amongst those whom he had to help was his mistress. He tried to show his skill, of which he really had some portion, by carving the fowl in an easy, genteel fashion; but either some supernal power, unfavourable to his suit, had previously blunted the knife, or it had become blunt through mere ordinary use, and had not been sharpened when it ought. He drew the dish nearer; he began to look anxiously for joints; he strained, he perspired, he became excited. Still, he was baffled in all his endeavours. Meanwhile, he felt that the eyes of Emmeline were upon him, and that to have detached the wing which she wanted, and laid it upon her plate, would have been worth untold gold. Alas! in one last, desperate effort, he caused the whole fowl to fly into her lap! Reader, only think what must have been the feelings of this unfortunate youth, as he forked up the errant hen from the lap of his lady-love, while all eyes were bent upon him and her, and waiting-maids were flying in all directions to give the assistance that was altogether in vain for the great object. Is it to be wondered at that Emmeline pre-

ferred the rival, and that our youth was three months after on his way to bury his grief and shame in the back settlements of Australia?

Blunt knives go deeper into the physiology of common existence than could be supposed from their character. Unable, without a great struggle, to cut your meat into sufficiently small pieces, you trust to your teeth instead. But perhaps your teeth are bad, or a natural hastiness disqualifies you for going through the process of mastication deliberately. You consequently swallow your food in a state not nearly so well prepared as it ought to be for the process of digestion, and thus injure your health.

Ladies, if you wish your husbands to preserve their temper, or their health; if you wish to save young men from disgrace in the eyes of their lady loves, have your knives well sharpened. It is a sacred duty, which you cannot neglect without the most serious evils ensuing.

Perhaps our whole system of carving meat at table is bad. A free-born Roman gentleman could never have submitted to the drudgery of cutting flesh and fowl to pieces for a set of hungry guests, whilst himself was as hungrily waiting for his own share of the feast. He had all this service performed by slaves. Juvenal describes these fellows standing at a side-table, dissecting the dishes, and handing the pieces to the guests as they were wanted:—

> "Meantime, to put thy partner to the test,
> Lo, the spruce carver, to his task address'd,
> Skips like a harlequin from place to place,
> And waves his knife with pantomimic grace,
> Till every dish be ranged, and every joint
> Dissected by just rules from point to point.
> Thou think'st this folly—'tis a vulgar thought;
> To such perfection now is carving brought,
> That different gestures by our carving men,
> Are used for different dishes, hare and hen," &c.
>
> —*Gifford's Translation.*

It also appears that appropriate music played all the time. There is nothing to hinder us from having a class of supplementaries for these duties, such as is customary on the continent. It would be a new and splendid feature at our dinner-parties, to see a spruce carver flourishing away at a side-table.

ENGLISH FARMERS' CLUBS.

Some time ago, we mentioned the gratifying fact of the institution of farmers' clubs in various parts of England, at whose meetings, conducted on strictly temperance principles, much good is likely to be done by conversations and discussions on topics connected with agriculture and practical science. As a specimen of the kind of entertainment at these rural assemblies, we are furnished with the following notes taken at a meeting in February in the present year. The subject for discussion referred to *climate, and the probable means of its melioration.*

The chairman for the night having been appointed, and all preliminaries arranged, the person whose duty it was to open the subject, commenced by observing that England, as well as many other countries in the same latitude, had a much lower temperature now than in former times; and, in comparatively late years, the climate had been much deteriorated. From its insular position, he continued, it must ever, to a certain extent, experience a variable atmosphere; and it was allowed by many who have had ample opportunities of judging, that it was the most variable of any on the globe. Its great defects, undoubtedly, are the dry cold easterly winds prevalent in spring, and the frequent rain and cloudy skies common to our summer months. Within the experience of the last forty years, how apparent was the deterioration of our climate to every one! He recollected that, when a boy, a bunch of grapes grown in the open air was as common as a bunch of cherries. It was in vain, however, to look for the maturity of the vine for these many seasons past. The increasing humidity of the atmosphere and deficiency of sun was unquestionably the cause of that change; and to the same cause, added he, is without doubt to be attributed the failure of our *wheat crops.*

Recurring to the subject of the former geniality of our climate, he referred to the writings of William of Malmesbury, whose luxuriant picture of certain tracts is well worth perusal. His description of the vale of Gloucester in those times refers an enchanting fertility to the spot. This author even spoke of the exportation of wine to other countries; and that England was at that period celebrated for the cultivation of the grape, is proved by certain localities in the southern districts of England bearing the name of vineyards. These occurred more particularly in the counties of Hereford, Somerset, Hampshire, Kent, Essex, and Cambridge; and it should also be added, that at the time of the Norman Conquest, the Isle of Ely was characteristically called the Isle of Vines.

A member, who seemed rather sceptical as to the capability of the climate to produce the vine, here interposed, and observed that the wines here noticed by the learned monk and others, might perhaps have been perry and cider—a construction which seemed to afford much amusement to many of the members.

The previous speaker, on resuming, continued at some length to prove the stability of his position, and adduced as evidence that cider and perry could not have been the liquors spoken of, these being evidently of modern invention, from the circumstance of there not being a word in the Latin language to signify either; and it was not till the time of Henry VIII. that the apple and the pear began to be generally cultivated in this country.

A foreign author, speaking of the climate of England, has with much point observed, that we had July weather in April, and November weather in May; and the opinion is generally received, that our summers are more wet, and consequently colder than they formerly were—a fact which the experience of the last twenty-six years goes far to corroborate.

The conversation now shifted to the hands of another member, who observed, that wheat was almost the only sufferer from this humidity; that neither barley, oats, nor green crops are much injured by wet; and that in the table just exhibited, it was wheat that was generally understood as the failure.

In the course of conversation, it was admitted that, from its superior value, wheat was an object of primary interest to the agriculturist of this country; its price being, on an average, more by two-thirds than that of oats, and by one-third than that of barley. It was also remarked, that of the 12,000,000 of acres in cultivation in England, 3,800,000 are appropriated to wheat; while in Scotland, where the principal grain reared is oats, the wheat crops cover but 140,000 acres.

A member here observed, that this very humidity which was so unfavourable to wheat was not prejudicial to other crops, but even favourable. The green appearance of England, and its luxuriant foliage, the consequence of its humid climate, never fail to strike every stranger with wonder. If wheat did not thrive, barley might be said to luxuriate; for where was that grain to be found equal to our English barley?

A well-read elderly gentleman, whose opinion seemed entitled to respect, in the course of many valuable remarks, said, that barley differed from wheat in many material points. That it thrives well near the sea, whereas wheat is averse to the sea-breeze; that barley is grown in high northern latitudes, as in Finland, Siberia, and Kamschatka; while wheat did not thrive beyond the 53d degree of north latitude.

The observations of this gentleman went also to prove, that the growth of wheat did not suffer from this excess of humidity, the *drawback* of our climate; on the contrary, the crops were often deficient, though seemingly luxuriant to the eye; and if there was at the proper time sufficient sun to mature them, the produce would be equally satisfactory with the appearance. Under the circumstances of this drawback, the "grains which fill the bushel," as an ingenious author has remarked, "are generally deficient. In the case of wheat, particularly," he observed, "it would appear that a certain duration of steady sunshine is absolutely necessary for the formation and development of gluten, the most valuable portion of vegetable substance."

The result of his reflection on the causes of the deterioration of our climate, and the probable means of its amelioration, he would endeavour to deliver to the meeting with as much brevity as possible. Without drawing on astronomical causes for the increased humidity of our climate, it will, he observed, be as well to confine ourselves to what is apparent to our senses, to those which daily present themselves to our view. It was an undoubted fact, that of late the evaporation from the earth's surface was much increased, and in his opinion the causes resolved themselves into the following:—

1. The numerous bodies of nearly stagnant water in the numerous canals, which have of late years been cut. 2. The numerous plantations, more especially of foreign trees, and of such whose exhaling or evaporating power is prodigiously great. 3. To the multifarious intersections of the surface by fences, especially of hawthorn. 4. To the conducting property of vegetable points abstracting the electricity of the atmosphere, and consequently the descent of rain.

I shall, continued our spokesman, consider these heads in the order I have given them; and as canals come first in order, I shall commence with them and their property in rendering the atmosphere humid.

The canals of Great Britain amount in number to 180, and extend to the amazing length of 2682 miles; an immense watery surface, considering the limited area of our island. These must necessarily give out a prodigious quantity of vapour, more, in short, than the same extent of sea-water would—the evaporating property of liquids being in the direct ratio of their boiling-point; that of fresh water being 212, while that of sea-water is 223 degrees.

Whatever may have been, added he, the necessity of these means of internal conveyance in past times, that necessity is now removed by the more speedy transit of the railway; so that, in the course of a few years, it is to be hoped that there will be much less evaporating surface of this kind than now exists.

Fish-ponds and artificial pieces of water had also their effect, too, in rendering the atmosphere more humid; but, as the speaker jocularly remarked, there was not much chance of our getting soon rid of these sources of humidity; as it would be a very difficult matter, indeed, to persuade our gentry to dispense with these ornamental appendages to their demesnes. He next noticed the

Evaporation from vegetable surfaces.—That vegetable substances evaporate from the under surface of their leaves, is a fact of which any one may satisfy himself by placing a leaf, without detaching it from the stem, under an inverted glass, and exposing it to the sun's rays; the dew collected on the inside of the glass is occasioned by the leaf's evaporation.

That some vegetable substances possess this property in a remarkable degree, was shown by a series of experiments above a century ago by Dr Hales, and which he communicated to the Royal Society; one of the most remarkable of which related to the evaporating property of the sun-flower, which the doctor exposed to the influence of the sun and air in a garden-pot, on a fine day in the month of July. The plant he selected for experiment weighed about 3 pounds, and during the day's exposure perspired about 30 ounces. By removing the leaves, and so diminishing the perspiring surface, the power of exhaling moisture nearly ceased, as it now, instead of 30, exhaled only 1 ounce in the same time. A great variety of ingenious experiments may be found in the same paper, all demonstrating the evaporating power of plants, especially those of foreign derivation.

The multifarious intersections of the land by fences.—Experiments have been made with a view to ascertain whether the exhalation of our fences might not be lessened by substituting other shrubs or plants for those now generally used. Accordingly, he found a sprig of hawthorn exhaled 7 grains out of 16, while a similar sprig of evergreen lost only 3 grains out of 16. The next experiment was the hawthorn and holly, each weighing 48 grains. The hawthorn lost 19, the holly only two grains. The loss of the furze was only half a grain in 17 grains, and the Scotch fir 2 grains in 74 grains. On comparing the results of other experiments, he adds, I found the exhalations always least from the indigenous trees; the native crab and pear being less than the cultivated variety, that of the sloe and bullace being less than that of the Orlean and green-gage plum.

The gentleman having sat down amid some applause, the chairman here observed, that a very important conclusion might naturally be drawn from these interesting experiments. It occurred to him, as he made no doubt it did to every other gentleman who was present, that exotic vegetables cultivated in this climate still retain the original functions which were given them by their Creator, who no doubt formed trees and plants of various qualities, but suited to the various climates in which he was pleased to place them; that men have incautiously removed such vegetable productions, still retaining their habits, into situations where the sun's influence is insufficient to dispel the vaporous atmosphere they continually generate.

Besides producing humidity in the atmosphere by evaporation, observed a gentleman who seemed to have given his subject much attention, vegetable substances, as had been observed by the last speaker but one, cause moisture by abstracting from the atmosphere its electricity, which held in solution the vapour exhaled from vegetable and other sources. The fact is known and acknowledged, that heat and electricity (modifications no doubt of the same agent) have the property of holding vapour, not merely in suspension, but in that fine state of division called solution, the consequence of which is transparency. This electricity abstracted, or its affinity for water overcome on a proper conductor being presented, a decomposition takes place somewhat similar to the precipitation of lead on metallic zinc.*

At this stage of the conversation, the chairman addressed himself to a person who had the reputation of having given some attention to chemistry, and asked whether that science, which was now becoming so general in its application, might not be called into requisition to ,counteract some of those drawbacks under which our climate suffered.

The gentleman so called on, with much promptness rose and observed, that he had of late given the subject much attention, and had come to the conclusion, that the aids which chemistry could lend to agriculture were chiefly limited to the examination of soils, that of vegetable and animal matter, and of appropriating the manure to the crop to be raised. These no doubt were very important points, but were not at all equivalent to the extensive benefit that Liebig proclaimed, when he asserted that agriculture might be equally benefited, as manufactures heretofore have been, by this powerful alliance.

It occurred to him (the speaker) that there was this great drawback on the part of the agriculturist, that almost destroyed all analogy between them. In all his operations, the manufacturer could go to work within doors, consequently could regulate his temperature at will; in short, form his own atmosphere. But the agriculturist was at all times and in all seasons subjected to every variation of temperature which this variable climate presented. As far

* [We consider that this mode of accounting for the humidity of modern summers, affords a fine instance of reasoning from local views and prejudices. The learned gentleman apparently knew or thought of no other country than England. We wonder how he would apply his theory to Scotland, where the fences are chiefly of stone, where there are few exotic plants, scarcely any canals, and above all, a system of universal drainage, which leaves no pools or moisture on the surface, yet where the summers have become as cloudy and humid as they are in the southern division of Britain. Absurd as are the views of this expounder of natural science, they will not be lost, if the present notice points out the danger of drawing sweeping conclusions from too narrow a basis of facts.—Ed. C. E. J.]

as the application of manures was concerned, the chemist could do much, from his knowledge of the ultimate elements of the manure, and the ultimate elements of the plant to be raised; and his skill may be most advantageously directed *in artificially supplying to the soil what has been abstracted by the last crop.*

The ability afforded by chemistry of *making* artificial manures is also undoubtedly great; nothing, however, as yet has been done in this way, except clumsy attempts by speculating men, who are taking advantage of the present agricultural enthusiasm; and it will remain a point worthy of the consideration of the ingenious chemist, whether he can present something to the world comprehensive in its principles and concentrated in its bulk. After all, added the gentleman, I much question whether we are not egregiously wrong in not imitating nature in her operations—in allowing, according to her example, no loss to take place in any of her various departments. Wherever we turn our eyes, change, continued change, is sure to meet our view; but then that change, although apparently it may not "leave a wreck behind" of the original substance, yet it is by no means destruction. In nature, all is economy, nothing being destroyed or allowed to run to waste, yet our national delicacy permits the *very best species* of manure thus to escape; as the Thames, and other rivers running through large towns, carry along with them to the ocean the most valuable aid which our soil could receive. The Chinese, the best gardeners in the world, might perhaps be able to give us a lesson on this subject. But there was no encountering deep-rooted prejudices; innovations, though ultimately improvements, must be gradually introduced; and time, with her mellowing hand, must soften down many repugnancies which have no foundation in nature, but often only borrow their authority from blind and unmeaning usage. Here the conversation turned on the subject of manures in general, and particularly on these two recently introduced to public notice—guano, and that of Mr Daniel of Bath; the one a natural product, being the deposit of a sea-fowl frequenting the shores of the southern coast of America, the other an artificial compound. But we shall not follow the speakers; and conclude by observing that, at a certain hour, the chairman having considered it time for any resolutions to be put and passed, the following resolution was accordingly put and carried unanimously:—

"That as a probable means of ameliorating our climate, and rendering it less humid, we consider an extended and efficient system of draining to be highly beneficial, a removal of all unnecessary exhaling surfaces and vegetable conductors of electricity, great caution in the choice of trees, and a judicious selection of vegetables in the formation of fences."

Thus passed the evening, in a manner, it must be allowed, rather different from what characterised the farmers' parties some half a century ago.

MOFFAT ON SOUTH AFRICA.

Mr Robert Moffat, who lately returned from South Africa, after having acted for twenty-three years as agent for the London Missionary Society in that colony, has published an account of his residence and adventures there in a somewhat bulky octave,* embellished with drawings of various characteristic objects and scenes. Making some allowance for certain class peculiarities of style and thought, it is a valuable addition to our means of forming an acquaintance with a very remarkable part of the earth, for it throws considerable light on the physical as well as moral features of the Cape colony and its neighbourhood. There is also much interest in the narratives of Mr Moffat's exertions for the enlightenment of the heathen, the fearfully difficult and dangerous journeys which he undertook, the great hardships which he at all times endured, and the almost ceaseless perils in which he stood from those whom he was endeavouring to benefit. Such a tale of self-sacrifice for the sake of fellow-creatures is fit to touch those who are most indifferent to the peculiar objects which missionaries have in view; and if any one has contracted the opinion that men always act from selfish motives, we would only request him to read this book, and be convinced of the contrary.

The country, upwards of a hundred miles inland from the Cape of Good Hope, is full of vast sandy and rocky tracts, with here and there fertile patches along the banks of rivers. Afflicted by long-continued droughts, it is in general ill adapted for cultivation, and no life could well be more miserable than that of the barbarous tribes who occupy it. These people are for the most part very meanly endowed by nature, and their whole attention is absorbed in the business of finding a bare sufficiency of food, of one kind or another, to keep soul and body together. They are frequently at war with each other, which adds greatly to the difficulty of maintaining missionary stations amongst them. Their country is also infested by lions, hyænas, hippopotami, and other beasts of prey. To obtain a serious and intelligent attention from such a people to the instructions offered to them, must have been a task as difficult as it was to travel through their scorching plains without water, without provision, and with wild animals ever howling around. Yet, by dint of a perseverance which the common affairs of the world rarely exemplify, some progress has been made in civilising and Christianising them; and there are instances of more than usually ferocious chiefs being converted into gentle and benevolent beings by these means.

One of these extraordinary converts was a man named Africaner, a chief among the Bechuanas. Having been exasperated by the aggressions of the Dutch settlers, he had proved a complete scourge to them; and distinguished himself by such a series of murders and other outrages, that the Cape government put a price of 1000 dollars upon his head. Strange to say, this lion of the desert was tamed by the missionaries, and became an excellent man, and the means of advancing their objects, to no small extent, among his countrymen. Mr Moffat gives an affecting account of a visit he paid to Cape-Town, with Africaner in his company. The chief had some difficulty in making up his mind to this step, for he was still an outlaw; but he at length consented to put on a semi-English dress and take his chance. In their intercourse with the Dutch boors, they often heard the most dreadful accounts of the savage doings of Africaner, and, when Mr Moffat stated that that person was now so much changed, they could hardly believe him. One honest farmer said, "Well, if what you assert be true respecting that man, I have only one wish, and that is, to see him before I die; and, when you return, as sure as the sun is over our heads, I will go with you to see him, though he killed my own uncle." Mr Moffat had not before known this fact; yet he ventured to say, pointing to his companion, "This is Africaner!" The astonishment of the honest boor was extreme. "On arriving at Cape-Town," says Mr Moffat, "I waited on his excellency the Governor, Lord Charles Somerset, who appeared to receive, with considerable scepticism, my testimony that I had brought the far-famed Africaner on a visit to his excellency. The following day was appointed for an interview, when the chief was received by Lord Charles with great affability and kindness; and he expressed his pleasure at seeing thus before him one who had formerly been the scourge of the country, and the terror of the border colonists. His excellency was evidently much struck with this result of missionary enterprise, the benefit of which he had sometimes doubted. Whatever he might think of his former views, his excellency was now convinced that a most important point had been gained; and, as a testimony of his good feeling, he presented Africaner with an excellent waggon, value eighty pounds sterling. A short time previous to my visit to the Cape, a deputation from the London Missionary Society, consisting of the Reverends J. Campbell and Dr Philip, arrived for the purpose of examining the state of our African missions, and to them Africaner's visit was a subject of deep interest. It appeared to be one of the happiest moments of Mr Campbell's life to hold converse with this man, at whose very name, on his first visit to Namaqua-land, he had trembled, but on whom, in answer to many prayers, he now looked as a brother beloved. Africaner's appearance in Cape-Town excited considerable attention, as his name and exploits had been familiar to many of its inhabitants for more than twenty years. Many were struck with the unexpected mildness and gentleness of his demeanour, and others with his piety and accurate knowledge of the Scriptures. His New Testament was an interesting object of attention, it was so completely thumbed and worn by use. His answers to a number of questions put to him by the friends in Cape-Town, and at a public meeting at the Paarl, exhibited his diligence as a student in the doctrines of the gospel, especially when it is remembered that Africaner never saw a catechism in his life, but obtained all his knowledge on theological subjects from a careful perusal of the Scriptures and the verbal instructions of the missionary."

It is not possible for us, in our narrow space, to present any thing like an outline of Mr Moffat's exertions amongst the tribes of the Cape. We must content ourselves with adverting to a few of the more curious and striking passages in his volume. One of these refers to a very odd though somewhat trivial occurrence in the life of Africaner before he was civilised. While sacking a place where a Dutch missionary, named Albrecht, had formerly been stationed, "one of the chieftain's attendants strayed into the burying-ground, where already a few mounds distinguished it from the surrounding waste as the place of the dead. Stepping over what he supposed a newly-closed grave, he heard, to his surprise, soft notes of music vibrate beneath. He stood motionless, gazing over his shoulder, with mouth and eyes dilated, hesitating whether to stand still and *see* the dead arise, which he had heard the missionaries preach about, or take to his heels. After no little palpitation of heart, in order to assure himself, he mustered courage to make another trial, for the tones he had heard had died away. His second leap again roused the sepulchral harp, which now fell in soft but awful cadence on his ear. Without casting an eye behind, he darted off to the camp, and, with breathless amazement, announced to Africaner the startling discovery he had made of life and music in the grave. The appearance of the man convinced Africaner that he was in earnest, for reason seldom reels in that country. The chief, fearless of the living or the dead, was not to be scared even by the supposed spectre of the tomb—arose, and ordered his men to follow him to the spot. One jumped and another jumped, and at each succeeding leap succeeding notes of the softest music vibrated on the ear from beneath. Recourse was had instantly to exhumation. The mysterious musician was soon brought to light. It proved to be Mrs Albrecht's piano-forte, which she had taken with her from London, and which was the first ever conveyed into the Transgariepine regions. Being too cumbrous to be taken in a hasty flight, it had been buried in a soil where, from the entire absence of moisture, it might, but for this circumstance, have remained unscathed. Africaner, whose martial spirit made him a fitter associate for Mars than for the Muses, allowed the instrument to be dissected, parts of which I have seen, from which those fingers now silent in the grave had called forth divine harmony."

As an illustration of the miseries incidental to savage life—"Among the poorer classes it is, indeed, struggling for existence; and when the aged become too weak to provide for themselves, and are a burden to those whom they brought forth and reared to manhood, they are not unfrequently abandoned by their own children, with a meal of victuals and a cruise of water, to perish in the desert; and I have seen a small circle of stakes fastened in the ground, within which were still lying the bones of a parent bleached in the sun, who had been thus abandoned. In one instance I observed a small broken earthenware vessel, in which the last draught of water had been left. 'What is this?' I said, pointing to the stakes, addressing Africaner. His reply was, 'This is heathenism;' and then described this parricidal custom. A day or two after, a circumstance occurred which corroborated his statements. We had travelled all day over a sandy plain, and passed a sleepless night from extreme thirst and fatigue. Rising early in the morning, and leaving the people to get the waggon ready to follow, I went forward with one of our number, in order to see if we could not perceive some indications of water by the foot-marks of game, for it was in a part of the country where we could not expect the traces of man. After passing a ridge of hills, and advancing a considerable way on the plain, we discovered, at a distance, a little smoke rising amidst a few bushes, which seemed to skirt a ravine. Animated with the prospect, we hastened forward, eagerly anticipating a delicious draught of water, no matter what the quality might be. When we had arrived within a few hundred yards of the spot, we stood still, startled at the fresh marks of lions, which appeared to have been there only an hour before us. We had no guns, being too tired to carry them, and we hesitated for a moment whether to proceed or return. The waggon was yet distant, and thirst impelled us to go on, but it was with caution, keeping a sharp look-out at every bush we passed.

On reaching the spot, we beheld an object of heart-rending distress. It was a venerable-looking old woman, a living skeleton, sitting, with her head leaning on her knees. She appeared terrified at our presence, and especially at me. She tried to rise, but, trembling with weakness, sunk again to the earth. I addressed her by the name which sounds sweet in every clime, and charms even the savage ear, 'My mother, fear not; we are friends, and will do you no harm.' I put several questions to her, but she appeared either speechless or afraid to open her lips. I again repeated, 'Pray, mother, who are you, and how do you come to be in this situation?' to which she replied, 'I am a woman; I have been here four days; my children have left me here to die' —— 'Your children!' I interrupted. 'Yes,' raising her hand to her shrivelled bosom; 'my own children, three sons and two daughters. They are gone,' pointing with her finger, 'to yonder blue mountain, and have left me to die.' 'And, pray, why did they leave you?' I inquired. Spreading out her hands—'I am old, you see, and I am no longer able to serve them; when they kill game, I am too feeble to help in carrying home the flesh; I am not able to gather wood to make fire; and I cannot carry their children on my back, as I used to do.' This last sentence was more than I could bear; and though my tongue was cleaving to the roof of my mouth for want of water, this reply opened a fountain of tears. I remarked, that I was surprised that she had escaped the lions, which seemed to abound, and to have approached very near the spot where she was. She took hold of the skin of her left arm with her fingers, and raising it up as one would do a loose linen, she added, 'I hear the lions; but there is nothing on me that they would eat; I have no flesh on me for them to scent.' At this moment the waggon drew near, which greatly alarmed her, for she supposed that it was an animal. Assuring her that it would do her no harm, I said that, as I could not stay, I would put her into the waggon and take her with me. At this remark she became convulsed with terror. Others addressed her, but all to no effect. She replied, that if we took her, and left her at another village, they would only do the same thing again. 'It is our custom; I am nearly dead; I do not want to die again.' The sun was now piercingly hot; the oxen were raging in the yoke, and we ourselves nearly delirious. Finding it impossible to influence the woman to move, without running the risk of her dying convulsed in our hands, we collected a quantity of fuel, gave her a good supply of dry meat, some tobacco, and a knife, with some other articles; telling her we should return in two days, and stop the night, when she would be able to go with us, only she must keep up a good fire at night, as the lions would smell the dried flesh, if they did not scent her. We

* "Missionary Labours and Scenes in Southern Africa." By Robert Moffat. London: Snow. 1842.

then pursued our course; and after a long ride, passing a rocky ridge of hills, we came to a stagnant pool, into which men and oxen rushed precipitately, though the water was almost too muddy to go down our throats.

On our return to the spot, according to promise, we found the old woman and every thing gone; but, on examination, discovered the footmarks of two men, from the hills referred to, who appeared to have taken her away. Several months afterwards, I learned, from an individual who visited the station, that the sons, seeing from a distance the waggon halt at the spot where they had so unnaturally left their mother to perish, came to see, supposing the travellers had been viewing the mangled remains of their mother. Finding her alive, and supplied with food, and on her telling the story of the strangers' kindness, they were alarmed, and dreading the vengeance of the great chief, whom they supposed me to be, took her home, and were providing for her with more than usual care."

Mr Moffat gives many anecdotes of wild animals, particularly lions, from which he made many narrow escapes in the course of his wanderings. The following is one of his most striking stories of lion adventure:—"A man belonging to Mr Schmelen's congregation, at Bethany, returning homewards from a visit to his friends, took a circuitous course in order to pass a small fountain, or rather pool, where he hoped to kill an antelope to carry home to his family. The sun had risen to some height by the time he reached the spot, and seeing no game, he laid his gun down on a shelving low rock, the back part of which was covered over with a species of dwarf thorn bushes. He went to the water, took a hearty drink, and returned to the rock, smoked his pipe, and, being a little tired, fell asleep. In a short time, the heat reflected from the rock awoke him; and, opening his eyes, he saw a large lion crouching before him, with its eyes glaring in his face, and within little more than a yard of his feet. He sat motionless for some minutes, till he had recovered his presence of mind; then eyeing his gun, moved his hand slowly towards it; the lion, seeing him, raised its head, and gave a tremendous roar; he made another and another attempt, but the gun being far beyond his reach, he gave it up, as the lion seemed well aware of his object, and was enraged whenever he attempted to move his hand. His situation now became painful in the extreme; the rock on which he sat became so hot that he could scarcely bear his naked feet to touch it, and kept moving them, alternately placing one above the other. The day passed, and the night also, but the lion never moved from the spot; the sun rose again, and its intense heat soon rendered his feet past feeling. At noon the lion rose and walked to the water, only a few yards distant, looking behind him as it went, lest the man should move; and seeing him stretch out his hand to take his gun, turned in a rage, and was on the point of springing upon him. The animal went to the water, drank, and returning, lay down again at the edge of the rock. Another night passed: the man, in describing it, said he knew not whether he slept; but if he did, it must have been with his eyes open, for he always saw the lion at his feet. Next day, in the forenoon, the animal went again to the water; and, while there, he listened to some noise apparently from an opposite quarter, and disappeared in the bushes. The man now made another effort, and seized his gun; but on attempting to rise, he fell, his ankles being without power. With his gun in his hand, he crept towards the water, and drank; but looking at his feet, he saw, as he expressed it, his 'toes roasted,' and the skin torn off with the grass. There he sat a few moments, expecting the lion's return, when he was resolved to send the contents of the gun through its head; but, as it did not appear, tieing his gun to his back, the poor man made the best of his way on his hands and knees to the nearest path, hoping some solitary individual might pass. He could go no farther, when, fortunately, a person came up, who took him to a place of safety, whence he obtained help, though he lost his toes, and was a cripple for life."

DICKSON ON THE MEDICAL PROFESSION.

Dr Samuel Dickson, a London physician, has written a rather strange sort of book—"Fallacies of the Faculty," in which, while upholding certain notions of his own on the cause and cure of disease, he gives a few hard hits to the medical world on its frequent rejection of evident truths:—

"How was the exposition of the circulation of the blood first received? Harvey, its discoverer, was persecuted through life; his enemies, in derision, styled him the *Circulator*, a word in its original Latin signifying 'vagabond' or 'quack;' and their efforts to destroy him were so far successful, that he lost the greater part of his practice through their united machinations. You all know that when a limb is amputated, the surgeons, to prevent the patient bleeding to death, tie the arteries. Before the time of Francis I., they were in the habit of stanching the blood by applying boiling pitch to the surface of the stump. Ambrose Parè introduced the *ligature* as a substitute—he first tied the arteries. What was the reward of Ambrose Parè? He was hooted and howled down by the Faculty of Physic, who ridiculed the idea of putting the life of man upon a thread, when boiling pitch had stood the test of centuries! In vain he pleaded the agony of the application—in vain he showed the success of the ligature. Corporations seldom forgive merit in an adversary; they continued to persecute him with the most remorseless rancour. Is there a physician now-a-days who would dispute the value of antimony as a medicine? Who first introduced it into practice? Paracelsus. But Paracelsus was not a fellow of the College of Physicians of Paris; the Parisian doctors were therefore, by the rules of their order, bound to oppose the introduction of antimony as a crime. A crime it was accordingly voted; and the French Parliament, at the instigation of the college, passed an act which made it penal to prescribe it. To the Jesuits of Peru Protestant England owes the invaluable bark. How did Protestant England first receive this gift of the Jesuits? Being a popish remedy, they at once rejected it. In 1693, Dr Groenvelt discovered the curative power of cantharides in dropsy. What an excellent thing for Dr Groenvelt! Excellent indeed; for no sooner did his cures begin to make a noise than he was at once committed to Newgate by warrant of the president of the College of Physicians for prescribing cantharides internally. Blush, most sapient college of physicians—your present president, Sir Henry Halford, is a humble imitator of the ruined Groenvelt! Before the discovery of vaccination, *inoculation* for small-pox was found to mitigate greatly that terrible disease. Who first introduced small-pox inoculation? Lady Mary Montague, who had seen its success in Turkey. Happy Lady Mary Montague! Her rank, sex, beauty, genius, all doubtless conspired to bring it into notice. Listen to Lord Wharncliffe, who has written her life, and learn from his story this terrible truth, that *persecution* ever has been, and ever will be, the only reward of the benefactors of the human race. 'Lady Mary,' says his lordship, 'protested that in the four or five years immediately succeeding her arrival at home, she seldom passed a day without repenting of her patriotic undertaking; and she vowed she never would have attempted it if she had foreseen the vexation, the persecution, and even the obloquy, it brought upon her. The clamours raised against the practice, and of course against her, were beyond belief. The faculty all rose in arms to a man, foretelling failure and the most disastrous consequences; the clergy descanted from their pulpits on the impiety; and the common people were taught to hoot at her as an unnatural mother who had risked the lives of her own children. We now read in grave medical biography, that the discovery was instantly hailed, and the method adopted, by the principal members of that profession. Very likely they left this recorded; for whenever an invention or a project, and the same may be said of persons, has made its way so well by itself as to establish a certain reputation, most people are sure to find out that they always patronised it from the beginning, and a happy gift of forgetfulness enables many to believe their own assertion. But what said Lady Mary of the actual fact and actual time? Why, that the four great physicians deputed by government to watch the progress of her daughter's inoculation, betrayed not only such incredulity as to its success, but such *an unwillingness to have it succeed*, such an evident spirit of rancour and malignity, that she never cared to leave the child alone with them one second, lest it should in some secret way suffer from their interference.'

How was the still greater discovery of the immortal Jenner received—vaccination? Like every other discovery—with ridicule and contempt. By the Royal College of Physicians, not only was he persecuted and oppressed, but the pedants of that most pedantic of bodies declined to give him their license to practise his profession in London, because, forsooth, he, a man of deeds, not words, very properly declined to undergo at their hands a schoolboy examination in Greek and Latin. But even religion and the Bible were made engines of attack against Jenner. From these Errhman of Frankfort deduced his chief grounds of accusation against the new practice; and he gravely attempted to prove, from quotations of the prophetical parts of Scripture, and the fathers of the church, that vaccination was the real *antichrist!* How can you wonder that medicine should have made so little progress, if those only make fortunes by means of it who know nothing more than the jargon and crudities which pass for medical science with the vulgar? The sight which two thousand years ago Solomon saw, *you*, gentlemen, with your own eyes have seen, 'he returned and saw *under the sun, that there was neither bread to the wise, nor riches to men of understanding, nor favour to men of skill.*'"

The doctor denounces most emphatically and justly an odious system pursued in London and perhaps other parts of England, by which the emoluments of the medical practitioner depend in a great measure on the quantity of useless drugs he inflicts on his deluded patient. We add the query—Are the English, generally speaking, not prejudiced in favour of taking drugs—would they think the doctor worthy of any payment at all if he did not give them a certain daily allowance of draughts, pills, and powders?

A SPANISH SLAVER.

[From a newspaper of July last.]

The maritime tribunal of Brest has been engaged in the trial of a case of piracy and violation of the existing treaties between France and Spain against a continuation of the slave trade. The hearing commenced on the 28th ult., and lasted till the 3d inst., inclusive. The whole of the important and interesting circumstances, as exposed by the proceedings, are comprised in the following statement:—

A Mexican brig of war, called the *Pocha*, taken by Admiral Baudin's fleet in 1838, became, by successive sales and transfers, the property of a Spaniard named Vivo, resident at the Havannah. Vivo, who had been previously engaged in the slave-trade in a subordinate capacity, had her fitted out as a slave-ship, and engaged a crew of forty-five men. As this traffic was prohibited by the laws of Spain, he, by fraudulent representations, furnished himself with Portuguese papers, and sailed on the 25th of December 1840, from the Havannah, direct for the coast of Mozambique. Being thus apparently under the Portuguese flag, he had not any visits to fear, except from the English cruisers, and from them he hoped to escape through the superior sailing of his vessel. When he left the Havannah he had no merchandise on board, but had provided himself with an ample sum of money in specie. On his arrival at Mozambique, the slave-trade had been prohibited by Portugal, and the governor, in obedience to orders he had received from his government, fined Vivo 2500 piasters for contravention of the treaty that had been entered into; and having seized and taken away from his ship all that could be used in the illicit traffic, he commanded Vivo to return to the Havannah, giving him papers expressly for this destination, and appointed a Portuguese subject, Captain Costa Vianna, to take the chief command of the ship. He at the same time embarked in her seventeen men who had lost their ship, as passengers for the Havannah.

Vivo, notwithstanding the new captain placed over him on leaving the coast of Mozambique, retained the full command of the vessel, and by his representations induced the crew and passengers to consent to deviate from the course to the Havannah, against the will of the Portuguese Captain Costa Vianna, who protested, as he has since declared, against the violation of the governor's orders. Steering to Bombestock, he on his arrival there found three American vessels, from which he procured water-tanks, provisions, planks, fifty muskets, and the other stores necessary for his first projected trade. Having obtained these, he sailed to the coast of Pomba. Here, by deceit, he gained possession of a small boat, called a pangaille, got her crew of six men on board, and secured them in the hold or between decks. When the chief of the boat remonstrated against this act of fraud and violence, Vivo justified himself on the ground that it was but a retaliation for the money of which the governor of Mozambique had robbed him.

On the following morning the Pocha fell in with, and by main force captured, a large pangaille, manned by eighteen free Arabs, and containing one hundred and twenty blacks. Having taken on board these, and all the provisions and stores the boat contained, he set it adrift with two old Arabs, of whose fate nothing has been heard. The Pocha then returned to Bombestock for the lieutenant, who had been left at that place to purchase rice. Thence she went to Nossibé, where Vivo found the French sloop of war Prévoyante, and went on board to visit Captain Jehenne, who received him politely, invited him to breakfast, and promised to return the visit the next morning. Although no doubt of the Pocha being a slaver could be entertained, Captain Jehenne was restrained from searching her, as Portugal did not admit that right. More serious suspicions, however, arose, when, early in the morning, instead of waiting for Captain Jehenne's return visit, the Pocha was seen making off with all her sails set. In the course of the day the whole shore was in commotion, it having been discovered that she had landed some of her men at another point of the island, and carried off many men and women, after killing one man who had offered resistance. The Prévoyante found the Pocha again at the island of Mayotte. As the sloop approached, the men at her mast head saw many heavy bodies, but of what nature could not be distinguished, thrown from the Pocha into the sea, and then water was drawn up and dashed upon the deck as if to clean it. No doubt was entertained that the objects thrown overboard were the poor blacks, or some of them. Captain Jehenne sent an officer into the vessel, who discovered in confinement the Arabs who had been captured in the two pangailles, and at the same time ascertained that the vessel was without any papers warranting her appearance in that latitude. Upon these facts the Prévoyante took possession of the Pocha, and carried her into the island of Bourbon. Here the vessel was condemned, and her crew sent to France to be tried for piracy.

On their arrival at Brest, a correspondence took place on the subject between the governments of France and Portugal, at the end of which the latter power renounced all claim to the prisoners as its subjects, and left them to be tried before the French tribunal. After reading the indictment and the report of Captain Jehenne, and the other documentary evidence, the prisoner Vivo was interrogated. He admitted all the essential facts, but denied his being guilty of piracy, justifying his seizure of the two pangailles as a mere act of reprisal on the governor of Mozambique, for taking from him the 2500 piasters, which he maintained was a robbery. He denied having been guilty of any outrage on shore, and of this it does not appear that any evidence was produced. He also denied that any blacks were thrown into the sea. Vianna, the nominal captain, was next called upon to account for being engaged in these infamous transactions. He declared that, although put in command of the Pocha by the governor of Mozambique, he never had the least authority in her, which was assumed and maintained throughout by Vivo, under whose orders every transaction took place. He gave his evidence with great reserve, being evidently under strong fears of the consequences which might arise from Vivo and his mate Ripoll, who was Vivo's principal agent, and who is evidently a man of determined resolution as well as great physical powers. Hamis Ben Omar, the owner of the smaller pangaille, who came willingly to France to appear as a witness on the trial, was examined, and gave in the French language, which he spoke well, a clear and distinct account of the treacherous manner in which he, his men, and boat, were gained possession of, and detained by the Pocha. He also acted as interpreter in the examination of Bacari Iman Bacos, the master of the larger boat. This witness repeated the account of the capture of her by Ripoll, and a crew sent out in the smaller pangaille. He stated that he had in his boat one hundred and twenty slaves, which he had purchased for working an estate he possessed at Zanzibar, and affirmed that he and his men were free and independent, and that the governor of Mozambique had no property or interest whatever in the slaves, which belonged to him alone. They both complained bitterly of the treatment they received on board the Pocha, and more particularly at having their beards shaven, which

was a gross violation of their religious feelings as Mahometans. Vivo, however, justified the act as necessary for cleanliness and the preservation of their health. The evidence of the numerous other witnesses tended to establish the truth of all the facts stated. The Commissaire Rapporteur, the public prosecutor in the French Admiralty Courts, in delivering his requisitory, insisted upon judgment against Vivo, Vianna, and Ripoll, as having been guilty of piracy in seizing and detaining the two pangailles, and plundering the merchandise they contained, leaving the rest of the prisoners to the discretion of the court.

The tribunal, after a very long deliberation, pronounced Vivo, Vianna, and Ripoll, guilty of piracy, but with extenuating circumstances as to the two latter. Consequently, Vivo was sentenced to close confinement, with labour, for ten years, and Vianna and Ripoll to the same punishment for five years. The rest of the prisoners, composing the crew of the Pocha, forty-five in number, were acquitted.

THE INDIAN CHIEF.

One of the first settlers in Western New York was Judge W., who established himself at Whitestown, about four miles from Utica. He brought his family with him, among whom was a widowed daughter with an only child—a fine boy about four years old. You will recollect that the tract around was an unbroken forest, and this was the domain of the savage tribes.

Judge W. saw the necessity of keeping on good terms with the Indians, for as he was nearly alone, he was completely at their mercy. Accordingly, he took every opportunity to secure their good will in return. Several of the chiefs came to see him, and all appeared pacific. But there was one thing that troubled him; an aged chief of the Seneca tribe, and one of great influence, who resided at a distance of about six miles, had not been to see him, nor could he by any means ascertain the feelings and views of the sachem in respect to his settlement in that region. At last he sent him a message, and the answer was, that the chief would visit him on the morrow.

True to his appointment, the sachem came. Judge W. received him with marks of respect, and introduced his wife, his daughter, and the little boy. The interview that followed was deeply interesting. Upon its result the judge considered that his security might depend, and he was therefore exceedingly anxious to make a favourable impression upon the chief. He expressed to him his desire to settle in the country; to live on terms of amity and good fellowship with the Indians; and to be useful to them by introducing among them the arts of civilisation.

The chief heard him out, and then said, "Brother, you ask much, and promise much. What pledge can you give of your faith?"

"The honour of a man that never knew deception," was the reply.

"The white man's word may be good to the white man, yet it is but wind when spoken to the Indian," said the sachem.

"I have put my life into your hands," said the judge; "is this an evidence of my good intentions? I have placed confidence in the Indian, and I will not believe that he will abuse or betray the trust that is thus reposed."

"So much is well," replied the chief; "the Indian will repay confidence with confidence; if you will trust him, he will trust you. But I must have a pledge. Let this boy go with me to my wigwam; I will bring him back in three days with my answer."

If an arrow had pierced the bosom of the mother, she could not have felt deeper the pang that went to her heart, as the Indian made this proposal. She sprang from her seat, and rushing to the boy who stood at the side of the sachem, looking into his face with pleased wonder and admiration, she encircled him in her arms, and was about to fly from the room. A gloomy and ominous frown came over the sachem's brow, but he did not speak.

But not so with Judge W. He knew that the success of the enterprise, the very lives of his family, depended upon the decision of the moment. "Stay, stay, my daughter," said he. "Bring back the boy, I beseech you. I would not risk a hair of his head. He is not more dear to you than to me. But, my child, he must go with the chief. God will watch over him. He will be as safe in the sachem's wigwam as beneath our roof and in your arms."

I shall not attempt to describe the agony of the mother during the three ensuing days. She was agitated by contending hopes and fears. In the night she awoke from sleep, seeming to hear the screams of her child calling upon his mother for help. But the time wore away, and the third day came. How slowly did the hours pass! The morning waned away, and the afternoon was now far advanced; yet the sachem came not. There was a gloom over the whole household. The mother was pale and silent, as if despair were setting cloudy round her heart. Judge W. walked to and fro, going every few minutes to the door, looking through the opening in the forest towards the sachem's abode.

At last, as the rays of the setting sun were thrown upon the tops of the forest around, the eagle feathers of the chieftain were seen dancing above the bushes in the distance. He advanced rapidly, and the little boy was at his side. He was gaily attired as a young chief, his feet being dressed in mocassins; a fine beaver skin was over his shoulders, and eagle feathers were stuck in his hair. He was in excellent spirits, and so proud was he of his honours, that he seemed two inches taller than before. He was soon in his mother's arms, and that brief minute she seemed to pass from death to life. It was a happy meeting—too happy for me to describe.

"The white man has conquered!" said the sachem; "hereafter let us be friends. You have trusted the Indian; he will repay you with confidence and friendship." He was as good as his word; and Judge W. lived there many years, laying the foundation of a flourishing and prosperous community.—*Merry's Museum.*

FEMALE BEAUTY.

Those who are accustomed to enlightened views on this subject, will know that there are different kinds of personal beauty, amongst which that of form and colouring holds a very inferior rank. There is beauty of expression, for instance, of sweetness, of nobility, of intellectual refinement, of feeling, of animation, of meekness, of resignation, and many other kinds of beauty, which may all be allied to the plainest features, and yet may remain to give pleasure long after the blooming cheek has faded, and silver grey has mingled with the hair. And how far more powerful in their influence upon others are some of those kinds of beauty; for, after all, beauty depends more upon the movements of the face than upon the form of the features when at rest; and thus, a countenance habitually under the influence of amiable feelings acquires a beauty of the highest order, from the frequency with which such feelings are the originating cause of the movements or expressions which stamp their character upon it. Who has not waited for the first opening of the lips of a celebrated belle, to see whether her claims would be supported by "the mind, the music breathing from her face," and who has not occasionally turned away repelled by the utter blank, or worse than blank, which the simple movement of the mouth, in speaking or smiling, has revealed? The language of poetry describes the loud laugh as indicative of the vulgar mind; and certainly there are expressions, conveyed even through the medium of a smile, which need not Lavater to inform us that refinement of feeling or elevation of soul has little to do with the fair countenance on which they are impressed. On the other hand, there are plain women sometimes met with in society, every movement of whose features is instinct with intelligence; who from the genuine heart-warm smiles which play about the mouth, the sweetly modulated voice, and the lightening up of an eye that looks as if it could "comprehend the universe," become perfectly beautiful to those who live with them and love them. Before such pretensions to beauty as these, how soon do the pink and white of a merely pretty face vanish into nothing!—*Mrs Ellis's Daughters of England.*

SUNSET.

[BY SWYNFEN JERVIS.]

Now to his palace in the west
The king of day returns to rest.
Not as when first he rose to sight,
Soaring through the fields of space,
Gladdening all things with the light
Of his ever-beaming face;
Nor when, too bright for mortal eyes,
His noontide splendour filled the exulting skies:
Around his car of glittering sheen
No more the dancing Hours are seen;
Of all that faithless, fleeting train,
True to their sovereign none remain:
High seated on his fiery throne,
He rides triumphant, but alone.
Meantime the gorgeous car of state
Through heaven's wide champaign slopes its downward flight;
Now sinks behind yon towering steep,
Now skirts the margin of the deep,
And now before the western gate
Stands, one broad blaze of living light.
Touched by some all-powerful hand,
Slowly the golden gates expand;
While echoing from the inmost hall,
Where duly ranged in order stand,
Rank above rank, the minstrel band,
A thousand pealing voices raise
The song of welcome, joy, and praise,
To Him whose greatness fears no fall,
Who by his own exhaustless might
Upholds the planets in their flight,
Yet looks with equal eye on all,
Scattering with impartial hand
Blessings o'er many a smiling land.
Nor ceased the harmonious strain, until
Sleep closed the monarch's eyes, and all was still.
While round his royal couch of state
The courtier stars in silence wait,
Meek Twilight, in her robe of grey,
To the lone mountain bent her way
But musing onwards kept her eye
Still fixed upon the western sky,
And as she viewed the changing scene,
Oft on her slender staff would lean,
With many a lengthened pause and lingering step between.
On lake, and forest, hamlet, hut, and tower,
Evening descends, like dew upon the flower.
Last rose majestic Night, and over all
Flung the dim foldings of her shadowy pall.

—*From the Spectator newspaper.*

FLIGHT OF THREE HUNDRED CARRIER PIGEONS.

An extraordinary and interesting flight of carrier pigeons, to decide a match, was witnessed in the neighbourhood of Birmingham, on Tuesday the 12th July last. About three hundred pigeons, belonging to merchants and other parties at Antwerp, were forwarded a few days previously to Mr Muntz, brother of one of the members for the borough, with a request that he would see them fairly started at six o'clock on the above morning. This request was accordingly complied with, the whole of the pigeons having been started on their journey almost simultaneously, from Mr Muntz's residence at Handsworth; and after making some gyrations in the air, they took an easterly direction, and favoured by a fresh breeze, they were out of sight in a few minutes. Mr Muntz has since received intelligence of the safe arrival of the whole flock, the first pigeon having reached Antwerp at half-past nine o'clock the same morning, followed in rapid succession by the others, in fives and tens, the last pigeon reaching its destination at half-past ten. Estimating the distance from Birmingham to Antwerp (measuring in a straight line) at 300 miles, and allowing for the difference in time between the two points, the first bird would appear to have travelled at the surprising velocity of ninety miles per hour. It is not the least singular fact connected with the match, that amongst so large a number of pigeons, not one should have wandered from its homeward course.—*Newspaper paragraph.*

FIR TOPS A VALUABLE FUEL.

Dr Howieson, lecturer on botany in Edinburgh, met with the following occurrence in Fifeshire, during one of his botanical excursions:—Calling at the cottage of a medical practitioner, a former pupil of his, he found the Æsculapius going to mount his pony to visit his patients. Upon the two friends meeting, the practitioner remarked, "Doctor, it is not every day I see you, we must go in and have a *haver*." Upon entering the parlour, there was no fire. He rung the bell; his housekeeper came in carrying in her white apron a quantity of dried fir-tree tops, and a lighted candle in her hand. She threw the fir-cones into the polished grate, broke a coal into pieces, and laid them over them. She then applied the candle, when almost instantaneously they broke into a beautiful strong flame, from the great quantity of turpentine they contained. They soon set fire to the coals, and in a few minutes a delightful warm fire was the result. A few blasts of the bellows might be an improvement. Next followed the decanters and glasses; and it may perhaps be unnecessary to add, the two doctors made themselves comfortable in front of the fir-cone fire. The practitioner obtained this knowledge in the following manner:—He was attending a poor woman residing close to the forest. She could not pay him. With the gratitude of the rural population, next morning her two daughters came to his house, each carrying a sack filled with dried fir cones collected in the wood. They told him they were for kindling a fire, and if he had no coals they would make an excellent durable fire of themselves. The cones of the *Pinus silvestris* (Scotch fir) contain a great quantity of solid woody matter in addition to the resinous, and are excellently adapted for fuel. They are used over Italy, Switzerland, &c. This circumstance is little known, and the intention of these remarks is to recommend their use to the poor population of Scotland.—*Newspaper paragraph.*

PEOPLE'S EDITIONS.

Anxious to promote a taste for an improving kind of reading among the less opulent classes of the community, Messrs Chambers have for several years been engaged in publishing, from time to time, a series of reprints of approved works in all departments of literature; and in such a form (royal octavo) as to combine extreme cheapness with good appearance, readableness, and durability. The books have been, and continue to be, selected with a regard to the amusement, instruction, and moral improvement of the people. The series also includes *Original Works* of an entertaining and instructive character, and *Translations* of some of the most approved productions of foreign writers. Such is the extraordinary cheapness of these People's Editions, that in general, what was originally published at a *guinea* is now issued for a *shilling*, and so on in proportion; in some instances, books once published at *two guineas and a half* are now issued at *sixteenpence*. The following is a list of the works till the present time:—

Sir George Mackenzie's Travels in Iceland; improved by the author,	1s. 4d.
Clarke's Travels in Russia, Tartary, and Turkey,	2s. 6d.
Life and Travels of Mungo Park,	1s. 4d.
Stephens's Incidents of Travel in Egypt, Arabia, &c.	1s. 10d.
Stephens's Incidents of Travel in Greece, &c.	1s. 10d.
Malcom's Travels in the Burman Empire,	1s. 6d.
Malcom's Travels in Hindustan and China,	1s. 6d.
Brydone's Tour through Sicily and Malta,	1s. 4d.
Parker's Journey beyond the Rocky Mountains, in 1835,	1s. 4d.
Adventures of Robinson Crusoe. By Daniel Defoe,	1s. 8d.
The Complete English Tradesman. By the same,	1s. 4d.
Goldsmith's Vicar of Wakefield,	0s. 8d.
Self-Control, a Novel. By Mrs Brunton,	2s. 2d.

"THERE IS NO HURRY!"—A TALE.

BY MRS S. C. HALL.

PART I.

I DO not tell you whether the village of Repton, where the two brothers John and Charles Adams originally resided, is near or far from London: it is a pretty village to this day; and when John Adams, some five-and-thirty years ago, stood on the top of Repton Hill, and looked down upon the houses—the little church, whose simple gate was flanked by two noble yew trees, beneath whose branches he had often sat—the murmuring river in which he had often fished—the cherry orchards, where the ripe fruit hung like balls of coral; when he looked down upon all these dear domestic sights—for so every native of Repton considered them—John Adams might have been supposed to question if he had acted wisely in selling to his brother Charles the share of the well-cultivated farm, which had been equally divided at their father's death. It extended to the left of the spot on which he was standing, almost within a ring fence; the meadows, fresh shorn of their produce, and fragrant with the perfume of new hay—the crops full of promise, and the lazy cattle laving themselves in the standing pond of the abundant farm-yard; in a paddock, set apart for his especial use, was the old blind horse his father had bestrode during the last fifteen years of his life; it leant its sightless head upon the gate, half upturned, he fancied, towards where he stood. It is wonderful what small things will sometimes stir up the hearts of strong men, ay, and what is still more difficult, even of ambitious men. Yet he did not feel at that moment a regret for the fair acres he had parted with; he was full of the importance which the possession of a considerable sum of money gives a young man, who has been fagging almost unsuccessfully in an arduous profession, and one which requires a certain appearance of success to command success—for John Adams even then placed M. D. after his plain name; yet still, despite the absence of sorrow, and the consciousness of increased power, he continued to look at poor old Ball until his eyes swam in tears.

With the presence of his father, which the sight of the old horse had conjured up, came the remembrance of his peculiarities, his habits, his expressions; and he wondered, as they passed in review before him, how he could ever have thought the dear old man testy or tedious; even his frequent quotations from "Poor Richard" appeared to him, for the first time, the results of common prudence; and his rude but wise rhyme, when, in the joy of his heart, he told his father he had absolutely received five guineas as one fee from an ancient dame who had three middle-aged daughters (he had not, however, acquainted his father with *that* fact), came more forcibly to his memory than it had ever done to his ear—

> "For want and age save while you may;
> No morning sun shines all the day."

He repeated the last line over and over again, as his father had done; but as his "morning sun" was at that moment shining, it is not matter of astonishment that the remembrance was evanescent, and that it did not make the impression upon him his father had desired *long* before.

A young, unmarried, handsome physician, with about three thousand pounds in his pocket, and "good expectations," might be excused for building "des chateaux en Espagne." A very wise old lady said once to me—"Those who have none on earth may be forgiven for building them in the air; but those who have them on earth should be content therewith." Not so, however, was John Adams; he built and built, and then by degrees descended to the realities of his position. What power would not that three thousand pounds give him! He wondered if Dr Lee would turn his back upon him now, when they met in consultation; and Mr Chubb, the county apothecary, would he laugh and ask him if he could read his own prescriptions? Then he recurred to a dream—for it was so vague at that time as to be little more—whether it would not be better to abandon altogether country practice, and establish himself in the metropolis—LONDON. A thousand pounds, advantageously spent, with a few introductions, would do a great deal in London, and that was not a third of what he had. And this great idea banished all remembrance of the past, all sense of the present—the young aspirant thought only of the future.

* * * *

Five years have passed. Dr John Adams was "settled" in a small "showy" house in the vicinity of Mayfair; he had, the world said, made an excellent match. He married a very pretty girl, "highly connected," and was considered to be possessed of personal property, because, for so young a physician, Dr Adams lived in "a superior style." His brother Charles was still residing in the old farm-house, to which, beyond the mere keeping it in repair, he had done but little, except, indeed, adding a wife to his establishment—a very gentle, loving, yet industrious girl, whose dower was too small to have been her only attraction. Thus both brothers might be said to be fairly launched in life.

It might be imagined that Charles Adams, having determined to reside in his native village, and remain, what his father and grandfather had been, a simple gentleman farmer, and that rather on a small than a large scale, was altogether without that feeling of ambition which stimulates exertion and elevates the mind. Charles Adams had quite enough of this—which may be said, like fire, to be "a good servant, but a bad master"—but he made it subservient to the dictates of prudence—and a forethought, the gift, perhaps, that, above all others, we should most earnestly covet for those whose prosperity we would secure. To save his brother's portion of the freehold from going into the hands of strangers, he incurred a debt; and wisely—while he gave to his land all that was necessary to make it yield its increase—he abridged all other expenses, and was ably seconded in this by his wife, who *resolved*, until principal and interest were discharged, to live quietly and carefully. Charles contended that every appearance made beyond a man's means was an attempted fraud upon the public; while John shook his head, and answered that it might do very well for Charles to say so, as no one expected the sack that brought the grain to market to be of fine Holland, but that no man in a profession could get on in London without making "an appearance." At this Charles shrugged his shoulders, and thanked God he lived at Repton.

The brothers, as years moved rapidly on—engaged as they were by their mutual industry and success in their several fields of action—met but seldom. It was impossible to say which of the two continued the most prosperous. Dr Adams made several lucky hits; and having so obtained a position, was fortunate in having an abundance of patients in an intermediate sort of state—that is, neither very well nor very ill. Of a really bland and courteous nature, he was kind and attentive to all, and it was certain that such of his patients as were only in moderate circumstances, got well long before those who were rich; his friends attributed this to his humanity as much as to his skill; his enemies said he did not like "poor patients." Perhaps there was a mingling of truth in both statements. The money he had received for his portion of the land was spent, certainly, before his receipts equalled his expenditure; and strangely enough, by the time the farmer had paid off his debt, the doctor was involved, not to a large amount, but enough to render his "appearance" to a certain degree fictitious. This embarrassment, to do him justice, was not of long continuance; he became the fashion; and before prosperity had turned his head by an influx of wealth, so as to render him careless, he got rid of his debt, and then his wife agreed with him "that they might live as they pleased."

It so happened that Charles Adams was present when this observation was made, and it spoke well for both the brothers that their different positions in society had not in the smallest degree cooled their boyhood's affection; not even the money transactions of former times, which so frequently create disunion, had changed them; they met less frequently, but they always met with pleasure, and separated with regret.

"Well!" exclaimed the doctor triumphantly, as he glanced around his splendid rooms, and threw himself into a *chaise longue*—then a new luxury—"well, it is certainly a charming feeling to be entirely out of debt."

"And yet," said his wife, "it would not be wise to confess it in our circle."

"Why?" inquired Charles.

"Because it would prove that we had been in it," answered the lady.

"At all events," said John, "now I shall not have to reproach myself with every extra expense, and think I ought to pay my debts first; now I may live exactly as I please."

"I do not think so," said Charles.

"Not think so!" repeated Mrs Adams in a tone of astonishment.

"Not think so!" exclaimed John; "do I not make the money myself?"

"Granted, my dear fellow; to be sure you do," said Charles.

"Then why should I not spend it as pleases me best? Is there any reason why I should not?"

As if to give the strongest dramatic effect to Charles's opinion, the nurse at that moment opened the drawing-room door, and four little laughing children rushed into the room.

"There—are four reasons against your spending your income exactly as you please; unless, indeed, part of your plan be to provide for them," answered Charles very seriously.

"I am sure," observed Mrs Adams, with the half-offended air of a weak woman when she hears the truth, "John need not be told his duty to his children; he has always been a most affectionate father."

"A father may be fond and foolish," said Charles, who was peculiarly English in his mode of giving an opinion. "For my part, I could not kiss my little Mary and Anne when I go to bed at night, if I did not feel I had already formed an accumulating fund for their future support—a support they will need all the more when their parents are taken from them, as they must be, in the course of time."

"They must marry," said Mrs Adams.

"That is a chance," replied Charles; "women hang on hands now-a-days. At all events, by God's blessing, I am resolved that, if they are beauties, they shall never be forced by poverty to accept unworthy matches; if they are plain, they shall have enough to live upon without husbands."

"That is easy enough for you, Charles," said the doctor, "who have had your broad acres to support

you, and no necessity for expenditure or show of any kind; who might go from Monday morning till Saturday night in home-spun, and never give anything beyond home-brewed and gooseberry wine, with a chance bottle of port to your visiters—while I, Heaven help me! was obliged to dash in a well-appointed equipage, entertain, and appear to be doing a great deal in my profession, when a guinea would pine in solitude for a week together in my pocket."

"I do not want to talk with you of the past, John," said Charles; "our ideas are more likely to agree now than they were ten or twelve years ago; I will speak of the future and present. You are now out of debt, in the very prime of life, and in the receipt of a splendid income; but do not, let me intreat you, spend it as it comes; lay by something for those children; provide for them either by insurance, or some of the many means that are open to us all. Do not, my dear brother, be betrayed by health, or the temptation for display, to live up to an income the nature of which is so essentially precarious."

"Really," murmured Mrs Adams, "you put one into very low spirits."

Charles remained silent, waiting his brother's reply.

"My dear Charles," he said at last, "there is a great deal of truth in what you say—certainly a great deal; but I cannot change my style of living, strange as it may seem. If I did, I should lose my practice. And then I must educate my children; *that* is an imperative duty, is it not?"

"Certainly it is; it is a *part* of the provision I have spoken of, but not the whole—a portion only. If you have the means to do both, it is your duty to do both; and you *have* the means. Nay, my dear sister, do not seem angry or annoyed with me; it is for the sake of your children I speak; it is to prevent their ever knowing practically what we do know theoretically—that the world is a hard world; hard and unfeeling to those who need its aid. It is to prevent the possibility of their feeling *a reverse*."

Mrs Adams burst into tears, and walked out of the room. Charles was convinced that *she* would not uphold his opinion.

"Certainly," said John, "I intend to provide for my children; but *there is no hurry*, and" ——

"There should be no hesitation in the case," interrupted Charles; "every man *intends* to provide for his children. God forbid that I should imagine any man to be sufficiently wicked to say—I have been the means of bringing this child into existence—I have brought it up in the indulgence of all the luxuries with which I indulged myself; and now I intend to withdraw them all from it, and leave it to fight its own way through the world. No man could look on the face of the innocent child nestling in your bosom and say *that*; but if you do not appropriate a portion of the means you possess to save that child from the 'hereafter,' you act as if you had resolved so to cast it on the wild waters of a turbulent world."

"But, Charles, I intend to do all that you counsel; no wonder poor Lucy could not bear these words, when I, your own and only brother, find them stern and reproachful; no wonder that such should be the case; of course I *intend* to provide for my children."

"Then DO IT," said Charles.

"Why, so I will; but cannot in a moment. I have already said there is no hurry. You must give a little time."

"The time may come, my dear John, when TIME will give you no time. You have been spending over and above your debt—more than, as the father of four children, you have any right to spend. The duty parents owe their children in this respect has preyed more strongly on my mind than usual, as I have been called on lately to witness its effects—to see its misery. One family at Repton, a family of eight children, has been left entirely without provision, by a man who enjoyed a situation of five hundred a-year in quarterly payments."

"That man is, however, guiltless. What could he save out of five hundred a-year? How could he live on less?" replied the doctor.

"Live upon four, and insure his life for the benefit of those children. Nay," continued Charles, in the vehemence of his feelings, "the man who does not provide means of existence for his helpless children, until they are able to provide for themselves, cannot be called a reasonable person; and the legislature ought to oblige such to contribute to a fund to prevent the spread of the worst sort of pauperism—that which comes upon well-born children from the carelessness or selfishness of their parents. God in his wisdom, and certainly in his mercy, removed the poor broken-hearted widow of the person I alluded to a month after his death; and the infant, whose nourishment from its birth had been mingled with bitterness, followed in a few days. I saw myself seven children crowd round the coffin that was provided by charity; I saw three taken to the workhouse, and the elder four distributed amongst kind-hearted hard-working people, who are trying to inure the young soft hands, accustomed to silken idleness, to the toils of homely industry. I ask you, John Adams, how the husband of that woman, the father of those children, can meet his God, when it is required of him to give an account of his stewardship?"

"It is very true—very shocking indeed," observed Dr Adams. "I certainly will do something to secure my wife and children from the possibility of anything like *that*, although, whatever were to happen to me, I am sure Lucy's family would prevent"——

Charles broke in upon the sentence his brother found it difficult to complete—"And can you expect distant or even near relatives to perform what you, whose duty it is, neglect? Or would you leave those dear ones to the bitterness of dependence, when, by the sacrifice or curtailment of those luxurious habits which, if not closely watched, increase in number, and at last become necessaries, you could leave them in comfort and independence? We all hope for the leisure of a death-bed—awful enough, come as it may—awful, even when beyond its gloom we see the risen Sun of Righteousness in all his glory—awful, though our faith be strong in Him who is our strength; but if the consciousness of having neglected those duties which we were sent on earth to perform be with us then, dark, indeed, will be the Valley of the Shadow of Death. I do not want, however, to read a homily, my dear brother, but to impress a truth; and I do hope that you will prevent the possibility of these dear children feeling what they must feel, enduring what they must endure, if *you* passed into another world without performing your duty towards them, and through them to society, in this."

Mrs Adams met her brother-in-law that day (people five-and-twenty years ago did dine by day) at dinner, with an air of offence. She was, of course, lady-like and quiet, but it was evident she was displeased. Everything at table was perfect according to its kind. There was no guest present who was not superior in wealth and position to the doctor himself, and each was quite aware of the fact. Those who climb boldly sometimes take a false step, but at all times make dangerous ones. When Charles looked round upon the splendid plate and stylish servants—when the children were ushered in after dinner, and every tongue was loud in praises of their beauty—an involuntary shudder passed through his heart, and he almost accused himself of selfishness, when he was comforted by the remembrance of the provision made for his own little ones, who were as pretty, as well educated, and as happy in their cheerful country home.

The next morning he was on his return to Repton, happy in the assurance his brother had given him before they parted, that he would really lay by a large sum for the regular insurance of his life.

"My dear John," said the doctor's wife, "when does the new carriage come home? I thought we were to have had it this week. The old chariot looked so dull to-day, just as you were going out, when Dr Fitzlane's new chocolate-colour passed; certainly that chocolate-coloured carriage picked out with blue and those blue liveries are very, very pretty."

"Well, Lucy, I think them too gay—the liveries I mean—for an M.D.; quieter colours do best; and as to the new carriage, I had not absolutely ordered it. I don't see why I cannot go on with the jobs; and I almost think I shall do so, and appropriate the money I intended for *my own* carriage to another purpose."

"What purpose?"

"Why, to effect an insurance on my life. There was a great deal of truth in what Charles said the other day, although he said it coarsely, which is not usual with him; but he felt the subject, and I feel it also; so I think of, as I said, going quietly on with the jobs—at all events till next year—and devoting this money to the insurance."

It is difficult to believe how any woman, situated as Mrs Adams was, could have objected to a plan so evidently for her advantage and the advantage of her family; but she was one of those who never like to think of the possibility of a reverse of fortune—who thrust care off as long as they can, and who feel more pleasure in being lavish as to the present than in saving for the future.

"I am sure," she answered, in the half-petted half-peevish tone that evinces a weak mind—"I am sure if anything was to happen to you, I would break my heart at once, and my family, of course, would provide for the children. I could not bear the idea of reaping any advantage by your death; and really the jobs are so very inferior to what they used to be—and Dr Leeswor, next door but one, has purchased such a handsome chariot—you have at least twice his practice; and —— Why, dear John, you never were in such health; there will be no necessity for this painful insurance. And after you have set up your *own* carriage, you can begin and lay by, and in a few years there will be plenty for the children; and I shall not have the galling feeling that any living thing would profit by your death. Dear John, pray do not think of this painful insurance; it may do very well for a man like your brother—a man without refinement; but just fancy the mental torture of such a provision."

Much more Mrs Adams talked; and the doctor, who loved display, and had no desire to see Dr Leeswor, his particular rival, or even Dr Fitzlane, better appointed than himself, felt strongly inclined towards the new carriage, and thought it would certainly be pleasanter to save than to insure, and resolved to begin immediately *after* the purchase of his new equipage.

When persons are very prosperous, a few ten or twenty pounds do not much signify, but the principle of careless expenditure is hard to curb.

Various things occurred to put off the doctor's plan of laying by. Mrs Adams had an illness, that rendered a residence abroad necessary for a winter or two. The eldest boy must go to Eton. As their mamma was not at home, the little girls were sent to school. Bad as Mrs Adams's management was, it was better than no management at all. If the doctor had given up his entertainments, his "friends" would have said he was going down in the world, and his patients would have imagined him less skilful; besides, notwithstanding his increased expenditure, he found he had ample means, not to lay by, but to spend on without debt or difficulty. Sometimes his promise to his brother would cross his mind, but it was soon dispelled by what he had led himself to believe was the impossibility of attending to it then. When Mrs Adams returned, she complained that the children were too much for her nerves and strength, and her husband's tenderness induced him to yield his favourite plan of bringing up his girls under his own roof. In process of time two little ones were added to the four, and still his means kept pace with his expenses; in short, for ten years he was a favourite with the class of persons who render favouritism fortune. It is impossible, within the compass of a tale, to trace the minutiæ of the brothers' history; the children of both were handsome, intelligent, and, in the world's opinion, well educated. John's eldest daughter was one amongst a thousand for beauty of mind and person; hers was no glaring display of figure or information. She was gentle, tender, and affectionate; of a disposition sensitive, and attuned to all those rare virtues in her sphere, which form at once the treasures of domestic life and the ornaments of society. She it was who soothed the nervous irritability of her mother's sick chamber and perpetual peevishness, and graced her father's drawing-room by a presence that was attractive to both old and young, from its sweetness and unpretending modesty; her two younger sisters called forth all her tenderness, from the extreme delicacy of their health; but her brothers were even greater objects of solicitude—handsome spirited lads—the eldest waiting for a situation, promised, but not given; the second also waiting for a cadetship; while the youngest was still at Eton. These three young men thought it incumbent on them to evince their belief in their father's prosperity by their expenditure, and accordingly they spent much more than the sons of a professional man ought to spend under any circumstances. Of all waitings, the waiting upon patronage is the most tedious and the most enervating to the waiter. Dr Adams felt it in all its bitterness when his sons' bills came to be paid; but he consoled himself, also, for his dilatoriness with regard to a provision for his daughters—it was impossible to lay by while his children were being educated; but the moment his eldest sons got the appointments they were promised, he would certainly save, or insure, or do something.

People who only *talk* about doing "something," generally end by doing "nothing." Another year passed; Mrs Adams was still an invalid, the younger girls more delicate than ever, the boys waiting, as before, their promised appointments, and more extravagant than ever; and Miss Adams had made a conquest which even her father thought worthy of her.

The gentleman who had become really attached to this beautiful girl was of a high family, who were sufficiently charmed with the object of his affections to give their full sanction, as far as person and position were concerned; but the prudent father of the would-be bridegroom thought it right to take an early opportunity of waiting upon the doctor, stating his son's prospects, and frankly asking what sum Dr Adams proposed settling on his daughter. Great, indeed, was his astonishment at the reply—"He should not be able to give his daughter anything *immediately*, but at his death." The doctor, for the first time for many years, felt the bitterness of his *false position*. He hesitated, degraded by the knowledge that he must sink in the opinion of the man of the world by whom he was addressed; he was irritated at his want of available funds being known; and though well aware that the affections of his darling child were bound up in the son of the very gentlemanly but most prudent person who sat before him, he was so high and so irritable in his bearing, that the fathers parted, not in anger, but in anything but good feeling.

Sir Augustus Barry was not slow to set before his son the disadvantages of a union, where the extravagant habits of Miss Adams had no more stable support than her father's life; he argued that a want of forethought in the parents would be likely to produce a want of forethought in the children; and knowing well what could be done with such means as Dr Adams had had at his command for years, he was not inclined to put a kind construction upon so total a want of the very quality which he considered the best a man could possess; after some delay, and much consideration of the matter, he told his son that he really could not consent to his marriage with a penniless bride. And Dr Adams, finding that the old gentleman, with a total want of that delicacy which monied men do not frequently possess, had spoken of what he termed too truly and too strongly his "heartless" want of forethought, and characterised as a selfishness the indulgence of a love for display and extravagance, when children were to be placed in the world and portioned—insulted the son for the fault of the father, and forbade his daughter to receive him.

Mary Adams endeavoured to bear this as meekly as she had borne the flattery and the tenderness which had been lavished on her since her birth. The bitter, bitter knowledge that she was considered by her lover's family as a girl who, with the chance of being penniless, lived like a princess, was inconceivably galling; and though she had dismissed her lover, and knew that her father had insulted him, still she wondered how he could so soon forget her, and never write even a line of farewell. From her mother she did not expect sympathy; she was too tender and too proud to seek it; and her father, more occupied than ever, was seldom in his own house. Her uncle, who had not been in town for some years, at last arrived, and was not less struck by the extreme grace and beauty of his niece, than by the deep melancholy which saddened her voice and weighed down her spirits. He was evidently anxious to mention something which made him joyous and happy; and when the doctor entered the library with him, he said, "And may not Mary come in also?" Mary did come in; and her gentle presence subdued her uncle's spirits. "I had meant to tell the intended change in my family only to you, brother John; but it has occurred to me we were all wrong about

my niece; they said at home, 'Do not invite my cousin, she is too fine, too gay to come to a country wedding; she would not like it;' but I think, surrounded as she is by luxuries, that the fresh air of Repton, the fresh flowers, fresh fields, and fresh smiles of her cousins would do my niece good, great good, and we shall be quite gay in our own homely way—the gaiety that upsprings from hearts grateful to the Almighty for his goodness. The fact is, that in about three weeks *my* Mary is to be married to our rector's eldest son! In three weeks. As he is only his father's curate, they could not have afforded to marry for five or six years, if I had not been able to tell down a handsome sum for Mary's fortune; it was a proud thing to be able to make a good child happy by care in time. 'Care in time,' that's my stronghold! How glad we were to look back and think, that while we educated them properly, we denied ourselves to perform our duty to the children God had given to our care. We have not been as *gay* as our neighbours, whose means were less than ours; we could not be so, seeing we had to provide for five children; but our pleasure has been to elevate and render those children happy and prosperous. Mary will be so happy, dear child—so happy! Only think, John, she will be six years the sooner happy from our *care in time!*" This was more than his niece could bear. The good father was so full of his daughter's happiness, and the doctor so overwhelmed with self-reproach—never felt so bitterly as at that moment—that neither perceived the death-like paleness that overspread the less fortunate Mary's face. She got up to leave the room, staggered, and fell at her father's feet.

"We have murdered her between us," muttered Dr Adams, while he raised her up; "murdered her; but *I* struck the first blow. God forgive me! God forgive me!"

That night the brothers spent in deep and earnest converse. The certainty of his own prosperity, the self-gratulation that follows a just and careful discharge of duties imposed alike by reason and religion, had not raised Charles above his brother in his own esteem. Pained beyond description at the suffering he had so unconsciously inflicted on his niece—horror-struck at the fact, that thousands upon thousands had been lavished, yet nothing done for hereafter, the hereafter that *must* come, he urged upon John the danger of delay, the uncertainty of life. Circumstances increased his influence. Dr Adams had been made painfully aware that gilding was not gold. The beauty, position, and talents of his beloved child, although fully acknowledged, had failed to establish her in life. "Look, Charles," he said, after imparting all to his brother, absolutely weeping over the state of uncomplaining but deep sorrow to which his child was reduced, "if I could command the necessary sum, I would to-morrow insure my life for a sum that would place them beyond the possible reach of necessity of any kind."

"Do not wait for that," was the generous reply of Charles Adams; "I have some unemployed hundreds at this moment. Come with me to-morrow; do not delay a day, no, nor an hour; and take my word for it you will have reason to bless your resolve. Only imagine what would be the case if God called you to give an account of your stewardship." But he checked himself; he saw that more was not necessary; and the brothers separated for a few hours, both anxious for the morning. It was impossible to say which of the two hurried over breakfast with the greatest rapidity. The carriage was at the door; and Dr Adams left word with his butler that he was gone into the city on urgent business, and would be back in two hours.

"I don't think," exclaimed Charles, rubbing his hands gleefully, "I don't think, that if my dear niece were happy, I should ever have been so happy in all my life as I am at this moment."

"I feel already," replied John, "as if a great weight were removed from my heart; and were it not for the debt which I have contracted to you—— Ah, Charles, I little dreamt, when I looked down from the hill over Repton, and thought my store inexhaustible, that I should be obliged to you thus late in life. And yet I protest I hardly know where I could have drawn in; one expense grows so out of another. These boys have been so very extravagant; but I shall soon have the two eldest off; they cannot keep them much longer waiting."

"Work is better than waiting; but let the lads fight their way; they have had, I suppose, a good education; they ought to have had professions. There is something to me awfully lazy in your 'appointments;' a young man of spirit will appoint himself; but it is the females of a family, brought up as yours have been, who are to be considered. Women's position in society is changed from what it was some years ago; it was expected that they must marry; and so they were left, before their marriage, dependent upon fathers and brothers, as creatures that could do nothing for themselves. Now, poor things, I really don't know why, but girls do not marry off as they used. They become old, and frequently—owing to the expectation of their settling—without the provision necessary for a comfortable old age. This is the parent of those despicable tricks and arts which women resort to to get married, as they have no acknowledged position independent of matrimony. Something ought to be done to prevent this. And when the country steadies a little from the great revolution of past years, I suppose something may be thought of by improved teaching—and systems to enable women to assist themselves, and be recompensed for the assistance they yield others. Now, imagine your dear girls, those younger ones particularly, deprived of you"——

"Here is the patient upon whom I must call, *en route*," interrupted the doctor.

The carriage drew up.

"I wish," said Charles, "you had called here on your return. I wanted the insurance to have been your first business to-day."

"I shall not be five minutes," was the reply. The servant let down the step, and the doctor bounded up towards the open door. In his progress, he trod upon a bit, a mere shred, of orange-peel; it was the mischief of a moment; he slipped, and his temple struck against the sharp column of an iron-scraper. Within one hour, Dr John Adams had ceased to exist.

What the mental and bodily agony of that one hour was, you can better understand than I can describe. He was fully conscious that he was dying—and he knew all the misery that was to follow.

SKETCHES IN NATURAL HISTORY.

PARASITICAL ANIMALS.

THE class of insects affords us numerous examples of creatures pre-eminently parasitic. They effect a lodgment, as has been seen, in and upon a great variety of different animals, and in an equally great variety of different methods: they do not themselves, however, escape similar inroads; and the great compensatory law, "To eat and to be eaten," is as strictly enforced in their case as it is in most others. The larger beetles are infested with those thread-like worms called *gordii;* and such as are so afflicted are said, in some parts of England, to be possessed by an imp. They are frequently also overrun with acari or mites; the great dorr, or dung-chafer, is often observed lying on the path in warm weather completely disabled from this cause. The useful and industrious bee not only has her treasured sweets pillaged by other animals, but is herself assailed by a small spider-like parasite (*Braula cœca*) of a very singular description. The body is brown and shining, composed of a tough leathery substance. The animal is totally blind, no appearance of eyes having been detected; their place is occupied by a subsidiary pair of feelers. The terminal joint of the foot is not provided with claws, as is commonly the case with such creatures, but with a cross row of numerous hooks, much better fitted for holding on by the fine hair which invests the body of the bee. The presence of the parasite evidently occasions great annoyance, for the bee becomes extremely restless, running about in all directions, as if seeking rest or the means of getting rid of its enemy; and when the queen is attacked, she intermits her operation of egg-laying, and shows every symptom of uneasiness. The vegetating mite (*Uropoda vegetans*) attaches itself to many kinds of insects in immense numbers, by means of a long and delicate filament arising from the extremity of its body; and through this slender tube it pumps the juices by which it is nourished. Thus it is that many insects which support themselves by sucking the blood of other animals are compelled, by a kind of retributary process, to contribute a portion of their own nutritive fluid for the sustenance of others. Those who have suffered from the phlebotomy of gnats and midges, and more especially those luckless travellers in foreign lands whose sleep has been so often murdered by the pestilent mosquitos, notwithstanding all their troublesome precautions of fumigation and muslin curtains, will, it is to be feared, be almost gratified to learn that their bloodthirsty assailants themselves suffer pain similar to what they inflict, by being forced to support in turn a tiny foe which makes a settlement on their bodies. Perhaps the most curious observation on the parasitical system ever made was that related by the distinguished Swedish naturalist, the Baron de Geer. He observed a heap of small acari upon the body of a kind of wood-beetle (*Leptura*), several of which are common in this country, and he placed them under a magnifying glass to watch their proceedings. He perceived that the beetle was incapable of walking, and seemed by its contortions to be enduring great pain. The cause of this immediately became apparent. One parasite had fixed its sucker in the insect, and was draining its juices; to this parasite another of the same kind was attached, and doing the same thing to it; while a third drained the second, and so on in succession through a considerable number, the whole firmly fixed together by the funnel-shaped tubes that issue from their tails, and forming a continuous chain of suckers! A portion of the fluid, or white blood of the insect, was no doubt absorbed by each in its passage; and thus the whole series appear to have been satisfied, although only one was drinking from the fountain head.

The little creatures hitherto alluded to as parasitical upon insects, are not themselves, properly speaking, insects, for although the acari are pretty closely related to them, they possess attributes indicating an essential distinction. But it does happen with insects properly so called, and it is one of the most remarkable circumstances in their history, that they are very often parasitic on each other. Extensive tribes can only maintain themselves in existence by the destruction of individuals of their own class; and this prevails to such a degree as to render it obvious that it is one of the natural checks which have been placed on their inordinate increase.

The tribe of insects on which this duty is principally, although by no means exclusively, devolved, are the *Ichneumons*, of which a great number occur in almost every country, and not much short of a thousand species in our own island. The name ichneumon has been transferred to them from a quadruped inhabiting the banks of the Nile, and which, as well as the famous Ibis, received divine honours from the Egyptians, on account of its supposed utility in destroying the eggs of crocodiles and serpents—a service similar to that performed by these insects in regard to noxious members of their own class. The larger kinds, or ichneumons proper, are easily known by their peculiar form, the body being generally long and very narrow, and the abdomen or hinder part united to the anterior by a narrow peduncle; and to the hinder extremity is attached a long slender appendage, often exceeding the length of the body, divisible into three pieces scarcely thicker than a hair. These constitute the instrument employed by the insects to place their eggs in the interior of the bodies of other insects, forming at once an auger to bore a hole and a conduit to convey the eggs to their destined station. There is not, perhaps, a caterpillar, especially if at all a common one, and devouring plants of utility to man and animals, that has not one or more of these parasites which make it their prey. The ordinary mode of proceeding is for the ichneumon to alight on the caterpillar, to thrust its auger into its body, and leave an egg in the hole, repeating the operation in several different places, care being taken at the same time that the number of eggs deposited be proportioned to the capacity of the caterpillar to afford food for the larvæ to which they are to give birth. The latter eat their way into the interior of the body, and consume all the fatty matter; directed, however, by a singular instinct, they avoid injuring the vital parts, so that the involuntary foster-mother lives sufficiently long to enable the parasites to reach maturity. They then either force a passage out, and undergo their remaining metamorphoses on the ground, or these changes take place within the shrivelled skin of the dead caterpillar.

It does not often happen that ichneumons commit their progeny to the bodies of mature, or, as they are called, perfect, insects; and this is quite in accordance with their assigned duty of preventing the superabundance of other tribes. Moths and butterflies, in general, are the most destructive insects to vegetation, and these, therefore, require most to be kept in subordination. Now, the females of these two tribes, particularly of the former, usually deposit their eggs in a very short time after they enter upon their winged state, and in most cases soon afterwards die, as if they had completed the grand purpose for which they had assumed the perfect form, namely, the continuation of the species. The same thing, to a greater or less extent, may be said of most insects. If, therefore, the parasitic flies were to oviposit on perfect insects, the probability, or rather in most instances the certainty, is, that these insects would not be thereby prevented from laying their eggs; and their speedy death, from natural causes, would also of necessity entail that of the parasites. Still, there are instances to the contrary; for example, the troublesome cockroach (*Blatta orientalis*), or black beetle, as it is often called, so common in bakehouses and similar places, often becomes the victim of a small ichneumonideous fly, of a most extraordinary aspect, from the circumstance of the abdomen, which usually forms the most conspicuous portion of these animals, being reduced to a minute triangular piece, and connected with the body by a long slender stalk, as if it were an accidental appendage rather than an organ of such essential importance.

The eggs of insects, especially those of butterflies and moths, are often made a receptacle for parasites; and the minuteness of the latter may be conceived from the singular fact, that a single egg, scarcely bigger than a pin head, has been known to produce several! The chrysalides of butterflies, moths, and saw-flies, are also chosen nurseries of the ichneumons, their auger enabling them to bore through the hard case, and lodge their eggs in the interior. The length of the ovipositing instrument is shown to be of essential advantage in such cases, for the chrysalides are generally placed in the bottom of crevices, in the interior of plants, under leaves, in the earth, and other places of concealment, which a shorter implement could not reach. It is impossible to mention this without being struck with the singular instinct, or faculty, by which the ichneumon discovers the object of its search, when to our senses there is not the smallest indication of its presence. One of them has been seen to pierce the tubular stalk of an herbaceous plant, just over the spot where a chrysalis was concealed in the interior; and yet a careful examination of the spot afterwards could not enable the observer to detect the slightest difference between that and the adjoining portions of the stem. This fact, and several others of a precisely similar nature, give strength to the supposition that these creatures are endowed with a peculiar sense or faculty, to which we and the higher animals possess nothing analogous, and of which, therefore, we can form no adequate conception. Sometimes a single ichneumon is reared in one chrysalis; as, for example, in that of the magpie moth, so common in gardens; sometimes a whole swarm, as in the chrysalis of the common white cabbage butterfly. Even though the ichneumons, however, as in the latter instance, issue from the chrysalis, they may have been first received by the caterpillar; and, indeed, this is generally the case where there are many. But the caterpillar may have been near its change when the parasites were hatched in it, and they therefore continue in the chrysalis till they come to maturity, their mordications not having been so great as to prevent the transformation to a chrysalis, although the infested insect in no instance survives that stage of its development. An example of a parasite of this nature, so common that it may fall under the observation of every one, is to be found in the *Microgaster glomeratus*, which occurs in the caterpillar and chrysalis of the

common white cabbage butterfly. After these caterpillars have climbed up walls, into outhouses, and occasionally even into dwelling-houses, which they do for the purpose of undergoing the change to a chrysalis, they may be often observed lying in a dead or dying state upon a cluster of small oval bodies, composed of a fine yellow silk. These are the cocoons of the Microgaster, which have been spun after they eat their way through the skin of the caterpillar, and there they will continue to lie till the mature flies be ready to issue forth. This they accomplish by pushing open a small circular piece at one end of the cocoon, which is but slightly attached, and opens to pressure from within, almost like the lid of a snuff-box. The flies are about two lines long, the body shining black, the legs reddish-yellow, the wings brightly iridescent, having few nervures, and each with a triangular black spot near the middle of the anterior margin.

Before the mode in which these creatures propagate themselves was understood, their appearance excited great surprise among naturalists, and it is amusing to observe how they attempted to account for a swarm of four-winged flies issuing from a chrysalis which was naturally expected to produce a butterfly. One supposed that when, from any defect or weakness, nature failed to bring forth a butterfly from a caterpillar, in order that her object might not be entirely lost she changed her purpose, and formed of the materials insects of smaller size and less perfect structure. In the parallel case of gall-flies, the most skilful observer of his day was forced into the notion that they were generated by a vegetative and sensitive soul in the plant itself; and other opinions, equally extravagant, were promulgated on the subject.

The number of insects, particularly of a noxious kind, that fall victims to these insidious foes, is greater than could be readily believed. It is not too much to assert, that without this corrective agency on the part of nature itself, it would be impossible for man, with all his skill and resources, to rear many of the crops on which he now chiefly depends for subsistence. A little midge (*Cecidomyia tritici*), just large enough to be distinctly visible without a magnifying glass, would in all probability sweep the wheat crop before it, so great are its capacities for multiplication and consumption, were it not kept within comparatively safe limits by the operation of no fewer than *three* separate species of parasites.* Its American counterpart, the still more formidable Hessian-fly (*Cecidomyia destructor*), is kept in check by a diminutive enemy of a similar description; and as this seems to take the field without receiving assistance from any allied force, its numbers are proportionally great to make up for the deficiency. The number of moths (one of the tribes most extensively injurious to vegetables) that fall a sacrifice to similar foes, is well known to those who collect caterpillars and chrysalides in the fields, and keep them for the purpose of obtaining fresh specimens of the perfect insects. Of ten chrysalides of the moth which defoliates currant bushes, collected for the purpose alluded to, seven were found to be pierced by ichneumons; and this is perhaps not much beyond the general average in such cases. The destructive caterpillar of the Arches Moth is attacked by no fewer than *four* species of two-winged parasitical flies, and *five* ichneumons; and so speedily do their combined onsets reduce its ranks to a harmless condition, that an esteemed German writer recommends that numbers of them should be reared in a room, and then let loose upon the depredators.

But if such parasites were always allowed to ravage uncontrolled, they might in certain cases completely extirpate the tribes on which they prey. Hence the necessity of an occasional counterpoise to adjust the balance. This is effected by a double parasitism—the parasite itself becoming the victim of another. Of this we shall mention only one example out of the many that might be adduced. Every one is acquainted with the injuries done to plants by the aphides or plant-lice, which live in society, and attach themselves to the stem, leaves, &c., and extract the vegetative juices by suction, clustering together in such numbers as to destroy the health of the plant, and give it a most unsightly appearance. These vegetable pests are preyed upon by many destructive enemies; but that now to be noticed is a small ichneumon named *Aphidius rapae*. "As there are many generations of these flies in a summer," says Mr Curtis, "it follows that they are most formidable enemies to the plant-lice; and Providence, watchful of all his works, and regarding in the smallest as well as the greatest that balance which preserves the order of the universe, to avert the total annihilation of the feeble aphides, has provided numerous other parasitic flies to destroy the destroyers, and again keep them in check. The aphidii are such constant attendants upon infested plants, that I scarcely ever notice any unaccompanied by the horny shells of the defunct plant-lice; and even in a green-house I have seen nearly as many of these parasites as there were of the aphides. The flies which destroy the maggots of the full-fed aphidii, glutted with the vitals of the plant-lice, are all Hymenoptera; and whilst they fly about to reconnoitre the aphides, no sooner have they met with one that contains a maggot than they pierce the already indurated shell, and deposit an egg within; as soon as it hatches, it commences feeding upon the parasitic maggot, or, more probably, on the quiescent pupa."† Instead of an aphidius, therefore, one or other of three or four different parasites burst from their dark cell, and these can propagate their species in no other way but by repeating the same process—a wonderful instance of ingenious and elaborate contrivance for maintaining an almost boundless multitude of living beings, and at the same time rendering the existence of these multitudes perfectly compatible with the general welfare of the whole.

* To enable him to form a definite notion of the number of larvæ of the wheat-midge that are housed with the grain from infested fields, Professor Henslow of Cambridge recently counted those contained in a certain measure of chaff-dust, and thence calculated the numbers in a bushel of it. These were, in one instance, 131,616; in another, 173,376; and in a third, 406,944!

OCCASIONAL NOTES.

IMITATIVE CRIME.

PUBLIC attention is now and then arrested by series of crimes, each instance of which after the first is clearly produced by the principle of imitation. It is a subject of some importance in highly advanced communities, and demands some investigation into its causes.

Offences which take place in these circumstances are the result of a morbid inclination to imitate. The imitative faculty is, like all the other mental faculties, liable to an excitation amounting to disease, in which condition it leads to acts that give an appearance of infatuation or want of self-control. A few cases in which this mental affection rose to a great height, may be said to be amongst the most curious anecdotes of human nature which have been recorded. M. Pinel describes an idiot girl who repeated, like an automaton, everything she heard said, and imitated every gesture and action of others with the greatest accuracy. Cabanis gives an account of a man so excitable, "that he felt himself impelled to repeat all the attitudes and movements which he witnessed. If at any time they hindered him to obey that impulse, either by constraining his limbs or obliging him to assume contrary attitudes, he experienced the most insupportable anguish." This is not strictly the class of cases to which those in question belong, but they serve to illustrate a morbid imitativeness generally. We here see a tendency to simulate the acts of others, to a degree which defied all control from the reasoning faculties, as usually exercised.

There is another class of cases which come a little nearer to those in question. These are cases in which a convulsive disorder or mental malady attacking one person, spreads to a number of others. It has been found in hospitals, that all the patients in one ward have been seized, one after another, with fits of some kind, in consequence of seeing a real case in one of their number. In 1837, at the school of Bielefeld, in Germany, a girl named Arnold was seized with an epileptic fit during school hours. Though she was instantly carried home, her appearance made a great impression on her female associates. After a few days, one of these was seized in like manner. Next day, two more were seized. On the ensuing day, the school had scarcely assembled, when three were affected; and in less than half an hour the number amounted to twenty. The malady was treated in the usual way with little effect. It was ascertained that, besides the girl Arnold, none of these children had ever had epileptic fits before, or shown the slightest predisposition to the disease.† In an English factory, a few years ago, a single girl being seized with convulsions, fully half of her companions had fallen into the same condition in the course of the ensuing two days, and it was not without great difficulty that a stop was put to the epidemic. The wild doings at some religious meetings in America are a similar affection. The process seems to be this. The feelings are, in the first place, much agitated, and the whole affective system becomes inordinately susceptible. The imitative faculty then acquires an unusual activity, and carries off the patient into acts and attitudes which he would never think of exhibiting in a sane moment.

Yet this condition is capable of being acted upon from without, and that to some purpose. In the well-authenticated case of the children of the poor-house at Haarlem, who fell one after another into fits in consequence of a girl of their number becoming so affected, Boerhaave put a stop to the malady by getting certain irons made red hot in presence of the juvenile inmates, and mentioning, with professional solemnity, that every one who took the fits must be burnt to the bone by these instruments. It is stated that not one case took place after this exhibition, although they had been frequent up to that moment. We have here, unquestionably, a simple instance of one strong impulse or tendency being overcome by another. The tendency to go off in convulsions like their neighbours was a strong and a real one, but the dread of cauterising was, while equally real, a stronger one, and therefore gained the victory. There is a story of suicide being prevalent in a French regiment in consequence of one striking instance, and being at last put down by an order that the corpse of every man who put an end to his own life should be subjected to some prescribed ignominious treatment.

The application of these facts to the regicidal mania which appeared in France a few years ago, and more recently in England, is obvious. The object is to repel the tendency by a force of the mind calculated to be effectual in such a class of cases. As it appears that those who commit such crimes are chiefly impelled by a desire to become the objects of a flattering public interest, the best course would be to inflict the punishment most inconsistent with that desire; one, in short, which would mark public contempt or ridicule.

It is curious to observe how crime is affected in modern times by that element of our state, formerly wanting—the press. Almost every day we may trace misdemeanours of an important character to the notoriety with which the newspapers invest some events. Had the boy Jones intruded into the palace in the time of Elizabeth, there would have been no means of acquiring notoriety from the act, and it probably would not have been repeated. Made a noted person by the press (which with many is the same as a hero), the offender is tempted to renew the misdemeanour. Popular disturbances long ago spread slowly: now, let any take place in one district, they are instantly proclaimed over all by the newspapers, and spread from point to point partly by favour of this diffusion of the simple intelligence, and partly by virtue of the excitement which the notoriety produces. The duties of those who enforce the laws must be much modified by these new conditions.

PEDESTRIAN TOUR IN SWITZERLAND.

THE GRIMSEL—GLACIER OF THE RHONE—DESCENT OF THE VALLAIS TO BRIEG.

AUGUST 24.—When I rose at an early hour in the hospice of the Grimsel, I felt much as I have done on many a winter morning in town—cold and drowsy, and averse to much exertion. The feeling was shared by my companions, and we were all eager to leave behind us the region of snow and granite, and descend as soon as possible to a sunnier clime: we waited not for breakfast, but carried with us bread and meat, and some wine, to which we might betake ourselves as hunger suggested. When we passed the door of the hospice, the open air sent a still colder chill through our blood. The rich light which the setting sun of last night had cast upon the rocks and snows was gone, and everything had a leaden and cheerless aspect; indeed, no objects were visible for any considerable distance, and if we had known the locality better, we would have perceived that the top of the pass, which we had to cross, was shrouded in mist. Early as it was, a few of the professional guides were lounging about; and as we started unattended, we could not but observe that they cast significant looks at each other, which seemed more emphatic than the usual professional sneer which personages of that class throw on the forlorn mortals who, either from choice or necessity, depend on their own resources. It was not difficult to find the path, which, for some way after we left the hospice, was well trodden. As we rose higher, we had to pass over ledges of bare rock and fields of hardened snow, where footsteps had left small trace, but there were poles erected here and there to mark the track, and we had little difficulty in noticing them. But there was an enemy in the path which we did not foresee—a dense and heavy mist, into the body of which we entered so gradually, that we were in thick darkness ere we were well roused to its existence. We walked in a triangle, and when any one came to a post, he shouted, and thus we knew that we were still in the track. Proceeding in this manner, we came at last to the edge of a piece of water. It was impossible to perceive boundaries to it; and for aught the eye could descry to the contrary, it might be the Black Sea, for it was swarthy as Spartan soup: we applied at this spot to Murray's Hand-book, in hopes of finding some account of these mysterious waters, and we there found the following statement: "On the crest [of the pass] lies a small lake called Todten See, or Lake of the Dead, because the bodies of those who perished in the pass were thrown into it by way of burial." This was highly consolatory.

We were now in what the Americans call a *fix*, for we had lost all trace of path or posts, and we condescended to admit, that if a guide were to present himself for one moment, and just tell us whether to go to the right or to the left, we would excuse his presence during such announcement. As matters stood, we had to make the best use of our own resources. We spread Keller's map on a stone, laid our compass above it, and grouping round it like the witches in Macbeth, set about taking bearings with a very serious and scientific formality. The result was, that we resolved to proceed to the left, which carried us apparently in a south-easterly direction. Here we found a footpath—it was so narrow that it might be used only by the goats; but it was something. We had still to ascend, and as we were between seven and eight thousand feet above the sea, the cold was severe. But a new element was gradually being added to our evils. The wind beginning with feverish gusts, at last blew fiercely in our faces, bringing with it a sleety rain; we were glad it was not snow. The hurricane grew louder and louder, and we heard its wild bellowings in the unseen clefts of the rocks like the blowing of a thousand bellows. At length it was clear that we were at the ridge of the pass, where the rain that trickled on one side would go down to the German

Ocean, and that on the other to the Mediterranean. It was a comfort to have a descent before us; but there was one alloy to this, in the too apparent fact that we had taken the wrong path, for that which we followed led decidedly too much eastward to lead to Ober Gestelen on the Rhone, our place of destination. However, it was a decided path, and leave it we would not. Our suspicion was, that it led to the Furca, and that we were thus on the way into Italy.

We had now wandered a good many miles, and hunger came upon us; but with the storm raging round and round us, it was a most puzzling problem how we could accomplish what could in any sense be called a comfortable meal. Among the huge rocks we were surrounded by, not one would afford a shadow of shelter, for the wind rushed into every cranny, and there was nothing for it but to open the brown paper package we had brought from the hospice, and feed in the face of the wind and rain. We had fortunately a bottle of wine with us, which was mighty acceptable, and so far raised our spirits, that we made some bold attempts to accompany our meal with vocal music, in which we were so far successful as to prove satisfactorily that not one of us had either voice or ear for such an accomplishment. On we went, recruited and refreshed, and at last the storm began to abate and the mist to clear away. It was during this latter operation that I observed, looming through the partial veil of vapour, a huge white-looking mass spread out far under us. When the atmosphere became a little clearer, there was no chance of the majestic features of this object being mistaken by any one who had seen it pourtrayed in picture—it was indeed the great Glacier of the Rhone, spreading its convex and almost dome-like surface of ice across the valley, of which the declivity we were descending formed one of the mountain walls. We now knew where we were, and taking off our hats, gave the glacier a hearty cheer. We did not venture to descend upon it, near which we saw a wild and lonely-looking house, probably a hospice for travellers crossing the Furca; and we contented ourselves with viewing from a safe distance its fearful chasms and glittering pyramids of ice. Not the least wonderful part of this prodigious scene is the mighty river which dashes at once full and large from the great portal arch below, like a plumed army galloping forth from a castle gate. It is a source worthy of a noble river, and we were far from regretting this result of a few miles' departure from the nearest path.

When we came near the river's brink, we passed a singular edifice of unhewn stone, with no windows, but with a locked and stancheoned oaken door. It was a mysterious-looking object, and made us suspect that the Todten See was not the only receptacle for the unfortunates who met their death on the three passes which here meet—the Gries, the Grimsel, and the Furca. We had a rapid descent by the side of the turbulent Rhone, which shoots itself over successive shelves of rock, making cataracts to which Foyers and the Falls of Clyde are driblets, and which, from the great bulk of water tossed over them, challenge comparison even with the great Handeck. Near the source there were no trees, but after a descent of a few miles, we came to forests of dusky pines, clothing the mountain sides in broad masses. The sky, though not misty, was dark and lowering; and the sad and solemn aspect of the whole scene—the pines, the dark sky, and the turbulent river—forcibly reminded one of the many such landscapes pourtrayed by the bold pencil of Ruysdael. At length we reached the villages of Ober-wald and Ober-gestelen; and at them we noticed, what every mile we walked in the canton of the Vallais confirmed to us, the marked difference between the population we had come among and that we had just left. The Bernese are fair, fat, and full featured—decidedly German in aspect; but if there be any truth in physiognomical characteristics, the oval faces, swarthy complexions, hooked noses, and penetrating black eyes of the Vallaisians, tell of a kindred origin with their Italian neighbours of the other side of the south-east chain of hills. In the females, the characteristic features of the two cantons are encouraged, as it were, by their distinguishing costumes. The broad straw hats of the women of Berne shade their complexions from almost every blink of sun, while those of the Vallais have a sort of coronet-shaped head-dress springing up in a continuous line from their straight foreheads. The first individual we saw was a girl of remarkable beauty standing at the church door of Ober-wald, in a gay and many-coloured dress, with her pasteboard coronet gilt, a wreath of flowers surrounding it, and a garland in her hand. We imagined this to be one of the characteristic devices for taxing our pockets; but we wronged the innocent girl, as she was apparently only doing honour to the holiday of her patron saint; and we soon found that we were in a land where, travellers being few, the extortion system so scientifically pursued in the Oberland is comparatively unknown.

We passed through several of the Vallais villages, and strange unearthly-looking things are the habitations they consist of. Each house is mounted high upon massive posts, and with its gallery and wide overshelving roof, peculiar to all the Swiss cottages, is built of a wood so darkly stained as to look like ebony. These sepulchral-looking edifices are disposed with a most marvellous degree of zig-zag disorder, and all had an air of the most abstract desolation. In these strange villages we noticed several Gothic churches, remarkable for the aërial lightness of their architecture. It closely resembled, if it was not indeed identical with, the kind of Gothic called the Byzantine, exhibiting long slender towers, sometimes with pear-shaped cupolas and airy belfries, with open galleries and rows of interlaced round-arched windows.

As we descended, the banks of the Rhone became less rocky, and in some places the river passed through rich meadow land; but its course was still furious. All along, the sides of the valley were high and steep, pines growing where the slope afforded room, bare rocks cropping out here and there, and occasionally snow or glaciers covering the higher ranges of the hills, or stretching down into the tributary glens. For some miles we lost sight of the river, and were ascending gradually to a considerable height. We then descended by an abrupt zig-zag path, from the top of which the river appeared like a rippling brook, passing under a small and elegant-looking bridge. The size of all the objects we were surrounded by deceived our eyes; the rippling brook, when the tedious descent had been accomplished, was the Rhone, still wider than when we had left it; and the bridge which spanned it was a prodigious mass of masonry, yet withal of elegant structure and fine proportions. We had here got into one of our old scrapes—a difficulty about the way, being in ignorance which bank of the river we should follow. We had not met a human being, or passed a wayside house, for several miles, nor was there any prospect of our being in future more fortunate. Now, there happened to be near this spot a pretty half mansion-looking cottage, peeping forth from the brow of a shady hill, and it was deemed expedient to consult the inmates as to our future movements. I was deputed to this task, which I found was not an easy one, for the eye had as usual diminished the distance. In any part of the world I had heretofore frequented, there would have been found a path of some description or other leading to such a dwelling, but here there was no such means of communication, and I had to scramble through thicket and brushwood, over stream and rock, as untrodden as if I had been finding my way in an uninhabited wilderness. The cottage had not so inviting an appearance from a near as from a distant view. Like the others, it was raised on poles; and having mounted a stair which led to the open door, I entered and found myself in a wareroom coated all round by cheeses, laid tier above tier. I was standing in the midst of the place cogitating on my position, when a tall sturdy man, uttering a gruff exclamation of surprise and wrath, issued from some unseen corner, and stood between me and the door. Here, now, was a dilemma; for not only had I to perform my original duty of asking the way, but I had likewise to summon up German enough to do justice to my own character, and to demonstrate that the felonious appropriation of Gruyere cheese was not a feature of it. Suffice it to say, that I was successful in both attempts, and returned with a mind at ease. Still had we to tread along that solitary road, with the river roaring at our sides, so close that we feared, as night approached, and the trees on the other side added to the darkness, there might be a danger of missing our footing, and being committed to its ruthless waves. Darkness came on while we were yet several miles from Brieg, our intended place of sleeping; and there were complaints about sore feet, and other indications, which rendered a nearer place of rest desirable. At length we came to a large irregular chateau-looking house, at the wide arched door of which a costumed ecclesiastic was mounting a horse, while a woman held a lantern. On asking if the place were a *gasthouse*, we were told that it was, and at our service. We followed her of the lantern up a steep staircase and along a corridor, all flagged with heavy blocks of granite. A door was then opened, which revealed a scene like the raising of the curtain in the theatre. It showed a large room, well and almost brilliantly lighted up. At a long table sat several male and female young peasants playing at cards, in their holiday dresses of divers colours—the females looking singularly like stage queens, with their high foreheads surmounted by the gilt pasteboard coronet peculiar to their costume. The landlady was here revealed to us, tall, stately, and swarthy, with a coronet too, *un peu de goitre* giving her neck a more stately arch, and the darkness of her costume and the majesty of her stride making her the Siddons of the exhibition. The old lady received us with a courteous and patronising urbanity, and set us down on carved chairs to a carved side-table, where we were provided with a comfortable though not rich supper, and a couple of bottles of the red wine of the neighbouring vineyards of Italy. While we remained in the room, we could not but wonder at the venerable appearance of all things about us. Hans Holbein or Theodore Beza might have entered such an inn, and had such fare from such a hostess among such guests. There were chests, and cabinets, and divers pieces of furniture in the room elaborately carved in oak; it was difficult to say whether they were relics of antiquity, or were the indications that here the genius of man stood at rest, and stuck to the ways and fashions which have fled from our busy island two centuries ago.

August 25.—We awoke early, after such slumbers as those only are entitled to who, like us, had trodden upwards of forty miles of mountain road. We proposed to walk on to Brieg before breakfast, and in pursuance of this object we demanded our reckoning. We expected that it would be moderate, but the amount, when stated, certainly surprised us—it was in all four francs, just one-fifth of what we would have been charged for the like entertainment in a tourist's inn. When we asked if she were sure it was quite right, the worthy landlady did not exactly comprehend the point of view from which we inspected it, and answered, with something like a frown, that it was quite right, and not too dear. On paying it, we handed a franc to the waiting-woman, and she, not being at all accustomed to such acts of munificence, while holding the coin in the palm of her hand, demanded a specific explanation of the intent of the gift. We reflected, as we went along, on the steps by which a run of tourists might metamorphose the unworldly simplicity of our hostess and her attendant into such sordid beings as the tourist inns generally present. Nay, we had a misgiving that we might ourselves have laid the first stone of such a change, and that, after our departure, it might enter into the dreams of the worthy couple that there are somewhere or other about the world people who can afford to pay more than a shilling and three farthings for a supper, a plentiful cup of wine, and a night's lodging.

We still pursued the banks of the Rhone, which was here a singular commixture of marsh land and precipice; the former created by the mud heaved up by the river in its restless course. Farther down the stream, and opposite to Brieg, we saw one of those bone receptacles which seem placed for the purpose of startling the thoughtless traveller into a recollection of the great journey of life. It was a low dark vault, with a small arch opening to the road, displaying within some thousands of skulls piled on each other like cannon balls.

We now crossed a long wooden bridge to Brieg, wherein, as we were looking round with hungry breakfast-seeking eyes, a civil jolly-looking man beckoned to us from the window of an inn, and seeing we were not averse to enter, came to the door thereof, and told us so many things about the excellence and the cheapness of his entertainments, that we were fain to think providence had sent us to precisely the right place. But the breakfast, when produced, by no means answered these high expectations. The coffee was not coffee, as the host himself admitted; for he said it was all they had for coffee at Brieg. The viands were not merely coarse and plain—that we were accustomed to—but they were antiquated and offensively mouldy. "Well, well," we thought, "the man wont charge much; let us pay him, and be off, and see what we can get elsewhere." But we forgot that we were on the high road to Italy by the Simplon, where the art of fleecing is carried to high perfection. The charge was seven and a half francs, just one penny each more than we had paid in London for the renowned breakfasts of the Tavistock. Our friend made a most civil bow when we paid the money, and another when we told him we would let all our friends know how he treated his guests. The promise so made to him I hereby faithfully fulfil, by stating that his house is called the Hotel de Simplon.

MANCHESTER.

About three years ago we noticed the publication of a neat and useful volume descriptive of Manchester, and now have the pleasure of observing that a second and enlarged edition of the same work has made its appearance.* The volume contains a large mass of materials respecting the metropolis of the cotton manufacture, and the whole so judiciously collected and arranged, that the work may well serve as a model for guide-books. Both from its handsomely printed pages, and from our own recollections, we propose giving our readers an idea of Manchester in its physical and social features.

The first glance at Manchester and its populous suburbs produces an unfavourable impression on those accustomed to a pure atmosphere and natural scenery. On all sides we see densely-packed masses of red brick houses; thoroughfares crowded with carts employed in some of the various branches of manufacture; if at the universal hour for dinner (one o'clock), great numbers of factory girls, and workmen in fustian or velveteen, hurrying along to that important meal; while overhead, there most likely floats a wide canopy of smoke produced from the numerous tall chimneys which environ the town. Lying in the middle of a generally flat territory, the town, with Salford on the one side, and Chorlton-upon-Medlock and Hulme on the others, has had ample room to expand, and is now found to comprehend the largest mass of population, that of the metropolis excepted, in the United Kingdom. According to the latest census, the number of persons inhabiting the combined town districts was 354,142, a large proportion of whom were young persons of both sexes engaged in manufacturing establishments.

In connexion with this prodigious hive of industry, there are many circumstances worthy of observation. First, let us say a word of the factory system which has called together so many human beings, and is the means

* The Hand-Book of Manchester. By B. Love. Manchester: Love and Barton. London: Simpkin, Marshall, and Co. 1842. 1 vol. 18mo.

of keeping them in employment. Cotton-spinning and power-loom weaving form, as is well known, the staple object of pursuit; next, bleaching, dyeing, and printing; silk throwing and manufacture; cotton thread and small wares; machine making; collieries; sawmills; fustian shearing; and so on—the whole using the enormous steam force of nearly 10,000 horses. The persons employed in a cotton-mill of the first order are in five departments, corresponding to the various stages of manufacture; and each individual performing a fractional part of the required labour. In the parish of Manchester alone there are nearly 40,000 boys, girls, men, and women, employed in the fractional labours of the cotton-mill system.

Farey, in his treatise on the Steam-Engine, has justly observed, that an extensive cotton-mill affords one of the most striking instances of the application of the greatest powers to perform a prodigious quantity of light and easy work. "A steam-engine of 100 horse-power," says he, "which has the strength of 880 men, gives a rapid motion to 50,000 spindles for spinning fine cotton threads; each spindle forms a separate thread, and the whole number work together, in an immense building, erected on purpose, and so adapted to receive the machines that no room is lost. Seven hundred and fifty people are sufficient to attend all the operations of such a cotton-mill; and by the assistance of the steam-engine, they will be enabled to spin as much thread as 200,000 persons could do without machinery, or one person can do as much as 266. The engine itself only requires two men to attend it, and supply it with fuel. Each spindle in a mill will produce between two and a half and three hanks (of 840 yards each) per day, which is upwards of a mile and a quarter of thread in twelve hours; so that the 50,000 spindles will produce 62,500 miles of thread every day, of twelve hours, which is more than a sufficient length to go two and a half times round the globe."

Perhaps the largest of the cotton-mill establishments in Manchester is that of Messrs Birley and Co. We find, from the account before us, that "the number of hands employed by this firm is 1600, whose wages annually amount to the sum of L.40,000. The amount of moving power is equivalent to the labour of 397 horses. The number of spindles in the mill is about 80,000. The annual consumption of raw cotton is about 4,000,000 lbs. weight. The annual consumption of coal 8000 tons. The annual consumption of oil, for the purpose of oiling the machinery, is about 5000 gallons, and of tallow for the same purpose, 50 cwt. The annual cost of gas is L.600. One room alone, belonging to this firm, contains upwards of 600 power-looms. The establishment in which the fabric is manufactured for waterproof clothing, such as 'Macintosh cloaks,' belongs to Messrs Birley and Co., and is a part of their concern. In this department of business the number of hands employed varies from 200 to 600. The immense amount of 250,000 lbs. weight of India rubber is annually consumed in the process of manufacture, to dissolve which 100,000 gallons of spirits are employed."

The establishments for the manufacture of small wares, such as tapes of silk or cotton, are among the most interesting in the place. "In its progress from the raw material, a piece of tape affords employment to the broker of the merchant, to the broker of the manufacturer, to the carrier, to the mixer of the cotton, to the tenters of the willow, of the blower, of the carding-engine, of the drawing-frame, slubbing-frame, roving-frame, and throstle; to the doffer, bobbin-winder, reeler, warper, pin-winder, weaver, taker-in, putter-out, bleacher, scraper, callender-man, lapper, maker-up, and salesman; or to at least twenty-five persons, before it leaves the warehouse of the manufacturer, where twelve pieces, of eighteen yards each, or 216 yards of cotton tape, of nearly half an inch in width, and containing 9170 yards of yarn, are sold for eighteenpence; or twelve yards of finished tape, containing 509 yards of yarn, for the small sum of *one penny*. Some idea of the extent to which this manufacture is carried on in Manchester may be formed from the fact, that at the works of Messrs Wood and Westheads, upwards of 1,240,000 yards of goods, not exceeding three inches in width, and composed partly or entirely of cotton, linen, silk, or worsted, are woven in *one week*, or upwards of 35,227 miles in *one year*."

Of late years, a considerable increase to the manufactures of Manchester and its neighbourhood has taken place by the establishment of factories for the making of engines and tools. One of the principal engineering concerns, and, for anything we know, the largest in England, is that of Mr W. Fairbairn. Of this great establishment, the author of "The Hand-Book" observes—"To persons unacquainted with the nature of working in iron, an admission into these works affords perhaps the most gratifying spectacle which the town can present of its manufactures in this metal. Consequently, almost every person of distinction visiting the town contrives to procure an introduction to the proprietor before leaving it. In this establishment the *heaviest* description of machinery is manufactured, including steam-engines, water-wheels, locomotive engines, and mill-geering. There are from 550 to 600 hands employed in the various departments; and a walk through the extensive premises, in which this great number of men are busily at work, affords a specimen of industry, and an example of practical science, which can scarcely be surpassed. In every direction of the works the utmost *system* prevails, and each mechanic appears to have his peculiar description of work assigned, with the utmost economical subdivision of labour. All is activity, yet without confusion. Smiths, strikers, moulders, millwrights, mechanics, boiler-makers, pattern-makers, appear to attend to their respective employments with as much regularity as the working of the machinery they assist to construct. In one department mechanics are employed in building steam-engines—those mighty machines which have augmented so immensely the manufacturing interests of Great Britain. All sizes and dimensions are frequently under hand, from the diminutive size of 8 horses' power to the enormous magnitude of 400 horses' power. One of this latter size contains the vast amount of 200 tons or upwards of metal, and is worth, in round numbers, from L.5000 to L.6000. The process of casting metal is conducted here on a very large scale. Castings of 12 tons weight are by no means uncommon; the beam of a 300 horses' power steam-engine weighs that amount. Fly-wheels for engines and water-wheels, though not cast entire, are immense specimens of heavy castings. A fly-wheel, for an engine of 100 horses' power, measures in diameter 26 feet, and weighs about 35 tons. In this establishment some of the largest water-wheels ever manufactured, and the heaviest mill-geering, have been constructed; one water-wheel, for instance, measuring 62 feet in diameter. The average weekly consumption of metal in these works, in the process of manufacturing, owing to the quantity of wrought-iron used, and the immense bulk of the castings, is 60 tons or upwards, or 3120 tons annually.

This extensive concern forwards its manufactures to all parts of the world. The stranger is told, on inquiry, that this article is for Calcutta, that for the West Indies—this for St Petersburg, that for New South Wales; and there are, besides, men belonging to it located in various parts of Europe, who are employed, under the direction of Mr Fairbairn, in superintending the erection of work manufactured on these premises. Many of the hands employed receive from L.2 to L.3 weekly wages, and scarcely any, except common labourers, receive less than 25s. per week. From these facts, some idea of the capital necessary to conduct a concern of this description may be imagined. In addition to the above, Mr Fairbairn has an establishment at Millwall, London, where upwards of 400 hands are employed in the manufacture of steam-engines, and in the building of iron steam-boats, and other vessels constructed of the same material."

From these particulars respecting the principal processes of manufacture in this great seat of trade, let us now turn to what is worthy of observation in the social condition of the place.

It will readily be supposed that, from the numerous manufacturing concerns of Manchester, many large fortunes have been realised; and it is universally allowed that what wealth has been thus accumulated has been spent with no niggardly hand. As respects perseverance, industry, integrity of principle, and open-handed liberality, we believe the mercantile men of Manchester are excelled by no class of persons in Britain; and it may be safely added, that few are so eminently distinguished as patrons of the fine arts. But all this, we lament to say, makes little or no head against the constantly downward gravitation of that large section of the community who depend on their daily labour for subsistence. Much has been done by public and private benevolence in establishing infant, day, evening, and Sunday schools; the religious institutions have extended the sphere of their operations; and there now exists a series of first-rate lyceums and mechanics' institutions for the instruction and literary recreation of artisans and all others who choose to become members. Yet all these means of improvement put together, leave the bulk of the people almost where they were. It may be that few of the children in or out of the factories are unable to read or write, or left without a smattering of religious knowledge, so called. But all this, and much more, has not prevented the growth of a wide-spread dissoluteness of manners. With an unexampled career of success in their undertakings—now suffering, we hope, only a temporary check—with the realisation of vast wealth, with an organisation in trade which is well entitled to be called one of the wonders of the world, the leaders of this great system of things have seen growing up under their hands a condition of society which may be almost pronounced at variance with public peace or safety.

Let us hear what the author of "The Hand-Book" says of the social condition of the working population. Improvident habits, he observes, are a distressing feature in the workman's condition, and chiefly in reference to intemperance. "Notwithstanding the present wretched condition of the poor, the number of persons that frequent gin palaces is astonishing. Dram-shops seem to fatten on misery and vice. The destitution of want appears to be met and counterbalanced only by the excitement of gin. Temperance societies have certainly wrought wondrous effects; but the mighty mass is unchanged. From an observation made on the 13th March 1842, by the writer's direction, there were found to enter *one* dram-shop only, in this town, the astonishing number of *four hundred and eighty-four persons in one hour!* The greater part were women! Some decently dressed, apparently the wives of mechanics; others almost naked, carrying in their arms a squalid infant. When wives frequent gin-palaces, no wonder their husbands, on leaving work, proceed straight to the beer house. This is a common practice."

The public-houses, our authority elsewhere remarks, are the fertile "hot-beds of immorality—the places in which vice is practised and taught—and where the best instructors can always be obtained. Lately there has sprung up among some of the public-houses in Manchester a new attraction. In a capacious room in the house a large organ is erected. On Sunday evenings, this is played by some low musician. To decoy the unsuspecting, and to lull the scruples of many, no music is performed except psalmody. By bribes, young people, with good voices, are seduced from Sunday schools to accompany the organ in singing. A crowded room is generally the result of these attractions. Pass by the door of one of these houses on the evening of a Sabbath, and you hear the pious strains of a consecrated instrument. So far, there appears nothing to shock. But enter the room; you perceive an indiscriminate mixture of both sexes—decently-dressed girls, and decent-looking workingmen. They range in groups; before each are pots of porter or ale; and men—and taller boys in imitation of men—are smoking tobacco. Some half drunk, others wholly so, join, or attempt to join, the singing. Here is a scene! Under the pretext of furnishing the poor with *religious* singing, the landlord fills his pockets, whilst he holds out a premium for the destruction of morals, and lays the foundation for an increase of crime.

These evils are graphically illustrated in a report published in 1840. It is there stated, that 'in all our large towns, the principal taverns and gin-palaces have now attached to them spacious saloons, in which, four or five evenings a-week, and *principally on the Sunday*, the operatives assemble in crowds to listen to vocal and instrumental music, generally speaking, of superior character. Those who spend a certain amount in liquor have admission free, so that the expenses, which are large, must, of course, be amply covered by increased custom, that is, from those who go there *for the music and not for the drink*. The number of such places of resort in Manchester and Salford is upwards of *fifty*, which display themselves in all directions, at an average of not more than a quarter of a mile's distance from each other. Reckoning one hundred persons at a time in each place, would give five thousand, principally young people of both sexes, nightly exposed to these contaminating influences. The nature of the scenes sometimes enacted, and the effects upon the character of those who frequent them, may be readily imagined."

The author of "The Hand-Book" does not perceive, or at least has not thought fit to mention, that a vast deal of this evil arises from *a deficiency in the means for indulging in harmless recreations*; and that no plan of social improvement would be so sure to effect its purpose, as the liberal institution of all such means for the daily, and particularly the holiday, recreations of the working-classes.

JOTTINGS FROM CAPTAIN ORLANDO SABRETASH.

ORLANDO SABRETASH is a publishing name assumed by a respectable retired officer of literary habits, who contributes to "Fraser's Magazine" and other popular works. He has just sent out a handsome pocket volume, entitled "the Art of Conversation,"* in which he treats in a dashing gentleman-soldierly manner a subject the most impalpable and difficult with which we are acquainted. Without any attempt to get down to philosophical principles, the honest captain has great tact and penetration, an unfailing pleasantry of manner, and a thorough appreciation of the value of conversation itself as one of the agencies for improving and amusing mankind. While he blames or laments the chilly manners too prevalent amongst us, he is no unqualified admirer of those of the continent; on the contrary, he brings up some experiences of his own to prove that we considerably over-estimate our neighbours across the channel in this respect. A summary of a considerable portion of his views on these points is given in the following passage:—

"I should really like to open and close every chapter of this ponderous tome with the following words of advice; for, if acted on, they would end my task, and save me the trouble of farther writing. 'Cast from you,' I would say to all who go into society, 'every particle of envy, malice, hatred, and uncharitableness the world's sayings and doings may have pressed upon your heart; leave affectation in the servants' hall, its proper place, and then enter the drawing-room, radiant with the happy feeling of good-will towards every individual present, your spirit buoyant with cheerfulness and hilarity, the certain consequence of relief from the dark and heavy burdens so gallantly flung away. Mark, then, how beautiful the women will look, how pleasant, witty, and agreeable the party will prove, and how rapidly the evening will pass. Nor will satisfaction end here; for you will next day be charmed to hear your praise sounded from every quarter by the gay, witty, pretty, and interesting. And then what a change this new fashion will produce; we shall move delighted, hand in hand, through this world with joy and pleasantry, even as, in the olden time, we flew up and down the middle of a

* London: G. W. Nickisson, Regent Street. 1842.

country dance, making some pretty girl skip along over miles of ball-room floor, and never feeling fatigue or regret till the dear course was ended.'

'Good advice this,' the reader will perhaps say; 'certain to be attended with pleasant consequences, but, like much other excellent counsel, far more easily given than likely to be followed.' And yet it could be easily followed; for, strange as it may seem, when the gloom and silence of so many of our parties are considered, English society is very far from wanting the qualities necessary for giving it the tone of cheerfulness here recommended. If those who mix in company do not always cast envy, malice, and affectation from them on entering a drawing-room, the majority of every party are, we may safely say, of a cheerful and kindly disposition, however grave and formal they may look; for we Anglo-Saxons, Celts, and Milesians, are naturally a gay, cheerful, and kindly race, endowed with a far keener perception of the ridiculous, fonder of society, and better formed, perhaps, for social pleasures, than the people of any other country.

With these advantages at our disposal, conversation in England might become the foundation of a most delightful system of social intercourse. It might be made to bind families and circles together by the best feelings of our nature, which would be called forth and cherished in proportion as they were understood and valued; it might make us known to each other, dissolve the ice by which chilly fashion blocks up the better avenues of the heart, and unite congenial spirits in friendship, good will, and mutual confidence.

Conversation could even do more. It could spread cheerfulness instead of formality over the face of society, and serve as a premium to wit, worth, conduct, and manners, by making them passports into the higher circles; and if substituted for those expensive entertainments that cause the ruin of so many old and respectable families—impoverished by foolish attempts to vie with wealthier acquaintances for the purpose of maintaining, what they fancy, a proper station in the fashionable world—it would confer an essential benefit on the country at large."

Sabretash is here and there, we humbly opine, a little out in his proprieties—as where he tells you, if you receive a present from an author of his book from a distance, to "acknowledge the receipt by return of post, so that you cannot be expected to give any opinion of its merits." Kitchener, we remember, gives the same advice. It seems to us a poor trick, by which no author of any sense could be imposed upon. But these are very subordinate and not very perceptible blemishes, something like the spots on the sun.

Our captain is extremely happy upon bores, of which he enumerates a considerable number of varieties. "First comes," he says, "the loud talker, the man who silences a whole party by his sole power of lungs. All subjects are alike to him: he speaks on every topic with equal fluency, is never at a loss, quotes high authority for every assertion, and allows no one else to utter a word: he silences, without the least ceremony, every attempt at interruption, however cleverly managed; calls out, 'I beg your pardon,' in a tone that shows how ill-used he thinks himself; or shuts your mouth with—'one minute, if you please, sir!' as much as to say, you are surely a very ill-bred fellow. Great, and especially loud and positive talkers, have been denounced by all writers on manners as shallow and superficial persons. And P. André, the author of a French essay on the beautiful, declares distinctly that 'no man of sense was ever a great talker.

Next to the talker, we have the bore who gives an account of his dogs, horses, lands, books, and pictures. Whatever is his, must, he thinks, interest others; and listen they must, however resolutely they may attempt to change the current of his discourse.

Women, sweet creatures, though much superior to us in tact, are sometimes too fond of praising their children. It is no doubt an amiable weakness; but I would still advise them to indulge as little as possible in the practice; for however dear the rosy-cheeked curly-headed prattlers may be to them, the chances are, that others will vote the darlings to be great bores. * * You must not even praise your near relations; for the subject deprives the hearer of all power of dissent, and is therefore clearly objectionable.

We must not forget the hosts of *dear friends*. And first is he who, in your distress, comes to give you good advice, who tells you of his admirable prudence if you have been extravagant, and boasts of his own stoicism if you have fallen in love. Next is the friend who comes to consult you on his own affairs; and fully conscious that you can afford him no aid in his difficulties, and determined to take no advice, even if you could give it, heaps upon you as great a share of suffering as he can make you carry, though perfectly aware that it will not lessen his own load by a single ounce.

Button-holders need not perhaps be mentioned, as the race is nearly extinct; but there is the man of jests, and squibs, always ready to break in upon any conversation, however pleasant and animated, even as the punster, constantly on the watch to fire off his vile pun. It should be fairly understood (and any deviation from the rule should condemn the offender to transportation), that puns and squibs are allowed only in the lightest conversation, when parties are anxious for a laugh, and jumping from one subject to another in search of sport. All interruptions to the conversation of others, whether by pun, jest, or squib, is *de mauvais ton*. I use the gentle French term, to avoid the harsher English one. You may give effect to anything you have been saying by a pun, or may overthrow by a squib what has been urged against you; but it is only an angry argument or discourse that can be turned and broken in upon by an idle jest; the object then justifies the means. On the other hand, it is your duty to laugh, if possible, at any jest uttered in good humour, and at proper time and place, however moderate its intrinsic value may be, as it shows your willingness to please. I have heard it said of Lord Brougham, that he is ever ready to laugh at any good-humoured joke, however poor; and I think it the greatest compliment ever paid to him. * *

Then you have the indifferent and apathetic bore, who hardly condescends to pay the least attention to what you say, and who, if he refrains from the direct and absolute rudeness of yawning in your face, shows, by short and drawling answers, given at fits and starts, and completely at variance with the object of the conversation, that he affects at least a total indifference to the party present, and to the subject of discourse. In society, the absent man is uncivil; he who affects to be so, is rude and vulgar. All persons who speak of their ailings, diseases, or bodily infirmities, are offensive bores. Subjects of this sort should be addressed to doctors, who are paid for listening to them, and to no one else. Bad taste is the failing of these bores. Then we have the ladies and gentlemen who pay long visits, and who, meeting you at the door prepared to sally forth, keep you talking near the fire till the beauty of the day is passed, and then take their leave, 'hoping they have not detained you.' Bad feeling or want of tact here predominates.

'Hobby-riders,' who constantly speak on the same eternal subject—who bore you at all times and at all hours, whether you are in health or in sickness, in spirits or in sorrow, with the same endless topic—must find a place on this page, though it is sufficient to denounce them. Their failing is occasioned by a total want of judgment.

Then there are the numerous clan of the *One-too-many*. The bore of this class is sure to join you when you are engaged in a pleasant *tête-à-tête* walk, or corner of library conversation, with some pretty girl, to whom you are probably saying the most interesting thing possible. And if he cannot find you so engaged, he is sure to come upon you when you have pressing and important business to discuss with a friend or lawyer perhaps. The total want of tact which made the *One-too-many* join you, also prevents him from seeing—unless where it is spite or malice—how disagreeable his intrusion is.

The *Malaprops* are also a numerous and unhappy family, for they are constantly addressing the most unsuitable speeches to individuals or parties. To the blind they will speak of fine pictures and scenery, and will entertain a person in deep mourning with the anticipated pleasures of to-morrow's ball. A total want of ordinary thought and observation is the general cause of the *Malaprop* failing.

Of authors who read, or only attempt to read, their own works in society, it is impossible to speak with common patience; for if any person is desirous of knowing the contents of their book or magazine article, he can purchase it from the publisher. It makes money circulate.

To this we may add, that your cool steady talkers, who speak with the care and attention of professors demonstrating mathematical problems—who weigh, measure, and balance every word they utter—are all decided objectionables in society. It is needless to say that such persons never blunder, and never 'stumble over a potato'—a matter of little recommendation. There are also many persons who commence speaking before they know what they are going to say. The ill-natured world, who never miss an opportunity of being severe, declare them to be foolish and destitute of brains. I shall not go so far; but hardly know what we should think of a sportsman who would attempt to bring down a bird before he had loaded his gun.

I have purposely reserved the egotistical bore for the last on this short and imperfect list. It is truly revolting, indeed, to approach the very *boa-constrictor* of good society, the snake who comes upon us not in the natural form of a huge, coarse, slow reptile, but Proteus-like, in a thousand different forms, though all displaying at the first sight the boa-bore, ready to slime over every subject of discourse with the vile saliva of selfish vanity. Pah! it is repulsive even to speak of the species—numerous, too, as the sands along the shore.

Some of the class make no ceremony of immediately intruding themselves and their affairs on the attention of a whole party; of silencing every other subject started, however interesting to the company, merely that they may occupy the prominent and most conspicuous position. There seems no escaping from them; for say what you will, the *boa* can spring upon you in some shape or other. If he inquires how you are, he answers the question himself, and tells you that he is always well and hearty, and takes good care of himself in the world. If Paris is spoken of—'Paris,' says the *constrictor*, 'I was there two years ago. I like,' or 'do not like Paris,' as the case may be; and once within the reach of the snake's scaly folds, the conversation is sure to be crushed and slimed over, as already stated. Nor are the *boa's* travels alone to be dreaded: far from it; there is no subject in heaven or on earth that he will not connect himself with. Speak of a parliamentary debate, and he tells you—'I *never* was in Parliament.' Talk of a coal-mine—'I should like so much,' he says, 'to see a coal-mine: I am so fond of adventures.' A metaphysical work is named—'I never read such books'; it takes off attention from more important subjects.' A poem is mentioned with applause—'I only read Byron.' Some one has fallen in love with a pretty girl—'I never was in love, and I think only fools fall in love;' the *boa* forgetting that he has all his life been so much in love with himself as to be totally incapable of loving any thing else.

'Others,' again, to quote the words of Swift, 'are more dexterous, and with great art will lie on the watch to hook in their own praise. They will call a witness to remember they always foretold what would happen in such a case, but none would believe them; they advised such a man from the beginning, and told him the consequences just as they happened; but he would have his own way. Others make a vanity of telling their own faults; they are the strangest men in the world; they cannot dissemble; they own it as a folly; they have lost abundance of advantages by it; but if you would give them the world, they cannot help it; there is something in their nature that abhors insincerity and constraint, with many other insufferable topics of the same altitude.' So far Swift, to which I beg to add, that though bores and *boas* find their account in speaking ill or well of themselves, it is the characteristic of a gentleman that he never speaks of himself at all."

We have just one additional remark to make on the great talkers. We are convinced that their fault, in a great number of instances, is connected with a nervous fear of a pause in conversation. They are eager to keep up the ball; and not having any faith in the power of their associates to put in a remark with sufficient quickness, go pouring on themselves without stop, while you sit in forced taciturnity by their sides. Thus new topics and pleasant turns to conversation, which many are ready and willing to introduce, are precluded, merely through a mistake on the part of one of the company.

A WORD ON THE BRITISH FISHERIES.

It has always appeared to us a national disgrace that so little is done to draw supplies of food from the seas around the coasts of Great Britain and Ireland. These seas teem with the finest fish in the world, and yet the capturing of them is conducted on the feeblest scale. While litigations and local disturbances go on without end, about the protection or illegal catching of a few salmon in rivers, thousands of times greater quantities of cod, haddock, brill, skate, halibut, turbot, and herrings, are suffered to swim about unmolested, or only exposed to the encroachments of a handful of poor and laborious fishermen.

We are glad to observe that this most important subject of national concern is beginning to attract some attention. It has formed one of the topics of a lecture lately delivered by Mr Milne to the students of the engineering department in the Seapoint College, Dublin, and we hope the observations made on the occasion will not fall unheeded to the ground. The lecturer, in alluding to the fisheries, went on to say—

"Great Britain, Ireland, and the islands, present a coast of about 4000 miles, much of which is excellent fishing ground; but that with which I am more intimately acquainted is on the eastern coast of Scotland, extending from Dunbar to Aberdeen, and northward.

The deep-sea ground, or that on which cod, ling, turbot, tusk, skate, &c, are found, is a bank, distant from the shore, and from some of the fishing stations, about forty miles; the consequence of which is, that our fishermen have to expend the greater part of their labour not in fishing, but in rowing their heavy boats to and from the fishing ground.

The manner of proceeding is as follows:—In order to prepare for the deep-sea fishing, whilst the men are employed in unravelling their lines (nets), the women and children collect mussels, limpets, log-worm, &c., for bait, and this takes up the greater part of their time; but a sufficient quantity having been procured, and the small or haddock lines having been baited, if the weather be favourable, the boats proceed to sea; but if it has become foul, or if the sky indicates a breeze, they remain on shore for a day or two, in which case the lines must be rebaited, else the fishes refuse the tainted food and hook. At length, the sea being calm and the sky serene, the boats proceed to the haddock ground, which, in general, lies six, eight, or ten miles from the shore, and here the small lines are shot, or laid alongst the bottom of the sea, in fifteen or twenty fathoms water; and after they have lain a few hours, they are hauled or brought up into the boat along with the fishes held by the hooks. The boats now proceed farther out to sea, about forty miles from land, as has been already noticed; and here the haddocks previously caught are cut each into two or three pieces as baits, and these being fixed on the hooks of the great lines, are shot or laid along the bottom of the sea, and stationed there by means of a small anchor at each end of the course of lines, which in many instances extends two or three miles in length; the water being from fifty to ninety fathoms deep.

Should the weather prove favourable, the lines are

allowed to lie at the bottom six or eight hours, to give time for a sufficient number of fishes to become fixed on the hooks; but if a breeze shall spring up, or if the sky shall give indications of a coming storm, they haul their lines at any time, however short, after their being let down, and proceed towards the land with all the speed they can; in which case the whole of their labour and that of their families is lost for at least a week. It also often happens, that, in consequence of bad weather coming on suddenly, the men are compelled to leave their lines in the sea, in which case they are seldom recovered, and great misery is consequently felt by the fishermen.

In this way the fishing proceeds from the beginning of May till the middle of August, the men being employed, on the average, about six hours per week on the fishing ground; and even this is attained only by great labour, and much risk both as regards life and property. It appears, therefore, that any means by which the labour of rowing to and from the ground could be saved, and the time of actual fishing extended, would increase the productiveness of this useful branch of industry.

The Dutch seem to manage better than we do. They send over to our fishing ground a number of large vessels, with a few small boats and men for each, as also men and women for curing the fish on the decked vessel, which they anchor on the fishing ground. The small boats fish all around this vessel within a mile or two, so that the whole energies of the men are applied to productive labour. They seldom or never come on shore, soon load their vessel, weigh anchor, and again make for Holland, with much less loss of lines than our fishermen, and with better remuneration.

This plan, I conceive, might be advantageously employed by us—I mean the use of the large stationary vessel; and some further improvements might also be introduced, such as a small steamer to run continually from the shore to the fishing ground to carry the fish to market, especially turbot, which from its fatness has not yet been cured, but which always brings a high price when fresh. By means of the steamer, fresh bait—haddocks, herrings, &c.—could be taken out to the deep-sea ground every day, also fresh provisions and men. Hence two sets of fishermen would be kept constantly at work, one near the shore catching bait, the other at the deep-sea station; and in this way the steamer might keep in full employment two or three thousand men, and carry all things necessary for the proper prosecution of the fishing; and in case of bad weather, the lines on the deep-sea ground could be hauled from the deck of the steamer when it could not be done in a common fishing boat; hence the fishing-tackle would not be lost, as at present. By means of the steamer, the fish could also be brought every day alongside of our coasting steamers, put on board, and conveyed in the course of a few hours to a very distant market; and from the increased facilities now afforded by railroads, fish can be dispersed very quickly in various directions, in good condition and at a cheap rate. A fishing company was lately established on the eastern coast of England, on a plan analogous to what I have now suggested; and from newspaper accounts, I perceive that the beneficial effects of their exertions in the interior are already much felt.

On good ground it appears to be impossible to overfish, so as to reduce the apparent number; if we do not catch them, they will continue to devour one another. Immense banks of their bones are at present being formed at the bottom of the sea. One in particular may be mentioned, lying east of the Faroe Islands; this bank is composed almost entirely of bones, and is two miles and a half long.

In concluding, it appears that whilst our country offers peculiar facilities for prosecuting a most useful branch of industry, it is either entirely neglected, or is left to the endeavours of a few laborious but poor men—persons who have not the means nor an idea of prosecuting it beyond procuring a daily scanty subsistence for themselves and families. No doubt government has encouraged the fisheries by bestowing bounties, but in my opinion this is not the way to do it effectually. What is wanted is organisation—a plentiful supply of the proper tackling—and the employment of steam to perform the unproductive and severe parts of the labour, so as to economise the time of the fishermen.

In this way thousands of our unemployed poor might be speedily relieved, at a very small expense compared with that of poor rates; whilst, at the same time, whatever subscriptions were required for effecting this object, would soon be repaid in the cheapening of fish, without reference to a direct return for the capital expended. It appears, however, that this neglected source of wealth would yield a more handsome return than any other joint-stock concern in these kingdoms. I am informed that a good many years ago a capital of five or six thousand pounds was subscribed for a fishing company in Dublin; that the returns for the first half year were 40 per cent., whilst the price of fish in the market was reduced to one-third of what it had previously been; that, unfortunately, it was subsequently resolved to pay the fishermen by day's wages, instead of allowing them to rely on the success of the fishing for the amount of their gains; and that, in consequence of this and such like circumstances, the company soon began to decay, and ultimately gave up business. But, surely, instead of this example proving a stumbling-block to proceeding now, it indicates, that if conducted on proper principles, it is a safe and a profitable speculation—one which appears to offer immediate relief to the unemployed, as well as the means of procuring cheap food for the rich and poor. And it should not be forgotten that from each meal of fish caught on these shores, the offal is capable of fructifying the soil so much as to produce an additional meal of farm produce—the refuse of fish being the very best manure for any soil. Let us not spend in idleness or frivolity any leisure hours we may have here, but endeavour, by our example, to show that in this sea-girt island there is plenty of food at our doors; and that in order to obtain it, we have only to use the means and to exert ourselves a very little."

THE BIRDS.

BY THOMAS SMIBERT.

Is there a man so dull of soul and sense,
That he can walk at morn, or noon, or eve,
Upon that mighty field which hath no fence
Save what it doth from airy space receive,
And, while the birds their varied notes enweave
Into one complete whole for him, can hear
The glorious descant flow,
Without a bosom-glow,
Without one thrill of joy, or one full-hearted tear?

Thus wholly apathetic none can be.
If the wild thunder, throeing as in pain,
And generating, over land and sea,
Dread air-quakes to alarm the souls of men,
Be held God's voice of wrath, oh surely, then,
The sounds that rise from copse, or grove of pine,
By mount, and vale, and stream,
Are such as man may deem
A voice of love—of love eternal and divine!

Beauty is planted with the seed; and, till
The flower puts on its perfect summer dress,
Grows with it, waxing rich and richer still:
The verdure of the grass is loveliness;
And on the mountain-pine, when breezes press
Its coying stem, and comb its flowing hair,
Sits a majestic ease;
These green existences
Such attributes display, ever and everywhere;

Yet, decked with every seasonable charm,
Nature, though not, like sculpture, still and cold,
Is even as a lovely human form,
When quickening speech informeth not the mould;
The brightest flowers that, Hebe-like, uphold
Their cups with dewy offerings to the sun,
Ask yet a voice; and where
May voice with that compare,
From the full-choiring birds by heavenly favour won?

Most beautiful, in truth, the doings all
In nature's mighty aviary seem!
What time the shadows, night's dim relics, fall
Prostrate in worship of the young sun-beam,
Go, rouse thee from thy gross and worldly dream,
And, while the woods are pæaning the morn,
Thine eye and ear employ,
And thou shalt taste a joy
Of all that can delight the mind and senses born.

Chances thine eye to light upon the home
Wherein two little ones, heart-wedded, dwell—
Whether it be the merlin's bowl of loam,
Or the quick sparrow's moss-encrusted cell—
Whether aloft, like an inverted bell,
It swingeth in the breeze, or lieth low,
With tender care concealed
In some green bank or field—
Gaze there, and say if aught more fair the eye could know!

But oh! peer gently through the fringy covers;
And be the parley of thy foot with earth
Soft as the vows of love to ears of lovers,
Or as the dew-falls which have viewless birth
When evening turns to tears the gay day's mirth;
Admire but touch not what may meet thy view,
Lest the scared mother fly,
And leave the hopes to die
That rest within her shells, so smooth and rich of hue.

Ah! sad the thought how many, many a time,
Thus by the rude hands of unthinking boy,
Those mated ones are forced, without a crime,
To quit their Eden of unbroken joy;
Not that the rifiers seek but to destroy,
But that they may compose a circlet rare,
And rich with many dyes—
Though seeming to the wise,
A bow that tells of hopes converted to despair.

So fondly doth the mother watch her home,
That, move one shell, and she will note the change,
And it may drive the poor one forth to roam,
And all her sweet economy derange;
And should man's footstep, loud to her and strange,
Startle her brooding o'er her young, her heart
Counts time upon its sides,
As wildly as the strides
Made by high-mettled courser on the racing mart.

But why so linger on a theme like this?
Poorly, at best, can pen or tongue display
The fullness of the beauty and the bliss
Cast by the birds on this our earthly way;
And while to us thus pleasing, who will say
Mute nature hath for them nor eyes nor ears?
Oh! yes, believe it well,
That when their anthems swell,
Rejoicingly each tree and flower both sees and hears!

THE BARINGS.

The present partners of the house of Baring, brothers, are Thomas Baring, the youngest son of Lord Ashburton; Francis Baring (late Chancellor of the Exchequer); Captain Mildmay, a baronet of small fortune, Lord Ashburton's son-in-law; and Joshua Bates, a Yankee from Boston, whose beginning was as supercargo of a merchant vessel. The first of the Barings that came into notice was the father of the present Alexander Baring, now Lord Ashburton. He was the son of a German toy-shopkeeper in Exeter, in England. The foundation of Baring's fortune was made as contractor to the British government, in their vain attempt to hold America in chains, and which tacked two hundred millions to the national debt in England. The Barings managed to keep on terms with both belligerents. The present lord was then the traveller of the house, and became acquainted with Mr William Bingham, who was an agent in the service of the Americans for obtaining supplies abroad for carrying on the revolution. On the termination of the war, Baring and Bingham turned to account the profits they had got out of the contest, purchasing up military and other claims against both governments, which they procured for mere trifles, and got them admitted into the funded debt of the United States and of Great Britain. Mr Bingham got rich, lived in princely style in Philadelphia, and had five daughters. Mr Baring wooed and married one, and his brother married a second. These two commissaries, by joining together, progressed to that degree of opulence and power which has astonished the world. In 1834, Alexander Baring retired from the house of Baring, brothers, taking with him a large fortune—leaving behind £800,000 on interest; but in 1836, the house was affected by the general pressure which took place, and Lord Ashburton came forward and lent them £500,000, which is yet due, together with the original £800,000. The house has an agency in Liverpool, New York, New Orleans, and at several ports of the continent of Europe; it is largely interested in the bonds and advances of the American state, and the present visit here of Lord Ashburton will disclose a page of very important matter in the current history of Britain and America.—*American paper.*

AN ABSENT GERMAN MUSICIAN.

Whilst hard at work one evening upon a very complicated theme for a fugue, and more than usually possessed by the spirit of music, he fidgeted about on his chair, paced up and down the room, humming tunes, and now and then muttering incoherent and disjointed sentences, whilst every moment he went to the candle to relight his pipe. His wife, also absorbed in thought, was sitting quietly at work. Rinck duly lighted his pipe; but instead of laying the match on the table, placed it in all innocence on his wife's cap. At length he settled himself at his desk, and was proceeding peacefully with his task, when lo! his labours were broken in upon by a sudden glare of light, accompanied by a shriek from his wife; her whole head was one blaze—cap and hair were a prey to the flames. Rinck maintained that his wife had put her head too near the candles; but two or three front locks that still survived of her (must we confess it?) *false hair*, and a strip of lace that came over her forehead, proved beyond a doubt that the conflagration must have commenced its perfidious career of devastation from that part of her head that was not immediately exposed to the candle. "Why, my child," expostulated Rinck, as he beheld his beloved Margaret standing a perfect wreck before him, "how could I possibly have done it, when I haven't stirred from my desk the whole evening?"—*Mainzer's Musical Athenæum.*

THE PRESENT STATE OF THE SAMARITANS.

The Samaritans are now reduced to a very small community, there being only thirty men who pay taxes, and few, if any, who are exempt; so that their whole number cannot be reckoned at over one hundred and fifty souls. One of them is in affluent circumstances; and having been for a long time chief secretary of the Mutesellim of Nabulus, became one of the most important and powerful men of the province. He had recently been superseded in his influence with the governor by a copt, and now held only the second place. He was called El-'Abdes Samary. The rest of the Samaritans are not remarkable either for their wealth or poverty. The physiognomy of those we saw was not Jewish; nor, indeed, did we remark in it any particular character as distinguished from that of other natives of the country. They keep the Saturday as their Sabbath with great strictness, allowing no labour nor trading, nor even cooking or lighting a fire, but resting from their employments the whole day. On Friday evening they pray in their houses; and on Saturday have public prayers in their synagogue at morning, noon, and evening. They meet also in the synagogue on the great festivals, and on the new moons; but not every day. The law is read in public, not every Sabbath day, but only upon some festivals. Four times a year they go up to Mount Gerizim (Jebel et Tur) in solemn procession to worship; and then they begin reading the law as they set off, and finish it above. These seasons are, the feast of the Passover, when they pitch their tent upon the mountain all night, and sacrifice seven lambs at sunset; the day of Pentecost; the feast of Tabernacles, when they sojourn here in booths built of branches of the arbutus; and lastly, the great day of Atonement in autumn. They still maintain their ancient hatred against the Jews; accuse them of departing from the law in not sacrificing the Passover, and in various other points, as well as of corrupting the ancient text, and scrupulously avoid all connexion with them. If of old "the Jews had no dealings with the Samaritans," the latter at the present day reciprocate the feeling, and neither eat nor drink, marry, nor associate with the Jews, but only trade with them.—*Robinson and Smith's Travels.*

STRONG SYMPATHY IN THE DOG.

An interesting instance of this feeling in the canine species, the authenticity of which may be relied on, lately took place, or rather is still proceeding, at Invergeldie, a large sheep-farm on the estate of Lawers, near Comrie, Perthshire. The overseer became severely indisposed, and for the first ten days after their master had taken to bed, his two faithful collies refused to be comforted, mournfully declining all sorts of food, nay, even milk warm from the cow, at last pressed upon them by the domestics. At length their case became so serious—for they were otherwise valuable dogs—that the overseer's mother was prevailed upon to inform her sick son, though at the time very low, of the circumstance, begging of him, as a *dernier* resort, to try what effect his own word would still have upon the mute mourners. By an effort he succeeded in a weak voice to name his favourites, pointing at the same time to some food, placed at hand for the trial. This gentle command had its effect; the dogs at once obeyed; and have since (as if it were still repeated to them, which it is not likely ever to be again) continued to take as much as supports life; but once every day, at least, and oftener if opportunity offer, they glide together into the room where the sick man is, slip stealthily to the bedside, raise their fore paws upon the bed-clothes, and in this attitude continue together for some time to gaze intently on the pallid features of their now unconscious master, and then droopingly retire out of the room.—*Perth paper.*

"THERE IS NO HURRY!"—A TALE.

BY MRS S. C. HALL.

PART SECOND.

"MARY—my dear niece," said Charles Adams, as he seated himself by her side; "my dear, dear niece, can you fix your thoughts, and give me your attention for half an hour, now that all is over, and that the demands of the world press upon us. I want to speak about the future. Your mother bursts into such fits of despair that I can do nothing with her; and your brother is so ungovernable—talks as if he could command the bank of England, and is so full of his mother's connexions and their influence, that I have left him to himself. Can you, my dear Mary, restrain your feelings and give me your attention?"

Mary Adams looked firmly in her uncle's face, and said, "I will try. I have been thinking and planning all the morning, but I do not know how to begin being useful. If I once began, I could go on. The sooner we are out of this huge expensive house the better; if I could get my mother to go with the little girls to the sea-side. Take her away altogether from this home—take her"——

"Where?" inquired Mr Adams; "she will not accept shelter in my house."

"I do not know," answered his niece, relapsing into all the helplessness of first grief; "indeed I do not know; her brother-in-law, Sir James Ashbrooke, invited her to the Pleasaunce, but my brother objects to her going there, his uncle has behaved so neglectfully about his appointment."

"Foolish boy!" muttered Charles; "this is no time to quarrel about trifles. The fact is, Mary, that the sooner you are all out of this house the better; there are one or two creditors, not for large sums certainly, but still men who will have their money; and if we do not quietly sell off, they will force us. The house might have been disposed of last week by private contract, but your mother would not hear of it, because the person who offered was a medical rival of my poor brother."

Mary did not hear the concluding observation; her eyes wandered from object to object in the room—the harp—the various things known from childhood. "Anything you and your mother wish, my dear niece," said her kind uncle, "shall be preserved—the family pictures—your harp, your piano—they are all hallowed memorials, and shall be kept sacred."

Mary burst into tears. "I do not," she said, "shrink from considering those instruments the means of my support; but although I know the necessity for so considering, I feel I cannot tell what at quitting the home of my childhood; people are all kind; you, my dear uncle, from whom we expected so little, the kindest of all; but I see, even in these early days of a first sorrow, indications of falling off. My aunt's husband has really behaved very badly about the appointment of my eldest brother; and as to the cadetship for the second—we had such a brief dry letter from our Indian friend—so many first on the list, and the necessity for waiting, that I do not know how it will end."

"I wish, my dear, you could prevail on your mother, and sister, and all, to come to Repton," said Mr Adams. "If your mother dislikes being in my house, I would find her a cottage near us; I will do all I can. My wife joins me in the determination to think that we have six additional children to look to. We differ from you in our habits; but our hearts and affections are no less true to you all. My Mary and you will be as sisters."

His niece could bear no more kindness. She had been far more bitterly disappointed than she had confessed even to her uncle; and yet the very bitterness of the disappointment had been the first thing that had driven her father's dying wail from her ears—that cry repeated so often and so bitterly in the brief moments left after his accident—"My children! My children!" He had not sufficient faith to commit them to God's mercy; he knew he had not been a faithful steward; and he could not bring himself from the depths of his spiritual blindness to call upon the Fountain that is never dried up to those who would humbly and earnestly partake of its living waters.

It was all a scene as of another world to the young, beautiful, petted, and fêted girl; it had made her forget the disappointment of her love, at least for a time. While her brothers dared the thunder-cloud that burst above their heads, her mother and sisters wept beneath its influence. Mary had looked forth, and if she did not hope, she thought, and tried to pray; now, she fell weeping upon her uncle's shoulder; when she could speak, she said, "Forgive me; in a little time I shall be able to conquer this; at present, I am overwhelmed; I feel as if knowledge and sorrow came together; I seem to have read more of human nature within the last three days than in all my past life."

"It all depends, Mary, upon the person you meet," said Mr Adams, "as upon the book you read; if you choose a foolish book or a bad book, you can expect nothing but vice or foolishness; if you choose a foolish companion, surely you cannot expect kindness or strength." The kind-hearted man repeated to her all he had before said. "I cannot," he added, "be guilty of injustice to my children; but I can merge all my own luxuries into the one of being a father to the fatherless."

But to all the plans of Charles Adams, objections were raised by his eldest nephew and his mother; the youth could not brook the control of a simple straightminded country man, whose only claim to be considered a gentleman, in his opinion, arose from his connexion with "his family." He was also indignant with his maternal uncle for his broken promise, and these feelings were strengthened by his mother's folly. Two opportunities for disposing of the house and its magnificent furniture were missed; and when Mrs Adams complained to her nearest and most influential connexions, that her brother-in-law refused to make her any allowance unless she consented to live at Repton—expecting that they would be loud in their indignation at his hardness—they advised her by all means to do what he wished, as he was really the only person she had to depend upon. Others were lavish of their sympathy, but sympathy wears out quickly; others invited her to spend a month with them at their country seat, for change of air; one hinted how valuable Miss Adams's exquisite musical talent would be *now*. Mary coloured, and said, "Yes," with the dignity of proper feeling; but her mother asked the lady what she meant, and a little scene followed, which caused the lady to visit all the families in town of her acquaintance, for the purpose of expressing her sympathy with "those poor dear Adamses, who were so proud, poor things, that really there was nothing but starvation and the workhouse before them!" Another of those well-meaning persons—strongminded and kind-hearted, but without a particle of delicacy—came to poor Mary, with all the *prestige* of conferring a favour.

"My dear young lady, it is the commonest thing in the world—very painful but very common; the families of professional men are frequently left without provision. Such a pity!—because, if they cannot save they can insure. We *all* can do *that*, but they do *not* do it, and consequently everywhere the families of professional men are found in distress; so, as I said, it is common; and I wanted you to suggest to your mother, that, if she would not feel hurt at it, the thing being so common—dear Dr Adams having been so popular, so very popular—that while every one is talking about him and you all, a very handsome subscription could be got up. I would begin it with a sum large enough to invite still larger. I had a great regard for him—I had indeed."

Mary felt her heart sink and rise, and her throat swell, so that she could not speak. She had brought herself to the determination of employing her talents for her own support, but she was not prepared to come with her family before the world as paupers. "We have no claim upon the public," she said at last. "I am sure you mean us kindly, but we have no claim. My dear father forwarded no public work—no public object; he gave his advice, and received his payment. If we are not provided for, it is no public fault. Besides, my father's children are able and willing to support themselves. I am sure you mean us kindly, but we have no claim upon public sympathy, and an appeal to it would crush us to the earth. I am very glad you did not speak first to my mother. My uncle Charles would not suffer it, even suppose she wished it."

This friend also departed to excite new speculations as to the pride and poverty of "poor dear Dr Adams's family." In the world, however—the busy busy London world—it is idle to expect anything to create even a nine days' wonder. When the house and furniture were at last offered for sale, the feeling was somewhat revived; and Mary, whose beauty, exquisite as it was, had so unobtrusive a character as never to have created a foe, was remembered with tears by many: even the father of her old lover, when he was congratulated by one more worldly-minded than himself on the escape of his son in not marrying a portionless girl, reproved the unfeeling speaker with a wish that he only hoped his son might have as good a wife as Mary Adams would have been.

The bills were taken down, the house purified from the auction-mob—everything changed; a new name occupied the doctor's place in the "Court Guide"—and in three months the family seemed as completely forgotten amongst those of whom they once formed a prominent part, as if they had never existed. When one sphere of life closes against a family, they find room in another. Many kind-hearted persons in Mrs Adams's first circle would have been rejoiced to be of service to her and hers, but they were exactly the people upon whom she had no claim. Of a high but poor family, her relatives had little power. What family so situated ever had any influence beyond what they absolutely needed for themselves? With an ill grace she at last acceded to the kind offer made by Mr Charles Adams, and took possession of the cottage he fixed upon, until something could be done for his brother's children. In a fit of proud despair the eldest son enlisted into a regiment of dragoons; the second was fortunate enough to obtain a cadetship through a stranger's interference; and his uncle thought it might be possible to get the youngest forward in his father's profession. The expense of the necessary arrangements was severely felt by the prudent and careful country gentleman. The younger girls were too delicate for even the common occupations of daily life; and Mary, instead of receiving the welcome she had been led to expect from her aunt and cousins, felt that every hour she spent at the Grange was an intrusion.

The sudden death of Dr Adams had postponed the intended wedding of Charles Adams's eldest daughter; and although her mother agreed that it was their duty to forward the orphan children, she certainly felt, as most affectionate mothers whose hearts are not very much enlarged would feel, that much of their own savings—much of the produce of her husband's hard labour—labour during a series of years, when her sister-in-law and her children were enjoying all the luxuries of life—would now be expended for their support; this to an all-sacrificing mother, despite *her sense of the duty of kindness*, was hard to bear. As long as they were not on the spot, she theorised continually, and derived much satisfaction from the sympathising observations of her neighbours, and was proud, *very* proud, of the praise bestowed upon her husband's benevolence; but when her sister-in-law's expensive habits were in daily array before her (the cottage being close to the Grange); when she knew, to use her own expression, "that she never put her hand to a single thing;" that she could not live without port wine, when she herself never drank even gooseberry, except on Sundays; never ironed a collar, never dusted the chimney-piece, or ate a shoulder of mutton—roast one day, cold the next, and hashed the third. While each day brought some fresh illustration of her thoughtlessness to the eyes of the wife of the wealthy tiller of the soil, the widow of the physician thought herself in the daily practice of the most rigid self-denial. "I am sure," was her constant observation to her all-patient daughter—"I am sure I never thought it would come to this. I had not an idea of going through so much. I wonder your uncle and his wife can permit me to live in the way I do—they ought to consider how I was brought up." It was in vain Mary represented that they were existing upon charity; that they ought to be most grateful for what they received, coming as it did from those who, in their days of prosperity, professed nothing, while those who professed all things had done nothing. Mary would so reason, and then retire to her own chamber to weep alone over things more hard to bear.

It is painful to observe what bitterness will creep into the heart and manner of really kind girls where a lover is in the case, or even where a commonplace dangling sort of flirtation is going forward; this depreciating ill nature, one of the other, is not confined by any means to the fair sex. Young men pick each other to pieces with even more fierceness but less ingenuity; they deal in a cut-and-hack sort of sarcasm, and do not hesitate to use terms and insinuations of the harshest kind when a lady is in the case. Mary (to distinguish her from her high-bred cousin, she was generally called Mary Charles) was certainly disappointed when her wedding was postponed in consequence of her uncle's death; but a much more painful feeling followed when she saw the admiration her lover, Edwin Lechmere, bestowed upon her beautiful cousin. Mary Charles was herself a beauty—fair, open-eyed, warm-hearted—*the* beauty of Repton; but though feature by feature, inch by inch, she was as handsome as Mary, yet in her cousin was the grace and spirit given only by good society; the manners elevated by a higher mind, and toned down by sorrow; a gentle softness, which a keen observer of human nature told me once no woman ever possessed unless she had deeply loved, and suffered from disappointed affection; in short, she was far more refined, far more fascinating, than her country cousin. Besides, she was unfortunate, and that at once gave her a hold upon the sympathies of the young curate: it did no more; but Mary Charles did not understand these nice distinctions, and nothing could exceed the change of manner she evinced when her cousin and her betrothed were together.

Mary thought her cousin rude and petulant; but the true cause of the change never occurred to her. Accustomed to the high-toned courtesy of well-bred men, which is so little practised in the middle class of English society, it never suggested itself, that placing her chair, or opening the door for her to go out, or rising courteously when she came into a room, was more than, as a lady, she had a right to expect; in truth, she did not notice it at all; but she did notice and feel deeply her cousin's alternate coldness and snappishness of manner. "I would not," thought Mary, "have behaved so to her if she had been left desolate; but in a little time, when my mother is more content, I will leave Repton, and become independent by my talents." Never did she think of the power delegated to her by the Almighty without feeling herself raised—ay, higher than she had ever been in the days of her splendour—in the scale of moral usefulness; as every one must feel whose mind is rightly framed. She had not yet known what it was to have her abilities trampled on or insulted; she had never experienced the bitterness consequent upon having the acquirements—which in the days of her prosperity commanded silence and admiration—sneered at or openly ridiculed. She had yet to learn that the Solons, the lawgivers of English society, lavish their attentions and praise upon those who learn, not upon those who teach.

Mary had not been six months fatherless, when she was astonished first by a letter, and then by a visit, from her former lover; he came to renew his engagement, and to wed her even then if she would have him; but Mary's high principle was stronger than he imagined. "No," she said; "you are not independent of your father, and whatever I feel, I have no right to draw *you* down into poverty. You may fancy now that you could bear it, but a time would come—if not to you, to me—when the utter selfishness of such conduct would goad me to a death of early misery." The young man appealed to her uncle, who thought her feelings overstrained, but respected her for it nevertheless; and in the warmth of his admiration, he communicated the circumstance to his wife and daughter.

"Refuse her old lover under present circumstances," repeated her cousin to herself as she left the room; "there must be some other reason than that; she could not be so foolish as to reject such an offer at such a time." Unfortunately, she saw Edwin Lechmere walking by Mary's side, under the shadow of some trees. She watched them until the foliage screened them from her sight, and then she shut herself into her own room, and yielded to a long and violent burst of tears. "It is not enough," she exclaimed, in the bitterness of her feelings, "that the comforts of my parents' declining years should be abridged by the overwhelming burden to their exertions—another family added to their own; it is not enough that an uncomfortable feeling has grown between my father and mother on this account, and that cold looks and sharp words have come where they never came before, but my peace of mind must be destroyed. Gladly would I have taken a smaller portion, if I could have kept the affections which I see but too plainly my cousin has stolen from me. And my thoughtless aunt to say, only yesterday, that 'at all events her husband was no man's enemy but his own.' Has not his want of prudent forethought been the ruin of his own children? and will my parents ever recover the anxiety, the pain, the sacrifices, brought on by one man's culpable neglect? Oh, uncle! if you could look from your grave upon the misery you have caused!"—and then, exhausted by her own emotion, the affectionate but jealous girl began to question herself as to what she should do. After what she considered mature deliberation, she made up her mind to upbraid her cousin with treachery, and she put her design into execution that same evening.

It was no easy matter to oblige her cousin to understand what she meant; but at last the declaration, that she had refused her old lover because she had placed her affections upon Edwin Lechmere, whom she was endeavouring to "entrap," was not to be mistaken; and the country girl was altogether unprepared for the burst of indignant feeling, mingled with much bitterness, which repelled the untruth. A strong fit of hysterics into which Mary Charles worked herself was terminated by a scene of the most painful kind, her father being upbraided by her mother with "loving other people's children better than his own," while the curate himself knelt by the side of his betrothed, assuring her of his unaltered affection. From such a scene Miss Adams hastened with a throbbing brow and a bursting heart. She had no one to counsel or console her; no one to whom she could apply for aid. For the first time since she had experienced her uncle's tenderness, she felt she had been the means of disturbing his domestic peace; the knowledge of the burden she was, and the burden she and hers were considered, weighed her to the earth; and in a paroxysm of anguish, she fell on her knees, exclaiming, "Oh, why are the dependent born into the world! Father, father, why did you leave us, whom you so loved, to such a fate!" And then she reproached herself for having uttered a word reflecting on his memory. One of the every-day occurrences of life—so common as to be hardly observed—is to find really kind good-natured people not "weary of well-doing." "Oh, really I was worn out with so and so; they are so decidedly unfortunate that it is impossible to help them," is a general excuse for deserting those whose continuing misfortunes ought to render them greater objects of sympathy.

Mr Charles Adams was, as has been shown in our little narrative, a kind-hearted man. Estranged as his brother and himself had been for a number of years, he had done much to forward, and still more to protect, his children. At first, this was a pleasure; but somehow his "benevolence," and "kindness," and "generosity," had been so talked about, so eulogised, and he had been so seriously inconvenienced by the waywardness of his nephews, the thoughtless pride of his sister-in-law, the helplessness of his younger nieces, as to feel seriously oppressed by his responsibility. And now the one who had never given him aught but pleasure, seemed, according to his daughter's representations, to be the cause of increased sorrow, the destroyer of his dear child's happiness. What to do he could not tell. His daughter, wrought upon by her own jealousy, had evinced, under its influence, so much temper she had never displayed before, that it seemed more than likely the cherished match would be broken off. His high-minded niece saved him any farther anxiety as far as she was concerned. She sent for and convinced him fully and entirely of her total freedom from the base design imputed to her. "Was it likely," she said, "that I should reject the man I love lest I should drag him into poverty, and plunge at once with one I do not care for into the abyss I dread? This is the common sense view of the case; but there is yet another. Is it to be borne that I would seek to rob *your* child of her happiness? The supposition is an insult too gross to be endured. I will leave my mother to-morrow. An old schoolfellow, older and more fortunate than myself, wished me to educate her little girl. I had one or two strong objections to living in her house; but the desire to be independent and away has overcome them." She then, with many tears, intreated her uncle still to protect her mother; urged how she had been sorely tried; and communicated fears, she had reason to believe were too well founded, that her eldest brother, feeling the reverse more than he could bear, had deserted from his regiment.

Charles Adams was deeply moved by the nobleness of his niece, and reproved his daughter more harshly than he had ever done before, for the feebleness that created so strong and unjust a passion. This had the contrary effect to what he had hoped for: she did not hesitate to say that her cousin had endeavoured to rob her both of the affection of her lover and her father. The injured cousin left Repton bowed beneath an accumulation of troubles, not one of which was of her own creating, not one of which she deserved; and all springing from the unprovoking nature of him who, had he been asked the question, would have declared himself ready to sacrifice his own life for the advantage of that daughter, now compelled to work for her own bread. To trace the career of Mary Adams in her new calling, would be to repeat what I have said before. The more refined, the more informed the governess, the more she suffers. Being with one whom she had known in better days, made it even more hard to bend; yet she did her duty, and *that* is one of the highest privileges a woman can enjoy.

Leaving Mary for a moment, let us return to Repton. Here discord having once entered, was making sad ravages, and all were suffering from it. It was but too true that the eldest of the Adamses had deserted; his mother, clinging with a parent's fondness to her child, concealed him, and thus offended Charles Adams beyond all reconciliation. The third lad, who was walking the London hospitals, and exerting himself beyond his strength, was everything that a youth could be; but his declining health was represented to his uncle, by one of those whom his mother's pride had insulted, as a cloak for indolence. In short, before another year had quite passed, the family of the once rich and fashionable Dr Adams had shared the fate of all dependents—worn out the benevolence, or patience, or whatever it really is, of their "best friends." Nor was this the only consequence of the physician's neglect of a duty due alike to God and society; his brother had really done so much for the bereaved family, as to give what the world called "just grounds" to Mrs Charles Adams's repeated complaints, "that now her husband was ruining his industrious family to keep the lazy widow of his spendthrift brother and her favourite children in idleness. Why could she not live upon the 'fine folk' she was always throwing in her face?" Their daughter, too, of whose approaching union the fond father had been so proud, was now, like her cousin whom she had wronged by her mean suspicions, deserted; the match broken off after much bickering; one quarrel having brought on another, until they separated by mutual consent. Her temper and her health were both materially impaired, and her beauty was converted into hardness and acidity.

Oh! how utterly groundless is the idea, that in our social state, where one human being must so much depend upon another, any man, neglecting his positive duties, can be called only "his own enemy." What misery had not Dr Adams's neglect entailed, not alone on his immediate family, but on that of his brother. Besides, there were ramifications of distress; he died even more embarrassed than his brother had at first believed, and some tradespeople were consequently embarrassed; but the deep misery fell upon his children. Meanwhile, Mrs Dr Adams had left Repton with her younger children, to be the dependants of Mary in London.

It was not until a fatal disease had seized upon her mother, that Mary ventured to appeal again to her uncle's generosity. "My second brother," she said, "has out of his small means remitted her five pounds. My eldest brother seems altogether to have disappeared from amongst us; finding that his unhappy presence had occasioned so fatal a separation between his mother and you—a disunion which I saw was the effect of many small causes, rather than one great one—he left us, and we cannot trace him. This has broken my poor mother's heart; he was the cherished one of all her children. My youngest brother has been for the last month an inmate of one of the hospitals which my poor father attended for so many years, and where his word was law. My sister Rosa, she upon whom my poor father poured, if possible, more of his affection than he bestowed upon me—my lovely sister, of whom, even in our poverty, I was so proud—so young, only upon the verge of womanhood—has, you already know, left us. Would to God that it had been for her grave, rather than her destroyer!—a fellow-student of that poor youth, who, if he dreamt of her dishonour, would stagger like a spectre from what will be his death-bed to avenge her. Poverty is one of the surest guides to dishonour; those who have not been tempted know nothing of it. It is one thing to see it, another to feel it. Do not think her altogether base, because she had not the strength of a heroine. I have been obliged to resign my situation to attend my mother, and the only income we have is what I earn by giving lessons on the harp and piano. I give, for *two shillings*, the same instruction for which my father paid half a guinea a lesson; if I did not I should have no pupils. It is more than a month since my mother left her bed; and my youngest sister, bending beneath increased delicacy of health, is her only attendant. I know her mind to be so tortured, and her body so convulsed by pain, that I have prayed to God to render her fit for Heaven, and take her from her sufferings. Imagine the weight of sorrow that crushed me to my knees with such a petition as that. I know all you have done, and yet I ask you now, in remembrance of the boyish love that bound you and my father together, to lessen her bodily anguish by the sacrifice of a little more; that she, nursed in the lap of luxury, may not pass from life with starvation as her companion. My brother's gift is expended; and during the last three weeks, I have earned but twelve shillings; my pupils are out of town. Do, for a moment, remember what I was, and think how humbled I must be to frame this supplication; but it is a child that petitions for a parent, and I know I have never forfeited your esteem. In a few weeks, perhaps in a few days, my brother and my mother will meet my poor father face to face. Oh! that I could be assured that reproach and bitterness for the past do not pass the portals of the grave. Forgive me this, as you have already forgiven me much. Alas! I know too well that our misfortunes drew misfortunes upon others. I was the unhappy but innocent cause of much sorrow at the Grange; but, oh! do not refuse the *last* request that I will ever make." The letter was blotted by tears.

Charles Adams was from home when it arrived, and his wife, knowing the handwriting, and having made a resolution never to open a letter "from that branch of the family," did not send it after her husband, "lest it might tease him." Ten days elapsed before he received it; and when he did, he could not be content with writing, but lost not a moment in hastening to the address. Irritated and disappointed that what he really had done should have been so little appreciated, when every hour of his life he was smarting in one way or other from his exertions—broken-hearted at his daughter's blighted health and happiness—angered by the reckless wildness of one nephew, and what he believed was the idleness of another—and convinced that Rosa's fearful step was owing to the pampering and mismanagement of her foolish mother—Charles Adams satisfied himself that, as he did not hear to the contrary from Mary, all things were going on well, or at least not ill. He thought as little about them as he possibly could, no people in the world being so conveniently forgotten (when they are not importunate) as poor relations; but the letter of his favourite niece spoke strongly to his heart, and in two hours after his return home, he set forth for the London suburb from whence the letter was dated. It so chanced, that to get to that particular end of the town, he was obliged to pass the house his brother had occupied so splendidly for a number of years; the servants had lit the lamps, and were drawing the curtains of the noble dining-room; and a party of ladies were descending from a carriage, which prevented two others from setting down. It looked like old times. "Some one else," thought Charles Adams, "running the same career of wealth and extravagance. God grant it may not lead to the same results!" He paused, and looked up the front of the noble mansion; the drawing-room windows were open, and two beautiful children were standing on an ottoman placed between the windows, probably to keep them apart. He thought of Mary's childhood, and how she was occupied at that moment, and hastened onward. There are times when life seems one mingled dream, and it is not easy to become dispossessed of the idea when some of its frightful changes are brought almost together under our view.

"Is Miss Adams at home?" inquired her uncle of a woman leaning against the door of a miserable house.

"I don't know; she went to the hospital this morning; but I'm not sure she's in; it's the second pair back; it's easy known, for the sob has not ceased in that room these two nights; some people do take on so"——

Charles Adams did not hear the concluding sentence, but sought the room; the door would not close, and he heard a low sobbing sound from within; he paused, but his step had aroused the mourner—"Come in, Mary—come in; I know how it is," said a young voice; "he is dead; one grave for mother and son—one grave for mother and son! I see your shadow, dark as it is; have you brought a candle? It is very fearful to be alone with the dead—even one's own mother—in the dark."

Charles Adams entered the room; but his sudden appearance in the twilight, and evidently not knowing him, overcame the girl, his youngest niece, so much, that she screamed, and fell on her knees by her mother's corpse. He called for lights, and was speedily obeyed, for he put a piece of gold in the woman's hand; she turned it over, and as she hastened from the room, muttered, "If this had come sooner, she'd not have died of starvation or burdened the parish for a shroud; it's hard the rich can't look to their own."

When Mary returned, she was fearfully calm. "No, her brother was not dead," she said; "the young were longer dying than those whom the world had worn out; the young knew so little of the world, they thought it hard to leave it;" and she took off her bonnet, and sat down; and while her uncle explained why he had not written, she looked at him with eyes so fixed and cold, that he paused, hoping she would speak, so painful was their stony expression; but she let him go on, without offering one word of assurance of any kind feeling or remembrance; and when she stooped to adjust a portion of the coarse plaiting of the shroud—that mockery of "the purple and fine linen of living days"—her uncle saw that her hair, her luxuriant hair, was striped with white.

"There is no need for words now," she said at last; "no need. I thought you would have sent; she required but little—but very little; the dust rubbed from the gold she once had would have been riches: but the little she did require she had not, and so she died; but what weighs heaviest upon my mind was her calling so continually on my father, to know *why* he had deserted her; she attached no blame latterly to any one, only called day and night upon him. Oh! it was hard to bear—it was very hard to bear."

"I will send a proper person in the morning to arrange that she may be placed with my brother," said Charles.

Mary shrieked almost with the wildness of a maniac. "No, no; as far from him as possible! Oh! not with him! She was to blame in our days of splendour as much as he was; but she could not see it; and I durst not reason with her. Not with him! *She would disturb him in his grave!*"

Her uncle shuddered, while the young girl sobbed in the bitter wailing tone their landlady complained of.

"No," resumed Mary, "let the parish bury her; even its officers were kind; and if you bury her, or they, it is still a pauper's funeral. I see all these things clearly now; death, while it closes the eyes of some, opens the eyes of others; it has opened mine."

But why should I prolong this sad story. It is not the tale of one, but of many. There are dozens, scores, hundreds of instances of the same kind, *arising from the same cause*, in our broad islands. In the lunatic asylum where that poor girl, even Mary Adams, has found refuge during the past two years, there are many cases of insanity arising from change of circumstances, where a fifty pounds' insurance would have set such maddening distress at defiance. I know that her brother died in the hospital within a few days; and the pale sunken-eyed girl, whose damp yellow hair and thin white hand are so eagerly kissed by the gentle maniac when she visits her, month by month, is the youngest, and, I believe, the *last* of her family, at least the last in England. Oh, that those who foolishly boast that their actions only affect themselves, would look carefully abroad, and if they doubt what I have faithfully told, examine into the causes which crowd the world with cases even worse than I have here recorded!

ENGLISH SURNAMES.

In a primitive community, each person has but one word or term applied to him as a name. In time, as population becomes more numerous, it is a natural expedient to add another for distinction, the variations possible in two sets of names being much more easy than it would be to devise a sufficient variety of single names. Hence that class of appellations which we recognise as *surnames*, so called, it is said, because originally written *over* the other name, instead of after it. English surnames are much more numerous than might be supposed. Those beginning with A have been ascertained to be above fifteen hundred in number; from which, considering that there are letters which commence more as well as letters which commence fewer, we cannot doubt that there are in all at least thirty thousand surnames amongst us. In all countries, the first approaches to surnames seem to have been chiefly through three particular modes—the father's name, a place, and a personal characteristic. Joshua the son of Nun is an example of a form of Scriptural names precisely similar to our numerous class of Wilsons and Johnsons. Herodotus of Halicarnassus is analogous to John Chichester or Thomas Carlisle. The Plauti and Scauri of Rome were just as the Strongs, Shorts, &c., amongst ourselves. These continue to be the ruling modes for several ages; and it is only, in general, when the custom of applying surnames has been long established that fanciful ones arise.*

In Saxon times, the earliest form of surname was the father's name, with the addition of the syllable *ing*, to express son; thus, Ceonred Ceolwalding, Ceolwald Cuthwinning; that is, Ceonred the son of Ceolwald, Ceolwald the son of Cuthwin. This was by and by changed for the word son, as in Gamelson, Grimkelson, both of which names occur in a deed dated 1051. It was long, however, before these names became regular surnames, descending with a family as they do in the present day. We find the successive representatives of a noble family entitled as follows:—Bardolph, Akaris Fitz-Bardolph [fitz being a Norman term for son], Hervey Fitz-Akaris, Henry Fitz-Hervey, Randolph Fitz-Henry, Henry Fitz-Randolph, Randolph Fitz-Henry, Hugh Fitz-Randolph, Henry Fitz-Hugh—when, at length, in the reign of Edward III., the family being ennobled, Fitz-Hugh was assumed as a fixed surname, which it ever after continued to be. A person of inferior rank, who in 1406 describes himself as William the son of Adam Emmotson, calls himself, in 1416, William Emmotson. Another person, who is designated John the son of William the son of John de Hunshelf, appears soon after as John Wilson. We here see things in a transition state. But it is curious to learn that even yet, in some rude portions of English society, surnames are not by any means fixed, or at least are so sunk beneath popular sobriquets as to be in a manner lost. Thus a pig-dealer in Staffordshire, whose father's name was Johnson, is so invariably called *Pigman* by his neighbours, that the man himself adopts the latter designation, which may be seen painted upon his sign. Amongst colliers, fishermen, and some other classes distinguished by peculiar manners, the proper name is like a garment brought forward only at weddings, christenings, and other remarkable occasions, while a nickname serves for ordinary use.

In a pleasant book on English surnames, recently published,* those which may be called local surnames are first treated. Some of these refer to proper names of places, as Yorke, Winchester, Grantham; others to common names expressive of situation, as Wood, Hill, Greene. The first class are supposed by Mr Lower to have originated in Normandy and the contiguous parts of France about the close of the tenth or beginning of the eleventh century. They came into England with the Conqueror. Camden remarks, that there is not a single village in Normandy that has not surnamed some family in England. Percy, Warren, Devereux, Neville, Tracy, Montfort, St Maure (corrupted into Seymour), are examples. The prefix *de* (of), usually applied by the Norman families, was generally dropped about the reign of Henry VI., when the title *esquire* was substituted; thus John de Alchorne became John Alchorne of Alchorne, Esq., younger sons at the same time adding the term *gentleman*, or shortly, *gent.* Great proprietors in Scotland in like manner took their names from their estates—as *De Douglas*, that is, of the district or vale of Douglas, afterwards shortened into *Douglas*. In that country, when a landed gentleman has the same name as his estate, or is *of that ilk*, as Dundas of Dundas, Guthry of Guthry, &c., it is generally held as a sign of great family antiquity, the name and estate being presumed to have been in connexion since the time when men began to take family names from their property, that is, the twelfth and thirteenth centuries. Owing to the prevalence in England of surnames from proper names of places, it was proverbially said—

> In *Ford*, in *Ham*, in *Ley*, and *Ton*,
> The most of English surnames run.

But to these may be added *field*, *hurst*, *wood*, *wick*, and *sted*, all of them syllables of frequent occurrence in English topography. Ham, we may remark, is town; lee, a pasture; hurst, a wood; wick, a place of defence; and sted, a station, or what in the American backwoods would be called a settlement.

We now come to surnames from common words expressive of locality. This seems to have been a practice adopted by the middle and humbler classes, in imitation of landed men. If a man dwelt upon a hill, he was called *At Hill*; if near a wood, *At Wood*; if on a moor, *At Moore*; if at a gate, *At Gate*; and so on; the plural *atten* being used when the local object was of a plural nature, as, for instance, *Atten Oaks*. Such terms were in time, for the most part, softened into Hill, Wood, Moore, and Gate; Atten Oaks becoming Nokes. Mr Lower gives a list of the common names which thus became surnames of men, some of them being words now obsolete in the sense in which they were originally used. We have *Beck*, a brook; *Becket*, a little brook (How inappropriate a name, he remarks, for the furious churchman of the twelfth century!); *Back*, a ferry; *Bayne*, a bath; *Barrow*, a tumulus of the early Britons; *Bent*, a place where rushes grow (Scott describes Rob Roy as taking the bent, that is, going to the wilderness); *Barton*, the yard of a house; *Bourn*, *Born*, *Brunne*, a boundary stream; *Bottle*, a village; *Bottom*, a low ground, hence, Longbottom (a long dale); Sidebottom, Ramsbottom, Shufflebottom, the last being originally Shaw-field-bottom; *Carne*, *Cairns*, a heap of stones; *Cobb*, a harbour; *Crouch*, a cross; *Dale*, *Dell*, *Dean*, nearly synonymous (Dennat and Dunnat are At Dean, with the order of the syllables changed); *Dyke*, a ditch or wall; *Fleet*, a small stream; *Foote*, the bottom of a hill; *Garnet*, a great granary; *Grange*, the farm-buildings of a monastery; *Grave*, a ditch; *Gore*, a narrow slip of ground; *Hall*, a great house; *Hatch*, a flood-gate; *Haugh*, *Howe*, a green plot in a valley (the Hague derives its name from the same thing); *Hay*, a hedge; *Head*, a foreland; *Herne*, a house; *Hide*, the quantity of land cultivable by one plough; *Holme*, a meadow; *Holt*, a small hanging wood; *Hope*, a hollow in the side of a hill; *Horne*, *Hurne*, a corner; *Kay*, a quay; *Knap*, the top of a hill; *Knowles*, little hills; *Lynch*, a stripe of green-sward between cultivated ridges in a common field; *Law*, a hill; *Lade*, a passage for water (mill-lade is still a common term for a mill course in Scotland); *Lee*, *Legh*, *Lea*, *Leigh*, *Lye*, a small pasture; *Locke*, probably from Loch, a lake; *March*, a boundary; *Mouth*, a haven; *Place*, a mansion; *Pend*, an archway; *Plastow*, a place for sports; *Ricks*, stacks of corn; *Ring*, an enclosure; *Rye*, a shore or bank; *Shaw*, an opening in a wood; *Spital*, an hospital; *Stoke*, *Stokes*, *Stow*, a place; *Spence*, a yard or enclosure; *Thorpe*, a village; *Thwaite*, a pasture; *Wade*, a meadow; *Wyche*, a salt spring; *Yates*, gates. "From such places, and many others of a similar kind, did numbers of our ancestors borrow their family names; short and generally monosyllabic, they were well suited to the plain, hardy, Anglo-Saxon race who assumed them." Before leaving the class, it may be remarked, that in some instances a syllable has been added, as *er* in the cases of Hofer, Weller, Rayner; and *man*, as in the instances of Houseman, Milman, Steadman.

Surnames from occupations and pursuits are a numerous class in England. They are found prevalent in early times, generally with the Norman prefix *le* (the); thus Stephen le Spicer, Walter le Bouchier. It is unnecessary to run over even a selection of this class, as they are generally familiar. Verstegan remarks of those who bear them—"It is not to be doubted but that their ancestors have first gotten them by using such trades, and the children of such parents being contented to take them upon them, after coming posterity could hardly avoid them." Mr Lower informs us that the name of Smith is partly indebted for its extreme prevalence to the fact, that the word (from *smitan*, to strike) was originally applied to artificers in wood and stone, as well as in metal. Some surnames of this class are not apt to be recognised as such, in consequence of the desuetude of the trade, or the disguise of the word, as the *Cappers* (cap-makers), *Lorimers* (makers of iron work for saddlers), *Girdlers* (makers of girdles, iron plates for firing bread), and *Pointers* (makers of the ties once used in men's clothes instead of buttons). *Chaucer* is a word for a shoemaker; *Leech* is a medical man; and *Latimer* a writer of Latin. *Barker* is synonymous with tanner. *Jenner* is an old form of Joiner. A *Shearman* is one who shears worsted, fustians, &c., an employment known at Norwich by the denomination of Shermancraft. A *Pelcher* is a maker of *pilches*, a warm kind of upper garment, the greatcoat of the fourteenth century. An *Arkwright* was a maker of meal-chests, an article still almost universally in use in Scotland, under the name of meal-arks. A *Conder* was a person who paraded the shore to give note to the fishermen at sea of the approach of shoals of pilchards and herrings, an appearance on the bosom of the deep which can only be discerned at a distance on the shore. *Walker* is a manager of fulling apparatus; a fulling-mill is still called a walk-mill in Scotland.

"Names of this description," says Mr Lower, "however mean their origin, are now to be found in

* English Surnames. Essays on Family Nomenclature, Historical, Etymological, and Humorous, &c. By Mark Antony Lower. London: John R. Smith. 1842.

the highest classes of society. The names *Collier* and *Salter* are, or have been, in the British peerage, although those occupations were, in the middle ages, considered so vile and menial, that none but bondmen or slaves would follow them. Some names of this sort have been changed in orthography to hide their original meanness, or 'mollified ridiculously,' as Camden has it, lest their bearers 'should seeme vilified by them.' *Carteer*, *Tailleure*, and *Smeeth*, occur frequently as the substitutes of Carter, Taylor, and Smith. 'Wise was the man that told my Lord Bishop that his name was not Gardener, as the English pronounce it, but Gardiner, with the French accent, and *therefore a gentleman*.' Some names have reference to military pursuits, as *Harman*, *Arblaster*, &c., as well as *Hookman*, *Billman*, *Spearman*, *Bowman*, and *Bannerman*. The number of names connected with the pleasures of the chase furnish evidence of the predilection of our progenitors for field-sports. Thus we have in great numbers our *Hunters*, *Fowlers*, *Fishers*, *Falconers*, *Faulkners*, or *Fawkeners*, *Hawkers*, *Anglers*, *Bowyers*, and *Bowmakers*, *Stringers*, that is, bow-string makers; *Arrowsmiths*, or makers of arrows; *Fletchers* (from the Fr. *fleche*), that is, either an arrow-maker, or, more generally, a superintendant of archery. *Todhunter* seems to be of this kind, but, then, what is a *Tod?* Probably it was a name given to some one of the smaller animals of the chase. [*Tod* is fox, and the *tod-hunter* is a regular functionary in some districts of Scotland.]

Many surnames are from civil and ecclesiastical dignities, as king, duke, earle, knight, bishop, abbot, prior, &c. Probably many of these have been originally applied through the dictates of caprice alone; others, perhaps, from a presumed affiliation of illegitimate and foundling children to persons of rank. Many high offices have become surnames; for example, *Steward*, converted into Stewart or Stuart; also *Chamberlain*, *Sheriff*, *Butler*, *Reeve*, *Porter*, &c. *Howard* is keeper of the ha' or hall; *Durward*, keeper of the door. *Heriot* is a provider of furniture for an army; *Sumner* is a summoner employed to cite delinquents to ecclesiastical courts. The "Sompnour" of Chaucer's Canterbury Tales was such an official. *Dempster* is doomster, signifying in the Isle of Man a judge, elsewhere an executioner, that is, executor of doom. *Paliser* is a person having the care of the palings of a park or forest.

To take surnames from conspicuous personal qualities was an obvious course, and accordingly surnames of this class are very numerous. Simple complexion has occasioned the Blacks, Whites, Reids, &c. [Green is At the Green, shortened]. Hair has produced *Hoare*, *Grey*, *Blacklocke*, *Fairfax* [that is, fair-haired], *Pigot* (speckled), &c. Stature gives us *Longs* and *Shorts*, *Longmans*, &c. There are *Smalls* [Bigg is probably a corruption of Begg, Gælic for little], *Groses*, *Thicks*, and *Stouts*; but *Thynne* is believed to be derived from At the Inn. The Gaelic and Welsh have added largely to this class of names; as *Dow*, black; *More*, great; *Bane*, white; *Gough*, red; *Greig*, hoarse. Moral and intellectual qualities have also contributed largely; as *Wise*, *Sharpe*, *Blyth*, *Good*, *Goodenough*, *Thoroughgood*, and (strange to say) *Toogood*.

The surnames derived from proper names require no enumeration. Probably these were also given with a regard to the father, as in the cases of Wilson, Johnson, &c. Some of this class are from Christian names long obsolete; as *Ayscough* (from Asculphus), *Ansell* (from Anselm), *Bardolph*, *Bennet*, *Drew* (from Drogo), *Etty*, *Harvey*, *Jernegan*, *Maynard*, *Rolle* (originally Raoul), *Seward*, *Sankey*, *Toby*, *Wishart* (from Wiscard). The surnames formed from Christian names by the addition of *son*, *Fitz*, *Mac*, and *O'* (signifying grandson), are amongst the most numerous we have. Some of these Christian names are each the foundation of various surnames; thus from William we have Williamson, Wilson, M'William, Williams, Wilkin (little William), Wilcock, which is also little William, and several others, to the amount of twenty-one in all. Many Christian names, also, have been surnamed from the softened and abbreviated forms which they take in the hands of nurses.

There is a large class of English surnames from natural objects; as sun, moon, star, lion, bear, buck, stag, hare, rabbit, bull, bullock, colt. Some of these have been conferred from a fanciful resemblance of the first bearer to the object referred to. Thus Ascaline, chief of a family which flourished in the middle ages, was called Lupus (wolf), from his violent temper. His son William, Earl of Yvery, was nicknamed Lupellus (the little wolf), which name was softened into Lupel; and this, under the soft and elegant form of *Lovel*, became the family name. Mr Lower informs us that there was once actually a gentleman of Kent named Savage Bear, Esquire. It is stated, that not long since, in a congregation of dissenters at Feversham, there were twenty-three members bearing names of the feathered creation, while the minister enjoyed the appropriate designation of Rooke. The name of the early martyr of the Protestant Reformation, Huss, signifies goose. When at the stake, he solemnly said, "They burn a *goose*, but in a hundred years a *swan* will arise out of the ashes." He probably had only some general meaning; but it was afterwards remarked, that *Luther* signifies a swan. Others of this class of names are supposed, on good grounds, to have arisen from the signs of inns. Not long before Camden's time, men dwelling at the signs of the dolphin, bull, racket, would be called by such names as *Thomas at the Dolphin*, *Will at the Bull*, *Robin at the Racket*; he therefore concludes, that such men would readily come to be called by the name of the sign only. This hypothesis, Mr Lower remarks, enables us to account for such surnames as *Angel*, *Saint*, *Apostle*, *Martyr*, &c., which could never have been applied with propriety to any living person.

A vast number of English surnames are not to be ranked in any of the above classes; they appear to be the produce of mere caprice or fancy, many of them doubtless having been coined by the sapient brains of parish overseers and clowns, and applied to foundlings. But there are many of whimsical sound, which we might be disposed to place in this great class, and which, in reality, are rational enough designations. For instance, *Duppa* is D'Uphaugh (of the upper plot of level ground); *Juphen* is Jugepen, the name of a place; *Higginbottom* is either a corruption of Ickenbaum, an oak-tree, or Higgin's-bottom, a piece of low ground belonging to Higgins, that is, Hugh; and Mungey is from Mountjoy. The popular voice is but too ready to produce such corruptions, as is shown in an anecdote of an Italian boy having his name *Benito* changed by his brother sailors to Ben Eaton, so that he actually put up the name *Benjamin Eaton* over his door. The author of a work entitled "The Stranger in America," makes a remark applicable to our own country as well as his:—"Sometimes names are positively translated. Thus I know of a Mr Bridge-builder, whose ancestors came from Germany under the name of Bruckenbauer. I have met with many instances of this kind. There is a family now in Pennsylvania whose original name was Klein; at present they have branched out into three chief ramifications, called Klein, Small, and Little; and if they continue to have many 'little ones,' they may, for aught I know, branch out into Short, Less, and Lesser, down to the most Lilliputian names. . . . . A German called *Feuerstein* (fire-stone, the German for flint) settled in the west when French population prevailed in that quarter. His name, therefore, was changed into *Pierre à Fusil;* but in the course of time the Anglo-American race became the prevalent one, and Pierre à Fusil was again changed into *Peter Gun!*"

We may add, that by adaptations of foreign words, names essentially vulgar may be made to sound as something very elegant. Thus, *Bouverie*, which seems a fine sounding name, is from a French term, signifying *cow-house* or *byre*.

VIGNE'S WORK ON UPPER INDIA.

A PRIVATE gentleman, G. T. Vigne, Esq., who left England in October 1832, and spent a large portion of the interval betwixt that period and 1839 in the countries bordering on the springs of the Indus, has just published two valuable volumes, containing the fruits of his observations on the interesting scenes which then fell under his eye.* Kashmir (or Cashmere) he describes as an Alpine valley of the Himmalaya range, lying between 33 and 35 degrees of north latitude, and 74 and 77 degrees of east longitude. It measures about ninety miles or so in length, and from sixteen to thirty-six in breadth. Embosomed in lofty mountains, it presents numerous traces of having once been the site of a variety of lakes, if not of one continuous sheet of water. The lateral slopes of the valley are for the most part gentle, well watered both naturally and by canals, and fertile to such a degree as to render the spot, in spite of its great elevation above the sea, one of the most delicious in all Asia. The products of Kashmir, in the shape of shawls and other woollen articles, have become celebrated over the whole world.

As in most of the countries of Hindostan, the population of Kashmir consists partly of Mussulmans, descendants of the Mogul invaders, and Hindoos, the former predominating in the cities in the proportion of three to one, and of nine to one in the villages. When Mr Vigne entered the country in 1835, it was under the rule of Runjeet Singh, an adventurous chief who had added it by force to his territories, and who has since died, leaving Kashmir, we believe, still subject to his successors. They derive considerable customs from the district, and more especially from the shawl-trade, the most prominent of its manufactures. Of late years, however, the population of Kashmir vale has dwindled away greatly, and does not now amount to two hundred thousand persons, according to late authors. Its trade, of course, has diminished in a corresponding degree.

The capital city of Kashmir, called Sirinagur (or Kashmir), is situated on the river Jylum or Veyut, near a beautiful lake five miles in length and of half that breadth. "The aspect of the city itself is curious, but not particularly striking. It presents an innumerable assemblage of gable-ended houses, interspersed with the pointed and metallic tops of musjis or mosques, melon-grounds, sedgy inlets from the lake, and narrow canals fringed with rows of willows and poplars. The surface of the lake itself is perfectly tranquil, and the very vivid reflections which cover its surface are only disturbed by the dabbling of wild fowl, or the rippling that follows the track of the distant boat. At one glance we have before us the whole of the localities described in Lallah Rookh. Numerous villages on the edge of the water, surrounded with walnuts and chunars, are taken into the *coup d'œil*; a green causeway which is extended across it is an object of attraction; but we look upon the famed floating gardens of Kashmir, without being able to distinguish them from the green and richly-cultivated grounds upon that edge of the water which borders the city."

The city abounds in relics of ancient grandeur, telling of the times of Nur Jehan Muhul (the "light of the world"), as well as of much older days. Seven bridges span the river, which is artificially contracted near the city to a stream eighty yards in width and fourteen in depth; and the causeway just mentioned crosses the whole breadth of the lake, which is from seven to ten feet deep. The fine and healthy climate, the rich surrounding soil, and the excellent site of the city of Kashmir, render it the point, Mr Vigne conceives, where, beyond all question, the power of the English on the Upper Indus should and must ere long be centralised. The shawl-trade would of itself be richly productive under British countenance and management. At present, though the population still amounts to about eighty thousand, there are not more than from five to six hundred shawl frames in the city, the exactions of Runjeet Singh and his viceroys having depressed all kinds of trade. "It occupies six or seven frames, of two men at each for six months, to make a pair of very large shawls," the looms being old and of very clumsy structure. The poshm, or goat wool, brought chiefly from the neighbouring districts of Thibet, is spun into thread, and dyed of different colours, about forty dyes being known and used. "All the thread used in making a large pair of shawls does not weigh more than fifteen or twenty pounds English, and may be purchased for 120 to 150 small rupis. After the thread is dyed, it is dipped in rice-water, a process which makes it stronger, and fits it to be more safely moved by the shuttle, and the stiffness is removed by washing. If the pattern be worked with the needle, the shawl is far inferior in every respect to those in which the pattern is woven in. An excellent pair of the former description may be purchased in Kashmir for 150 rupis (about L.10), whereas an equally good pair of the Usuleh (the real), or the latter kind, could not be procured for less than 700 or 800 rupis." Gloves, socks, and various other articles, are also made from the shawl-wool. It is applied, indeed, to many beautiful purposes even with the imperfect machinery possessed, and might be the source of a splendid trade.

The floating-gardens of Kashmir lake have become so famous in poetry as to merit mention. Mr Vigne, however, says that they are "very un-Lallah-Rookish in their appearance, not being distinguishable from beds of reeds and rushes. Their construction is extremely simple, and they are made long and narrow, that they may be the more easily taken in tow. A floating-garden, ten yards long by two or three in width, may be purchased for a rupee. Mr Moorcroft has well described the manner in which these gardens are made. The weeds at the bottom, cut by means of a scythe, rise and float on the surface; these are matted together, secured, and strewed with soil and manure; a protecting fence of rushes is allowed to spring up around them, and upon this platform a number of conical mounds or heaps of weeds are constructed, about two feet in height. On the tops of these is placed some soil from the bottom of the lake; the melon and cucumber plants are laid upon it, and no further care is necessary." Notwithstanding this slight "down-taking," Mr Vigne does full justice to the beautiful gardens, sparkling fountains, noble groves, and blue waters of this natural paradise, though his account but makes us feel how frequently man is unworthy of the beauteous scene he inhabits—the sad truth, that

"All but the spirit of man is divine."

The people are ignorant, and their rulers barbarous, or at least capable of great occasional barbarities. One of the late governors of Kashmir, while our author was at Cabool, was guilty of an act of atrocity which may be considered as a specimen of the summary and vindictive justice of the east. He baked alive his favourite wife, the mother of his only son. She happened to be in the Punjab, where some of her enemies accused her of an intrigue, and Runjit sent her to her husband in Kashmir. Her son, who feared the worst from the hands of his father, dashed his turban on the ground before him (the most imploring act of supplication that an oriental can make use of), and knelt bareheaded at his feet. Mihan Singh promised to forgive her. Soon afterwards the poor lad was sent to the Punjab, in order to be there when Sir Henry Fane, the commander-in-chief, was on his visit to Lahore. His unfortunate mother was then seized and forced into a bath, the temperature of which was increased for the purpose of destroying her by suffocation. This did not succeed as soon as was expected; her screams were so horrible that several people left the Shyr Gurh, that they might not be obliged to listen to them; and in the end, her husband sent her a bowl of poison, which she swallowed." The cruel wretch was himself murdered in 1841.

The people of Kashmir are physically a fine race, not unworthy of their beautiful country. "The broad Herculean build and manly features of the Kashmirian peasant, contrasted with his whining complaints and timid disposition, if considered apart from the effects of a long-continued subjection to tyranny and

* Travels in Kashmir, Ladak, Iskardo, and the countries adjoining the mountain course of the Indus. By G. T. Vigne, Esq., F.G.S. In 2 vols. London: Henry Colburn. 1842.

despotism, may perhaps form a subject for physiological speculation. I think it would now be difficult to induce the Kashmirians to rise alone and unassisted against their oppressors. Mahmud of Ghuzni, it is said, was at first foiled in his endeavours to make himself master of Kashmir; though he afterwards took it. The great Akber took it, after, I think, two unsuccessful attempts; and tradition says that, in order to subdue the then warlike spirit of the inhabitants, he made them doff their more martial habiliments, and wear the large plain cloak of the Affghans; and also, in furtherance of the same plan, that he forced them to eat their bread stale—which, in these countries, where the cakes are swallowed hot as soon as made, caused them, it is said, to have only 'stomachs to eat, and not to fight.'

'Many fowls in a house will defile it, and many Kashmiris in a country will spoil it.' 'If you meet a snake, do not put it to death, but do not spare a Kashmiri.' 'Do not admit a Kashmiri to your friendship, or you will hang a hatchet over your doorway.'

In this spirit are the remarks of the neighbouring nations, when speaking of a Kashmirian; but the same want of courage that obliges them to have recourse to artifice and dishonesty, has caused their other faults to be regarded in a still more unfavourable light; for, as far as mere morality is concerned, I should say that the Kashmirian had very much the advantage both of the Sikh and the Patan—'Give a dog a bad name and hang him,' is fully exemplified in the manner in which they are spoken of. They are certainly a lying and deceitful race of people; but when detected in a fault, their excuses are so very ready and profuse, and so often abound in humour, that it is impossible to abstain from laughing, and to attempt an exhibition of anger becomes a farce. Many of the women are handsome enough to induce a man to exclaim, as did the Assyrian soldiers when they beheld the beauty of Judith—'Who would despise this people, that have among them such women?' Their dress has already been described: a red gown, with large loose sleeves, red fillet on the forehead, over which is thrown a white mantilla. The hair is collected in separate plaits, then gathered together, and a long tassel of black cotton is suspended from it almost down to the ankles. The Hindoo women usually wear a white rolled cloth tied loosely round the waist.

In Kashmir, there is no purdah, or concealment of the features, excepting amongst the higher classes. I do not think that the beauty of the women has been overrated. They have not often that slim and graceful shape which is so common in Hindostan, but are more usually gifted with a style of figure which would entitle them to the appellation of fine or handsome women in European society. They have the complexion of brunettes, with more pink on the cheek, and that of the Hindoo women has often too much of the pink and white in it; and in this respect they resemble the Armenians and Turks of Yarkund. But whatever the other features may be, they have usually a pair of large almond-shaped hazel eyes, and a white and regular set of teeth. I am not speaking of the unbeautifying effects of dirt, poverty, and misery united; and the Kashmirian women are, of course (the innamorata of Gil Blas at Algiers is an exception), wholly deficient in the graces and fascinations derivable from civilisation and accomplishment; but for mere uneducated eyes, I know of none that surpass those of Kashmir; to the natural brilliancy and softness to which the length of a black eyelash, and a little surmu or antimony, is a great addition."

We have given this degree of attention to the country, capital, and people of Kashmir, because, as already said, it is the point where, in all probability, our power in Upper India must ultimately be concentrated, lying, as it does, on the west of the Indus, to the east of which experienced men say we ought not to go, and possessing natural advantages which render it a most excellent spot for commerce, as well as for the habitation of men from a temperate clime.

It is now time that we should turn for a moment to our author's livelier sketches. Here is his meeting with the messenger sent to meet him by the Khan of Little Thibet, whom he visited. "When all was ready for a start on the morning, I was informed that a messenger from Ahmed Shah of Iskardo had arrived, and wished to speak to me. He proved to be Nasim Khan, who is mentioned in M. Jacquemont's letters. A singular-looking person, thin and pale-faced, dressed in a black velvet frock, with silver buttons, and wearing a black leathern belt profusely ornamented with little knobs of the same metal. He approached me bareheaded, with the look and manner of a captive brigand, his small, keen, and dark eye glancing suspiciously on my Sikh guards; and for a time he was reserved in his address. But when all his fears and suspicions were over, his tongue was rarely at rest, and I listened with avidity and delight to the recital of his own adventures (for he was, I think, a native of the Khyber pass, who had taken service with Ahmed Shah); his personal recollection of M. Jacquemont, and what he had heard of Mr Moorcroft; his stories of little and great Thibet, and the countries on the north of us, including Yarkund and its Chinese masters; how they were ever at war with the Kokanis; how they had laboured for months to cut through a glacier, in order to form a passage for their army; how the general of the Kokanis had loaded several waggons with the pig-tails of the Chinese soldiers slain in action; and how, in return, his celestial majesty had sent back the same number of waggons laden with millet-seed, by way of intimating the countless number of his troops; how a Chinese general, to prove his powers of ubiquity, would start off his whole army in carriages overnight to a distant post; how these vehicles were sometimes drawn across the country by paper kites; how the walls of one of their strongholds were of loadstone; and how the advancing force were aghast, when (fit subject for a pantomime) their side-arms flew from their scabbards, and their matchlocks struggled fiercely for the encounter; how beautiful were the Túrki women, and how, when a merchant came to reside in any of the cities of Yarkund, it was customary for him to contract a marriage, to be dissolved upon his departure; how the Chinese, if a row took place in the streets, came down upon the mob with whips, but were, nevertheless, very just in their decisions, and enforced the law of retribution; how the great and wonderful painter, Mani, came in disguise to China; how a celebrated Chinese painter had painted a bath so naturally, that it was mistaken for real water, and some people plunged into it; and how Mani, hearing of this, became acquainted with the painter, who sent him, as he had sent others, to look at the bath, and bathe if he pleased; and how he returned, saying, that he dare not bathe because there was a dog looking at him from the bottom of the water; and how the painter, and others with him, who went to see the dog, were all afraid of it, and when they had found it to be a painting, turned to the stranger, and said, that he could be no other than Mani, the Persian painter, of whom they had heard such wonders; and, finally, how the Chinese soldiers would not run, if beaten in action, but commenced killing each other and themselves afterwards; and how, nevertheless, two British regiments would be sufficient to conquer the whole country, &c. I remember hearing in these countries, as something very new and amusing, the old schoolboy story, of the man who undertook to plunge a knife into a certain grave, and was found senseless from fear, in consequence of his having pinned himself to the ground, by passing the knife through his own robe. In fact, my friend Nasim was a most amusing companion."

The game of shinty or "hocky," as the English call it, is played in a curious way in Thibet. "At Shighur (says Mr Vigne) I first saw the game of the Chaughan, which was played the day after our arrival on the Mydan, or plain, laid out expressly for the purpose, being about three hundred and fifty yards or thereabouts in length by about sixty in breadth, covered with a fine turf, and surrounded by a low stone wall, and rows of poplars or linden-trees. Two pillars of stone are let into the ground at a short distance from either end, and the space between them, about ten yards, is the goal or home of the players. It is, in fact, hocky on horseback. The ball, which is larger than a cricket-ball, is only a globe made of a knot of willow-wood, and is called in Tibeti, 'pulu.' The stick or byntu is of the strong and straight bough of the almond-tree, about four feet in length, and let in at the top, and passed quite through to the end of a curved piece of solid birchwood, about the size and shape of a drenching-horn. The course is attended by numerous spectators, who remain upon the wall, and watch the game with the greatest interest. A carpet was spread for the Rajah, and he invited me to sit beside him. Meanwhile, a boy was blindfolded, and the sticks of all the players, whose number is unlimited, but of course equal on both sides, were put into his hands, and from these he forms the sides, by placing one alternately on the right and left of him. The Gylfo's band is in attendance, and plays whilst the game is going on. It commences by one of the chief players, perhaps a relation of the Gylfo, taking the ball in the left hand, and then, allowing the reins to lie upon the back of the horse, he starts off at speed, tosses the ball into the air, and does not often fail to strike it, sending it far and high towards the opposite side. Immediately on its falling, a desperate *melée* takes place, in order to hit it; and the players, perhaps sixteen in number, are rarely at rest until the game is finished. The horses are galloped, suddenly halted, and thrown on their haunches, and turned with all possible rapidity; and the riders, anxious for a hit at the ball, are constantly obliged to strike at it, and deliver the cuts one, two, three, and four, at a racing pace, stooping low from their saddles to reach it, and keeping an eye to their personal safety at the same time; for, although the greatest good humour appears to prevail, an accidental blow is sometimes received, to the great detriment of one or more of the features.

I have never seen a game more manly or more exciting; and the musicians appeared to partake of the enthusiasm, playing their loudest when the rush was most rapid. I regret much that I cannot recall the notes in which they gave an excellent imitation of the tumultuous hurry-scurry and clangour of a charge. When the ball has been driven between the pillars sufficiently often, and the game is won, the victors ride up to the music, and remain there to receive the congratulations of their friends, the band playing them what is meant to be a welcome in the meantime."

We have found it difficult to give our readers a fair idea of the merits of Mr Vigne's work, the interest lying in a multitudinous assortment of brief incidental observations, which it is difficult to cut out or string together. We are all the more disposed, therefore, to counsel a perusal of the work itself. One thing has struck us forcibly in reading it, and this is, the abundance of ancient structures, bridges, causeways, canals, and aqueducts, which the portion of Upper India under observation presents, proving that the region must have long been occupied by a people fully alive to its industrial resources. We hope that it will be so again ere long.

SANATORY CONDITION OF THE LABOURING POPULATION.

THIRD ARTICLE.

CONSIDERING it as proved that an immense amount of loss is sustained in consequence of the physical and moral deterioration produced by the generally unhealthy state of the habitations of the industrious classes in this country, Mr Chadwick next addresses himself to the consideration of preventive measures. These are of two kinds—those which public authority alone can effect, and those within the range of private means.

We cannot follow the reporter in his inquiries into the existing state of the laws as to the removal and extinction of nuisances, and the establishment of drains. Neither can we well follow him in his details of the calculated cost of an efficient system of sewerage. The point which he mainly labours to establish is the necessity or strong expediency of a general system, under the care of scientific persons, to be provided for by money raised on the security of the rates, and to be paid by instalments in thirty years. The advantage of a uniform system he illustrates by the case of the Bedford Level, where a large district, naturally marshy, has been redeemed to a first-rate tillage by a combined effort, after the total failure of many separate efforts made at a much greater expense. There is something, we fear, far too grand for the comprehension of politicians in the idea of a universal supply of pure water, and discharge of refuse, provided for a country by one set of regulations; but if there be an inclination to view the expediency of it as proved, we may at least hope to see an exemplification of it in some limited field, the success of which might be expected to encourage its gradual extension to other districts. Already, striking distinctions are observable with reference to the comparatively efficient drainage of some districts. Birmingham is allowed to be one of the best drained towns in England, and in all the sanatory statistics of its operative classes it shows well accordingly.

From Mr Chadwick's view of what has been done by private efforts, we can see that much more might still be done in that way, if the employing classes were more enlightened on the subject. We have said that the question is very much one of locality and police. Low physical, and consequently low moral condition, springs in a great degree from mere structure and laying out of houses, and from personal habits as to cleanliness. The working classes in general have to live in ill-fashioned ill-conditioned houses, provided for them by persons (generally of inferior condition) who only aim at realising a profit from them, and who are little interested in making them agreeable or healthy. When employers have undertaken to provide better houses, excellent results have followed. It proves an unfailing means of bringing around a master a set of steady respectable persons, and both in this way and in a return of rent proves profitable. It is a step never undertaken unless where there is ample capital, and thus adds to the proofs which exist of the benefit which capital in the employer tends to confer upon the employed. "In one instance," says Mr Chadwick, "of a large outlay on improved tenements, and in provision for the moral improvement of the rising generation of work-people, by an expensive provision for schools, the proprietor acknowledged to me, that although he made the improvements from motives of a desire to improve the condition of his work-people, or what might be termed the satisfaction derived from the improvements as a 'hobby,' he was surprised by a pecuniary gain found in the superior order and efficiency of his establishment, in the regularity and trustworthiness of his work-people, which gave even pecuniary compensation for the outlay of capital and labour bestowed upon them. He stated that he would not, for L.7000, change the entire set of work-people on whom care had been bestowed, for the promiscuous assemblage of work-people engaged in the same description of manufactures."

The inevitable result of the existing condition of many seats of factory population has been to produce a general impression, that such a population must necessarily be a painful anomaly wherever it exists, and a most unfavourable field for the development of the humble virtues. But there are examples of factory populations which completely refute this conclusion, being remarkable for a degree of general good conduct far above the average. Such are those which reside at Catrine and Deanston in Scotland, and there are some similar examples in England. Catrine is a great cotton factory in a rural district of Ayrshire, employing about 1000 persons. The village in which the working people live was built by the master, but many of the houses have subsequently been bought by the men with their savings. A committee of proprietors impose a rate to keep the village clean. "The houses are substantially built of stone and lime, and slated, and are generally of two storeys, containing four families, occupying two rooms each. They have generally

small plots of garden-ground behind." Mr Stuart, the factory commissioner, says, that "the work-people, 'more especially the females, are not only apparently in the possession of good health, but many of them (quite as large a proportion as we have seen in any of the extensive well-regulated similar establishments in country districts) are blooming—as unlike as possible to the pale languid-looking females too frequently to be found in similar works in great cities.' Mr Hill, the prison inspector for Scotland, stated that the procurator fiscal, or public prosecutor, reported to him that he had nothing to do in that village; and in his third report he thus mentions it:—'There is little crime here, and very few offences of any kind, and it is reported that there is not a single person in the village who is of a bad character. Indeed, no person of bad character, or who is in the habit of drunkenness, is allowed to remain in the mills, on which nearly the whole population of the village is directly or indirectly dependent. The few offences which are committed are almost all by vagrants. The inhabitants of Catrine appear to be in the enjoyment of an unusual amount of comfort; they are well clad, live in neat houses, many of them their own property, and look healthy and cheerful; indeed, the only person in the village who has reason to be downcast is the medical man, who complains that he has nothing to do.'

Similar effects are manifested in the mills at New Lanark, and at the flax-mills near Cupar. These instances would suffice to establish the fact of the very little sickness that is *essential* to the occupation itself. Mr Hill, who, by his office, is led to appreciate highly instances of exemption from crime and disorder, exclaims, upon the sight of such establishments—'Notwithstanding what has been said on the subject of factories, I have no hesitation in declaring, that I believe that the work-people at Catrine, New Lanark, and other similar establishments, form some of the healthiest, happiest, and most moral communities in the world.'"

At the cotton factory of Turton, near Bolton, the people were at first accommodated in wretched dwellings, where a malignant fever in time broke out amongst them. This awakened the benevolence of the employer, and led to a revolution which furnishes at once encouragement and a pattern for other masters. "We ordered," says one of the firm, "an examination of every cottage in our possession, both as regarded cleanliness and ventilation, as well as bedding and furniture. The striking difference exhibited in the state of these cottages, the neatness and cleanliness of some, the gross neglect of others, *appearing to have no relation to the amount of income*, convinced us that an occasional repetition of these visits would be essential, in order to effect any permanent improvement amongst them. These periodical visits have now been continued through a series of years, and, as no invidious distinction or selection was ever made, do not appear to have been viewed in the light of an intrusion; a week or two of notice being mostly given, a laudable degree of emulation has been excited as to whose house, bedding, and furniture, should be found in the best order; my brother or myself has occasionally joined in these visits. By these means we were made acquainted with the wants and necessities of the various families in our employment. Having had such opportunity of observing the great inconvenience arising from small dwellings where the families were large, both as regards bed-rooms and living-rooms, few cottages having more than two bed-rooms, and where there were children or young persons of both sexes, the indelicacy of this arrangement was apparent; we therefore concluded to build larger cottages, and make them with three bed-rooms in each. These houses were sought after with the greatest avidity, and families allowed to remove to them as an especial favour; the increase rent, of 1s. to 1s. 6d. per week, was a small consideration in regard to the additional comfort afforded to a family where the income was from 24s. to 30s. or 60s. per week, as is frequently the case with families employed in manufactories."

Masters have also the power of improving the condition of their workmen very materially by discouraging intemperance amongst them, establishing or encouraging savings' banks, and taking a special personal interest in their welfare. The payment of wages on Friday evenings, that they may have the advantage of the Saturday's markets, and be saved from the temptation of vicious indulgences on Saturday evening and Sunday, is also a good measure within the option of masters. It is suggested in the report, that Saturday morning is a better pay-time than Friday evening, which is perhaps true. We may here advert to a plan which a benevolent country gentleman known to us adopted for inducing his servants to commence depositing in savings' banks. It consisted simply in paying in a portion of their wages into one of these banks a little while before they were due. A nucleus was thus formed, to which spontaneous additions were in some instances made afterwards. The Rev. Mr Whitwell Elwin observes—"Where gain was dependent on the growth of better habits, I have seen, with the agency of judicious individuals, encouraging cases of complete reformation: an intelligent engineer in this neighbourhood was about paying off a man whose profligacy had left him without a decent covering, and who often depended for his victuals upon the generosity of his fellow-workmen. He begged hard to be retained, and his master at last consented, on condition that he himself should lay out his wages for the next three months. He provided the man with good lodgings, allowed him tea, sugar, and bread and butter night and morning; meat, and either bread or potatoes, with a pint of beer every day for his dinner; and before the appointed time was up, bought him with the surplus a new suit of clothes. The man was so sensible of the advantage of the change, that he became one of the most thrifty and valuable workmen; and his master has often since tried the same experiment with the same success. If we could collect all the philanthropy and much of the self-interest of the country into wise and profitable channels, we might, I believe, in a twelvemonth, do much towards regenerating the most wretched classes.

Individual employers, who possess the means, can also confer a vast benefit on their workmen by establishing baths in connexion with the factories. A bath is a moral engine of far greater power than is dreamt of. It belongs to the class of innocent luxuries which preclude others of an improper kind. In many instances, warm baths have been supplied with the condensed waste steam, and thus kept up at scarcely any expense; but a little expense for so good an object may be well incurred. A manufacturer in London, finding mere admonitions useless in inducing men to bathe, "began with his apprentices, and took them several times to the new tepid baths, as a holiday and reward, until they had experienced the comfort, and had formed a habit, when he left them to themselves, and they paid out of their own pocket-money the small amount necessary to defray the expenses."

Many benevolent landlords have erected good dwellings for the labourers on their property; but in most instances, the cost has been such as only can be admitted of where wealth seeks a peculiar mode of self-gratification. Mr Chadwick justly remarks, that in ordinary circumstances, we must calculate upon a cost which the labourer, in his present circumstances, would justify by a remunerating rent. After passing over, therefore, the cottages of the late Earl of Leicester at Holkham, and some others, he comes to those erected by the excellent Sir C. S. Monteath on his estate of Closeburn, which have cost only about L.70, and comprise an important economical improvement of an original kind. A Closeburn cottage is 36 feet in front, and consists of two floors (the uppermost being an attic), with two rooms on each, each room 16 feet square and 8 in height. In the rear is a series of conveniences—necessary, coal-house, scullery, larder, and cowhouse. The back of the kitchen fire-place is composed of an iron box which projects into the adjoining room. This box has a subterranean passage for admitting cold air to it at the bottom, and it extends upwards into the garret floor, where it sends off a pipe into each room. The cold air entering at the bottom, is heated as it passes behind the fire, and then ascends into the garrets. It will be observed, that by these means one fire is not only made to serve the ordinary purposes in the kitchen, but to communicate a certain degree of warmth to all the other parts of the house, maintaining perfect dryness in all.

Finally, individual masters and proprietors might do much for those under them by providing spaces of ground for healthful recreation. Mr Strutt of Derby has, as is well known, given eleven acres to serve as a pleasure-ground for the working classes in that town. The Duke of Norfolk designs to bestow a similar gift on those of Sheffield. It is to be lamented that the teeming population of Manchester is altogether destitute of such a source of innocent enjoyment. "Pent up," says Mr Mott, "in a close dusty atmosphere from half past five or six o'clock in the morning till seven or eight o'clock at night, from week to week, without change, without intermission, it is not to be wondered at that they fly to the spirit and beer shops, and the dancing-houses on the Saturday nights, to seek those (to them) pleasures which their own destitute and comfortless homes deny?" Who can deny the justice, or repudiate the feeling, of this remark? "But," Mr Chadwick observes, "want of open spaces for recreation is not confined to the town population. In the rural districts the children and young persons of the villages have frequently no other places for recreation than the dusty road before their houses, or the narrow and dirty lanes, and accidents frequently take place from the playing of children on the public highways. If they go into the fields they are trespassers, and injure the farmer. The want of proper spaces as playgrounds for children is detrimental to the morals as well as to the health in the towns, and it probably is so generally. The very scanty spaces which the children, both of the middle and the lower classes, the ill as well as the respectably educated, can obtain, force all into one company, to the detriment of the better children, for it is the rude and boisterous who obtain predominance. In the course of some investigations which I had occasion to make into the causes of juvenile delinquency, there appeared several cases of children of honest and industrious parents, who had been entrapped by boys of bad character; I inquired how the more respectable children became acquainted with the depraved; when it was shown, that in the present state of many crowded neighbourhoods, all the children of a court or of a street were forced to play, if they had any play whatsoever, on such scraps of ground as they could get, and all were brought into acquaintanceship, and the range of influence of the depraved was extended. The condition of the children in large districts, where there are no squares, no gardens attached to the houses, and no play-grounds even to their day-schools, and where they are of a condition in life to be withheld from playing in the streets, is pronounced to be a condition very injurious to their bodily development. The progress of the evil in the rural districts has been to some extent arrested by a beneficent standing order of the House of Commons, that all Enclosure Bills shall include provision for a reserve of land for the public use for recreation. For children, however, the most important reservations would be those which could be made for play-grounds in front of their homes, on plots where they may be under the eye of their mothers or their neighbours. Where the cottages are near a road, they should be some distance from it, with the gardens or play-ground in front. The separate or distant play-grounds have many inconveniences besides their being out of sight; and where they are far distant, they are comparatively useless. I have great pleasure in being enabled to testify that the instances are frequent where the regulated resort to private pleasure-grounds and parks has been indulgently given for the recreation of the labouring population."*

We have now presented as full a summary as our space will allow of Mr Chadwick's very remarkable volume. We cannot part with it without at least congratulating the public on the favourable auguries held forth by the very production of such a work. Much there is to depress the British philanthropist—selfish blind party-spirit engrossing nearly the whole energies of our legislature—classes serried against each other in anger—clamant social evils without a science by which to ascertain their source or order their redress. Amidst all this, it is truly gratifying to trace the labours of such a man as Mr Chadwick, painfully amassing evidence on a subject which twenty years ago would have at the utmost been occasionally adverted to as a mere matter of vague supposition, but deemed far too remote from clear apprehension to call forth the least effort for its demonstration. In bringing this evidence to a point where inferences can be made with tolerable clearness, and remedies suggested with some confidence, a great step is made in advance. We have next to see if there be in our statesmen sufficient largeness of mind and goodness of meaning towards the people, to induce them to act upon what has been now at length demonstrated.

PEDESTRIAN TOUR IN SWITZERLAND.

DESCENT OF THE VALAIS TO MARTIGNY—THE COL DE BALME AND CHAMOUNI.

August 25.—Brieg, though almost a city-looking town, contains only about 600 inhabitants, who seemed to have hidden themselves from the hot glare of the sun in the stony recesses of a collection of great old mansions, built apparently for a much larger population. As we wandered through its picturesque streets, we scarcely met a soul; its shops appeared as if they were purposely and laboriously kept out of the way of intruders; and being in want of a few necessary articles which almost every village can supply, it was with difficulty that we found out where they were to be had. The Jesuit's College is an epitome of the desolate grandeur of the whole place. Though consisting of a great range of buildings, it is said only to contain ten members, who have room and verge enough, for we entered their dwelling here and there by open gates, and wandered through long echoing vaulted corridors, without meeting with a living being or with any sign of inhabitancy, save it might be here and there an old mouldering picture or a carved cabinet. We entered the chapel, which, though well ornamented, and in itself a fine specimen of Gothic architecture, was equally lonely.

The ascent of the Simplon commences here, and we ascended so far as to be able to appreciate the admirable engineering by which the abrupt ascents and descents of the mountain side were mastered and rendered accessible. From our elevation we looked down on Brieg, which, with all its pear-shaped cupolas, or rather minarets, glittering in the sun, had a truly oriental effect. These architectural ornaments, as well as many of the abrupt roofs of the larger buildings, are covered with glittering scales, which at first sight seem made of tin, but which a nearer view induced us to believe were of a micacious schist.

As we did not expect to find much matter of interest in the remainder of the descent of the Valais, and were pressed for time, we resolved to take the diligence to Martigny. It started at twelve o'clock, and went on as lazily as a deliberative mind could wish. The scenery was monotonously in the character of what we had already passed, and no object of great interest appeared till we reached Sion, the capital of the Lower Valais (about twenty-five miles from Brieg), where the diligence stopped for an hour. Long before we reached the edge of the town, we had seen the ruins of its three princely-looking castles,

* [The conduct of local authorities, generally, with respect to public accommodation and health, contrasts unfavourably with that of many private individuals. On a late occasion, the town-council of Edinburgh made an effort to shut up the outlet of an alley, on the plea that the ground was town property (worth, perhaps, 10s. a-year): this most reprehensible attempt to block up a useful thoroughfare and means of ventilation in a crowded neighbourhood, which had been open for half a century, was, we are glad to say, checked by the interference of two conterminous proprietors.—*Ed. C. E. J.*]

towering upwards from the sharp precipices, round the sloping bases of which the old gray houses of the city were clustered in terraces. We started on an exploring expedition, without any definite object in view; but in the venerable character of the streets and their massive toppling houses, there seemed to be no loss of curious objects in any quarter. Wandering through the old and dirty streets, we arrived at the cathedral, in its size and the richness of its architecture a wonderful contrast to the poverty of the whole canton, and a memorial of the wonderful influence of that church which has raised the proudest monuments of its pomp and power amidst the dust and ashes of a diseased and poverty-stricken population. Having wandered so long among nature's noblest works, it was not unpleasing to contemplate one of those objects which are perhaps the most impressive specimens of man's skill and perseverance—a Gothic church; and for some time we walked up and down beneath this roof made with hands, listening to the echoes of our footsteps on the marble floor, and enjoying the religious silence and solitude of the spot. Sion seems to show that the power of the church is not waning within it; for we observed a handsome new palace in the course of erection for the prince bishop, who, though the canton is nominally democratic, retains the right of convoking and presiding at the legislative assemblies. We next directed our attention to the grey old ruins which crowned the rocks. Our progress among them was as uninterrupted as our visit to the cathedral; but it would be difficult to give any further account of them than to say, that they left in our minds an impression of an endless succession of shattered walls, mouldering square towers, vaults, and small Gothic chapels, looking as old and as long deserted as if no one had entered them since the flood.

We had still about sixteen miles of the diligence—a weary drive of nearly four hours. The road generally accompanied the Rhone, from the inundations of which it was protected by being laid on the top of a long mound or mole. It was straight, and a continuous descent. Twilight was coming in, and it appeared as if there were a wall of rock right before us, and not above a mile ahead, where we must stop per force; but still on went the diligence, down, down, hour after hour, the wall of rock neither coming nearer to us nor receding, but rising higher over our heads, as if we were descending into the bowels of the earth; at last we reached Martigny nearly at midnight. Here we found waiting for us our passports, which we had to send from Berne to Lausanne, to be visé for entering the Sardinian dominions. We found it duly certified that we had presented ourselves before the proper authority at the Canton de Vaud, and that we were what we were; and though some hundred miles or so off at the time, we were content with this testimonial to our personal identity, since the public officer himself was so.

August 26.—Martigny is a mere village, if possible more gloomy than any of those we had hitherto passed. Its houses have all a grey ancient aspect; yet this cannot proceed in all cases from their antiquity, for one or two which we saw masons erecting looked like deserted ruins. A huge round tower frowns over the village from a projecting rock on the side of the mountain barrier, many hundreds of feet up. We were now some thousands of feet below the source of the Rhone, and the influence of a warmer climate appeared in luxuriant vines and multitudes of plum and walnut trees. There was here abundance of the grand and beautiful in inanimate nature, but it had never before been our lot to see humanity so physically degraded. The whole valley is an hospital. Every grown-up person has a huge goitre, and swarms of disgusting imbeciles, with large swollen heads and distorted bodies, lay basking in the sun like so many horrible caricatures of humanity. It might be fancy, but we thought we could *feel* the cause of all this misery in a hot stifling atmosphere, which rendered breathing oppressive. Nowhere had we yet seen a valley so abruptly bounded by high steep mountains, which seemed to enclose it on all sides, except in the gap which admitted the inclined plane we had descended by, and there was a painful feeling of confinement, which made us long for the pure air of the hills.

It was our intention to cross to Chamouni by the Col de Balme, leading from Martigny.* To accomplish this, we had in the first place to cross the Col of the Forclaz. The ascent was steep and rugged, and we did not reach the top till near mid-day. We looked down into the narrow quiet valley of Trient, all calm and peaceful below, with its hamlets, trees, and pastures, but presenting a wilderness of rock and glacier towering above in all directions. We descended by a very steep path, and in a retired nook of the narrow glen, under the shade of broad trees, and by the side of a rippling brook, we ate a cold collation we had brought with us from Martigny. The ascent of the Col de Balme threatened to be a stiff job, and it turned out as we anticipated. We had not much scrambling among rocks, but the way rose with extreme abruptness straight up the steep hill-side, with a nearness to the perpendicular, indeed, which I do not think the earthy coating of the path could have preserved, had it not been for the forest of pines through which it passed, the roots of which cast a net-work through it. We had been a little alarmed at Martigny by observing a slight coating of new snow on the range we had to cross (a snow-storm on the higher passes of the Alps is a fearful thing to encounter, for in an instant it darkens the air and obliterates the landmarks), but the heat of the noon-day sun melted what had already descended, and the clearing up of the sky quieted any apprehensions of a farther fall. When we rose above the forest girdle, we found smooth short turf, on which we had a pleasant footing, for the ascent was less steep. It was with some anxiety that we found the wavy outline of the pass which bounded the horizon in our front becoming more near, for we knew that if the clouds favoured us, the moment our eyes could look across that line, they would behold one of the most wonderful scenes in the world. And it came to pass according to our highest hopes; first there appeared a snowy summit distinct and white against the blue sky, and then a pace or two further revealed to us "the monarch of mountains" from the summit to the broad base, with all its snows and glaciers, its pyramids, its walls of precipice, and its dusky forests. One could imagine our grander cathedral architecture—I mean as illustrated in St Peter's and St Paul's—to have been partly imagined from such a scene as this. The summit of the mountain is broad and dome-like, and, as if to harmonise with and give effect to the majestic proportions of this the most conspicuous feature of the great range, several rugged points rise spire-like here and there, each in itself a grand and imposing object, yet by its inferior proportions giving greater effect to the vast dome above. On all this, as well as on the shivered rocks of the Brevent, at the north side of the valley, and the vale of the Chamouni below, with the glaciers running in wide masses down its edges, and the various thread-like streams which issue from them, the sun was shining brightly, and through the clear atmosphere the whole appeared before us as complete as if it were an accurate model. Vaulting ambition prompted us not to be content with this gorgeous scene, without mounting to the top of a neighbouring eminence, where, in addition, we saw the range of the Bernese Alps, with our old friends the Jungfrau, the Wetterhorn, and their whole array of companions. We were here between seven and eight thousand feet above the sea level, and we saw before us, deep down, and with the shadows of the mountain beginning to fall upon it, the few dots in the vale of Chamouni which indicated the village where we were to pass the night; a pretty long and tedious journey we knew we had yet before us.

Before leaving the Col, we were invited into a cottage, the owner of which professed to possess a quantity of mineralogical specimens gathered in the neighbouring mountains. We found the collection to be a petty jewellery establishment of German agates and Brazil crystals. The proprietor could not deny that the stones had been cut in Germany, where they are a well-known manufacture, but he maintained that they had been found on Mont Blanc—an arrant falsehood; which, however, does not in the least degree reduce the value of his commodity to the most of his visiters. The descent was tedious, but not difficult; and the eyes were all along feasted by the ever-varying aspect of the hill. When we had entered the upper part of the valley, we passed the glacier of the Arve, whence that river issues, like the Rhone, from a great archway. But every few miles we passed brought us to a new glacier stretching down from between the steeple-like points of rock into the valley. Close to the termination of one of these was a pretty church, with the parsonage-house or manse. It occurred to us that the minister could at least congratulate himself on indefinite facilities in supplying himself with ices.

It was quite dark ere we reached the village; night came on before we had descended to its level, and we saw the darkness gradually settle on the lower portions of the landscape before it ascended to the higher ranges. For some time, our view of the mountain top was interrupted, and we thought we had bid good-bye to it for the night, when a meteoric-looking phenomenon attracted our attention. It was large and luminous, shining with a bright and pure lustre; and so completely did it appear some wondrous object belonging to the department of astronomical science, that it was not easy for us to convince ourselves that we saw the setting sun illuminating the snows of the mountain top. Hungry and a little tired, we entered one of the brilliantly-lighted inns of Chamouni, where, seated at the table-d'hôte, I had the unexpected pleasure of meeting a respected friend, Mr S. T——, who has achieved the rare distinction of acquiring celebrity as a poet, an essayist, a lawyer, and a legislative debater. He was accompanied by his family. I had last seen them on a visit to the Highlands of Scotland, and was gratified to find that the scenery of my native land was not obliterated from their minds by the more sublime scenes I now found them traversing.

* [Martigny is situated on the right bank of the Rhone, near the point where it receives the Dranse, a small river issuing from the valley which leads towards the pass of the Great St Bernard. Another route from Martigny by the Trient, being that adopted by our tourist, is the path towards Chamouni, which leads in the direction of Mont Blanc. The Rhone at Martigny makes a sharp turn down the Valais, in a north-westerly direction; and at about half way to its outlet in the Lake of Geneva, is situated the small town of Bex, noted for its baths and salt works. The road up the Valais from the lake is the highway to Italy, travellers either adopting the char road by the Great St Bernard, or the more perfect road by the Simplon, which strikes off at Brieg. The route to Italy, which we should recommend all persons from this country to take, is as follows:—London, Ostend, Brussels, Liege, Cologne, the Rhine, Basle, and Lausanne, at which diligences are found in daily communication with Milan by way of the Valais and Simplon. A route somewhat more direct is by Lucerne and the pass of St Gothard. At Lucerne, various vehicular conveniences offer. To those who take an interest in glaciers, and their power of changing the face of the lower valleys, ample opportunities are afforded of studying the subject in the Val de Bagne, above Martigny, which has been the scene of extraordinary commotions in the icy and watery world.—*Ed. C. E. J.*]

COMPARATIVE SAFETY OF STEAM-BOAT AND RAILWAY TRAVELLING.

On this subject the following lately appeared in the *Railway Magazine*:—"We should have liked to see a comparison drawn between the accidents by steam-boats and sailing vessels. Notwithstanding the many serious accidents that have occurred with steam-boats, we have no doubt that fewer lives are lost in proportion to the numbers carried by steam than by sailing vessels. But, in comparative safety with railways, steam-boats hold a very low rank, and, unfortunately, when they do occur, they are very serious.

'From an abstract of 92 accidents, it appears that 40 steam-vessels were wrecked and foundered, 23 exploded, 17 were burned, and 12 were destroyed by collision. The greatest number of lives lost at any one time from wreck was 119; from collision, 62; from explosion, 24.'

On the other hand, 'It appears, from the returns made to the Board of Trade of the aggregate traffic upon railways, that during the half year from 1st January to 1st July 1841, 9,122,000 passengers travelled upon the various railways of the United Kingdom. It also appears, from a table showing the nature of the traffic on a number of lines, that the average distance travelled by each passenger is about twenty miles. Now, on analysing the returns of accidents for the same period of six months, I find thirty persons lost their lives. These consisted of

Passengers who were killed from causes beyond their own control,	3
Passengers who suffered from their own folly, negligence, or misconduct,	2
Total number of passengers killed,	5
Trespassers on the line of railway,	5
Engineers, servants, labourers, and workmen on the line of railway,	20
Total killed in six months,	30

The number of passengers travelling was 9,122,000; the distance travelled 182,440,000 miles; and the number of passengers killed from causes beyond their own control was three. There was, therefore, one passenger killed out of each 3,040,666 passengers; or, in other words, one passenger lost his life for each 60,813,333 miles travelled. Contrast this with stage-coach travelling. A railway traffic of 9,122,000 persons, each travelling twenty miles, is equivalent to a stage-coach with ten passengers per day, travelling an equal distance daily for 2,500 years. If, then, stage-coaches were attended with as little personal injury to the public as railways, the following would be nearly the proportional number of accidents:—

The number of passengers killed from causes beyond their own control,	1 in 833 years
The number killed from their own folly, negligence, or misconduct,	1 in 1250 ..
The number of persons run over on the public road,	1 in 500 ..
The number of coachmen, guards, ostlers, and other servants of the coach,	1 in 125 ..

There is another circumstance which should not be overlooked. All the passengers who lose their lives in steamers perish from causes wholly beyond their own control, whereas a large proportion of those who are killed upon railways suffer from their own folly, negligence, or misconduct. It will perhaps scarcely be credited, when I state, that of the serious accidents reported to the Board of Trade, twenty-two happened to persons who jumped off, when the carriages were going at speed, generally after their hats; and five persons were run over when lying either drunk or asleep upon the rails.

Indeed, after contemplating the sad picture of steam-boat casualties, it almost provokes a smile to turn to the schedule of railway accidents.'

After an able analysis of the dangers of the two modes, Mr Lang sums up—'1st, That the history of travelling by steam, both in Great Britain and foreign countries, had proved, prior to the introduction of Lord Seymour's bill, that passengers by railway were exposed to less risk of personal injury than passengers by steam-boats.

2d, That since the passing of Lord Seymour's act, notwithstanding the increase in the number of passengers by railways, the number of accidents to railway passengers has diminished, while the number of accidents to steam-boat passengers is increasing.

3d, That where steamers come into direct competition with railways, there is a tendency, arising from obvious causes, that the ordinary risks of steam navigation should increase.'

He then suggests the following rules and regulations for steam-boats to be established by the authority of parliament, in which we perfectly concur:—

'1st, That all steam-vessels should be registered and classed.

2d, That the conflicting usages of different ports, as to the manner in which steam-vessels meeting should pass each other, should be abrogated, and a uniform 'rule of the road' fixed by the authority of parliament.

3d, That a uniform system of night-lights or signals should be established.

4th, That steam-vessels should be embraced within the operation of Lord Seymour's act, rendering it imperative on them to make a return of all accidents attended with personal injury, in the same manner as is done by railways.

5th, That the engineers and crews of steam-vessels should be subjected to the same penalties for drunkenness or misconduct as the engineers and conductors of railway trains.'"

AFFECTATION OF EASE.

There is a practice getting into vogue, almost into a sort of fashion, among young gentlemen who wish to impose upon the unwary by *nonchalant* airs of affected ease and freedom from restraint, which I must here denounce as a breach of good manners and a want of all just feelings of propriety: I mean the practice of lounging in graceless attitudes on sofas and arm-chairs, even in the presence of ladies. All these vile and distorted postures must be reserved for the library-couch or arm-chair, and should never be displayed in the society of gentlemen, and still less in that of ladies. In their own houses, ladies must submit to such conduct, as they cannot well leave a visiter to himself: at all other times, they should, if they have any respect for their own dignity, give the lounger the cut-direct, and go to some other part of the room. Once denounced, however, as vulgar and uncivil, the nuisance will cease of itself; for the guilty only offend under the impression of being thought superlatively fine.

Lounging is not a foreign vice, though foreigners take up the practice, to an extravagant degree, when mixing with English society. Out of the English circles it is, however, so little known, that a slight attempt of the kind once caused a regular uproar at one of the German courts. Many of our countrymen, even plain, unaffected, good sort of men, have a foolish trick of throwing the foot of one leg over the knee of the other—bringing the right ankle, for instance, to rest on the left knee, so as to place themselves in a half tailor-like attitude. The custom is certainly neither graceful nor elegant, but not very reprehensible. An English gentleman, a member of the *corps diplomatique*, happened one evening to be sitting near a countess of high degree, to whom he was explaining, in very indifferent French, perhaps something about the public walks that surrounded his house, when, in the middle of his discourse, up went the right leg, placing the foot exactly over the left knee, and presenting the sole of the diplomatic shoe fully in view of her ladyship's eyes. The countess blushed through three layers of rouge, rose indignantly from her seat, and hurried to the other end of the room, declaring that she had been grossly insulted by the English ambassador, who had mistaken her for a cobbler, and held up the very soles of his shoes for her inspection. Mighty rage filled the bosoms of princesses, baronesses, and countesses; and the lord-marshal of the palace came with bows and smiles to the diplomatist, requesting that he would make some apology to the lady, who was no cobbler at all, but a person of high rank and great merit. Our excellent countryman was utterly confounded, not knowing what crime he had been guilty of, as he was well aware of the lady's rank and respectability, and so far from speaking of shoe-soles, he had been speaking of willows (*saules*); and if the lady had seen the sole of his shoes, it arose merely from the circumstance of his having placed himself in an attitude very general in his own country. The explanation was readily received, as no one wished to press the point; but the whole court were convinced that it was a mere evasion, as no one could comprehend why the ambassador should have presented the sole of the shoe to a lady while talking to her about willows. "*N'import, n'import, Monsieur l'ambassadeur*," said the princess-consort to the unhappy diplomatist, who attempted to convince her of the truth of his asseveration, "it is a *bagatelle*, already forgotten. We are always delighted to hear your excellency's opinions about gardens, for you English have great taste in gardening; but defend me from English attitudes!"

This trifling anecdote tends, though in a feeble and insufficient way, to illustrate the worthlessness of all merely local, conventional, or professional finery or exquisiteness, whether displayed in wit, humour, attitude, or slang-jargon. Freedom from all these fetters is therefore indispensable to a perfect gentleman and man of the world; while the constant display and jingling of such fetters show, on the other hand, a limited understanding, and an ignorance of society.—*The Art of Conversation, by Captain Sabretash.*

THE MOORS.

In the Highlands, in spite of the myriads of boxes of birds sent to the south, by land and water, every autumn, moor game of all descriptions continues steadily to increase. Individual ranges of shooting ground do occasionally get fearful sweeps towards the end of a lease; yet one year's jubilee generally puts things to right again; and experienced hands will rather "bite" at good grounds that have been well "shot," than grounds that have been "carefully preserved," and none allowed to shoot upon them without "written leave from the proprietor." It seems rather paradoxical to assert, that the killing of any sort of animal should tend directly or indirectly to the increase of its numbers; nevertheless, we believe it to hold good in regard to grouse, as the grouse in the northern counties have certainly increased under the murderous guns of our southern aristocracy. The fact, however, may be satisfactorily accounted for by the circumstance, that the moment a southern signs his lease of the shooting grounds, he engages his keepers and orders his vermin traps, and from that day declares war against every description of poacher, whether clad in hair, feathers, or hodden grey. A regular sportsman, let his disposition be what it may, is a perfect tyrant in all matters touching his game, and would *jamb* the legs of the golden eagle—the monarch of the air—in a steel trap, as pleasantly as he would jamb the legs of his fellow-creature in the stocks, if caught with a gun in his hand and a bushel of birds in the corner of his plaid. In the north, this iron rule seldom fails to have the desired effect, and shooting grounds are comparatively unmolested.

It will thus be seen that a proprietor, in letting his shootings, only transfers the right to kill from one description of the *carnivora* to another, and that, whereas the eagle, the fox, the raven, the pole-cat, &c., &c., pay no attention to the term-days and other provisions of the game act, but pursue their sports and pastimes the whole year round, and in all weather, the sportsman is circumscribed to three or four months in the year, and even this space is much curtailed by such contingencies as bad weather, sprained ankles, worrying dogs, &c. These things considered, the grouse have evidently exchanged rulers for the better; and this is seen, as in all well-governed realms, by the increased amount of population.

But besides the increase which arises from the destruction of the natural and direct enemies of the grouse tribe, other and less direct causes, called into play by the system of killing, undoubtedly tend to the same end. Systematic and judicious sportsmen invariably pick out the old birds of a covey, and these, especially the old cocks, when past the age of breeding, are generally believed to be hurtful to the rising generation, not only in breaking eggs, but in usurping the place of vigorous and young male birds. Again, some imagine, and perhaps with reason, that when a range is judiciously but sharply shot over, so many family compacts are broken up, and so many widows and orphans left desolate; that adventurous youths of both sexes are tempted from neighbouring districts to fill up the void, and a great infusion of fresh blood is thus added to the stock, which, as every naturalist knows, tends to add to the prolific properties of almost every description of animals. This may be quite imaginary in as far as relates to grouse; but if it be generally a law of nature, why should we doubt it in the case of the grouse? It is, however, enough for us to know, that under severe shooting, grouse will increase, provided the vermin be well kept down. All the disputes about burnt heather, which arise between the proprietor, the storemaster, and the lessee of the shooting, should at once cease, if this is rigidly done, as grouse naturally avoid rank heather as much as sheep do. They never feed upon and never seek shelter from it in stormy weather, at least if the weather be at all wet. In short, they only fly to it to avoid their natural enemies, and when these are destroyed, the shepherd should be allowed to burn away, as he will thus be serving both the storemaster and sportsman, provided that he does it judiciously, and in the proper season.—*Inverness Courier.*

VERSES FROM SCHILLER.

[The following passages are from the translation of Schiller's *Wallenstein* by Coleridge, one of the few versions from one language to another where the original is equalled, if not surpassed.]

THE HOME AND LANGUAGE OF LOVE.

Oh, never rudely will I blame his faith
In the might of stars and angels! 'Tis not merely
The human being's PRIDE that peoples space
With life and mystical predominance;
Since, likewise, for the stricken heart of LOVE
This visible nature, and this common world,
Is all too narrow: yea, a deeper import
Lurks in the legend told my infant years
Than lies upon that truth we live to learn.
For fable is Love's world, his home, his birth-place:
Delightedly dwells he 'mong fays and talismans,
And spirits; and delightedly believes
Divinities, being himself divine.
The intelligible forms of ancient poets,
The fair humanities of old religion,
The Power, the Beauty, and the Majesty,
That had their haunts in dale, or piny mountain,
Or forest by slow stream, or pebbly spring,
Or chasms and wat'ry depths; all these have vanish'd.
They live no longer in the faith of reason!
But still the heart doth need a language, still
Doth the old instinct bring back the old names.
And to yon starry world they now are gone,
Spirits or gods, that used to share this earth
With man as with their friend; and to the lover
Yonder they move, from yonder visible sky
Shoot influence down: and even at this day
'Tis Jupiter who brings whate'er is great,
And Venus who brings every thing that's fair!

THE SOLDIER'S RETURN.

Oh, day thrice lovely! when at length the soldier
Returns home into life; when he becomes
A fellow-man among his fellow-men.
The colours are unfurl'd, the cavalcade
Marshals, and now the buzz is hush'd; and, hark!
Now the soft peace-march beats, Home, brothers, home!
The caps and helmets are all garlanded
With green boughs, the last plund'ring of the fields.
The city gates fly open of themselves,
They need no longer the petard to tear them.
The ramparts are all fill'd with men and women,
With peaceful men and women, that send onwards
Kisses and welcomings upon the air,
Which they make breezy with affectionate gestures.
From all the towers rings out the merry peal,
The joyous vespers of a bloody day.
O happy man, O fortunate! for whom
The well-known door, the faithful arms are open,
The faithful tender arms with mute embracing.

LAMENT OF THE OLD FOR THE YOUNG.

This anguish will be wearied down, I know.
What pang is permanent with man? From the highest,
As from the vilest thing of every day,
He learns to wean himself; for the strong hours
Conquer him. Yet I feel what I have lost
In him. The bloom is vanish'd from my life.
For O! he stood beside me, like my youth,
Transform'd for me the real to a dream,
Clothing the palpable and the familiar
With golden exhalations of the dawn.
Whatever fortunes wait my future toils,
The *beautiful* is vanish'd—and returns not.

FEMALE HEROISM.

During a conflict at the farm of Rainerhof, in the Tyrolese war in 1809, a young woman, who resided at the house, brought out a small cask of wine to encourage and refresh the peasants; and had advanced in the scene of action, regardless of the tremendous fire of the Bavarians, with the cask upon her head, when a bullet struck it, and compelled her to let it go. Undaunted by this accident, she hastened to repair the mischief, by placing her thumb to the orifice caused by the ball; and encouraged those nearest her to refresh themselves quickly, that she might not remain in her dangerous situation, and suffer for her generosity.—*Percy Anecdotes.*

BRANDING DESERTERS.

An instrument has recently been invented for marking deserters: it is of brass, shaped at the end into the form of a D, from the outline of which is protruded, by means of a spring, a series of needle points, which are regulated by a screw at the end, and by turning which, their length may be increased or diminished. By pulling back the nut of the screw, after the points are regulated, they recede into the box, when the instrument may be considered charged. A slight pressure on a small brass lever delivers the needle points, inflicting a puncture on the skin the exact shape of the instrument. These punctures, on being rubbed with a marking fluid, composed of a quarter of a pound of pulverised indigo, two sticks of Indian ink, and enough of water to render it liquid, leave an indelible D upon the hand or arm of the deserter; and there is no possible means by which the marking can be accomplished with less pain and more certainty.—*United Service Museum.*

[The above paragraph has appeared pretty generally in the newspapers in Great Britain, and, as far as we have observed, without exciting a word of comment. We consider the practice of branding the person in any circumstances, and for any crime, as infamous, and altogether at variance with either an enlightened humanity or sound principles of jurisprudence; for *once* mark a man with an indelible stain, and in all likelihood he is ruined for ever—the door by which he may return to a sense of rectitude is shut, and he becomes an outcast—a degraded thing both in his own eyes and those of his fellow-creatures. It is to be lamented that the British army should, at this time of day, have included such a punishment in its code of discipline.]

EDUCATION OF ITALIAN BOYS.

The benevolence of Englishmen is untiring in its pursuit of objects. The following, from the *Literary Gazette*, presents one of the latest examples:—"We have received, in common with many others, we presume, a circular issued by a party of Italian gentlemen, the object of which is to found, by subscription, a gratuitous school for the number of wandering Italian minstrels, mendicants, and monkey or mouse-leaders, who are so much seen plying their melancholy trades in our highways and byways. The idea is very humane, and will, we hope, be successfully adopted and carried into operation. The preliminary step was to try an experiment, and a school was opened on the 10th of last November; and the first week there were 100 scholars, and latterly more than 230. The total expense of this great good, up to June, has been only £111, 11s., 2½d.; receipts £82, 3s.

EDUCATION IN INDIA.

The *Bombay Monthly Times* of June 18th contains a long and interesting account of a meeting, at which an address, with a testimonial of the value of £1500, was presented to the new native Parsee knight, Sir Jamsetjee Jeejeebhoy. Unlike the pieces of plate or statues of Europe on such occasions, the testimonial is to constitute a fund for the purpose of procuring translations into Goozerattee (the language of the Parsees) of the best European works, ancient and modern, and generally for the institution of schools and promotion of knowledge, and the relief of sick and indigent natives. But what enhances this noble proceeding is the princely munificence of Sir Jamsetjee, who, in returning thanks, stated that he would add *three* lakhs of rupees (£30,000) to the sum subscribed, the whole to be devoted to the objects notified in the address, under the designation of "The Jeejeebhoy Fund." Within the last few years, it is mentioned, this illustrious merchant has contributed nearly £60,000 to public charities, independently of private benefactions. He is the architect of his own fortunes, and has a large family treading in his exemplary footsteps. An address, with a piece of plate, value £1500, was also presented to James Matheson, Esq., of China, on the eve of his departure for England, and in honour of his great services to India.—*Literary Gazette.*

HOW TO FALL FROM A HORSE.

In all falls, the horseman should roll away from his horse as soon as he possibly can, lest in his struggle to rise again he strike him with his legs or head. It frequently happens that the horse himself rolls after he falls, and if in the direction in which his rider lies, is apt to crush and injure him. Indeed there is scarcely any hard rider who has not been thus served; but here, again, self-possession often stands his friend. When he sees the body of his horse approaching him, he frequently saves himself by meeting it with one of his feet, and, by obtaining a fulcrum, shoves his own body along the ground out of his reach. Coolness in this hour of peril likewise serves the sportsman in another way. Instead of losing hold of his reins, and abandoning his horse to his own will, as the man who is flurried at this time invariably does, he keeps them in his hand, if not always, perhaps in nine falls out of ten, and thus secures his horse. It was the remark of a gentleman who was, from his desperate system of riding, and despite of his fine horsemanship, known to have more falls than any other man during the time he hunted in Leicestershire, that nothing had so low an appearance as that of a man running on foot over a field calling out, "Stop my horse."—*The Horse and Hound.*

A HINT TO LOOK UP.

In all societies it is advisable to associate, if possible, with the highest; not that the highest are always the best, but because, if disgusted there, we can at any time descend; but if we begin with the lowest, to ascend is impossible. In the grand theatre of human life, a *box ticket* takes us through the house.—*Lacon.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

FORMS.

TAKE any number of individuals, and ask them, one by one, if they despise forms, and probably nine out of ten will be found to acknowledge that they do. Yet social life is full of forms, and it seems to be the pleasure of society at large that forms of various kinds should be kept up. How should it happen that the general dictum on this point is so inconsistent with what appears to be the opinion of the great majority of individuals.

If we set ourselves seriously to find out the real value of forms, we shall quickly come to discern that, merely in maintaining regularity or uniformity, there is a utility in them. When there is a form of procedure for anything, it precludes dispute, and insures that the thing will be done with a certain decency agreeable to well-ordered minds. The form may impose a restraint where freedom is desired, and thus it may appear tyrannical; but if it saves at other times from confusion, it may be worth while to put up with occasional inconveniences. In many instances, going through the form may appear absolutely ridiculous, from the reality being already sanctioned, unresisted, and even performed by the common consent of all parties; yet it may be as well to go through the form for all that, seeing that, when this is never neglected, it acquires the greater force over men's minds, and may thus help to carry a point rightly when it would otherwise be but feebly supported. Forms are particularly necessary where a principle is to be carried out by a small body amidst a great multitude. For example, the law is everywhere in the hands of a small body. It can only be conducted when this small body is able to exercise a control over a large one. For this reason, apparently, it is invested and surrounded with forms of various kinds, from the system of process itself to the erection of the mace and the judge's wig. The old unvarying traditionary regularity of all its goings on gives it immense force with the multitude, and doubtless helps to make its behests be obeyed. The military and naval service is also full of forms, because there it is necessary to use every means of making a multitude pay implicit obedience to a small number. This principle is most strikingly seen in the last and highest case of all—monarchy. Some councillor objected to a king being so strict in the observance of forms. "What am I but a form myself?" was the answer, and a most sound one. Monarchy requires the most forms of all, because it is a *prestige* maintained in one person only against a whole people. It is said to have a divine hedge about it, and it would need it too.

But the main value of forms is perhaps to be found somewhat farther from the surface. Amidst the mysteries of our nature, there is a certain sympathetic or imitative influence, which makes us liable to be operated upon by the feelings which we see expressed by others. An orator weeps as he addresses us—we weep also. A commander puts on the appearance and uses the language of a hero before his men: they feel like heroes likewise. The contagiousness of all feelings, particularly under circumstances of unusual excitement, is a well-known law of human nature. But a feeling is not alone capable of being expressed in words. Every single feeling has its natural language independent of words—in look, in attitude, or in gesture. A skilful actor knows all these natural expressions of feeling, and can represent them in pantomime. They are instinctively recognised by us all—many of them even by infants; they are the same in all nations, and they pass down with unerring uniformity from age to age. Thus, the toss of the head which is dictated by disdain, the throwing back which expresses pride, the downcast look of bashfulness, the sidelong look of fear, the clasping of the hands which marks intreaty, the genuflexion and prostration into which humility is thrown before greatness, were probably expressions of those respective feelings in the first men on earth who experienced them, as well as they are now. We see physical agony in the Laocöon, fashioned upwards of two thousand years ago, as we would see it in any hospital patient of the present day. The Apollo is the representation of Graceful Triumph, and the Venus the impersonation of Beautiful Modesty, as truly as any living figures could be. This is, in fact, a speech to all men, the only universal free-masonry. There live none who can altogether set at nought the impressions which natural language makes. The very barbarians were awed when they entered the Roman senate. A long solemn procession of uniformly-dressed figures would impose upon the rudeness of the greatest savage. The natural language of perfect bravery in Murat awed the Cossacks. And even wild beasts are said—and we may well believe the fact—to have been repelled by a firm-set human countenance, expressing fearlessness and command. In the constant operation of this law, we obtain a tolerably good key to much of the effect of forms and ceremonials of all kinds. They are usually the natural language of some august, or amiable, or awful feeling, and men who behold are affected accordingly.

But we are not only liable to be affected by the feelings of others. When we ourselves simulate the natural language of any feeling, we are apt to be affected by it almost, if not quite, to the same extent as when we contemplate it in another. If we throw back the head like a proud man, we feel an emotion of pride, though the moment before we had no such sentiment in our minds. If we strut along brandishing a weapon, we feel somewhat like a hero for the moment. If we fall a-gazing on the evening star till the breeze brings water into our eyes, we presently become as pensive as if we really wept. All unequivocally great actors have, while upon the stage, felt the emotions which they represented, and even for some time before and after. It is, for example, related of Mrs Siddons, that, from the moment of her going into her carriage to proceed to the theatre, where she had to act a part, till her return home afterwards, she felt entirely as the person whom she was to represent, and could not without pain admit any other feeling into her mind. The celebrated French tragedian Baron, who was naturally timid, always felt as a hero for several days after he had performed any of the principal characters of Corneille's plays. These cases, though they may be thought extreme, are strictly natural, for Siddons and Baron may be presumed to have had more of impressionable and imitative in their mental constitutions than what belongs to ordinary persons. It is very much owing to this disposition that human beings, thrown into any particular society, or constrained to act any particular part in life, although at first they may feel repugnant, usually become reconciled at last, and in many instances conclude their days with vices of which they had originally no taint, the conforming to low manners and the performance of dubious acts having the inevitable effect of calling forth in them appropriate feelings, which in time become habitual, and perhaps predominant. So mighty is the power of natural language, when we only act it before our own understandings.

The application of the principle to many of the affairs of life must be obvious, even upon our imperfect explanation. With regard, for instance, to the forms of politeness, we can see in a moment how it must operate. The tones, phrases, and ritual, as it may be called, of the polite world, are nothing but the *natural language of benevolence*. We say, emphatically, they are what actual benevolence, in any cultivated mind, would directly prompt, and they can be mistaken for nothing else. This language often comes from a heart destitute of the real feeling; granted that such is the case. It is, nevertheless, true, that the great majority of persons, entering company in a state of perfect indifference to all and sundry, being immediately compelled, by the laws of society, to speak and act courteously—that is, to exhibit the natural language of benevolence—do in a little while feel *that* become a reality in their bosoms which was at first only a fiction in their external behaviour. It is rarely that any company assembles and spends an evening together, following all the time the rules of politeness, without feeling more warmly towards each other at the close than they were at the beginning. This is generally said to be the effect of *knowing* each other, but it is in reality chiefly attributable to a real feeling of good-will having been evoked or induced by that assumption of it which constitutes politeness. The semblance has been, to use a homely but expressive phrase, a *shoeing-horn* to the reality; and something has been created, and that a good something, out of nothing. How different it is when the rules are not observed by the company, or by some part of it? Suppose a failure in respect of kindly warmth of manner, all part coldly at last, without any one having made the least progress in another's good graces, or any one's feelings towards his fellow-creatures at large having been in the least improved. If the rules have been positively broken by the introduction of the natural language of malevolence, then the meeting ends in mutual ill-will and general discomfort. We thus see how important it is for human beings to meet each other occasionally, under sanction of the forms of politeness; it is evidently one of the grand means of promoting peace and good-will in the world. We see, too, how more than important it is for every person to submit implicitly to these forms, and maintain them, by his personal example and influence, to the minutest tittle. A schismatic on the score of sincerity—one who claims the privilege of speaking as he feels on all occasions, or takes a pride in being gruff or gloomy to all round, if such be his mood at the moment—is simply one who prefers to exhibit the natural language of bad feelings to exhibiting the natural language of good ones; and who, accordingly, for a selfish whim, chooses to raise a bad spirit instead of a good one—one of mutual repugnance instead of mutual kindness—amongst a certain portion of his fellow-creatures. Such persons should be hunted out of society, as being among its worst enemies. It is true, at the same time, that there are heartless persons, with good acting powers, who go through the forms of politeness without the least trace of the genuine feelings which they represent, giving, it may be said, the semblance without the substance. But this is from no fault in the principle to which we are adverting. These persons are incapable, in any circumstances, of the real feeling. They only can act, not feel; and though they were to appear in all their true colours every hour of the day, it would not mend the matter. It is with the great mass of ordinary natures that our principle manifests its utility. Investing themselves with the natural language of benevolence, or with the natural language of any other good feeling, they unavoidably experience some visiting of the feeling represented. The principle would equally act if they were to exhibit the natural language of bad feelings; but it is a remarkable fact, that there is no *form* of

the civilised world which represents a bad feeling. The drama of ostensible and legitimate social life comprehends no characters, acts, dresses, or decorations, which are not allied to virtue.

Not long ago, we received a letter from a friend—a man of decided ability—which commenced without the usual phrase, "Dear Sir," or any other to the like purpose, and concluded with the simple signature of his name. At the top of the first page was a printed note, stating that the writer hoped that his friends would excuse his addressing them in this manner, as it proceeded from no disrespect, but merely from a conviction in his mind that the usual phrases of superscription and subscription were ridiculous expletives, of no manner of use, and which therefore he retrenched. Upon the principle now laid down, this was a complete mistake. The phrases in question are often used by a mind that was perfectly indifferent the moment before to the person addressed. But the act of writing them must nevertheless do good. It is a fiction which induces a certain amount of the feeling which it simulates. It raises, also, good will in the person addressed. Any one will feel that such is the case, without following all this reasoning to prove it, if he only receives one of Mr ——'s letters, whether he be one of that gentleman's friends or not. We take leave to add the remark, that Mr ——'s mistake is one of a class prevalent amongst men of considerable ability, who see something which they think wrong in the surface of things, but cannot penetrate deep enough to detect the occult reasons which make that something right. We suspect that clownish, thoughtless, human nature does better in the main by itself, following its own instinctive tendencies, than if it were under the conduct of a committee of its very cleverest specimens.

The forms so universally used in worship are to be defended on the same grounds. Religious feeling has its natural language; submission is expressed by kneeling, solemnity by a composure of the countenance, imploration by the folding or clasping of the hands; the non-dependence on self, which is one of the first dictates of religion, finds a proper external expression in a lowly attitude and downcast look. When these expressions of feelings are simulated, the actual feeling itself, if it be not present already, is apt to be induced, and the object is of course far better gained than it would be if looks and gestures expressive of indifference or of the opposite feelings were maintained. The utility which some find in music as an aid to devotion depends on the same principle. All the feelings find a natural language in music, and the religious feeling among the rest. It is expressed in deep and solemn tones, whether of the voice or of such an instrument as the organ; and when these tones are given forth, it is scarcely possible even for the most hardened to resist experiencing the actual feeling of which they are the language.

What is here written will perhaps be considered as throwing some light on the adage—"Assume a virtue if you have it not." When this is done, one of two results must follow. In some cases, the virtue will be assumed in vain as far as the person assuming it is concerned, owing to the incapability of his nature of really exemplifying it. It will not, however, be in vain for society, for it is better for the multitude to see the appearances of virtue than the opposite. In the great majority of cases, as we believe, the act of assuming a virtue will be attended with some indication of the real feeling, partly through the above principle, and partly from one which holds a powerful sway over all uncorrupted minds. There is an inclination constantly experienced by such minds to *be* that which they *seem*. Hypocrisy is with them a painful sensation, from which they are always anxious to escape. Even when forced, by some tyrannical compulsion, to act upon opinions opposite to their own, they will endeavour, if possible, to adopt those opinions rather than have their conduct out of harmony with their inward feelings. How much more powerful will this tendency be when they are called upon to assume a port which their understanding pronounces to be in all respects laudable? It must be well, then, where any one possesses an influence over his fellow-creatures, to use it, under proper limitations, in inducing them to assume the virtues which they have not, and adopt the forms which present the semblance of the better feelings. Only let influence not be used tyrannically, and due care be taken not to degrade good feelings by a system of hardened hypocrisy, and nothing but good can flow from such exertions.

VENTRILOQUISM.

This is the name generally given to a well-known art, which consists in speaking in such a manner that the bystanders believe the voice to proceed from a person different from the speaker, or from a place at a distance from him. It was formerly believed that the practisers of this art spoke from the belly, and hence the name of ventriloquism. This is now known to be an error, but the name is nevertheless too fixed in the public mind to be easily unseated or changed. The art would appear to have been practised in remote times, as a form of divination, and called *gastromancy*. In the early ages of Christianity, this was a prevalent mode of imposition. It was perhaps for this reason that the authors of the various translations of the Bible, called the Septuagint and Vulgate, then executed, rendered the Hebrew *ob*, applied to those who had familiar spirits, respectively by the words *engastrimuthos* and *ventriloquus*, meaning speakers by the belly. St Chrysostom and Œcumenius make mention of diviners who were called *Engastrimandri*, a word pointing to the same mode of deception. It is easy to conceive how, in those ages, when the populace were so easily deceived by anything transcending the common powers of understanding, any one possessing this power of speech would be tempted to use it in the way of imposture for his own advantage.

Engastrimism was believed to be a demon in the belly till the end of the seventeenth century, when Conrad Amman, a Dutch doctor of medicine, published a treatise to disprove that notion, and establish that it was a natural power which consisted in swallowing the speech, or making it run backward; that is to say, in speaking during the drawing in of the breath, and not, as usual, during expiration. It was not till a later period that any treatise on the subject, founded on actual investigation, was given to the world. This was first done in 1772 by M. de Chapelle, a learned Parisian, who had had opportunities of observing the practice of two highly-skilled ventriloquists—a Baron Mengen in the household of Prince Lichtenstein, at Vienna, and a person of the name of Saint Gille, a grocer at St Germain-en-Laye, near Paris. The baron's account of himself is in substance this—"That he owed his art to a passion, which showed itself in him at a very early age, to counterfeit the cries of animals and the voices of persons; and he soon found that he had the power of imitating sounds in such a way as to give them the appearance of coming from points different from his own mouth; that his organs gained flexibility by use, so as to be able to sustain a long illusion. For the sake of amusing his friends, he made a small figure or doll, with a contrivance with which, by inserting his hand under the dress, he could occasion appropriate motion of the lips; with this figure, from which he could make his voice to appear to come, he carried on droll and often highly-satirical conversations. His own words, describing the kind of vocal exertion he made, are as follows:—'I press my tongue strongly against my teeth and left cheek, and the voice, which appears articulated by the mouth of the figure, is formed in reality between the teeth and left cheek of my own. For this I use the precaution to *hold in reserve* in the windpipe (*le gosier**) a sufficient portion of air either to sing or speak, without the stomach or belly giving any assistance; and it is solely with that portion of air in reserve, *moderated*, retained, and suffered to escape with effort, that I produce the voice which I wish to make heard. Add to that a *quality in my tongue extremely subtile* and rarely possessed, by means of which I articulate all syllables and words (either singing or speaking), without in the least moving the lips; and taking great care to retain to the end of each period, phrase, or sentence, the air which comes from the *lungs* for the renewing of my respiration, *which requires a very good chest*.'

The theory of M. de la Chapelle, as confirmed by the Academy, is in substance as follows:—The *same* sound varies in its effect on the ear, according to the distance or place from which it comes. But every sound, as it reaches the ear, is a sound that may be imitated. A power of imitating sounds, which we are all accustomed to refer to certain distances and certain situations, is the whole art of ventriloquism. It is worthy of remark, that by custom the illusion lost its effect on M. de la Chapelle—he referring the words to the mouth of the speaker, which all others referred to distant points. The members of the Academy commissioned to make the inquiry with M. de la Chapelle, compare this gradation of sound to the imitations of distance in the symphonies of the opera; the distance being judged by the first sound heard, diminishes in appearance as the sounds become fainter.

The savans, satisfied that the effect produced was *imitation* of the sounds appropriate to certain distances, applied themselves to investigate the nature of the organic power which produced this effect, and they referred it to a power acquired by habit over the larynx, by which it could be readily shut and opened to the required degree, with the additional power, from flexibility of tongue, to articulate within the mouth, or even in the back part of it. The constriction and expansion of the larynx they believed to be very fatiguing, and attended with hoarseness after a lengthened exertion."

Towards the close of the last century a very dexterous ventriloquist, of the name of Garbutt, exhibited his powers in various parts of England and Scotland. He usually endeavoured to fix the attention of his audience, in the first place, upon the spot from which he was to represent the sounds as proceeding—as, for instance, upon the place under the benches on which they sat, or the spot under an inverted glass. In our own city, he played off one or two amusing practical jests in public. Seeing a fish-woman selling a fish at a gentleman's door, and alleging, in the usual style, that it was *living caller*, or only taken out of the sea that morning, he instantly caused the fish itself to exclaim against her lying declaration, and assert that it had not seen the Firth of Forth for a week. On another occasion, seeing an honest unthinking rustic driving a load of hay, he caused a voice as of a child to proceed from the interior of the hay, declaring that it had been covered over there, and was on the point of being smothered. The poor man heard with consternation, and with all haste unloaded his hay on the road, and it was not till the last armful was thrown out, that an imp's laugh proclaimed the success of the deception.

Ventriloquism was among the varied powers of the late admirable Mathews, and it has been practised of late years as a comic entertainment by many persons of less note; but modern times have seen no artist of this kind comparable to Monsieur Alexandre, a native of Paris, born in 1797, and who exhibited his talents about seventeen or eighteen years ago in the principal cities of Europe and America. Alexandre was universally acknowledged to be a well-bred, respectable young man, and his pleasant manners everywhere secured him an affectionate regard beyond what his mere talents could have procured for him. It says something for his industry and general intellect that he exhibited in six or eight different languages, to suit the various European nations amongst whom he sojourned. His entertainments, which usually took place in ordinary theatres, consisted of short comic pieces, in which he was the sole actor, but always under a great variety of characters. One of these pieces he performed in English for six months, before he had learned the language so as to understand what he was uttering, and it is said that his mistakes were extremely few. The best account which perhaps exists of this remarkable man was one drawn up while he was in Edinburgh by a learned gentleman belonging to the sect of phrenologists, to whom so amazing an example of the imitative power naturally became an interesting subject of study. Of this able paper we present an abridgment, trusting that to many the attempts to explain and rationalise the wonders of M. Alexandre's exhibition will only be a recommendation.

"We shall endeavour," says this writer, "to describe what we saw as minutely as we observed it narrowly. He performed a sort of drama, the hero of which is a clever young rogue, in the service of an old physic-taking valetudinarian and his careful fantastical wife, upon whom he perpetrates all sorts of mischievous tricks, both in revenge of his own short-commons, and in furtherance of a scheme, for which he is well paid, to unite the only daughter to a very agreeable young officer of infantry. Without merit as a comedy, the incidents of this piece (some of them very ludicrous) afforded him the means of exhibiting every variety of his vocal illusion. He represents the whole characters, male and female, young and old, himself; and, besides displaying an address and quickness which we never saw exceeded, he changed his dress at least thirty or forty times, with a rapidity which appears almost preternatural; so that the deception is perfect, that the whole *dramatis personæ* are bustling and talking at the same moment.

His change of dress is not, however, more complete than his change of manner, voice, and whole character. He spoke with his own natural voice in the valet; with a deep strong voice in the old man; in a whining, and chattering, and most affected voice in the lady; with a *degagé*, easy style in the dandy officer; and with the softest tripping femininism in the dandy's beloved. Of all these, he maintained the character with such judgment and effect as to convince us that his histrionic powers—his talents as an actor—are very considerable.

As it is of great moment for our phrenological tests in the sequel to keep steadily in view the power of imitation, we may here mention a sort of interlude which M. Alexandre performed, in which he manifested his possession of that talent, with the farther power of concealing self, to a degree of intensity which, till we saw them, we could not have believed possible. He exhibited the visages, voices, and manners of several different nuns of a convent, where he is supposed to have served outside the grate. He is first a pretty noviciate endeavouring to sing, but covered with bashfulness. In an instant he is the angry abbess chiding her pupil, with a face as round, as flat, and as pitted as a split muffin, and a voice to suit. Anon, he rises like a ghost from the ground, attired as Sister Beatrice, with a face double the length of the average of the human countenance. Down he sits again, and shows a face as preternaturally broad as the other was long, just above the level of the table, the said face being the index to the soul of Sister Agnes. A visage reduced to the size of a man's fist now peeps from the hood of Sister Angelina. The next face is all gone off to the east, its successor to the west, till he concludes with Sister Celestine's lamentable paralytic deformity, an exhibition greatly too like reality not to be painful to the spectators. His other personations, amounting to an absolute change of identity before our eyes, are quite sufficient to establish him as the most wonderful personator that ever exhibited.

M. Alexandre's vocal exhibition consisted of two very obviously distinguishable parts:—First, his mere imitations, or changes of voice to suit the different characters in which he appeared on the stage, in which he meant no farther illusion, and left the audience to take the personage in their sight for the speaker. In this it is obvious there was comic imitation, but none of the illusion more strictly called ventriloquism. To this class belong his imitations of animals and inanimate things, as a plane, a screw, a saw, an omelet frying, &c. Secondly, his ventriloquial efforts. In these he produced the effect of persons speaking from a distance; from the other side of a door, both shut

* This is physically impossible; and the baron afterwards shows that he means the lungs or chest.

and open; from a trunk also alternately open and shut; from a chimney-top; and from a cellar, with gradation of the voice as the person in the chimney and cellar ascended or descended. With his ventriloquial exertions alone we have to do here; and in these the illusion of confinement, freedom, distance, and gradual approach and recession, was complete.

We were not disappointed in our hopes to obtain M. Alexandre's own account of his singular powers. He assured us—1. That his voice does not come from his stomach or belly, in which, as he said in ridicule, he has neither tongue nor teeth, and against which inelegant region he has a sort of ill-will, for having occasioned the disgusting as well as absurd name of ventriloquism to an art which is merely vocal illusion. He wished to have offered himself in England as a professor of vocal illusion; but was advised that John Bull loves the marvellous, and would rather give his money to see a man who can speak with his stomach than one who avowedly can only speak with his mouth.

2. That he possesses uncommon power and flexibility in the organs of speech: he can extend and contract the larynx or windpipe, which has great muscular strength, so as to produce all the gradations from a bass voice of great power to the shrillest squeak; and his tongue has a degree of flexibility and power of change of shape and position in the mouth which enable him to do anything with it he pleases. The exertion, he says, does not exhaust or fatigue him.

3. He is not conscious of speaking even during expiration; certainly he does not speak during *inspiration* upon any occasion. When he speaks *en ventriloque*, he is not aware that he breathes at all, but seems to use a confined supply of air, which he retains in his chest till the period is finished, when he breathes again. He must, however, although unconsciously, expend it in expiration as he speaks. This seems proved by what follows next.

4. That he can ventriloquise *with his lips shut*.

5. That he cannot articulate the labial consonants *m*, *b*, and *p*, without using the lips. When he uses these consonants, therefore, he turns away his face from the person he wishes to deceive. He endeavours as much as possible to avoid the labials, and then he can speak without the slightest movement of the lips or any muscle of the face.

6. That he makes no use of echoes existing, much less does he create any, such a thing being far beyond human power. He scrupulously avoids places where echoes already exist, and this is the first thing he tries.

7. That he deceives the audience into the belief of the direction of the sound, entirely by previously fixing the direction, and trusting (which he never does in vain) to their imagination for the rest. He says, when he has fairly frightened people, which he has often done, he has no farther trouble; which way soever he looks, that becomes the direction of the dreaded sounds. He once horrified a party of visiters to the embalmed bodies of the Prince and Princess of Lignitz, in Silesia, in the vault in which they had lain 230 years. He first declared himself 250 years old, and that he was present at the interment, and then made the prince and princess complain of want of air, in consequence of an order of the magistracy to prevent the coffin being opened to gratify public curiosity. The attendants, in consternation, made no attempt to prevent him from opening the coffins, for which service he received the grateful thanks of the prince and princess therein reposing, and an inconvenient quantity of holy water to exorcise him as he came out of the vault.

Last of all, M. Alexandre declares that he has a ready perception of the varieties of sound, according to distances; and that each distance having its own specific sound, he imitates the sound as it is when it reaches his own ear. He has particularly studied this power of graduation, and has repeatedly imitated a person's voice who spoke at intervals as he receded above 300 yards. He has likewise sent a chimney-sweeper up a vent, with instructions to speak down every few yards, and has imitated the voice in his gradations so exactly, that the persons in the room could not tell which was his and which the chimney-sweeper's. On one occasion, in Vienna, at Prince Metternich's hotel, he hung a rope from the window of an apartment on the third floor from the ground, to which a weight was suspended to serve for a man, whom he undertook to pull up, and with whom he conversed every yard or two as he pulled the rope, the voice of the man gradually getting plainer, till he was at the window-sill, when, all at once, M. Alexandre allowed the rope to slip, and down went the poor man with a scream, and many a groan as he lay, knocked to pieces, on the ground. The company were terrified, and it required a clear exposition of the illusion to restore their composure.

He gave no other account of his change of countenance in the nuns, quack-doctor, &c., than that his endeavour was to conceal himself, and imitate, or, as near as possible *be*, another person. He has often disguised himself by this means when he wished not to be known. Aware of the severe trial to which such exertions must put the nerves of voluntary motion, and the subservient muscles, we asked him if he has no fears of some permanent set in these hideous forms? He answered that, at Manchester, he did remain the quack-doctor some hours longer than he intended. He can remain voluntarily for a great length of time so metamorphosed."

M. Alexandre, in leaving Scotland, visited Abbotsford, where he entertained Sir Walter Scott and some of his friends with such success, that next morning the illustrious minstrel inserted the following lines in an album carried by the mimic:—

"Of yore, in old England, it was not thought good
To carry two visages under one hood;
What should folks say to *you*, who have faces such plenty,
That from under one hood you last night show'd us twenty!
Stand forth, arch-deceiver! and tell us, in truth,
Are you handsome or ugly, in age or in youth?
Man, woman, or child? or a dog, or a mouse?
Or are you, at once, each live thing in the house?
Each live thing, did I ask?—each dead implement too!
A workshop in your person—saw, chisel, and screw.
Above all, are you one individual? I know
You must be, at the least, Alexandre *and Co.*
But I think you're a troop—an assemblage—a mob—
And that I, as the sheriff, must take up the job;
And instead of rehearsing your wonders in verse,
Must read you the riot-act, and bid you disperse!"

BETY AMBOS.

Mrs Jameson, during a tour in Germany, accidentally met with a young woman returning home from the execution of a similar errand with that of the heroine Elizabeth, described so pathetically by Madame Cottin in her "Exiles of Siberia." There was, however, one striking difference between the two cases—Elizabeth was poor, while Bety Ambos, the German heroine, was rich. Yet, though the possession of wealth diminished some of the difficulties of the undertaking, it scarcely perhaps lessened the greatness of the moral worth; since it cannot be denied, that those who are accustomed to poverty are less alarmed at the prospect of its evils than the rich, who, reared amidst comforts and luxuries, have never encountered physical evils and privations.

Mrs Jameson describes herself, when travelling to Frankfort, as attracted by the appearance of a female who alighted, amongst many other travellers, from a post-coach; her dress was extremely rich, her figure fine, and her countenance pretty, with a decided frank and good-humoured expression; her age appeared to be about two or three and twenty; her manner evinced innocence and modesty, mingled with the ease and self-possession of one accustomed to travel. She appeared to be an object of great interest to the persons of the house; and, after some little time, Mrs Jameson found that she was on her way home, alone and unprotected, from the wilds of Siberia. At a subsequent period, they again met at Frankfort, when Mrs Jameson renewed her acquaintance with her, and conveyed her in her carriage to Mayence, where she learned her whole history, which she gives with an apology for a failure of recollection respecting some of the names, dates, and circumstances, and with a promise that she will not supply these defects from her own imagination, adding—"Of the animation of voice and manner, the vivid eloquence, and the grace and vivacity of gesture with which the relation was made by this fine untutored child of nature, I can give no idea."

The following account is slightly altered from Mrs Jameson's narration:—

Bety Ambos was the daughter of a rich brewer and wine merchant, of Deuxponts or Zweibrücken, the capital of the provinces of the kingdom of Bavaria lying on the left bank of the Rhine. She was one of five children, two much older and two much younger than herself. Her eldest brother was called Henri: he had early displayed uncommon talents, and such a decided inclination for study, that his father determined to give him all the advantages of a learned education, and sent him to the university of Elangau, in Bavaria, whence he returned to his family with the highest testimonies of his talents and good conduct. His father now destined him for the clerical profession, with which his own wishes accorded. His sister fondly dwelt upon his praises, and described him as being not only the pride of his family but of all his fellow-citizens, "tall, and handsome, and good," of a most benevolent enthusiastic temper, and devoted to his studies. When he had been at home for some time, he attracted the notice of one of the princes in the north of Germany, with whom he travelled in the capacity of secretary. It appeared that, through the recommendation of this powerful patron, he became Professor of Theology in the University of Courland, at Riga, or somewhere near it. Henri was at this time aged about twenty-eight.

Here he fell deeply in love with the daughter of a rich Jew merchant, and endeavoured to convert the object of his affection: her relatives discovering their correspondence, the Jewess was forbidden to see or to speak to her lover; they, however, met in secret, and he prevailed upon her to change her faith and to fly with him beyond the frontiers, there to be baptised and to become his wife. Their plan was frustrated; they were pursued and overtaken by her relatives and the police. The Jews are protected at Riga, and the affair was brought before the tribunal, where Henri was accused of carrying off the girl by force. He defended himself by declaring that she had fled with him by her own free will, that she was a Christian, and his betrothed bride, as they had exchanged rings, or had gone through some similar ceremony. The father, on the part of his daughter, denied this, and Henri desired to be confronted with the lady, who was thus said to have turned his accuser. Her family made many objections, but by the order of the judge she was obliged to appear. She was brought into the court of justice, pale, trembling, and supported by her father and others of her kindred. The judge demanded whether it was by her own will that she had fled with Henri Ambos? She answered, in a faint voice, "No." "Had, then, violence been used to carry her off?" "Yes." "Was she a Christian?" "No." "Did she regard Henri as her affianced husband?" "No." On hearing these replies, so different from the truth and from all he could have anticipated, the unfortunate young man appeared for a few minutes stupified; then, as if seized with a sudden frenzy, he made a desperate effort to rush upon the young Jewess. On being prevented, he drew a knife from his pocket, which he attempted to plunge into his own bosom, but it was wrested from him; in the scuffle he was wounded in the hands and face, and the young lady swooned away. The sight of his mistress insensible, and his own blood flowing, restored the lover to his senses. He became sullenly calm, offered not another word in his own defence, refused to answer any questions, and was immediately conveyed to prison.

These particulars came to the knowledge of his family after the lapse of many months; but of his subsequent fate they could learn nothing. Neither his sentence nor his punishment could be ascertained; and although one of his relations went to Riga for the purpose of obtaining some information or redress, he returned without having effected either of the purposes of his journey. Whether Henri had died of his wounds, or languished in a perpetual dungeon, remained a mystery.

Six years thus passed away. His father died; and his mother, who persisted in hoping while all others despaired, lingered on in heart-wearying suspense. At length, in the beginning of 1833, a travelling merchant passed through the city of Deuxponts, and inquired for the family of Ambos. He informed them, that in the preceding year he had seen and spoken to a man in rags, with a long beard, who was working in fetters with other criminals, near the fortress of Barinska, in Siberia, who described himself as Henri Ambos, a pastor of the Lutheran church, unjustly condemned; and who besought him, with tears and the most urgent supplications, to convey some tidings of him to his unhappy parents, and beseech them to use every means to obtain his liberation.

The feelings which this intelligence excited must be left to the reader's imagination. A family council was held, and it was determined that application should be made to the police authorities at St Petersburg, to ascertain beyond a doubt the fate of poor Henri, and that a petition in his favour should be presented to the Emperor of Russia; but who was to present it? The second brother offered himself, but he had a wife and two children; the wife protested that she should die if her husband left her, and would not hear of his going; besides, he was the only remaining hope of his mother's family. The sister then said that she would undertake the journey, and argued that, as a woman, she had more chance of success in such an affair than her brother. The mother acquiesced. There was, in truth, no alternative; and being amply furnished with the means, this generous, affectionate, and strong-minded girl set off alone, on her long and perilous journey; and receiving her mother's blessing, she silently vowed that she would not return alive without her brother's pardon. She entertained no doubt of success, because she was resolved to succeed. She had health and strength, and feared nothing. She reached the city of Riga without mischance. There she collected the necessary documents relative to her brother's character and conduct, with all the circumstances of his trial, and had them properly attested. Furnished with these papers, she proceeded to St Petersburg, where she arrived safely in the beginning of June 1833. She had been furnished with several letters of recommendation, and particularly with one to a German ecclesiastic, of whom she spoke with the most grateful enthusiasm. She met with the utmost difficulty in obtaining from the police the official return of her brother's condemnation, place of exile, punishment, &c.; but at length, by almost incredible boldness, perseverance, and address, she was in possession of these, and with the assistance of her good friend, the pastor, she drew up a petition to the emperor. With this she waited on the minister of the interior, to whom, with great difficulty, and after many applications, she obtained access. He treated her with much harshness, and absolutely refused to deliver the petition. She threw herself on her knees, and added tears to intreaties; but he was inexorable, and added, brutally, "Your brother was a villain; he ought not to be pardoned; and if I were the emperor, I would not pardon him." She rose from her knees, and stretching her arms towards heaven, exclaimed with fervour—"I call God to witness that my brother was innocent; and I thank God you are not the emperor, for I can still hope." The minister, in a rage, said, "Do you dare to speak thus to me? Do you know who I am?" "Yes," she replied; "you are his excellency the minister C——; but what of that? You are a cruel man; but I put my trust in God and the emperor." Thus she left him, without even a curtsy, though he followed her, speaking loud and angrily, to the door.

Her suit being rejected by all the ministers—for even those who were most gentle, and who allowed the hardship of the case, still refused to interfere, or deliver her petition—she resolved to do, what she had been dissuaded from attempting in the first instance—to appeal to the emperor in person. But it was in vain she lavished hundreds of dollars in bribes to the inferior officers; in vain she beset the imperial suite at reviews, at the theatre, and on the way to church; invariably beaten back by the guards or the attendants, she could not penetrate to the emperor's presence. After spending six weeks in daily ineffectual attempts of this kind, hoping every morning, and almost despairing every evening—threatened by the police, and spurned by the officials—Providence raised her up a friend in one of her own sex. Among some ladies of rank who became interested in her story and invited her to their houses, was a countess whose name is not recorded. This lady, perceiving the despair of her young friend, proposed to lend her on the next day her equipage, servants, and robes, when she should drive to the palace, and, under the name of the countess (who dared not present the petition herself for fear of exile), obtain an audience of the emperor. Overpowered with gratitude, Bety threw herself at the feet of the countess, unable to speak; and though the thought crossed her mind that the deception might risk the safety of her friend, she dismissed the idea, for she had resolved to obtain her brother's pardon at every hazard. This plan was soon arranged; and at the time appointed she drove up to the palace in a splendid equipage, preceded by a running footman, with three laced lacqueys, in full dress, mounted behind. She was announced as the Countess Elise ——, who supplicated a particular audience of his majesty. The doors flew open, and in a few minutes she was in the presence of the emperor, who advanced one or two steps to meet her, but suddenly started back.

Bety had, fortunately, no dread of rank or power; her heart did not fail her; she sprang forward, and knelt at his feet, exclaiming, with clasped hands—"Pardon, imperial majesty! Pardon!" "Who are you?" said the emperor, astonished; "and what can I do for you?" He spoke gently, more gently than any of his ministers; and overcome, even by her own hopes, she burst into tears, and said—"May it please your imperial majesty, I am not Countess Elise ——; I am only the sister of the unfortunate Henry Ambos, who has been condemned on false accusation. Oh, pardon—pardon! Here are the papers—the proofs. Oh, imperial majesty! pardon my poor brother!" Still kneeling, with one hand she held out the petition and papers, while with the other she pressed the skirt of his embroidered robe to her lips. Not heeding the emperor's command to rise, she still held out the papers; at last, apparently much moved, he extended one hand towards her, and taking the papers with the other, said, "Rise, mademoiselle; I command you to rise." Kissing his hand, and weeping, she intreated him to read the paper. He replied, "I will read it." Bety then rose from the ground, and, as he read the petition, eagerly watched his countenance; it changed, and he once or twice exclaimed, "Is it possible? This is dreadful!" When he had finished, he folded the paper; and, without any observations on its contents, said, at once, "Mademoiselle Ambos, your brother is pardoned." The poor girl, scarcely knowing what she said, but with the words ringing in her ears, again fell at the emperor's feet, and poured out her gratitude and blessings.

On her return, she received the congratulations of her benefactress, the Countess Elise ——, and of her good friend the pastor; but both advised her to keep her audience and the emperor's promise a profound secret. She was the more inclined to do this, because, after the first burst of joyous emotion, her spirits sank. Recollecting the pains that had been taken to shut her out from the emperor's presence, she feared some unforeseen obstacle, or even some knavery, on the part of the officers of government. Her sufferings during the next few days were fearful; her agitation, her previous fatigues, and the terrible suspense, apparently threw her into a fever, or acted on her excited nerves so as to produce a kind of delirium; but her composure soon returned, for just five days after her interview with the emperor, a lacquey, in the imperial livery, came to her lodging, and put a packet into her hands, with the emperor's compliments to Mademoiselle Ambos. It was her brother's pardon, signed and sealed by the emperor. Those mean officials, who had before spurned her, now pressed upon her with offers of service, and even the minister C—— offered to expedite the pardon himself to Siberia, in order to save her trouble; but she would not suffer the precious paper out of her hands. She determined to carry it herself, to be herself the bearer of the glad tidings; she had resolved that none but herself should take off those fetters, the very description of which had entered her soul; so, having made her arrangements as quickly as possible, she set off for Moscow, where she arrived in three days.

According to her description, the town in Siberia to the governor of which she carried an official recommendation, was nine thousand versts beyond Moscow; and the fortress to which the wretched malefactors were exiled was at a great distance beyond that. Mrs Jameson says, "I could not well make out the situation of either; and, unluckily, I had no map with me but a road map of Germany, and it was evident that my heroine was no geographer." After leaving Moscow, she travelled for seven days and seven nights, sleeping in the carriage. She then reposed for two days, and then posted on for another seven days and nights. Her sensations, as she was rapidly whirled over the wide solitary plains, were so new and strange, that at times her head seemed to turn (so she described it); she could scarcely credit her own identity. On waking in the middle of the night, alone, and unable immediately to collect her thoughts, she experienced a temporary feeling of fear, but never at any other time. Twice, only, did she meet with insult; and although she spoke of her journey as horrible, yet there were anticipations of a happiness which made all fatigues light and all dangers indifferent.

At length, in the beginning of August, she arrived at the end of her journey, and was courteously received by the commandant of the fortress. She presented the pardon with a hand which trembled with impatience and joy, too great to be restrained, almost to be borne. The officer looked very grave, and took, she thought, a long time to read the paper, which consisted only of six or eight lines. At last he stammered out, "I am sorry—but the Henri Ambos mentioned in this paper—is dead." Poor girl! she fell to the earth.

She had travelled thus far to seek a brother, and found but his grave. The unfortunate man had died a year before. The fetters in which he worked had caused an ulcer in his leg, which he neglected, and, after some weeks of horrid suffering, death released him. The taskwork, for nearly five years, of this accomplished and even learned man, in the prime of his life and mental powers, had been to break stones upon the road, chained hand and foot, and confounded with the lowest malefactors. She found, on inquiry, that some papers and letters which her unhappy brother had drawn up by stealth, in the hope of being able at some time to convey them to his friends, were in possession of one of the officers, who readily gave them up to her; and with these she returned, half broken-hearted, to St Petersburg. If her former journey, when hope cheered her on the way, had been so fearful, what must have been her return! She was seized with a dangerous illness, and was for many weeks confined to bed.

Her story excited much commiseration, and a very general interest and curiosity. A great many persons of rank invited her to their houses, and made her rich presents, among which were the splendid shawls and the ring which had first caught Mrs Jameson's attention. The emperor expressed a wish to see her, and very graciously spoke a few words of condolence. He even presented her to the empress. Mrs Jameson asked—"What did the empress say to you?" "Nothing; but she looked so" (drawing herself up).

On receiving her brother's pardon from the emperor, she had written home to her family; but since that time she had not written. She had not courage to inflict a blow which might affect her mother's life; it remained for her to tell what she dared not write.

She left Petersburg in October, and proceeded to Riga, where those who had known her brother received her with interest and kindness, and sympathised in her affliction. She had resolved to see the Jewess who had been the cause of all her brother's misfortunes; she felt that to say to her, "Your falsehood has done this," would be a source of satisfaction; but her brother's friends persuaded her that such an act could do Henri no good, that it was wrong, that it was unchristian; she yielded, and left Riga.

Having reached the Prussian frontiers, she stopped at the custom-house, where, on searching her packages, the chief officer, observing her address on a trunk, exclaimed, "Mademoiselle Ambos! Are you any relation of the Professor Henri Ambos?" On hearing that she was his sister, the officer explained that he was the intimate friend of her brother, and inquired what had become of him. In learning his unhappy fate, the officer with tears expressed his commiseration, and pressed on Mademoiselle Ambos offers of service and hospitality; but her impatience to reach home increased hourly, and her funds were getting low. The driver had heard her relate the sad story to the officer; and on stopping at the next town to feed his horses, he came to the door of the carriage, and informed her she had just missed seeing the Jewess lady, who, with her sister and her sister's husband, had passed in a caleche. What followed must be read with an allowance for continental feelings and the peculiar excitability of one who had gone through such tremendous trials. Bety ordered the driver to drive back as fast as possible to the custom-house, where she knew the party would be delayed. On reaching it, she saw a caleche; trembling with agitation and emotion, she went up to it. Two ladies were sitting within; and addressing the most beautiful, she asked, "Are you Mademoiselle de S——?" Her manner was probably strange and startling, for the lady addressed replied, in a frightened manner, "I am—who are you?—and what do you want with me?" On hearing this reply, she said, "I am the sister of Henri Ambos, whom you murdered." The lady screamed aloud, and some men ran from the house. Holding fast by the carriage door, Bety continued—"I am not come to hurt you; but you are the murderess of my brother, Henri Ambos. He loved you, and your falsehood has killed him." Having uttered other fearful expressions, while the lady stared at her with a ghastly expression, she fell into a fit, and was carried into the house of the custom-house officer, her brother's friend, and laid on a bed. On recovering her senses, the caleche and all were gone, and she herself proceeded on her journey. The scene which had occurred appeared so strange, so *like* a dream, that, on reaching Berlin, she wrote to the officer of the customs, to beg that he would attest that it was really true.

Mrs Jameson parted with this interesting girl at Mayence, after seeing the pardon and many other documents, all proving the truth of the story, even to the minutest particulars. Here the relation ends. Whatever her subsequent fate, however severe her own disappointments, and the fresh trial that awaited her in breaking the melancholy news to her mother, the reader feels that Mademoiselle Ambos was supported by the greatest of all consolations—the consciousness of duty well performed.

HINTS FOR PICTURE CRITICISM.

EXHIBITIONS of the works of living artists are spreading over the country, particularly into the manufacturing districts, where it is understood there is occasionally a good deal of wall requiring the proper covering. It must be very annoying to the conductors of country newspapers, when, after living happily for years without knowing anything of pictures, like Goldsmith's professor who knew nothing of Greek, they find themselves suddenly called upon to exhibit taste and learning in the fine arts, in order to convey to their readers proper information and sound criticism on the various works of art which have been hung up for show in their town. For persons of this class, it is evidently desirable that there should be some instructions afforded in the art of writing proper criticisms on the works of the pencil and brush; that is to say, not merely such empty common-places as—"So-and-so is a rising artist," and "The Blind Beggar is perhaps the finest work of art in the room," but real, deep, knowing-looking criticism, which will pass muster with the general public, and advance, or at least support, the character of the paper. Now, such instruction we believe we shall be able in some measure to present, by a sketch of the system of Tom Barker, as confessed to by himself.

Tom was a tradesman in a provincial city, who chose to support by his pen a certain specimen of the free and independent British press, called "The —— Herald." He had been contented for many years to contribute letters on neglected crossings and pavement-encumbering apple-women; but when an exhibition of pictures was set up in his native town, he had at length risen to be a critic on works of art. The editor of the newspaper which he patronised looked constantly to him for a series of articles on the pictures exhibited; and, to do Tom justice, his criticisms were drawn up in a very imposing manner. Artists alternately capered with joy, or were sunk in despair, according as the "Herald" praised or condemned one of their productions. Tom's criticisms became noted articles, and for years no one ventured to dissent from his authority. Many of the leading artists were so sensible of the value of having Tom's good word, that they would occasionally send him bits and first draughts gratuitously, all of which he hung up in his parlour to let his ignorant neighbours know what a great man he was. When any of them were particularly anxious to secure Tom's approbation, they would invite him to their studios, and consult him about the proper management of the subject which they were handling; and it oftener than once happened that he ruined their picture by taking up a brush, and in his cool way rubbing out a considerable group with which he professed to be displeased. Considering the eminence which this gentleman attained, it seems pretty clear that a full and particular exposition of the means by which he became a critic of pictures will serve to illuminate those who have occasion to write on that subject without having given it any previous study.

Tom gave a full account of his art as a picture-critic to a friend who had one day treated him to a remarkably good dinner. A sufficiency of champagne, followed up by a competency of Burgundy, had opened his heart, or perhaps rather lulled asleep his caution, and he gave his confessions with an air which, it is to be feared, was not quite free of the spirit of boasting. "How did I become a critic of pictures, say you? why, I will tell you. The fact is, my dear fellow, I know little or nothing of art; and how could I? But I know something that is better; I know all the technical terms which the artists employ. My first business was to pick these up; after that it was all smooth sailing. You may turn critic to-morrow if you only follow my plan. Look you," said he, his bright eyes twinkling like stars, "if you would wish ever to be a critic, you must have your vocabulary at your finger ends. I would have you begin with a few simples, such as breadth, depth, light, shade, cast, style, tone, energy, purity, outline, repose, unobtrusive, fore-shorten, and, above all, chiaro-oscuro—that is a term sure to tell. And, then, you must have your list of compounds—correct outline, admirably contrasted, felicity of expression, clear and transparent, dark and gloomy, skilfully blended, grace and dignity, fineness of thought, harmony of colouring, breadth of expression, sweetness of tint, easy and flowing pencil, exuberant foliage, admirable study, grand relief, splendour diffused, juxtaposition, boldness of fore-shortening, exquisite morceaux! And then, my boy," he continued, whipping off a bumper with the rapidity of lightning—"And then, my boy, you must be pre-

pared with your choice bits, such as—touched with inexpressible fire and spirit, great richness and vigourousness of colouring, delightful union of harmony, chiaro-oscuro wonderful and effective, grand perspective beauty, nothing better conceived or more happily executed, grounds charmingly broken, coloured with great sweetness, designed with infinite ease, grace, or anything—accustomed boldness of decision, fine receding of the objects—an elegance in the whole which perfectly conceals the poverty of—why any thing. And observe, my dear boy, when you are presented with a grand performance which you cannot understand, just conclude with—a degree of boldness bordering on temerity." The auditor thought that the famous critic would have halted here; but no—he was not done yet. There were the requisite cuts and banters, such as—"faulty in expression, injudiciously introduced, out of keeping, want of relief, slovenly production, offensively gaudy, careless of reputation, somewhat awkward and constrained, not exempt from vice of mannerism, fore-shortening monstrous, an abortion, a painted absurdity—a what?" Finally, to crown all, a few of his sly rubs in the way of advice, only one of which is remembered, and that, probably, from its almost ridiculous affectation of expression. It was to this effect. "This artist might have even added to the perfection of this his *chef-d'œuvre*, had he been a *little more sparing of his yellow!* And now," said Tom, flourishing his glass, "if you can recollect but one half of this lecture, you may dub yourself a genuine critic to-morrow morning."

We leave the gentlemen of the press to fructify upon the hint.

SANATORY CONDITION OF THE LABOURING POPULATION.

CONCLUSIONS.

We trust it will scarcely be deemed superfluous to quote in this place the conclusions at which Mr Chadwick arrives at the close of his Sanatory Report. If any of our readers have overlooked the three articles given in preceding numbers of the Journal on that subject, we earnestly intreat their attention to them; but alike for those who have, and those who have not read these articles, the following still more brief and expressive summary will be worthy of a careful perusal:—

"*First, as to the extent and operation of the evils which are the subject of the inquiry:*—

That the various forms of epidemic, endemic, and other disease caused, or aggravated, or propagated chiefly amongst the labouring classes by atmospheric impurities produced by decomposing animal and vegetable substances, by damp and filth, and close and overcrowded dwellings, prevail amongst the population in every part of the kingdom, whether dwelling in separate houses, in rural villages, in small towns, or in the larger towns, as they have been found to prevail in the lowest districts of the metropolis.

That such disease, wherever its attacks are frequent, is always found in connexion with the physical circumstances above specified; and that where those circumstances are removed by drainage, proper cleansing, better ventilation, and other means of diminishing atmospheric impurity, the frequency and intensity of such disease are abated; and where the removal of the noxious agencies appears to be complete, such disease almost entirely disappears.

That high prosperity in respect to employment and wages, and various and abundant food, have afforded to the labouring classes no exemptions from attacks of epidemic disease, which have been as frequent and as fatal in periods of commercial and manufacturing prosperity as in any others.

That the formation of all habits of cleanliness is obstructed by defective supplies of water.

That the annual loss of life from filth and bad ventilation is greater than the loss from death or wounds in any wars in which the country has been engaged in modern times.

That of the 43,000 cases of widowhood, and 112,000 cases of destitute orphanage relieved from the poor's rates in England and Wales alone, it appears that the greatest proportion of deaths of the heads of families occurred from the above specified and other removeable causes; that their ages were under 45 years; that is to say, 13 years below the natural probabilities of life, as shown by the experience of the whole population of Sweden.

That the public loss from the premature deaths of the heads of families is greater than can be represented by any enumeration of the pecuniary burdens consequent upon their sickness and death.

That, measuring the loss of working ability amongst large classes by the instances of gain, even from incomplete arrangements for the removal of noxious influences from places of work or from abodes, this loss cannot be less than eight or ten years.

That the ravages of epidemics and other diseases do not diminish, but tend to increase the pressure of population.

That in the districts where the mortality is the greatest, the births are not only sufficient to replace the numbers removed by death, but to add to the population.

That the younger population, bred up under noxious physical agencies, is inferior in physical organisation and general health to a population preserved from the presence of such agencies.

That the population so exposed is less susceptible of moral influences, and the effects of education are more transient than with a healthy population.

That these adverse circumstances tend to produce an adult population short-lived, improvident, reckless, and intemperate, and with habitual avidity for sensual gratifications.

That these habits lead to the abandonment of all the conveniences and decencies of life, and especially lead to the overcrowding of their homes, which is destructive to the morality as well as the health of large classes of both sexes.

That defective town-cleansing fosters habits of the most abject degradation, and tends to the demoralisation of large numbers of human beings, who subsist by means of what they find amidst the noxious filth accumulated in neglected streets and by-places.

That the expenses of local public works are in general unequally and unfairly assessed, oppressively and uneconomically collected, by separate collections; wastefully expended in separate and inefficient operations by unskilled and practically irresponsible officers.

That the existing law for the protection of the public health, and the constitutional machinery for reclaiming its execution, such as the Courts Leet, have fallen into desuetude, and are in the state indicated by the prevalence of the evils they were intended to prevent.

Secondly, As to the means by which the present sanatory condition of the labouring-classes may be improved:—

The primary and most important measures, and at the same time the most practicable, and within the recognised province of public administration, are drainage, the removal of all refuse of habitations, streets, and roads, and the improvement of the supplies of water.

That the chief obstacles to the immediate removal of decomposing refuse of towns and habitations, have been the expense and annoyance of the hand-labour and cartage requisite for the purpose.

That this expense may be reduced to one-twentieth or to one-thirtieth, or rendered inconsiderable, by the use of water and self-acting means of removal by improved and cheaper sewers and drains.

That refuse, when thus held in suspension in water, may be most cheaply and innoxiously conveyed to any distance out of towns, and also in the best form for productive use, and that the loss and injury by the pollution of natural streams may be avoided.

That for all these purposes, as well as for domestic use, better supplies of water are absolutely necessary.

That for successful and economical drainage, the adoption of geological areas as the basis of operations is requisite.

That appropriate scientific arrangements for public drainage would afford important facilities for private land-drainage, which is important for the health as well as sustenance of the labouring-classes.

That the expense of public drainage, of supplies of water laid on in houses, and of means of improved cleansing, would be a pecuniary gain, by diminishing the existing charges attendant on sickness and premature mortality.

That for the protection of the labouring-classes, and of the rate-payers against inefficiency and waste in all new structural arrangements for the protection of the public health, and to insure public confidence that the expenditure will be beneficial, securities should be taken that all new local public works are devised and conducted by responsible officers, qualified by the possession of the science and skill of civil engineers.

That the oppressiveness and injustice of levies for the whole immediate outlay on such works upon persons who have only short interests in the benefits, may be avoided by care in spreading the expense over periods coincident with the benefits.

That by appropriate arrangements, 10 or 15 per cent. on the ordinary outlay for drainage might be saved, which, on an estimate of the expense of the necessary structural alterations of one-third only of the existing tenements, would be a saving of one million and a half sterling, besides the reduction of the future expenses of management.

That for the prevention of the disease occasioned by defective ventilation, and other causes of impurity, in places of work and other places where large numbers are assembled, and for the general promotion of the means necessary to prevent disease, that it would be good economy to appoint a district medical officer, independent of private practice, and with the securities of special qualifications and responsibilities to initiate sanatory measures, and reclaim the execution of the law.

That by the combinations of all these arrangements, it is probable that the full insurable period of life indicated by the Swedish tables (that is, an increase of thirteen years at least) may be extended to the whole of the labouring-classes.

That the attainment of these and the other collateral advantages, of reducing existing charges and expenditure, are within the power of the legislature, and are dependent mainly on the securities taken for the application of practical science, skill, and economy in the direction of local public works.

And that the removal of noxious physical circumstances, and the promotion of civic, household, and personal cleanliness, are necessary to the improvement of the moral condition of the population; for that sound morality, and refinement in manners and health, are not long found co-existent with filthy habits amongst any class of the community."

ONE OF OUR FORGOTTEN POETS.

The names of Donne, Herrick, and Carew, are now well known to every lover of true poetry. Not so familiar is the name of Richard Crashaw; but it is one that merits to be associated with theirs, as the designation of a genuine son of the muses. Crashaw was one of the remarkable band of writers who, giving loose to the free notions that inspired the universal mind of England in the reign of the first Charles, shook off from the national literature the pedantic trammels in which the tastes of James I. had bound it, and restored to it the freshness and the fire of its earlier days. He was the son of a clergyman of the English church, and was born in the beginning of the seventeenth century. Educated in the first instance at the Charterhouse, he afterwards became a scholar of Pembroke-hall, and fellow of Peter-house, in the University of Cambridge. The fellowship was held by him in 1637, and at that time he had attained distinction as a preacher, and as a man of learning and poetical genius. His first efforts in verse were some Latin poems, published so early as 1634, and the fruit, most probably, of the academical leisure hours of his youth. These pieces possess very considerable merit. Besides his skill in the Latin tongue, Crashaw is said to have been master of the Greek and Hebrew, as well as of the Italian and Spanish languages.

Richard Crashaw was ejected from Peter-house in 1644 by the parliamentary army. After his ejection, he betook himself to France, and there embraced the Roman Catholic religion. It is unnecessary to inquire by what motives he was actuated on this occasion. Necessity was most probably the leading cause. His conversion enabled Henrietta Maria, queen of Charles I., to compensate so far his losses as a royalist, by recommending him to the ecclesiastical dignitaries of Italy; and on going thither, he was made a canon of Loretto, from which situation he derived sufficient emolument to maintain life in comfort.

Crashaw's English poems seem to have been published for the first time in 1647, under the title of "Steps to the Temple; Sacred Poems, with other Delights of the Muses." As he had in all likelihood left England previously to the year mentioned, they may have been there issued by his friends, in order to procure him some little store of funds; and possibly Cowley or Herbert, both of them his warm friends and admirers, may have done him that service. Crashaw was of the same school of poetry with Cowley; a school by which ingenuity of similitudes appears to have been deemed the chief end of the bard, and the staple of his art. Though mingled at times with such a leaven of feeling and passion as redeems them from the character of mere glittering conceits, too many of the pieces of Crashaw, it must be admitted, exhibit the peculiar feature in question to a faulty excess. Yet, as has been said, he was a true poet, and the pursuit of erroneous models cannot hide the fact. The following verses, for example, though extremely fanciful, possess much tenderness. They are headed, "The Weeper:"—

"The dew no more will weep
The primrose's pale cheek to deck;
The dew no more will sleep,
Nuzzled in the lily's neck.
Much rather would it tremble here,
And leave them both to be thy tear.

Not the soft gold which
Steals from the amber-weeping tree,
Makes sorrow half so rich,
As the drops distilled from thee.
Sorrow's best jewels lie in these
Caskets of which Heaven keeps the keys.

When sorrow would be seen
In her brightest majesty—
For she is a queen—
Then she is dressed by none but thee.
Then and only then she wears
Her richest pearls—I mean thy tears.

Not in the evening's eyes,
When they red with weeping are
For the sun that dies,
Sits sorrow with a face so fair.
Nowhere but here did ever meet
Sweetness so sad, sadness so sweet."

More simple than the preceding lines, and more tender too, are the subjoined verses, forming an epitaph upon a husband and wife, who died and were buried together:—

"To these whom Death again did wed,
This grave's the second marriage-bed.
For, though the hand of fate could force
'Twixt soul and body a divorce,
It could not sever man and wife,
Because they both lived but one life.
Peace! good reader, do not weep!
Peace! the lovers are asleep.
They, sweet turtles, folded lie
In the last knot that Love could tie.
Let them sleep, let them sleep on,
Till this stormy night be gone,
And the eternal morrow dawn.
Then the curtains will be drawn,
And they waken with that light
Whose day shall never sleep in night."

But we shall not take up our space with these slighter specimens of Crashaw. We wish to give as large a portion as possible of a more elaborate

piece, which is nominally a translation from the Latin of Strada, but in which the translator has far excelled his original, exhibiting, as an able critic says, "a wonderful power over the resources of our language," and producing an English poem of eminent beauty. It is entitled "Music's Duel," and the subject is the contest of the nightingale with the lutist, so finely treated by Ford in his "Lover's Melancholy." Crashaw opens the subject beautifully, and with the easy strength of a master :—

"Now westward Sol had spent the richest beams
Of noon's high glory, when hard by the streams
Of Tiber, on the scene of a green plat,
Under protection of an oak, there sate
A sweet lute's master; in whose gentle airs
He lost the day's heat, and his own hot cares.

Close in the covert of the leaves there stood
A nightingale, come from the neighbouring wood;
(The sweet inhabitant of each glad tree,
Their muse, their syren, harmless syren she),
There stood she list'ning, and did entertain
The music's soft report; and mould the same
In her own murmurs; that whatever mood
His curious fingers lent, her voice made good.
The man perceived his rival and her art.
Disposed to give the light-foot lady sport,
Awakes his lute, and 'gainst the fight to come
Informs it, in a sweet præludium
Of closer strains, and e'er the war begin,
He lightly skirmishes on every string,
Charged with a flying touch; and straightway she
Carves out her dainty voice as readily
Into a thousand sweet distinguish'd tones,
And reckons up in soft divisions
Quick volumes of wild notes, to let him know
By that shrill taste she could do something too.

His nimble hand's instinct then taught each string
A cap'ring cheerfulness; and made them sing
To their own dance; now negligently rash
He throws his arm, and with a long-drawn dash
Blends all together; then distinctly trips
From this to that, then quick returning skips
And snatches this again, and pauses there.
She measures every measure, everywhere
Meets art with art; sometimes as if in doubt
Not perfect yet, and fearing to be out,
Trails her plain ditty in one long-spun note
Through the sleek passage of her open throat,
A clear unwrinkled song; then doth she point it
With tender accents, and severely joint it
By short diminutives, that being rear'd
In controverting warbles evenly shared,
With her sweet self she wrangles. He amazed.
That from so small a channel should be raised
The torrent of a voice, whose melody
Could melt into such sweet variety,
Strains higher yet, that tickled with rare art
The tattling strings, each breathing in his part,
Most kindly do fall out: the grumbling bass,
In surly groans disdains the treble's grace;
The high-perch'd treble chirps at this, and chides,
Until his finger (moderator) hides
And closes the sweet quarrel, rousing all
Hoarse, shrill at once; as when the trumpets call
Hot Mars to th' harvest of death's field, and woo
Men's hearts into their hands: this lesson too
She gives them back; her supple breast thrills out
Sharp airs, and staggers in a warbling doubt
Of dallying sweetness, hovers o'er her skill,
And folds in waved notes, with a trembling bill,
The pliant series of her slippery song:
Then starts she suddenly into a throng
Of short thick sobs, whose thund'ring volleys float,
And roll themselves over her lubrick throat
In panting murmurs, still'd out of her breast;
That ever-bubbling spring, the sugar'd nest
Of her delicious soul, that there does lie
Bathing in streams of liquid melody;
Music's best seed-plot; when in ripen'd airs
A golden-headed harvest fairly rears
His honey-dropping tops, plough'd by her breath,
Which there reciprocally laboureth.
In that sweet soil it seems a holy choir,
Sounded to th' name of great Apollo's lyre;
Whose silver roof rings with the sprightly notes
Of sweet-lip'd angel imps, that swill their throats
In cream of morning Helicon, and then
Prefer soft anthems to the ears of men,
To woo them from their beds, still murmuring
That men can sleep while they their matins sing;
(Most divine service) whose so early lay
Prevents the eyelids of the blushing day.
There might you hear her kindle her soft voice,
In the close murmur of a sparkling noise;
And lay the ground-work of her hopeful song,
Still keeping in the forward stream, so long
Till a sweet whirlwind (striving to get out)
Heaves her soft bosom, wanders round about,
And makes a pretty earthquake in her breast,
Till the fledged notes at length forsake their nest,
Fluttering in wanton shoals, and to the sky,
Wing'd with their own wild echoes, prattling fly.
She opes the floodgate, and lets loose a tide
Of streaming sweetness, which in state doth ride
On the waved back of every swelling strain,
Rising and falling in a pompous train:
And while she thus discharges a shrill peal
Of flashing airs, she qualifies their zeal
With the cool epode of a graver note:
Thus high, thus low, as if her silver throat
Would reach the brazen voice of war's hoarse bird;
Her little soul is ravish'd, and so pour'd
Into loose ecstacies, that she is placed
Above herself, music's enthusiast.

Shame, now, and anger mix'd a double stain
In the musician's face; yet, once again,
Mistress, I come: now, reach a strain, my lute,
Above her mock, or be for ever mute."

The poet goes on to describe most vividly the succeeding effort of the lutist. It was beyond the powers of the bird, and the issue is thus told :—

"And she, although her breath's late exercise
Had dealt too roughly with her tender throat,
Yet summons all her sweet powers for a note:
Alas! in vain! for while (sweet soul) she tries
To measure all those wild diversities
Of chatt'ring strings, by the small size of one
Poor simple voice, raised in a natural tone,

She fails, and falling, grieves, and grieving, dies—
She dies, and leaves her life the victor's prize,
Falling upon his lute. Oh, fit to have
(That lived so sweetly) dead, so sweet a grave!"

"Music's Duel" speaks itself to be the work of one, as our readers may now admit, whose very soul was steeped in music, and would alone entitle him to a place among the poets of his nation.

Richard Crashaw died in the situation of a canon of Loretto, in the year 1650.

PROGRESS OF VACCINATION.

In No. 458 of this Journal, a statement was made with the view of showing the excessive loss of human life, deprivation of sight, personal disfigurement and debility, which had from time to time resulted from small-pox; and some observations were given in support of the indisputable superiority of vaccination to inoculation with small-pox, both as a means of warding off the attacks of that terrible disease, and as being, unlike the system which it has supplanted, wholly unattended with the danger of contagion from a patient under the operation of vaccination. Attention was likewise pointed to the circumstance, and a brief abstract given of the leading provisions of an act of the legislature (3d and 4th Victoria, cap. 29), which had been passed with the humane object of encouraging the extension of vaccination, and of suppressing the practice of inoculation with small-pox, as in a high degree dangerous, and comparatively inoperative besides, by placing the latter in the catalogue of penal offences.

Since that time, the reports of the poor-law commissioners, to whom the duty of carrying this act into operation was confided, furnish some interesting information relative to the progress of legalised vaccination, both in England and Ireland. It may be worthy of remark, in passing, that Scotland was excluded from the operation of this act, for some reason which we are wholly unable to understand or explain, unless it was that there existed no machinery there similar to the English poor-law commission for carrying it into effect, and the greater difficulty and expense consequent on its introduction.

For the purpose of carrying the Vaccination Extension Act into effect, the commissioners directed each of the English poor-law unions to be divided into districts, and in each of such districts vaccination stations to be appointed, so numerous and so near to each other, that few persons would have to travel more than two miles to the station to have their children vaccinated, and ordinarily the distance would be much less. The local boards of guardians were also required to enter into contracts with properly qualified medical practitioners for the attendance and performance of vaccination at each of such stations periodically on a fixed day and hour. Where the population is sufficiently numerous to admit of it, the commissioners have preferred a weekly attendance by the vaccinators at each station, so that the persons vaccinated in one week are inspected the next; and from the cases so inspected, vaccine matter can at once be taken so as to vaccinate from arm to arm those who are then in attendance to be vaccinated. Where the population is less dense, they have recommended a series of weekly attendances during part of the year only; and where the population is scanty, and the stations numerous, they have acquiesced in a very limited number of attendances in the year at each station.

On the 1st of May 1841, the date of the seventh report, such arrangements as have been described, or similar, had been entered into in 533 out of 583 of the unions, for giving effect to the act; and between that time and the 1st of May of the present year, thirty-eight unions in which the provisions of the act are now in force had been added, besides twenty-two unions and parishes under local acts. Similar arrangements for vaccination under the act, differing only so far as to suit certain local peculiarities, have also been made in the unions in Ireland, as these have from time to time been formed. Up to the 25th of March last, vaccination contracts had been entered into throughout the whole of eighty-eight unions in Ireland, and partially in twelve others, embracing a population of nearly five millions and a half; and the total number of persons returned as successfully vaccinated up to the last-mentioned date was 104,713. The commissioners have been desirous of obtaining information from the tables published by the registrar-general, as to the mortality arising from small-pox, which has taken place since the passing of the vaccination act, as compared with the mortality, from the same cause, known to have taken place in former years; but from the very recent introduction of the machinery for vaccination throughout the kingdom, the returns published do not as yet embrace any part of the time since the passing of the act, though they ultimately will.

There have been many obstacles opposed to the introduction and progress of the vaccination act, which have been only partially removed. Although it was perhaps more especially passed with the view of extending the practice of vaccination among the *poor*, still, in point of fact, no distinction of that kind is made in the act, which provides for the vaccination of the whole community alike, without reference as to whether the applicants for vaccination are paupers or not. We fear this has never been generally understood, and that the misapprehension which prevails on this point originated in the introduction of the act being intrusted to the poor-law commissioners. It has been found that many persons have not availed themselves of the benefit thus provided by the legislature, from an apprehension that the acceptance of it would, so far as respects the elective franchise, be tantamount to the acceptance of relief or alms, and so operate to disfranchise the party whose child might thus be vaccinated. Others of the guardians refused taking proceedings because they have doubted whether the act authorised the payment of the remuneration for vaccination out of the poor-rates. Both these doubts, however, have now been completely removed by a short amending act (4th and 5th Vict., cap. 32) recently passed, which expressly enables the guardians to defray the expenses of vaccination out of the poor rates, and also declares that vaccination under the act shall not be considered to be parochial relief, and that no person shall be deprived of any right, or subject to any disability, by reason of such vaccination.

The most serious obstacle which impedes the progress of vaccination, and more particularly in Ireland, is the difficulty which the vaccinator finds in inducing persons who bring their children to the stations to be vaccinated, to return on his next visit and afford him the opportunity of judging whether or not the vaccination has been successful. Others of them evince the greatest unwillingness to permit a supply of lymph to be taken from their children, which is necessary for the vaccination of others, and not in the slightest degree hurtful to those from whom it is taken. The failure to return at the proper time to enable the vaccinator to inspect the progress of the operation is attended with three bad consequences; it prevents him from certifying the successful result of the vaccination, which is the most important point of all; it has the effect of limiting the necessary supply of lymph or cow-pox *virus*; and it goes to deprive the vaccinator of his remuneration, which is sufficiently small as it is, by disabling him from furnishing the requisite certificate of successful vaccination, upon which his remuneration depends. In Ireland, efforts have been made to obviate these difficulties, by compelling the parties to leave a deposit of sixpence or a shilling, which is to be returned on the successful issue of the case, and provided the child is brought on the prescribed days, and that liberty is given to take lymph from the vesicle; which have had the desired effect in most cases of insuring the return of the parties.

Some degree of prejudice, too, prevails, especially in Ireland, against the use of cow-pox, but this is stated to be rapidly wearing away. It is likewise to be feared that a great deal of ignorance still exists in all parts of the kingdom as to the provision made by the legislature in respect to vaccination, and the arrangements made for carrying this provision into effect. We hope to be instrumental in some degree of conveying information relative to this important subject into quarters which it may not yet have reached.

We say to every parent in England and Ireland having children to vaccinate, "Go instantly to the proper vaccinating station of your district, and get the operation performed according to the rules laid down by the medical attendant. You cannot be too thankful for the offer of so great a boon, free of either expense or trouble, and which is so likely to save the lives of your offspring." We may add, "How much better off are you than the people of Scotland, who are born and vaccinated, no one cares how, and of whose children great numbers perish for want of those institutions with which you have been blessed!"

FISHING IN THE OHIO.

Mr Audubon, the ingenious American naturalist, in one of his volumes of ornithology, presents the following simple sketch of the mode of fishing in the Ohio, many years ago, or at least previous to the introduction of steam navigation on the western waters :—

"It is with mingled feelings of pleasure and regret that I recall to my mind the many pleasant days I have spent on the shores of Ohio. The visions of former years crowd on my view, as I picture to myself the fertile soil and genial atmosphere of our great western garden, Kentucky, and view the placid waters of the fair stream that flows along its western boundary. Methinks I am now on the banks of the noble river. Twenty years of my life have returned to me; my sinews are strong, and the 'bowstring of my spirit is not slack;' bright visions of the future float before me, as I sit on a grassy bank gazing on the glittering waters. Around me are dense forests of lofty trees and thickly-tangled undergrowth, amid which are heard the songs of feathered choristers, and from whose boughs hang clusters of glowing fruits and beautiful flowers. Reader, I am very happy. But now the dream has vanished, and here I am in the British Athens, penning an episode for my Ornithological Biography, and having before me sundry well-thumbed and weather-beaten folios, from which I expect to be able to extract some interesting particulars respecting the methods employed in those days in catching cat-fish.

But before entering on my subject, I will present you with a brief description of the place of my residence on the banks of the Ohio. When I first landed at Henderson, in Kentucky, my family, like the village, was quite small. The latter consisted of six or eight houses; the former of my wife, myself, and a young child. Few as the houses were, we fortunately found one empty. It was a log-*cabin*, not a log-*house*; but as better could not be had, we were pleased. Well, then, we were located. The country around was thinly peopled, and all purchasable provisions rather scarce; but our neighbours were friendly, and we had brought with us flour and bacon-hams. Our pleasures were those of young people not long married, and full of life and merriment; a single

smile from our infant was, I assure you, more valued by us than all the treasures of a modern Crœsus would have been. The woods were amply stocked with game, the river with fish; and now and then the hoarded sweets of the industrious bees were brought from some hollow tree to our little table. Our child's cradle was our richest piece of furniture, our guns and fishing-lines our most serviceable implements; for although we began to cultivate a garden, the rankness of the soil kept the seeds we planted far beneath the tall weeds that sprung up the first year. I had then a partner, a 'man of business,' and there was also with me a Kentucky youth, who much preferred the sports of the forest and river to either day-book or ledger. He was naturally, as I may say, a good woodsman, hunter, and angler, and, like me, thought chiefly of procuring supplies of fish and fowl. To the task, accordingly, we directed all our energies.

Quantity as well as quality was an object with us, and although we well knew that three species of cat-fish existed in the Ohio, and that all were sufficiently good, we were not sure as to the best method of securing them. We determined, however, to work on a large scale, and immediately commenced making a famous 'trot-line.' Now, reader, as you may probably know nothing about this engine, I shall describe it to you.

A trot-line is one of considerable length and thickness, both qualities, however, varying according to the extent of water, and the size of the fish you expect to catch. As the Ohio, at Henderson, is rather more than half a mile in breadth, and as cat-fishes weigh from one to a hundred pounds, we manufactured a line which measured about two hundred yards in length, as thick as the little finger of some fair one yet in her teens, and as white as the damsel's finger well could be, for it was wholly of Kentucky cotton, just, let me tell you, because that substance stands the water better than either hemp or flax. The main line finished, we made a hundred smaller ones, about five feet in length, to each of which we fastened a capital hook of Kirby and Co.'s manufacture. Now for the bait.

It was the month of May. Nature had brought abroad myriads of living beings; they covered the earth, glided through the water, and swarmed in the air. The cat-fish is a voracious creature, not at all nice in feeding, but one who, like the vulture, contents himself with carrion when nothing better can be had. A few experiments proved to us that, of the dainties with which we tried to allure them to our hooks, they gave a decided preference, at that season, to *live toads*. These animals were very abundant about Henderson. They ramble or feed, whether by instinct or reason, during early or late twilight more than at any other time, especially after a shower, and are unable to bear the heat of the sun's rays for several hours before and after noon. We have a good number of these crawling things in America, particularly in the western and southern parts of the Union, and are very well supplied with frogs, snakes, lizards, and even crocodiles, which we call alligators; but there is enough of food for them all, and we generally suffer them to creep about, to leap or to flounder as they please, or in accordance with the habits which have been given them by the great Conductor of all.

During the month of May, and indeed until autumn, we found an abundant supply of toads. Many 'fine ladies,' no doubt, would have swooned, or at least screamed and gone into hysterics, had they seen one of our baskets filled with these animals, all alive and plump. Fortunately we had no tragedy queen or sentimental spinster at Henderson. Our Kentucky ladies mind their own affairs, and seldom meddle with those of others, farther than to do all they can for their comfort. The toads, collected one by one, and brought home in baskets, were deposited in a barrel for use. And now that night is over, and as it is the first trial we are going to give our trot-line, just watch our movements from that high bank beside the stream. There sit down under the large cotton-wood tree. You are in no danger of catching cold at this season.

My assistant follows me with a gaff-hook, while I carry the paddle of our canoe; a boy bears on his back a hundred toads as good as ever hopped. [Arriving at the station, and the hooks being baited with toads,] the line is left in the river, and there *it* may patiently wait, until I visit it towards night. Now I take up my gun and note-book, and, accompanied by my dog, intend to ramble through the woods until breakfast. Who knows but I may shoot a turkey or a deer? It is barely four o'clock; and see what delightful mornings we have at this season in Kentucky!

Evening has returned. The heavens have already opened their twinkling eyes, although the orb of day has yet scarcely withdrawn itself from our view. How calm is the air! The nocturnal insects and quadrupeds are abroad; the bear is moving through the dark canebrake; the land-crows are flying towards their roosts; their aquatic brethren towards the interior of the forests; the squirrel is barking his adieu, and the barred owl glides silently and swiftly from his retreat, to seize upon the gay and noisy animal. The boat is pushed off from the shore; the main-line is in my hands; now it shakes; surely some fish have been hooked. Hand over hand I proceed to the first hook. Nothing there. But now I feel several jerks stronger and more frequent than before. Several hooks I pass; but see! what a fine cat-fish is twisting round and round the little line to which he is fast. Nat, look to your gaff; hook him close to the tail. Keep it up, my dear fellow. There now, we have him! More are on, and we proceed. When we have reached the end, many goodly fishes are lying in the bottom of our skiff. New bait has been put on, and, as we return, I congratulate myself and my companions on the success of our efforts, for there lies fish enough for ourselves and our neighbours.

Several species or varieties of cat-fish are found in the Ohio, namely, the blue, the white, and the mud cats, which differ considerably in their form and colour, as well as in their habits. The mud cat is the best, although it seldom attains so great a size as the rest. The blue cat is the coarsest, but when not exceeding from four to six pounds, it affords tolerable eating. The white cat is preferable to the last, but not so common; and the yellow mud cat is the best and rarest. Of the blue kind, some have been caught that weighed a hundred pounds. Such fishes, however, are looked upon as monsters.

When the waters are rising fast, and have become muddy, a single line is used for catching cat-fish. It is fastened to the elastic branch of some willow several feet above the water, and must be twenty or thirty feet in length. The entrails of a wild turkey, or a piece of fresh venison, furnish good bait; and if, when you visit your line the next morning after you have set it, the water has not risen too much, the swinging of the willow indicates that a fish has been hooked, and you have only to haul the prize ashore.

One evening I saw that the river was rising at a great rate, although it was still within its banks. I knew that the white perch were running, that is, ascending the river from the sea, and anxious to have a tasting of that fine fish, I baited a line with a cray-fish, and fastened it to the bough of a tree. Next morning, as I pulled in the line, it felt as if fast to the bottom, yet, on drawing it slowly, I found that it came. Presently I felt a strong pull, the line slipped through my fingers, and next instant a large cat-fish leaped out of the water. I played it for a while, until it became exhausted, when I drew it ashore. It had swallowed the hook, and I cut off the line close to its head. Then passing a stick through one of the gills, a servant and I tugged the fish home. On cutting it open, to our surprise we found in its stomach a fine white perch, dead, but not in the least injured. The perch had been lightly hooked, and the cat-fish, after swallowing it, had been hooked in the stomach, so that, although the instrument was small, the torture caused by it no doubt tended to disable the cat-fish. The perch we ate, and the cat, which was fine, we divided into four parts, and distributed among our neighbours. My most worthy friend and relative, Nicholas Berthoud, Esq., who formerly resided at Shippingport in Kentucky, but now in New York (a better fisher than whom I never knew), once placed a trot-line in 'the basin' below 'Tarascon's Mills,' at the foot of the rapids of the Ohio. I cannot recollect the bait which was used; but on taking up the line, we obtained a remarkably fine cat-fish, in which was found the greater part of a sucking pig.

A STORY OF NAPOLEON.

[From a Newspaper.]

A YOUNG man was passing with his regiment through Lyons in 17—, where he fell sick, and was obliged to remain at an hotel. He found himself very ill supplied with money, and his purse was speedily exhausted by the expenses his malady occasioned him. The hostess, untouched by his destitute situation, had him carried into a granary, where all the furniture she allowed him was a paillasse and a chair, and all the sustenance a little barley water, refusing to call in the aid of a physician, to avoid the responsibility in which she apprehended such an additional charge might involve her. It happened that the first floor of this furnished hotel was occupied by two Genevese ladies, Madam and Mademoiselle Agiee, who had visited Lyons for the benefit of change of air; they were both advanced in years, Mademoiselle Agiee being nearly fifty. These two ladies were clever and well-informed; but, according to an unfortunate habit, they did injustice to their real merit by a pretension to something beyond it, and a pedantry completely national. The fate of the young soldier interested all the domestics of the hotel, and the particulars of his friendless condition reached the ear of Mademoiselle Agiee through her maid, who acquainted her at the same time with the cruelty of the landlady, who threatened to send him to the hospital. The maid succeeded in awakening the sympathy of her mistress, who immediately sent for a physician, informing the hostess that she would answer all expenses, and that it was her pleasure that the sick man should be removed, without delay, to a comfortable chamber.

The humane waiting-maid, meanwhile, never quitted the chamber of the invalid whom she had taken so happily under her protection. Weakened by his illness, which had been so aggravated by neglect, the young soldier was in a frightful state of delirium when the physician visited him, and during the process of changing his apartment, so that, when he recovered his senses, he was greatly astonished to find himself in a well-furnished chamber, and believed himself dreaming. Near his bed was his faithful nurse, whom he began to question, but who contented herself with replying, that a friend, who took an interest in him, had given orders that he should be properly attended. Days and even weeks passed thus, till at length the young soldier, recovering his strength, insisted on being informed to whom he was indebted for so many benefits. There was, in the expression of his countenance, something that commanded respect—which, perhaps, even excited fear: the good woman named her mistress, and with all possible delicacy related to him the miserable circumstances in which she had found him. He intreated to see Mademoiselle Agiee, that he might lighten his heart of some of its gratitude. He was not yet able to rise, nor was he permitted to read; but he was, nevertheless, sufficiently reinstated to feel the weight and weariness of an idle life. Mademoiselle Agiee consented to the demand of the young soldier, and paid him her first visit. She remained with him only a few moments, but promised to return and bring him books, desiring him to make his choice, and offering to read for him till he should no longer be forbidden to occupy himself. He accepted her proposal with joy, and selected the "Life of Turenne," and a book on geometry. Every day Mademoiselle Agiee passed some hours with the convalescent soldier, who listened eagerly as she read, often interrupting her to make observations, which were always just, and sometimes very striking. He did not seem easily inclined to confidence; and it was not till some time had thus elapsed, that one day, as if led on by a military ardour beyond his power to restrain, he began to speak of his projects to Mademoiselle Agiee: she smiled as she listened to him. "In truth," said she, "I believe we shall one of these days see you a colonel." "Colonel!" replied he, in a tone of indignation, "I shall be a general, and perhaps"—— but he interrupted himself, as if alarmed at what he was about to say, and perhaps even internally rebuking himself for what he had said. "Until now," said Mademoiselle Agiee, "I have never asked you a single question, either with regard to your family or country. By your accent I conceive you to be a foreigner, although you belong to a French regiment." "I am a Corsican, and my name is Napoleon Bonaparte.

Mademoiselle Agiee every day became more and more interested in Napoleon; and when he was entirely recovered, she equipped him, and supplied him with money necessary to enable him to rejoin the regiment. On taking leave of his benefactress, the young man was much affected. "Believe me," said he, "I shall never forget what you have done for me! you will hear of me." He departed, and Mademoiselle Agiee returned with her mother to Geneva. Very soon the name of Napoleon became celebrated; and Mademoiselle Agiee, in reading the gazettes, exulted in the success of her protégé, who, meanwhile, seemed to have entirely forgotten her. Years passed thus away, when, some time before the battle of Marengo, Bonaparte passed through Nyon, a little town of the Canton de Vaud, twelve miles from Geneva, on his way to Italy; he could only stop a few hours; he sent an aide-de-camp to Geneva, with orders to inquire for a lady, named Agiee, very ugly and old, and to bring her to him: such were his directions. The aide-de-camp soon succeeded in finding Mademoiselle Agiee. She had become nearly blind, and very seldom quitted her own house, but the name of her hero seemed to inspire her with new strength, and she hesitated not to follow his messenger. Bonaparte was impatient, and came to meet his friend on horseback, attended by his staff, at Versoix; as soon as he perceived her carriage, he spurred on to receive her, and the feelings of Mademoiselle Agiee, on this rencontre, may better be imagined than expressed. "Gentlemen," said Bonaparte, turning towards his suite, "you see my benefactress, she to whom I am indebted for life; I was destitute of everything when she succoured me. I am happy and proud to be obliged to her and I shall never forget it." Mademoiselle Agiee passed two hours at Nyon with Bonaparte, at the hotel of the Croix Blanche, where he detailed to her all his plans; and on taking leave of her, repeated the same words he had uttered at Lyons, "You will hear of me." From that hour to the epoch of Napoleon's coronation, she received from him no token of his existence; but fifteen days before the coronation, General Hullin was announced to Mademoiselle Agiee. He desired her to prepare to accompany him, as Bonaparte was resolved that she should witness his glory; he was furnished with the strictest and most minute orders. Mademoiselle Agiee was permitted to carry nothing with her beyond what was indispensable during the journey; and in spite of her age and infirmities, the day after the general's arrival she set out. On arriving at Paris, she slighted at a house in the Place du Carousal, opposite to the Palace of the Tuilleries; there she found domestics in the livery of Bonaparte; and, in short, a completely furnished mansion and a well-stocked wardrobe had been prepared for her. Bonaparte had recollected even her favourite colours, and had omitted nothing he imagined would give pleasure. She had a long audience with Napoleon; and he assigned her, besides a house, carriage, and domestics, maintained at his expense, an annual income of six thousand francs. He continued to preserve towards Mademoiselle Agiee the most marked regard, often consulting her even on the most important affairs.

On the fall of Bonaparte, Mademoiselle Agiee lost the house and the advantages he had conferred upon her; but I believe her pension was always regularly paid by the agents of Napoleon till her death, which happened in 1822. It was from herself that I received the details I have given. It is easy to imagine with what animation she descanted upon her hero; even without partaking her enthusiasm, it was impossible not to listen to her with interest. Besides, noble and generous sentiments belong to our intellectual existence; no matter what country they belong to, or what are our opinions, the emotions of the heart will not wait to consult our prejudices. Mademoiselle Agiee died in the Hotel de la Rouchefoucault, Faubourg du Roule, at Paris, of which she inhabited a small wing, after having quitted her house in the Place du Carousal.

CONSUMPTION IN MAN AND THE LOWER ANIMALS.

THE greater part of the sitting of the Parisian Academy of Science of July 25, was occupied with the reading of a paper by M. Rayer, on consumption in man and the lower animals. M. Rayer remarks, that animals in a state of nature are particularly subject to the development of parasitical insects, but that, with few exceptions, they are not subject to tubercles in the lungs, or in any of the other organs. The case, however, is very different in the vertebrated classes in a state of domesticity and captivity, particularly in the former. In the monkey, when removed from its native climate, phthisis is, he says, a very common disease. M. Wolfthigel relates a case of a tiger affected with phthisis; Perrault mentions a lion; Youatt and Martin speak of a tiger and a lion thus affected. Owen found the same disease in a kinkajou. M. Rayer states that he found tubercles and their excavations in the lungs of a jaguar. In the domestic dog consumption is of rare occurrence, but inflammation of the lungs is very common. Of two hundred and forty-two dogs examined, two were phthisical, and thirty-one had general symptoms of inflammation of the lungs. In the division of the animals called *rongeurs*, consumption is rare; examples, however, have been found of this disease in rabbits, squirrels, and guinea-pigs, particularly when in a state of domesticity. M. Rayer could never discover tubercles in rats. M. Morand states that the prevailing disease with the latter is stone in the kidneys. In the domestic and captive ruminating animals, for instance, in

the stag and chamois, consumption is common. M. Rayer found hydatids and tubercles in the lungs of the camel. Sporner found several vormicæ and hydatids in the lungs of the dromedary. Milch cows, particularly those in and near Paris, are frequently attacked with this disease. This is not, however, the case with milch goats; but the she-ass is not entirely exempt. Hence, M. Rayer concludes that it would be more reasonable to prescribe to consumptive patients the use of goats' milk than that of the ass, and the milk of the ass in preference to the milk of the cow. In the pachydermous tribe, Perrault has observed consumption, particularly in the female elephant. Consumption, attended with the ordinary symptoms observable in man, has also been found in the pig, and in the porpoise or sea-pig, and in a variety of other animals. The relative frequency of consumption in man, in the different races scattered over the world, is, says M. Rayer, but little known. It is, however, certain that negroes are little subject to it in their native climes, although they frequently fall victims to this dreadful disease in passing from one climate to another, especially when they remove into northern latitudes; on the contrary, certain animals, such as the reindeer, when conveyed from north to south, die of tubercles in the lungs and other inflammatory symptoms. This has been particularly noticed in lamas. In the mammiferous animals, the pus which is found in their system is composed of granulated globules, but in their tubercles no such appearance has been observed. This distinction does not exist in birds, as was ascertained by examining their morbid structure by means of the microscope. A chronic disease, with progressive wasting away, and the existence of small brown masses, easy of separation, similar to the small yellow grains in the liver or other organs, are the only character of consumption in the various tribes of birds. The removal of animals from one climate to another, and from liberty to captivity, is, as already observed, according to M. Rayer, the grand cause of consumption. He mentions, among other animals thus affected, owls, parrots, fowls, pigeons, pheasants, the heron, the stork, bullfinch, the blackbird, the jay, and the magpie. M. Gruby declares that he has found tubercles in the lungs of the frog, but M. Rayer states that he has never been able to ascertain the existence of any such lesion in this animal. Mr Harrison pretends also to have found tuberculous matter in reptiles; and M. Rayer mentions that he did find in a boa certain deposits of matter analogous to the tuberculous secretion of other animals. He has great doubts, however, whether any similar morbid changes are to be found in the organs of fishes and insects, contrary to the statement made by Messrs Harrison and Newport. In concluding this part of his paper, M. Rayer says that tuberculous affections are the most common of the chronic diseases of animal life in the classes which he has named. Proceeding to some general considerations on the nature of consumption, he asserts that it is hereditary, but scarcely ever congenital. M. Rayer also further adds, that ulcer of the larynx, of the windpipe, and of the bronchia, are not to be found alike in man and in the lower animals. In the human race these ulcers almost always indicate pulmonary consumption, and occasionally syphilis. As in animals captivity and domesticity are the great causes of consumption, so in man are misery and fatigue. He is decidedly of opinion that the proximate cause of tuberculous consumption arises from changes in nutrition; and hence he concludes that, in relation to tubercles, science, excepting in rare cases, is not only absolutely powerless as regards cure, but also as regards prevention. In winding up his memoir, M. Rayer, in illustration of the exceptions to the general principles which he has laid down as to these pathological changes, cites the case of a fox in a wild state, and the lungs of which were quite covered with tubercles; and also that of a woman in savage life, who died with all the symptoms of phthisical destruction.—*From a Newspaper.*

LOCAL DISTINCTIONS.

In Mr Carleton's introduction to the new series of his "Traits and Stories of the Irish Peasantry," he utters, in our opinion, a most unreasonable lamentation over the settlement of Irish writers in England, thus, as he alleges, depriving their native country of the direct benefit of their labours.

"A nation," he observes, "may produce one man or ten men of eminence, but if they cannot succeed in impressing their mind upon the spirit and intellect of their own country, so as to create *in her* a taste for literature or science, no matter how highly they may be appreciated by strangers, they have not reached the exalted purposes of genius. To make this more plain, I shall extend the metaphor a little farther. During some of the years of Irish famine, such were the unhappy circumstances of the country, that she was exporting provisions of every description in the most prodigal abundance, which the generosity of England was sending back again for our support. So was it with literature. Our men and women of genius uniformly carried their talents to the English market, whilst we laboured at home under all the dark privations of a literary famine.

In truth, until within the last ten or twelve years, an Irish author never thought of publishing in his own country, and the consequence was, that our literary men followed the example of our great landlords; they became absentees, and drained the country of its intellectual wealth precisely as the others exhausted it of its rents.

Thus did Ireland stand in the singular anomaly of adding some of her most distinguished names to the literature of Great Britain, whilst she herself remained incapable of presenting anything to the world beyond a school-book or a pamphlet; and even of the latter, it is well known that if the subject of it were considered important, and its author a man of any talent or station in society, it was certain to be published in London.

Precisely in this state was the country when the two first volumes of the 'Traits and Stories of the Irish Peasantry' were given to the public by the house of Messrs Curry and Co. of Sackville Street. Before they appeared, their author, in consequence of their originating from an Irish press, entertained no expectation that they would be read, or excite any interest whatever, in either England or Scotland. He was not, however, without a strong confidence that, notwithstanding the wild and uncleared state of his own country at the time, so far as native literature was concerned, his two little pioneers would work their way with at least moderate success. He felt conscious that everything depicted in them was true, and that, by those who were acquainted with the manners, and language, and feelings of the people, they would sooner or later be recognised as faithful delineations of Irish life. In this confidence the event justified him; for not only were his volumes stamped with an immediate popularity at home, where they could be best appreciated, but awarded a very gratifying position in the literature of the day by the unanimous and not less generous verdict of the English and Scotch critics.

Thus it was that the publication of two unpretending volumes, written by a peasant's son, established an important and gratifying fact—that our native country, if without a literature at the time, was at least capable of appreciating, and willing to foster, the humble exertions of such as endeavoured to create one. Nor was this all: for so far as resident authors were concerned, it was now clearly established that an Irish writer could be successful at home without the necessity of appearing under the name and sanction of the great London or Edinburgh booksellers."

We are glad of the success of Mr Carleton through the agency of Dublin publishers; we are also glad that Irish booksellers have the spirit to compete with London and Edinburgh houses; but we take leave to say that, as a general principle, it ought to be a matter of indifference whether Irish writers stay at home or remove to England. Mr Carleton, like many persons, apparently wishes to keep up distinctions of country, which it were well if completely obliterated. The three kingdoms of England, Scotland, and Ireland, are now all one; and of what consequence is it *to the public at large* where a person resides, or where his book is published—whether in the county of Dublin, Mid-Lothian, or Middlesex? *Native* literature! *Native* talent! It is with such terms that mankind vex themselves, and keep alive feelings of strife and rivalry that ought for ever to be buried in oblivion.

AN EXAMPLE TO COUNTRY GENTLEMEN.

Amongst the instances of practical attention to the improvement of the physical condition of labouring classes in the agricultural districts, I may notice the following statement made to me by the late Mr Monck of Coley House, Reading, who had bestowed much care upon the cottages on his own estate. It comprehends the provision adverted to:—"The care taken of these cottages and gardens," said he, "affords an excellent criterion of the character of the labourers. I have paid especial attention to those labourers who have displayed cleanliness and order; and I pay the most respect to those who have achieved a situation of the greatest comfort, and keep themselves and their houses cleanly, and their children tidy. Formerly, the cottages were in bad order, their pavements and windows were broken; I had them all paved, and their windows glazed. I told the cottagers that I did not like to see shabby broken windows with patches of paper and things stuffed in, or broken pavements which they could not clean; and that I disliked Irish filth, and all Irish habits of living. I engaged, after the cottages were thoroughly repaired, to pay L.1 a-year for repairing them. I undertook to make the repairs myself, and deduct the expense from this L.1; but if no repairs were wanted, they were to have the whole L.1 themselves. This course has, I find, formed habits of care; and their cottages are now so well taken care of, that very little deduction is made annually from the L.1. Formerly, they used to chop wood carelessly on their pavements, and break them; now they abstain from the practice, or do it in a careful manner, to avoid losing the money. In the winter, I give them two score of faggots towards their fuel. I have found that by this means I save my hedges and fences, and am pecuniarily no loser, whilst pilfering habits are repressed. Since the enclosures have been made, I think some place should be provided for the exercise and recreation of the working-classes, and especially for their children. I have set out four acres at Oldworth as a play-ground for the children, or whoever likes to play. They have now their cricket-matches, their quoit-playing, and their revels there. Sheep and cows feed on it, so that it is no great loss to me. I let it for L.4 a-year to a man, on condition that he cuts the hedges and keeps it neat. I have surrounded it with a double avenue of trees. The sheep and cows do good to the ground, as they keep the grass under, which allows the ball to run. I give prizes to the boys at the school, which is maintained by the cottagers themselves, and to which I contribute nothing but the prizes for reading, writing, and knitting.

Many persons accuse the poor of ingratitude, but I find them the most grateful people alive for these little attentions. And what do they all cost me? Why, not more altogether than the keep of one fat coach-horse."—*Chadwick's Sanatory Report.*

RAILWAY TRAFFIC.

The following calculation of a late weekly return of 38 railways, 1387 miles in length, will be of interest:—Number of passengers on 25 railways 315,986½, consequently the total for the week must be about 400,000. The receipts for passengers on 37 railways L.68,087, 16s. 3d.; ditto for goods on 31 railways L.16,129, 5s. 3d.; total L.84,217, 1s. 6d. This is an average of L.63 per mile per week. The traffic, therefore, is certainly at the rate of about L.4,000,000 a-year, and carrying 15,000,000 of passengers.—*Railway Magazine.*

ADVICE TO LADIES.

Captain Sabretash, in his lately published work, "The Art of Conversation," gives the following good advice to ladies:—"My fair friends, never scold servants. Instruct, reprove, admonish, as much as may be necessary; give warning, or, if need be, turn the worthless out of the house, but never descend to scolding or to the use of rude or harsh language; for there is, in truth, something very undignified in the practice. There are no doubt plenty of bad servants, but there are more bad masters and mistresses in proportion, and for this very evident reason, that it is the object and interest of servants to please their masters; whereas the latter are independent of the former, and need take no trouble about the matter: and as there is effort on one side and none on the other, the result will naturally be on the side of those who make at least a fair attempt. Besides, bad masters often make bad servants, when the servants cannot well influence the conduct of the masters. And even the humble individual who writes these lines can assure the reader that he has known grief, shame, sorrow, and affliction fall upon poor servants, particularly female servants, owing to the undeserved harshness with which they had been treated by ladies, who could be all smiles and blandness to persons of high degree. You do not know, my pretty dears, how much a foolish fit of passion may ultimately give you to answer for.

If people could only see the undignified figure they make when in a towering rage, the chances are that they would contrive to keep their temper rather more within bounds. We may excuse anger, and even passion perhaps, where the name, fame, or character of friends and relatives are assailed; but to fly into a fury about broken plates or overdone mutton, is to show a want of mental composure, that few would like to have described in its proper light and called by its proper name. Recollect that servants are made of the same clay, and may possess feelings—kind, generous, and just feelings too—as well as their superiors; and is it not casting a stain upon ourselves to rail, with ignoble language, at those who are made in the same high image of which it is our best boast on earth to bear the faintest impress? Let us hear no more of scolding servants, therefore: if you will scold, my dear lady fair, scold your husband; and if he is a sensible man, he will pat your cheek, give you a kiss, and laugh at you for your pains."

DECISION OF CHARACTER.

There is a certain constitution of mind, which, of all others, is the most likely to make our fortunes if combined with talent, or to mar them without it; for the errors of such minds are few but fatal. I allude to those characters who have a kind of mathematical decision about them, which dictates that a straight line is the shortest distance between any two points, and that small bodies *with* velocity have a greater momentum than large masses *without* it. Thus, they would rather use a *cannon ball* than a *battering ram*. With such minds, to resolve and to act is instantaneous; they seem to precede the march of time—to foresee events in the chrysalis of their causes—and to seize that moment for execution which others waste in deliberation.—*Lacon.*

THE INSOLVENT NEGRO.

A negro of one of the kingdoms on the African coast, who had become insolvent, surrendered himself to his creditor; who, according to the established custom of the country, sold him to the Danes. This affected his son so much, that he came and reproached his father for not rather selling his children to pay his debts; and after much intreaty, he prevailed on the captain to accept him, and liberate his father. The son was put in chains, and on the point of sailing to the West Indies; when the circumstance coming to the knowledge of the governor, through the means of Mr Isert, he sent for the owner of the slaves, paid the money that he had given for the old man, and restored the son to his father.—*Percy Anecdotes.*

WOMEN OF FORTY AND FIFTY.

The man who is ashamed of his poverty would be proud of his riches; but though many a hobble-de-hoy blushes at looking so young, he makes no boast of his years when he comes to be a grey-beard. To women, whose youth and beauty sometimes form their only distinction, it is doubly difficult to grow old with a good grace, especially as they approach that semi-centenarian bourne, beyond which, unless they possess the Medean secret of Ninon de l'Enclos, they cannot hope to extend the preservation of their good looks. None of them can expect to rival a living, I might say an undying, contemporary, who will be known as middle-age Hallam, even when he shall have accomplished his three-score years and ten. Women aspire not to any such mediœval celebrity, for to them the middle ages are the dark ages. It was said of a lady, who had just completed her fourth decade, and who played very loudly on the piano, while she never alluded to her age except in a whisper, that she was *forte* upon her piano, but *piano* upon her forty. But the trial of trials comes ten years later. To that female, therefore, be awarded the palm of *fortitudinis fortitudo fortissima*, who has shown that she knows how to bear her fifty-tude with fortitude.—*New Monthly Magazine.*

GOSSIP ABOUT GOLF.

It is curious to observe how even such a matter as sport is determined by local circumstances. *Cricket* may be said to be a natural result of the existence of the village greens of England. In like manner, *Golf* exists in Scotland by virtue of the previous existence of a certain peculiar kind of waste ground called *links*. Links are chiefly found along the shores of the Firth of Forth and the neighbouring coasts, being low undulating tracts composed of sand which has been blown up from the sea, and covered with a slight herbage, varied here and there by patches of broom and furze. They are generally common to the inhabitants of the nearest town, by whom they are devoted statedly to the feeding of a few sheep or geese, and occasionally to purposes of recreation and amusement. Thus there are links at Leith, Musselburgh, and Gullane, on the south side of the Firth, and at Kirkaldy, Dunbarnie, Crail, and St Andrews, on the north side—all of them, but especially the last, being fine open cheerful expanses of ground, albeit of little more than nominal value in the eye of the rural economist. On these prairies of the north, the game of golf, which is said to be of Dutch extraction, has been naturalised for hundreds of years, without spreading to other places, and this simply because in no other places is there ground adapted for the sport. A links (there is no distinct singular for the word) and golf go, it may be said, hand in hand together. Where there is no links there can properly be no golf; and where there is a links, there golf is as sure to be as a public-house by the side of a stable-lane, or the dandelion and groundsil where there is nothing else.

But what sort of game is this said golf? Why, to speak of it with a regard merely to its materialities, it is a game played with clubs of a peculiar form, and balls. Holes of a size fit to admit an ordinary-sized tumbler are made in the ground in a series, at the distance of from three to four hundred yards from each other. The player is furnished with a ball of about an inch and a half in diameter, formed of leather stuffed as hard as possible with feathers; and this he plays from hole to hole with his club, he and his opponent contending which shall get it *holed* by the smallest number of strokes. This is all that a man of no soul and *not a golfer* would see in the game, and all that he would say in description of it; but it would not be a more correct definition than that celebrated one of the sport of angling, "a stick and a string," &c. To appreciate golf fully, it must be studied in some such school as that of St Andrews, where its whole character is fully developed, in consequence at once of the admirably adapted ground, and the enthusiasm of the votaries.

This quiet venerable university town, where literary and philosophical society is agreeably mixed with miscellaneous persons in independent circumstances, happens to be skirted by a links of more than two miles in extent, a fine rolling field, as the Americans would describe it, bearing herbage and furze, and, as usual, open for the recreation of the inhabitants. St Andrews is confessedly the Melton of golf, for no other place presents ground nearly so well adapted for the amusement, or which is the haunt of so many players. The links is entirely composed of sand blown up from the sea, upon a spot where the waves must have once held sway, for the ancient sea-cliff is still distinctly traceable along the inland verge, although now softened down by time, and reduced to tillage, pasture, and pleasure-ground. With this fine slope on one side, and the German Ocean on the other, the striking outline of pinnacled St Andrews behind, and in front the distant hills of Perth and Forfar shires, extending from the central Grampians down to the Red Head near Arbroath, the whole scene is something more than beautiful; the very spaciousness of a view commanding objects much more than a hundred miles distant from each other, affects the beholder in an uncommon manner. At one end is what may be called the Golf Settlement, comprehending the Club-house with its flag-staff, houses for the makers of clubs and balls, and lodgings occupied by the more unfailing of the members. At that spot begins the series of holes, which extends curvingly outwards to the amount of nine from the starting one, along a tract which may be easily distinguished from the rest of the ground by its being comparatively feet-worn. Day after day, from a time beyond record, between the hours of eleven and five, have groups of golfers been seen pacing that course, in pursuit of their half-meditative game, equally regardless of summer's heat and winter's cold, of the scorching sunshine and the rain, if, indeed, it be not a fact which is usually spoken as a jest at St Andrews, "that it never rains on the links." Certainly, if it does ever rain there, the wet instantly disappears through the sandy ground, leaving the sward as firm and dry as before. I may here as well mention that the present Club—called Royal in consequence of the patronage of the late king, William IV., who bestowed a gold medal upon it—dates from 1754, and has at all times included the names of the most considerable men of the district, as also those of many of the best players of other places. Four times a-year, the members meet to contend for the various medals connected with the institution; after which there is always a festive meeting. The Club-house is used as a receptacle for the implements and dresses of the members, and connected with it there is a reading-room for such of these gentlemen as choose to subscribe to it.

It is about two o'clock of a fine August day, when, after a forenoon of useful avocations, I pop into the club-house to glance at the papers, and be in the way of any agreeable temptation that may arise. All is emptiness and silence within and without, for there are no visiting members, and many of even the resident ones are gone, some to grouse-shooting, some to watering-places, some here and some there. Most of the *cadies*, as the servants who carry clubs are called, have gone to work at the harvest, in pure despair of so much as one job per day, leaving only one or two to attend to the business of the green—who are to be seen leaning listlessly against the corners of distant houses, as if they thought employment a thing more to be wished for than expected. John Ness, porter to the club-house, and who is also a cady, seated on the low wall near the door, is heard through the open window remarking to a passing acquaintance, that things are most uncommon dull just now. An old gentleman is poring over the Standard; but he has for some years retired from sport, so that nothing is to be looked for from him. However, Colonel Elder has been practising for an hour or two on the green near the house, playing his balls to short distances, unable to get a partner, and, seeing me approach, he sends in to ask if I will come and play with him. This makes two, but a *foursome* is considered the preferable game, and we wait a few minutes longer in the hope of two more gentlemen appearing. As our good stars will have it, Captain Strong and another gentleman heave in sight, and the match is then made up. There are two skilful and experienced players, and two tyros, I being of the latter description. Each good player takes one of the other kind as his partner; and as one of the expert gentlemen is a little more expert than the other, a small odds is allowed to make up the inequality. The first thing to be done is to put on the light scarlet coat of the Club, a cap, and a pair of strongly nailed shoes, the last being necessary to give a firm footing on the green while playing the long strokes. Each man has his cady behind him carrying his clubs and balls. We take our station at the starting hole, and the first thing to be done is to *tee* the balls, of which each party or *side* has one. The cady of the gentleman who is to play the first stroke, takes the ball and puts it upon the top of a small lump of sand, merely to give it that prominence above the ground which will make it a fair object for the stroke. This is *teeing*. He then gives his master the play-club, which is the implement to be used when the ball lies unusually fair for a stroke. The club-part of this instrument is a piece of wood about four inches long, lined with horn below, and loaded with lead behind, having a straight face slightly sloping backwards. Its handle is a slender shaft of hard elastic wood (generally hiccory), thickening upwards to the part where it is grasped by the hands of the player, and where it is lined with strips of thin leather. The handle is of such a length, and it is attached to the club part at such an angle, that the player, having the ball about two feet in front of him, can easily strike it off, having first made the club swing back to his left side, so as to gain a purchase. The first stroke is generally one which tells well in respect of distance, as the ball lies unusually fair, and the club used is that which strikes most powerfully. Some are so great in driving, or *swiping*, as this feat is variously called, as to make the ball go to a distance not easily credited. I have heard that, on one occasion, in frosty weather, a good player made his ball go two hundred and eighty yards. One of my own acquaintance assures me that he has played one to two hundred and sixty yards. Much of this effect is of course due to the nature of the ball, which, felt in the hand, seems as hard as a stone, but rebounds tremendously under a powerful appulsion.

Our game is for a trifle, as is the general practice at St Andrews. For reasons good, the two inexperienced players, who may be called Messrs Rawson and Greene, are appointed to strike off. Mr Greene makes a happy-looking stroke, and thinks he has been doing worthy service to his side; but lo! his ball lights upon a cart-track some hundred yards onwards, where a second stroke will probably be found no easy matter. This, you must understand, good reader, is one of the hazards of the game. A very expert player would fall short or go beyond; but Mr Greene is upon the road—"to ruin," as the St Andrews joke goeth. Well, but what is Mr Rawson about? Mr Rawson is a gentleman excessively anxious to do great things. He plays as an insane steam-engine would do. See how he musters strength, how he straddles for a posture, with what frenzied anxiety he eyes his ball! Gemini! what a *swipe* he takes—there he is down upon it—and, behold .... the ball runs some ten yards, and stops! The undisguisable fact is, that Mr Rawson has *topped* his ball; that is, he has hit it on the crown of its head, and his force has been mostly squandered in vain. Captain Strong, his partner, is too much a gentleman to make a single remark. He asks for his *long spoon*, which the cady hands to him. This is a club in all respects resembling the driver, excepting in its face being slightly curved, and more angular, so as to catch up a ball lying in grass. The captain is unerring and powerful, and his stroke almost repairs the disaster of his partner. He is said to have played *the odds*; that

is, one stroke more than the stroke on the other side. The ball of this side being propelled farther than the point where the other is lying, it is now Colonel Elder's turn to play: he is said to play *the like;* that is, the stroke which makes the one side equal with the other. The ball being found deep in the loose earth of the cart-track, he calls for the *iron;* that is, a club with a comparatively short handle and a heavy spoon-like termination of iron, designed for exercising great force upon a ball lying in a difficult situation. The colonel uses the tool so dexterously, that the ball is sent a good way onward, and laid in a good place for Mr Greene's next effort. But ah! see a little in front, good reader, a treacherous trench zig-zagging across the green, the channel, to wit, of the Swilkin burn, or rivulet, which has chosen to make its exit into the sea in this most improper situation. The law of the links is, that when a ball is sent into the channel of this burn, it must be lifted out and laid on the rear bank, with the loss of a stroke in the reckoning. Mr Greene is most anxious to carry his ball over this difficulty, and for that purpose uses the long spoon, which is calculated to raise it well off the ground. It goes over . . . he breathes again . . . but who can calculate at golf? See! as it rolls onward along the grass, it meets a back-sweeping angle of the deceitful Swilkin, into which it disappears. Mr Greene is in despair, and the colonel looks grave. But there is no avoiding accidents, and one beautiful moral feature of golf is, that you never come by any misfortune without having tolerable hopes that an equally great one will befall your neighbour next minute. Mr Rawson, however, has been more fortunate this time, for he gets over the burn splendidly, and has laid his ball near the hole. When balls have advanced to this situation, a new kind of play, called *putting* (*u* being sounded as in *lull*), comes into requisition. It is performed with a short light club, with a straight and vertical face, and consists in slight careful strokes, designed to bring the ball close to the hole, or into it. Some men are good putters without being good drivers, while others are good drivers, but fail in putting, having perhaps more strength than nicety. It is a feat requiring great calculation of forces, and of the amount of friction which the nature of the ground to be passed over will occasion; and no man without good mechanical faculties can possibly excel in it. It is often amusing to see how a good player is disconcerted by a false step in putting, and how eager he is to find palliations for his failure. "That blade of grass turned me aside!" "I was disturbed by your moving." "Your shadow on the green put me out." Such are the excuses daily heard wrung from men who putt amiss. In fact, the exigency of the moment is, like oppression, sufficient to make a wise man mad. Well, the colonel and Mr Greene have as yet rather the worst of the hole. But the colonel is a capital putter, and a surprising hand at a *steal;* that is, a holing of the ball from a considerable distance. By one of these feats he makes up for the misadventure of the burn, and leaves the hole even with the antagonist party.

We tee again, and the colonel and captain play off for the next hole. There are no more cart-tracks, no more burns, but no want of difficulties for all that. All along the golfing course there is every here and there to be seen a yawning sand-pit, called in the technology of the links a *bunker*, which a stranger would suppose it a piece of gross negligence in the club to leave un-filled-up for a single day, but which is in reality valued as amongst the most important features of the ground, bunkers being hazards from which only skilful players may have any hope of escaping. Right in front of the teeing-place in this case, there is one gaping in the hither side of a knoll, which is sure to catch a ball not well raised, at once stopping short its career, and placing it in a situation from which it is difficult to strike it out. Our two players are over this; but Messrs Rawson and Greene, who have to play the next strokes, see others at convenient distances before them along the course. The bunkers are in fact a sad annoyance to the novice. The holes in some cases are planted in the midst of a set of them, calling for very peculiar skill in bringing up the balls. But to a true player they are the principal charm of the game. As a proof of this, it was lately mentioned in the Fife newspapers that a set of natives of the district, resident at Bombay, had begun to golf on the government esplanade, and enjoyed their sport greatly, although, it must be confessed, they found the ground very deficient in the proper irregularities—meaning, chiefly, *bunkers*. I may here mention that the Royal Golf Club has a lithographed plan of the course, in which all the bunkers, as well as other features of the ground, are laid down by name with all the care exercised in indicating sand-banks and sunk rocks in a mariner's chart. Here, too, of course, the holes are all duly noted, each having its appropriate name, as the Bridge Hole, the Heathery Hole, the Hole o' Cross, and the Hole o' Shell, while one, where an old woman sometimes waits to sell refreshments for bethirsted players, is called the Ginger Beer Hole. An exact knowledge of the topography of the links may well be supposed to be of the greatest consequence, where the ground is so various and in general so difficult.

Mr Rawson now plays, and makes so good a stroke, that the colonel remarks, in his dry way, that he promises ere long to be quite an artist. Mr Greene strikes next, and, eager to avoid a bunker right in the centre, sends his ball into the long deer's grass which skirts the course. The colonel plays it out with his iron at the odds, when, being still behind the position of the opposite party's ball, Mr Greene has to play it again, thus counting *two more*, or an excess of two over the strokes of the adversary. Captain Strong now, playing *one off two*, gives his ball one of those vigorous and well-managed strokes which distinguish him so much, and causes it, clear flying over all dangers, to alight about ten yards from the hole. Following up this advantage with good putting, the captain and Mr Rawson are triumphant. "Dat is one hole in my side, as the Pole said," remarks Captain Strong, referring to a foreigner who was a player at St Andrews some years ago. This is one of the established jokes of the links. On inquiry, I learned that, when his opponent jocularly asked him "which side?" the countryman of Kosciusko very smartly replied, "De right side, to be sure."

Tee again, and now it is Messrs Rawson and Greene's turn to strike off. Let them take care, for there are two small but dangerous bunkers exactly far enough off to receive a ball at the end of a moderate flight. Mr Greene escapes the peril for this time; his ball is seen lying clear on the sward at a very fair distance. Mr Rawson does his best. As there is a breeze at the time, he drives straight for the bunker, expecting that the wind will carry him the necessary distance aside. But the breeze lulls for a moment; and the ball takes a low course, where wind does not much affect it, and accordingly he proceeds in the line of danger. Some think he has gone in, some not, but we shall soon see. He *is* in—snug at the base of the little sand-cliff, where scarcely any club can reach. The cady of one of the opposite party is the first to ascertain the fact, and the gentlemen of that party give an "Ah, indeed!" with an air of concern as seeming sincere as could reasonably be expected. Strong takes his iron, and, making the best of a bad case, brings the ball spinning into the bottom of the pit, where it lies somewhat more fair. Rawson plays it out at *two more*, and at *three more* Strong gives it one of his famous strokes. The colonel now plays *one off three*, and even excels the last stroke. Things look rather bad for Strong and Rawson; but *nil desperandum*. And truly may this be said; for observe Mr Greene, in endeavouring with his short spoon to cant the ball over a bunker, so as to make it fall fair on the green beside the hole, has—oh! ye stars—gone in. Elder eyes the ball ruefully, but thinks he may repair the calamity. He takes his iron, and, striking deeply into the sand beneath, not only gets it out, but places it within a yard of the hole. That stroke was one off two. Captain Strong has now to play two more from a grassy place about ten yards off. For this he takes a short club not yet adverted to, called the *cleek*, the striking part of which consists of a thick slip of smooth iron, with its face inclined at an angle of forty-five degrees backward. It is useful for tilting a ball out of a rough place near the hole. He plays like an adept, and places his ball right between the other and the hole—in the language of the links, a *stymie*. It is now Mr Greene's duty to putt at one off two; but how to reach the hole, with a rival's ball directly in the way! The cadies stand round with suspended breath. Mr Greene scans the ground even to its slightest inclinations, and seems to mark every blade of grass. He goes behind, and, shutting one eye, carefully notes on which side of the interposed ball there is most room for a chance. With the putting club clenched spasmodically in his hands, he stands in a rigid pause of about a minute, and plays. His ball just grazes the other, and takes its place about six inches from the hole. Mr Rawson now putts at *the like*, and seems to have an easy task, as his ball is only eighteen inches from the hole. But the least over-exertion of strength baulks the simplest movements in golf; and, this being the case at present, behold his ball just wheels round the rim of the hole, and lies without. Colonel Elder is in at the odds, and so that hole is divided after all.

'Twere long to tell of every hole in the round; but yet, if this were done, there would be novel circumstances in each, for there is no space between any two holes exactly or even nearly like another, and consequently every step in the player's progress gives occasion to something peculiar in his play, and probably something new in his fortune. Sometimes he has to allow for the wind, sometimes for the dryness or wetness, as well as for the roughness or bareness, of the sward. Sometimes he must, in putting, allow for swelling or sloping ground, and approach the hole by a sort of sweep or curve, difficult to be calculated beforehand, and very difficult to be effected after it has been calculated. Sometimes, as we have seen, he tops his ball, which is not favourable to its progress; sometimes, hitting too low, he strikes what the wit of the links calls the greater ball (namely, the earth) without touching the lesser (namely, the golf-ball), or, at the best, raises the latter high in the air, without sending it on any considerable way. Then he may stand unfair, or he may *draw* his stroke, and thereby send the ball off the course, which is one of the most fatal of misfortunes. There is a space between holes containing ground of an unusually rough character, which bears a name not to be freely mentioned to ears polite. Some powerful players there are who can, in the words of a clever local poem, send a ball "smack over —— at one immortal go;" lighting upon a fine expanse beyond called the *Elysian Fields*. But the penalty of failure is so great, in consequence of the vast sand-pits lying below, that most players, even of good skill, are content to take a somewhat less rough by-course, which they generally pass over at two strokes, or three at most. There is another hole, from which the first stroke sends the ball over a hillock in front, with numerous pitfalls beyond, which are only to be escaped by mere favour of fortune. Then there are furzy places, where, when a man sends his ball, his antagonist asks if he designs to go a-hare-hunting . . . and, in fact, there is a tradition amongst the cadies, of an errant player having one day killed a hare with his ball. Too often, when a ball falls in such a place, it is never more seen. There are also rushy places most easy to be got into, but most consumedly difficult to get out of, the stalks of that herbage blunting the strokes of the heaviest clubs: here an antagonist, if too polite to fall a-laughing, is sure at least to whistle up the first bar or two of "Green grow the rashes O!" for a gentle joke is dearly loved at golf. There is one hole placed only at the distance of one full stroke from the other, but with tremendous bunkers between, into which inexperienced players can scarcely avoid falling. It is amongst the marvellous stories of the links that a deceased professor of the university once holed his ball here at one stroke, an event against which the chances must have been very great indeed; yet he, after all, lost the hole, as he could not find his ball till it was too late. A tolerably good player would be glad to do it at three, and a tyro, if unfortunate in the sand pits, would perhaps take so many as half a dozen. It may here be observed, that the whole round of the course—eighteen holes in all—is generally done by good players at from 100 to 105 strokes, though there are instances of its being done at so few as 90, and even, if cadies speak truth, at 87. I must, by the way, remark of cadies, that they are generally a faithful and zealous class of servants. They take the keenest interest in the play of their temporary master, carefully directing him if unskilful, gently counselling him if otherwise, and always feeling deeply both his successes and his failures. I have heard a cady sigh with genuine grief at a false stroke of his employer, and often observed that those against whose masters the game is going, walk along in as dispirited a condition as if the loss were their own. Some of them are extremely good players, having perhaps had the advantage of learning the game in their earliest boyhood. There is a ball-maker, Allan Robertson by name, who, besides having the highest character for his wares, is reputed to be the best player at St Andrews, and consequently in Scotland—I may as well add, in the world! This is an eminence which golfers must needs admire; and in the little world of the links, men of estate and title will be heard speaking of worthy Allan as if he were a kind of king amongst them.

I have here chanced to advert to a day when only one match is out; but often there may be seen five or six playing along after one another—occasioning such a pell-mell of balls, that quiet promenaders are fain to give the course a wide berth. Some men of leisure are out every day, and never make less than two rounds before dinner, often three, each round being a walk of four miles, to say nothing of the exercise of playing, so that it may well be supposed the golfers are a healthy people. Generally, they are quiet country gentlemen, or retired officers of the army or navy; but several of the professors also play. To judge from the perseverance of its votaries, the game is a most fascinating one:—only, perhaps, too much so, if it be true, which the non-golfing world allege, that genuine denizens of the links can converse during the evenings upon no other subject; but this I am inclined to think something of a calumny. They usually continue to enjoy it to an advanced age, the healthiness of the exercise being itself favourable to longevity; and there is at least one authentic instance of a gentleman playing till considerably past eighty. When unable any longer to play in the usual manner, they resort to what are called the *short holes*—a series placed in a small circle near the golf-house, where, of course, the play consists of *putting* alone. This breaks the fall from the high estate of the long-hole play; and one regards a couple of seniors at the short holes with something like the same mixture of melancholy and satisfaction with which he sees a set of good old hunters turned out into a comfortable park. They can also pop along the green for a hole or two after their juniors, and make remarks on the play of modern times in comparison with that of the great hands

of a former day. Thus, with whist in the evenings, pass the latter days of a golfer, until his old friends have to break short their rounds some pleasant forenoon to attend him to some shady nook beneath the crumbling walls of the old cathedral, whence they retire, remarking, perhaps, that, though never very much of a *swiper*, there was not once a better *putter* on the green.

"NEWFOUNDLAND IN 1842." *

The observant and industrious officer of the British army, who lately published the fruits of his inquiries into the state of the Canadas during a residence there of some years, has just produced a sequel to that work, under the title of "Newfoundland in 1842." His two volumes on Newfoundland contain a careful and well-written statement of facts respecting the island and its inhabitants.

Newfoundland is the largest of the islands lying in the mouth of the St Lawrence. It seems to have been formed, not as great rivers usually form deltoid tracts of land at their outlets, but simply and directly by the bursting of the St Lawrence stream from some pre-existing inland lake, thus isolating the present isle for ever from the continent. The island is situated in latitude 50 degrees north, and between 50 and 60 degrees of west longitude. It is of a triangular shape, measures about 1000 miles in circumference, and is nearly 300 miles broad at some points. The coasts, and many parts of the interior, are elevated and rugged, and deep bays and creeks indent the shores. The present population is estimated by Sir R. H. Bonnycastle to amount to 100,000 persons, of whom between 80,000 and 90,000 are of British descent, the remainder being composed of French residents, and a hundred or two individuals of Indian blood. The capital of Newfoundland is St John's, a city placed on the east of the island, and surrounded by a district containing in all 18,000 inhabitants, the civic population included. There are several other towns of rising consequence on the island.

Newfoundland is chiefly famous for the rich cod-fisheries on its coasts, and for its dogs. Regarding the latter, Sir Richard Bonnycastle tells us enough to show that the practice of sending for Newfoundland pups to the native land of the race is now a very vain proceeding. In the time of the Indians and early settlers, the island-dogs were noble and valued animals, being the only beasts of burden in the region. The breed, however, has now degenerated; and it is "well for the poor spurious descendant of the famed Newfoundland dog," says Sir Richard, "that he is so rapidly yielding in utility; for of all the ill-used animals in creation, none are worse treated by capricious man than these patient and forbearing creatures, which, in winter, may be seen toiling harnessed in pairs, or with two and a leader, to low sledges called catamarans, from before daybreak until the evening sets in, hauling firewood and fence pickets, at the mercy of boys, and the very lowest class of the population; beaten, jaded, ill-fed, and occasionally wounded and killed when their over-exerted strength forbids their further progress. In summer, they swarm at every poor man's door, lying idle, listless, and basking in the sun, feeding on the offal of the fishery, hunting manure heaps for the garbage of the seal, and becoming perfect adepts in the art of breaking fences to get access at night to the yards of houses, in order to carry off bones.

These dogs have also another propensity common to the whole race of Newfoundland dogs—that of worrying cattle and sheep; and have been known to make an entrance under an outhouse where sheep have been stalled, and to commit serious devastation. In short, half the mischief said to be performed by wolves, which are very rare near St John's, is done by their starved congeners." The Labrador dogs are still fine animals, however; and even of good Newfoundland dogs, compared with these, our author says, "I think, from having kept both kinds, and also the spotted, mahogany-coloured, and short-haired Labrador dog, that the short-haired kind are the most faithful friends of man, and the best guardians of a house; and that the other variety, with his bushy and curling tail, is the best water-dog, although both are able to endure the most severe cold in that element, and would, if left alone, sleep in the snow in preference to having a more sheltered bed.

I have known the mahogany-coloured Labrador dog, an animal of immense size and power, to follow my sleigh during a long journey upon the crust of the snow, until his feet became so chafed and sore that he was unable to proceed. His affection was unbounded, and the whole race appear to be particularly fond of children; but perhaps, from their originals having been of the wolfish nature, which manifests itself in those of the colder regions of Labrador and the Esquimaux country, they are all sheep-biters, and, if not very well-fed, most dexterous thieves."

The account given by Sir Richard of the fisheries and oil-trade is at once interesting and instructive. The extent of these branches of commerce is very great. In 1841, upwards of 1000 sail of good-sized vessels entered, and more than 950 left the ports of the island, leaving out of the reckoning the numerous schooners and small craft engaged in the actual fisheries, which amount, during each season, to somewhere about 4500. In the British fishery, each year, are engaged never less than 30,000 sailors, with 10,000 boatmen and curers; and 140,000 tons of produce are annually exported, Britain and her colonies receiving the largest share, while continental Europe and the United States also take great quantities. Cod, mackerel, herrings, capelin, cods'-tongues and sounds, salmon, train-oil, seal-oil, seal-skins, some little peltry, with staves, constitute the chief items of export. Much of the whole produce is found near the island, or on its immediate coasts.

The traders in this branch of commerce are arranged as follows:—"First, the British merchant, or owner, residing most commonly in Britain, but in some cases remaining in the country till he has amassed a fortune, and more rarely remaining altogether there. Next, the middle-man or planter, as he is most absurdly called, probably from all the original English settlements in America having received the official designation of plantations; but the Newfoundland planter has had, in reality, as little to do with cultivating the soil as an Esquimaux. Thirdly, the working-bee, or fisherman. The merchant finds the ship or vessel, the nets, and the provisions—in fact, the means of carrying on the fishery—which he supplies to the planter. In some few cases the planter owns the vessel. The planter agrees with his crews, and superintends the toil of catching and curing."

The actual catching of cod is thus described: "The fishery commences usually about the second week in June, and is carried on in boats manned with two, four, or more hands, according to size and the distance required to go from shore; most of these are mere open boats, and many have no sail, and are worked by girls or boys. Most of them have, however, four men, who have each two lines placed over each gunwale of the boat, and armed with double hooks. The bait, according to the season, being capelin, entrails of fish, herring, mackerel, lance, and cuttle-fish, or squids.

When once favourable ground is reached, which is very often near the mouth, or even in the mouths of the bays, harbours, and coves, the boat is anchored, and the lines thrown over so as to reach the bottom. Then begins a most laborious operation if the fish are plentiful; for as fast as the man hauls up one line, he disengages the fish, or gaffs him if heavy and not well hooked, throws him into the boat, and then hauls upon the other, having first rebaited his hook, if necessary, and let the first line down again, and so on for hours together. When the boat is full, or there is no prospect of more fish, she proceeds to her stage, or curing-station; and this admits of little delay, as in summer the fish soon require salt to make them fit to pack.

A chapter might be written upon the construction of stages, which I have already concisely mentioned—the modes of splitting, salting, and packing; but it would not prove very interesting, and the process has been often described.

The most serious drawback to the successful accomplishment of this tedious and laborious process, during which the fish must be often separately turned and shifted by hand, arises from the fickleness of the weather in the autumnal months, heavy fog and rain being very prejudicial, until the fish is finished and placed in heaps, which resemble in shape the two-penny sponge-cakes of the confectioners. These heaps are formed by placing a row of dried fish, with the tails outwards, circularly, and so continuing to pile, until a circular mound is raised, whose upper circumference, from the varying sizes of the fish, is larger than the lower; after which a semi-conical top is raised, and the whole covered with bark, fastened down, if intended to remain long, by stones or withes.

The fish is split, and the liver, tongue, and sounds collected into separate receptacles, and the entrails and heads pitched through a hole on the stage, when they fall on the beach, or into another stage placed to receive them, as this offal is now universally sold or used for manure. Thus constant and heavy labour is required; and what with the seal-fishing, the collection of bait, and the catching and curing the cod, perhaps in no country are the labouring population more incessantly and toilfully employed than in Newfoundland; whilst the migrations of the fish themselves in pursuit of food will sometimes render one station productive, and again in another season poor."

The seal-fishing, which begins about the 1st of March, is a much more dangerous occupation, being followed on the ice. At the season mentioned, "the sealers are seen coming in from all parts of the country to St John's, with their bundle of spare clothing over their shoulders, supported by a stick six or eight feet long, which is to serve as a bat or club to strike the seal on the nose, where he is very vulnerable; and also to answer as an ice-pole and gaff, or ice-hook, with which landing is effected, as well as for drawing the spoil over the floes and fields. He has likewise his long sealing-gun, if he is intended as a bow or after gunner, or, in other words, as an expert marksman, to shoot the animals where they cannot be otherwise readily destroyed. These gunners rank before the mere batmen, and have some trifling remuneration in the way of a remission of the charge of berth money, which the sealers pay to the merchant who supplies the vessel and stores, for permission to go the voyage, the outfitting being defrayed by the receipt of one-half of the cargo of seals, the other half going to the adventurers, with these and other deductions for extra supplies.

Nothing can exceed the danger and hardships of such a life, yet nothing in the commercial marine pays so well as the sealer when successful. It would be needless to expatiate upon the horrors and constant danger of running to the northward in small brigs and schooners, of from 50 to 150 tons, and in large decked boats of half that size, in the month of March, in such seas and on such coasts as those of Newfoundland and Labrador, with a constant set of ice from the frozen ocean, driven southward by a powerful current, and in a most variable temperature, with the total uncertainty as to where to find the seals.

The seal casts its young, or whelp, as it is called, about the middle of February; and as the young animal grows very rapidly, and contains a purer oil than the old ones, it is chiefly sought after. These whelps remain about the ice near which they were born for a considerable time, and about three weeks after their birth are very fat and in perfect condition.

In a favourable field, hundreds of them are soon deprived of life by the batmen, who merely strike them on the nose. Five or six kinds frequent the shores of Labrador, and are found on the ice; of which the hooded seal, the great seal, the harp, and the rough seal, with the common kind so like a water-dog when swimming, are the best known.

The principal object is to secure the animal's skin with as little damage as possible, and therefore firing at them is not resorted to, except in case of its being otherwise impracticable to kill them, the large seals often being so pugnacious as to require the gun, and the hooded seal having, moreover, a membrane like a hood, which he can draw over his nose, and inflate so as not to be destroyed like the others with a mere blow, unless he is fast asleep. This seal is very fierce. The reason why it is requisite to skin them soon after death is obvious, as they soon freeze; and because the pelt, with the fat adhering, occupies very little room in comparison to the whole body. Some of the flesh of the cub seal—the heart and liver—is also eaten by the men." The blubber is cut from the skin, and melted for its valuable oil. Upwards of half a million of seals are said to fall victims annually in this adventurous trade.

The fishermen of Newfoundland form a large part of the lower or third order of the population, a first class being composed of the judges, clergy, and other officials, while the resident merchants and small proprietors constitute the second class. "The fishermen, formerly, during seven months of winter weather, had no resources but idleness or drink. But a change is coming over the nature of society here. Temperance has made great progress where it is most requisite, and that is among the industrious poor. Agriculture is patronised by the government, and no man presumes any longer to assert that the necessaries for a poor man's existence—potatoes, hay, and oats—cannot be successfully raised, whilst, with common attention, every 'tilt,' as the wretched dwelling of the extremely poor is here called, might be supplied from a small garden with cabbage and all other common vegetables and herbs." Though a portion still remain in a miserable condition, the majority now reside in substantial dwellings of native wood, and enjoy comparative comfort. Their disposition is hospitable. After mentioning that, in place of hams and bacon, the ceiling joists of the Newfoundland peasant's house sustain sealing-guns, fishing-apparatus, and some kind of fish, Sir R. H. Bonnycastle continues—"But the good things of this world are not wanting. I never walked into one of these kind-hearted people's dwellings (and I very often did so during my rambles last summer) without immediate and silent preparations for the stranger; for they do the same to all respectable persons; and in my instance, very frequently at first they did not know me. The good wife puts some tea in the pot, spreads a clean cloth, if she has one at hand or time admits, boils some eggs, produces a pat of fresh butter, and a large jug of milk, with a loaf of home-made bread, or, if that is wanting, white biscuit, and without saying a word during the preparation, expects her visiter, whether he is hungry or not, to fall to, being perfectly satisfied if you drink three or four cups of tea (luckily the cups are usually small), and eat a good deal of bread and butter, and two or three eggs, which she always takes good care shall not hurt your digestion by their hardness. They never offer fish, of which I daresay, from experience, they think you have daily enough; and of course fresh meat is seldom seen, but on rare festive occasions, when the fatted calf or the household lamb graces the board. They have usually, however, a store of flour, and of salt beef or pork, which, with their poultry, would afford at all times a good table, were it not that the latter are too profitably employed in producing eggs for the market, and the former too dear to eat much of."

Sir Richard, it may be observed in conclusion, is of opinion that Newfoundland, being the key of the St Lawrence, and possessing many natural and other advantages, must attain, ere long, to great importance. "It is," he says, "to British America what England is to Europe and to Asia, the sea-girt

* "Newfoundland in 1842," being a sequel to "The Canadas In 1841. By Sir Richard Henry Bonnycastle, K.N.T. Henry Colburn, London. 1842.

fortress in which the destinies of those immense and wonderful regions must hereafter be regulated and controlled." We give our hearty thanks to Sir Richard for this work, and can safely commend it to the public.

A PARISIAN INCIDENT.

In the year 1822, the Marquis de Marigni, an Italian nobleman, inhabited one of the most splendid hotels in the Champs Elysées. The marquis had in early life been sent to Paris in order to complete his studies; and while there, had imbibed the principles of the revolutionary party, which at that period was silently but surely at work to undermine the monarchical government, whose power was then vested in the person of the unfortunate Louis XVI.

The education of the young marquis being completed, he returned to his own country, where his republican spirit was not allowed to remain long inactive; the French army entered Italy, and its numbers were soon augmented by the followers of the Marigni family, headed by the youthful marquis, who soon attained great distinction in his military capacity, and, in the subsequent campaigns of Napoleon, became one of the most successful of his officers.

When the discord which had spread throughout the whole of civilised Europe subsided, and when the excitement of war was over, the marquis found himself again in Paris, an exile from his country, proscribed, banished from kindred and friends, shattered in body, and wearied and exhausted in mind. Nevertheless, he had, by dexterous management, contrived to save some portion of his wealth, which, although trifling in comparison with his original fortune, was yet sufficient to enable him to keep a good establishment in Paris, where, in 1822, our story introduces him to the reader.

At this period the marquis enjoyed the acquaintanceship of two young Parisians, named Hurcan, who, although brothers, were as distinctly different in character as if they each had belonged to a different race. Jules, the eldest, was exceedingly frank and amiable in disposition, possessing all the gaiety of heart and liveliness of manner peculiar to his countrymen. He was also accomplished and well-informed, and had both intelligence and observation, which elevated him above those fortunes enabled them to aim at gaining a more distinguished place in society. The younger brother, Philip, was, on the contrary, gloomy and distrustful, and the dark shades of his character served only to bring out the bright joyousness of Jules's nature, whose only source of unhappiness seemed to be in his brother. Philip, morose and jealous, looked with feelings of envy and dissatisfaction on the ripening friendship of the marquis for Jules.

One evening the Marquis de Marigni communicated to his friend Jules Hurcan, that he was obliged, on account of some matters connected with his family, to leave Paris for a time, during which his house would be shut up, but that, on his return, he hoped to be able to resume his friendly intercourse with him. M. Hurcan, in return, confided to the marquis the change which he expected would soon take place in his condition, and he expressed a wish that his absence would not be prolonged beyond a certain time, as he was desirous that he should be present at his marriage, which was shortly to take place; but this the marquis could not promise to do, as he did not then know where his wandering fancies might lead him in the interval. The last evening on which the friends were together was spent by them in the most agreeable manner, and it was late before M. Hurcan rose to take leave of his host, who begged permission to accompany him on his way home. They sauntered out together; and after an hour's absence, the marquis returned home, apparently very much depressed. The necessary orders having been given to his servants, he retired to rest, and at an early hour next morning he quitted Paris.

Twelve months elapsed before the return of the Marquis de Marigni, for, having no home ties, he had extended his travels much beyond his original intention; and no sooner did he arrive than he made his way to the lodging formerly occupied by M. Hurcan, in hopes of there obtaining some clue by which to find out the new residence of his accomplished friend. The first answer made to his inquiries was an exclamation of surprise that he should not have heard that M. Hurcan was dead; then followed the dreadful intelligence, that he had been assassinated twelve months before; that part of his body had been found concealed in the garden behind the hotel of the Marquis de Marigni in the Champs Elysées; and that the marquis was supposed to have been the murderer, as he had quitted Paris on the very day on which M. Hurcan was missing. Fortunately, the person of the supposed murderer was unknown to his informant, so that the agitation he manifested was attributed to horror at the recital to which he had just listened; and having questioned and cross-questioned the loquacious keeper of the Conciergerie, he, in a state of the utmost perplexity, prepared to retrace his way to his lodging.

He had not proceeded far on his return, when he was arrested by two of the emissaries of Vidocq, whose vigilance it would have required superhuman efforts to have eluded, and who, without farther ceremony, conveyed him before the prefect of police. The unfortunate Marquis de Marigni was here informed that he stood charged with the murder of M. Jules Hurcan, who had never been seen alive since the night on which he left the hotel of the marquis, who was known to have accompanied him on his way home; that subsequent discoveries had led to a still clearer degree of proof against him, as part of the body had been accidentally found in the garden attached to his house; and that these suspicions had been confirmed by his sudden departure from Paris on the morning of the day on which his unfortunate friend was missing.

The marquis confessed that appearances were very much against him, but at the same time brought forward, in exculpation, the absence of all motive to the committal of so heinous a crime; the unfortunate gentleman was his most intimate friend; he had informed *him* of his intention to leave Paris for a time, and on his return it was his first object to find him out. But these palliations had little weight with the stern functionaries before whom he was now arraigned; he was ordered to produce some stronger evidence of his innocence, and in the meantime he must submit to be sent to the prison of La Force, there to await a farther investigation of the affair.

Here, then, in a gloomy chamber of La Force (whose name carried along with it terror and dismay to the hearts of thousands of poor wretches, who, if once lodged within its walls, had little hope of escape), sat, in no very enviable mood of mind, the Marquis de Marigni. He was so deeply engrossed by his own thoughts, that it was some time before he discovered that he was not alone; and on glancing at his companions, he was not long in coming to the conviction that they were *spies*, who were placed beside him in the hope of finding out, either by accident or stratagem, whether or not he were really guilty. This was a common practice in France; but we will not stop to inquire how far it was in accordance with the principles of *honour*, as in this instance it will be found to have defeated the object it had in view.

The marquis had been too long accustomed to danger to dread its approach in the present instance; his grief arose, not from personal alarm, but from the loss of his friend; and as he sat absorbed by his own bitter reflections, it was in vain his fellow-prisoners endeavoured to draw him into conversation. In the apparent consciousness that in a prison vice or misfortune levels all distinction both in classes and feelings, they from time to time presumed to address him, sometimes expressing sympathy with his misfortunes, and at other times giving way to invectives against the authorities by whose orders they were confined; but their unfortunate companion was proof against their arts, and he maintained, evidently to their chagrin, a most imperturbable silence. At length the night closed in, and the voluntary captives in the dungeon dropt, one after the other, asleep; but the excitement in the mind of the principal inmate was such as prevented him from enjoying repose, however much he stood in need of it, after a day of unmitigated distress.

In the middle of the night, the stillness of the gloomy dungeon was interrupted in an unexpected manner by the murmurs of one of the supposed spies. His words were at first unintelligible; but the marquis, whose curiosity was excited by hearing something, as he imagined, relative to his unfortunate friend M. Hurcan, listened attentively for some further elucidation of the mysterious hints involuntarily offered by his sleeping companion, and was thus in his turn forced to become the spy. The name of Jules Hurcan was distinctly mentioned in a tone of regret, accompanied by a half-suppressed groan and a convulsive movement of the body. A few moments' quiet slumber followed, and then the soliloquy was resumed. "Ah!" he ejaculated, "'tis lucky that the prefect does not know that I had any concern in this affair; the Italian may take his chance; Philip knows better than to say anything of it; so I am pretty safe. The head! ah! it will not be covered enough under the wall! The eyes! how they stare! Ah! Monsieur Philip, *he was your brother!*" Here the sleeper made a sudden pause, and he moaned, as if in agony of spirit; but notwithstanding the vigilance of the person most interested in this confession, nothing further was heard.

The broken sentences, however, which had escaped, were sufficient to rouse the dormant energies of the Marquis de Marigni, and he felt as if inspired with new life. Here, in a most singular manner, he had been put in possession of facts which, if true, were conclusive as to the assassin of Jules Hurcan; and he had little doubt that the deed had been sanctioned, if not participated in, by Philip, who had always appeared as the evil genius of his light-hearted brother. The only difficulty now lay in bringing his evidence forward so as to be credited; and turning his gaze, which, even in darkness, he felt to be riveted upon the place where the dreamer lay, he directed his thoughts to the use he might be able to make of his acquired information, so that it might be the means of accomplishing his own liberation.

As soon as it was day, he, by bribing his jailor, got him to send a note which he prepared to his friend M. de P——, one of the most celebrated advocates in Paris, stating the circumstances which had come to his knowledge, and begging him to hasten to him, in order that they might consult upon the adoption of measures for bringing the guilty parties to punishment. The advocate soon obeyed the summons; and in whispers it was arranged between them, that, at the second examination which was to take place that day, a charge was to be preferred against Philip Hurcan and his wicked accomplice; but, then, some further proof was necessary than the mere assertion of the marquis, founded, as his testimony was, upon the vague murmurs of a dreaming man.

When the examination commenced, the marquis told the events of the preceding night, which excited no small astonishment; and it was resolved to bring in the man and confront him with his accuser. Utterly unconscious of the dangerous position in which his troubled dream had placed him, he entered the bureau of the prefect in high spirits, no doubt thinking that everything was in proper train for the condemnation of the marquis; but who shall attempt to pourtray his horror and dismay when accused of being himself the murderer! The effect was so startling that he lost all presence of mind, and, in an agony of passionate apprehension, threw himself upon his knees, crying for mercy, offering to confess all if he were only insured pardon. Of course no promise of this kind could be made; but on being told that it would be better for him to state at once all he knew of the murder, he confessed that he had been hired by Philip Hurcan to assassinate his brother; that the act had been perpetrated while the unfortunate youth was returning to his lodgings, immediately after he had parted from the Marquis de Marigni. The murder was committed in a retired part of the Champs Elysées; and Philip assisted in concealing the body until the following night, when, having gained an entrance over a low part of the wall adjoining the Hotel de Marigni, they severed the head and arms from the body, and concealed them in the interior of the court-yard of the marquis's hotel, by which they hoped that, in case of any discovery taking place, the owner of the mansion would at once be suspected, having been last seen alive in his company The rest of the body was buried in the garden, to which they had ready access, the hotel having been shut up on the day following the murder. Philip he supposed to have been actuated by jealousy of his brother, who was about to be married to a young and beautiful girl, to whom Philip had previously paid his addresses. The unhappy man, having finished his tragic story, pled in the most piteous manner for mercy, and his senses seemed almost deserting him when ordered back to prison as a culprit. The court-yard was examined, and the remains of the head and arms of the hapless young Frenchman were found in the precise place mentioned.

When the officers of justice entered the dwelling of Philip Hurcan at Versailles, where he had been living for some months, he, having obtained previous notice of their arrival, shot himself through the heart. Need it be added, that having lived unloved he died unlamented; in fact, such was the horror excited in the public mind by the knowledge of his crime, that it was found difficult to restrain the populace from taking vengeance upon his body.

His villanous accomplice made a more public expiation of his crime, while the Marquis de Marigni came out in triumph; but his feelings had received a shock which rendered him almost insensible. To the congratulations which were offered to him on every side, the loss of his estimable young friend, at a period of life when the most agreeable prospects of happiness were opening up to him, caused the warm-hearted Italian a desolation of heart which no personal or external circumstances could altogether alleviate.

A few months after these events took place, the beautiful Mademoiselle D——, the betrothed mistress of Jules Hurcan, entered upon her noviciate in the convent of L——, and endeavoured by her zeal in holy things to induce forgetfulness of the hapless fate of her earthly lover.

A WORD TO RAILWAY DIRECTORS.

Much as we admire the great and excellently conducted system of railways in this country, we feel bound to say that the directors generally have proceeded on a too narrow principle as to charges of conveyance and accommodation. We might pass over the charges as being perhaps what prudence dictates, but there is something indescribably mean in the accommodation of third-class passengers, who are turned into a waggon without seats, and are there hurled along like so many cattle in a pen. The class of persons whose means limit them to the choice of this degrading method of locomotion, jocularly call the waggon the *Tub*; and as such we see it referred to in the following passages in a late English newspaper. The writer first adverts to the practices on the German railways:—"There are four classes abroad: *La Berline*, *La Diligence*, *Les Chars-a-banc*, and *Le Wagon*. The *Berline* corresponds to our first-class in all respects, and is the most expensive: the *Diligence* has stuffed seats (without the division into chairs), windows on the sides, and is open from end to end like our second-class: the *Chars-a-banc*, or third-class, differs from the last-mentioned in not having windows, and being less convenient, but there are blinds at the side, and you sit upon stuffed benches; and the *Wagon*, or fourth-class, resembles our second-class, and is equal to it in every respect. The first-class is used by the directors of the company, the aristocracy, and families on travel; the second by the gentry and the middle classes; the third by a somewhat similar description of persons, though it is more 'common' (to use an Anglicism); and the fourth by operatives, peasants, mar-

ket people, and others. There is no invidious or contemptuous epithet applied to the *Wagon*—no calling it the *Tub*, and making people stand up to deter them from resorting to it—there is no contrivance to render certain carriages inconvenient in order that you should be forced to select a more expensive seat elsewhere—plans which, whilst they manifest a narrow and unaccommodating spirit, reflect upon the impolicy and short-sightedness of those who devise them, and prove that they have formed an erroneous estimate of the proper mode of acting upon the taste and feeling of the public. The class-arrangements of the foreign railroads (I speak of the German and Belgian lines) are such as show that the directors know how to meet the wants and appreciate the tastes of the people better than we do at present. People fall into that class which suits them, and where they meet with persons of that station of life with whom they are accustomed to associate ordinarily. These and other considerations cause travellers to select their seats with reference to comfort, and not to do as many do, choose the *Tub*, or an inferior class, because the second-class is so uncomfortable that there is no alternative between the first and third, or no intermediate carriage to tempt them."

BIOGRAPHIC SKETCHES.

SIR FRANCIS CHANTREY.

Francis Chantrey was born at Norton, a village on the borders of Derbyshire, on the 7th of April, 1782. His family was respectable, some branches of it being yet possessed of considerable heritable property. Agriculture was the occupation of his immediate progenitors; and, though not wealthy, his mother, who was prematurely left a widow, was able to educate her only child respectably. Francis was sent to the school at Norton; and up to his sixteenth or seventeenth year, passed his time betwixt that place and the paternal farm. It is said, that in very early boyhood he amused the leisure hours of his agricultural terms by making *clay men*, as well as other figures with the same material. Nevertheless, though the promptings of natural genius were thus far indicated, he never entertained a thought of turning his attention permanently to such pursuits, most probably from his having no opportunity of witnessing any workings in statuary that could stimulate his latent powers. Accordingly, not being an enthusiast in agriculture, he resolved, or was advised, to study the law under a solicitor at Sheffield. All was arranged for this purpose, and the day was fixed when Chantrey should go to Sheffield and meet some friends who were to witness his entrance on his apprenticeship. A full hour before the time, the young man reached the town; and in order to while away the interval, he walked up and down the streets, little deeming, when he commenced his stroll, that those few minutes were to form the crisis of his life. So the case turned out. The window of one Ramsay, a carver and gilder, attracted the eye of Chantrey. He stopped to gaze on various figures there; and as he gazed, emotions novel and unexpected were awakened within him. The strongest and finest chord in his nature was struck forcibly and at once, and the tones elicited were so powerful as to drown all the deterring whispers of youthful timidity or shame. Chantrey turned from the window with his resolve firmly taken —"I will be an artist."

The counsels of friends made no change in his determination. In place of articling himself to the Sheffield solicitor, young Chantrey went and bound himself to the carver and gilder Ramsay. The work to which he was here set by no means suited his expectations; but he found a compensation in the voluntary tasks of his leisure hours. Drawing and modelling were his amusements, and for these he forsook all the pleasures natural to his age. The people of Sheffield yet speak of the gleaming of the lamp, through the long hours of night, from the window of the young lover of art, when, in his enthusiasm, he forgot day and night, and all around him, save the ripening conceptions of his creative fancy. He had no teacher to aid him in his progress. He drew and modelled after nature, and his rules of art were the rules of nature. His master repressed rather than encouraged his attempts; yet, ere the three years of his engagement with Ramsay had closed, the casual productions of Chantrey had begun to attract some notice; so much so, that various friends, some of them gentlemen of taste and respectability, strongly advised the young artist to go to London, and apply himself directly to the pursuit of the art of statuary. As his kind mother was one of those who had penetration enough to perceive the high promise of her son's modellings—a promise which she lived to see amply fulfilled—Chantrey found no difficulty in purchasing a release from the latter term of his engagement with Ramsay.

The future sculptor was in his twentieth year when he settled in London, the date being May 1802. His entrance upon that great field of success and failure was as unpromising as might well be. No proofs of study nor flattering testimonials from teachers had he, for he was entirely self-instructed; and at the very close of his life the case was the same, as we find him then saying, that "he never had received a lesson in art in his life." No handsome studio, rich with the evidences of talent, had he to attract employers; he was poor, and his works were to execute. He had almost no acquaintances, to leave friends and patrons out of the question. In short, he had to climb the steep path to eminence solely by his own unaided exertions. Year after year passed away ere he even obtained the chance of arriving at success. Yet he never drooped, nor was his time thrown away. Continuing to study nature with ardent diligence, he made rapid progress towards perfection both in conceiving and executing. He was yet unknown, however, after a cheerless period of seven or eight years, when, almost by chance, he was employed to execute a bust of Horne Tooke, then the Nestor, as it were, of liberalism in Great Britain, from whose lips the younger adherents to the same principles were content to draw inspiration. The execution of this work formed an era in Chantrey's career. The mere features of the ancient adversary of Junius were not only given to the marble, but the sculptor succeeded also in conveying with them that expression of keen penetration and sagacity which characterised the living individual. Horne Tooke was widely known, and numbered among his friends Sir Francis Burdett, and many other persons both wealthy and influential. Their attention was called to Chantrey; and in the course of one month, as he himself tells us, orders poured upon him to the pecuniary amount of five or six thousand pounds. The opportunity had alone been wanted; and when it did come, he stepped, by one effort of genius, from obscurity to eminence, from poverty to wealth.

Chantrey immediately (in 1810) fixed his residence in Pimlico, and erected there a studio for his labours. His earliest works, after this period, were chiefly busts; and it is universally admitted that he never excelled, at any future period, the productions of this order then executed by him. His first prominent public work was the statue of George III., for the city of London. His design for this monument, though the one approved of, was almost rendered unsuccessful by a curious cause. Mr Chantrey handled the pencil as well as the chisel; and such was the beauty of his design, that one of the Common Councilmen observed—"This artist is a painter, and must therefore be incapable of executing a work of sculpture." The remark called the attention of others to the subject, and they summoned Chantrey. "What say you, sir," said Sir W. Curtis; "are you a painter or a sculptor?" "I live by sculpture," simply answered Chantrey. The task was confided to him without more words, and he produced a statue, the ease, dignity, and versimilitude of which render it one of the chief public monuments of the British capital.

While engaged on this statue, another commission was given to him, the result of which was the production of a work held to this hour one of the most finished specimens of English sculpture, and known by engravings over the whole civilised world. This was a monument to the memory of the daughter of Mr Johnes of Hafod, translator of Froissart. In this work, Chantrey's peculiarities of style were first fully developed. Blindly following the customs of their predecessors, sculptors continued, in the beginning of the nineteenth century, to expend all their power upon emblematic figures, allegorical groups, and imaginary mythological models. The powerful examples of Canova and Thorwaldsen have, indeed, done much to sustain the system to this hour. Chantrey adopted and acted on very different principles. With a mind unbiassed by the regulations of the schools, he followed nature alone as his guide. The perpetual repetitions of Britannia, Victory, Peace, Justice, and the like, upon our public monuments, and of Piety, Hope, Religion, Virtue, &c., on private ones, were things too forced and strained to accord with his simple taste. The object of monumental sculpture is to perpetuate the remembrance of the great or the good, and to call up in the minds of the spectators appropriate emotions of sympathy and regret for their loss. Who ever shed tears with Britannia, or participated in the feelings of any others of these frigid generalities? The sculpture may be admired as a work of art; but it is then a monument, at best, only to the artist, not to the occupant of the tomb. Chantrey threw off all conventional trammels, and sought to make his monuments what common sense dictated that they should be. The monument at Hafod, for example, introduces the real party concerned, and presents an exquisite scene of domestic sorrow, exalted by the meditative beauty thrown over the main figure. Another splendid example of Chantrey's art is to be seen in the monument in Lichfield Cathedral, where two lamented sisters are figured asleep in each other's arms. The grace and beauty of the forms cannot be depicted in words; nor can the pen express the skill with which the state of calm and profound repose is imaged forth. Suffice it to say, that the spectator views this group with breathless awe, and that the marble portraiture of "death's counterfeit, balmy sleep," causes the tear to start at thought of the fair innocents, prematurely plunged into the deeper slumbers of the grave itself. Such, surely, is the effect that a monument to the dead should produce; and if the beholders should turn away, in such a case, without even asking the artist's name, a higher compliment would then be paid to him than if his skill had been the sole object of their admiration.

The Lichfield monument was modelled by Chantrey in 1816. Before that time, however, he had been called to execute several public works, and in all of them the same principles were displayed. He executed, for the Scottish Court of Session, a statue of Lord President Blair—a noble work, embodying vividly in marble the calm, thoughtful, and discriminative expression of that judge's features. Another figure, executed by the sculptor for Scotland, was that of Lord Melville. A bust of Professor Playfair was also modelled by Chantrey, and a beautiful work was the result, as might have been expected where a competent artist had so intellectual a head to work upon. In 1814, Chantrey produced for St Paul's two historical monuments for Colonel Cadogan and General Bowes. Before and after the Hundred Days, the artist visited Paris, and saw the great collection of ancient works of art in the Louvre, ere the fall of Napoleon scattered them anew over Europe. Though he felt and acknowledged the beauty of these works, they did not change his style, as the Lichfield monument immediately afterwards proved. A similar proof was given by another of his most celebrated and truly classical works, the statue of Lady Louisa Russel, a child of the Bedford house, who is represented as standing on tiptoe and fondling a dove on her breast. So exquisite is the simplicity and fidelity to nature of this figure, that children of three years old, or so, have been observed to address it, in the perfect assurance of receiving an answer from their playmate.

Advancing every day in public favour, Mr. Chantrey successively executed, among a multitude of private busts and statues, those of Rennie the engineer, James Watt, Sir Joseph Banks, Sir Walter Scott, and many others. Equestrian statues of George IV. and the Duke of Wellington (the latter for the city of London) were also executed by Chantrey, who was knighted by William IV. in 1835. He was offered a baronetcy shortly afterwards, but declined it on account of his want of personal heirs.

In the latter years of Chantrey he was an honoured and admired man, as his works had deserved that he should be. His statuary establishment became an extensive and splendid one, being intrusted to his valued friend Allan Cunningham, the distinguished poet, as secretary and manager of the works. Sir Francis for some time had been, not in ill health, but in such a condition of body that his friends had expected to find him fall a victim to apoplexy; and, on the 25th of November 1841, he was seized with that disease, and expired at his house in Pimlico.

Sir Francis Chantrey was about five feet seven inches in height, with a fine face, and an address at once pleasing and courteous. At his death he left, from the ample fortune accumulated by him, provision at once for the maintenance of the arts which he loved, and for the support of the poor, with whom his kind heart deeply sympathised.

PEDESTRIAN TOUR IN SWITZERLAND.

MONT BLANC.

August 27.—We intended, if the weather favoured us, to spend the day on the Mer de Glace, and some of the other glaciers of Mont Blanc; and, if we could accomplish it, to penetrate as far as the Jardin, in the glacier of Talèfre. The sky, so far as visible from the depths of the valley of Chamouni, was of stainless blue, and promised a day exactly adapted to our purpose. When we had taken a very early breakfast, a guide was sent for, and we held a consultation under his auspices. He seemed a shrewd, sensible fellow, whose words were few, simple, and explanatory, for he probably saw, from our travel-stained aspect, and, indeed, we very distinctly explained to him, that the usual operations for impressing the visiters of the glacier with an awful consciousness of its perils and horrors would be very much thrown away upon us. He had the discretion not to propose cramps for the feet, or ropes about the waist: and here let me remark, that the guide who subjects his protegées to these portentous preparations, indicates thereby a palpable design to lead them through a series of dangers corresponding to the extent of the precautions. The duty of a guide on the glacier is indeed precisely that of a pilot, who is expected rather to avoid dangerous places than to rescue those who have encountered them. There is an analogy between the perilous inequalities of the glacier and breakers at sea, for both are caused by the same circumstance, namely, by rocky projections on the terrestrial surface, covered by water in the one case, and by ice in the other. When the glacier moves over a smooth unbroken level, its own surface is equally plain, and though intercepted by numerous cracks or fissures, these have a certain uniformity in their arrangement, running parallel to each other, and appearing at tolerably regular intervals. But when the ice, in its descent, encounters rocks, or is pressed through narrow openings between precipices, it is tossed into a chaos of spikey and precipitous icebergs, beetling over yawning caverns, for the bottom of which the eye searches in vain. The professional skill of the guide is exemplified in a knowledge of the parts of the glacier where these formidable inequalities occur, and it is his duty to conduct his employers by the least dangerous route. There is one instrument, however, without which no one should venture on the glacier—the alpen-stock, or spiked pole, so serviceable in leaping the chasms, and giving support on narrow ledges or abrupt slopes of ice. Not being prepared for the extent of service we required of these instruments, we thoughtlessly accepted the loan from the guide of some which had previously been used. I would recommend to any one who intends to penetrate to the Jardin, to buy a new pole

for the purpose, as this one expedition will fully exhaust its capabilities for use.

Our path lay first through gentle meadows, reposing in the shadow of the hills, and then we crossed the fierce Arve, and began the ascent of the forest girdle of Mont Blanc, or, as this particular spur of the mountain is called, of the Montanvert. Mile after mile we kept ascending the steep bank by a rutty pathway, ribbed here and there by the mossy roots of a dense forest, and, in other places, overwhelmed by the chaotic debris of the spring avalanches. There is no feature in the scenery of Switzerland from which I have had more enjoyment than in the long walks under the shade of great pine forests. There is something so solemn and majestic, and so suited to the scenery it is cast among in the pine, whether we encounter it among the dark heather hills of Scotland, or on the turved and wavy mounds of the Black Forest, or clustering round the base of the snowy Alps, that one feels his heart less worldly, and his thoughts more solemn, in those deep solitudes,

> Where, o'er the rock, the scarcely waving pine
> Fills the brown shade with a religious awe.

In our ascent, we had an opportunity of observing how a French family could turn their means to the best account. There were two ladies among the party, and while one rode on the back of a mule, another kept hold of the tail, and was in that manner assisted up the acclivity. So dense was the canopy of pines overhead, that only at a few points could we obtain any view of the surrounding scenery. At these we could see the village of Chamouni apparently under our feet, with the Arve looking like a tiny brook, the broad meadows like paddocks, and the inhabitants like Lilliputians. At some other points we saw, glimmering through the dark foliage, the broad white masses of the glacier, and the dark rocks rising here and there from its surface. At length we reached the edge of the forest, and looked down from a range of rocks on the mighty ocean of ice to which we were about to commit ourselves. Here there is a house of refreshment, called the Pavilion. After we had passed it a mile or two, and while we were seated contemplating the view, there came to us two beautiful kids—the most gracefully-formed creatures of the kind I had ever seen—clamorously demanding marks of attention from us. One of them was fawn-coloured, and the other pure white. The latter had taken a peculiar fancy to me—it scraped me with its sharp little hoofs till I was fain to cry mercy; and varying the method of its kindness, leapt on my shoulder, and rubbed its head on my cheek, to the imminent risk of poking out my eyes with its little horns. Truly, these children of the desert had found nothing but kindness and good faith among the few members of the human family it had been their fate to encounter. The milk-white kid followed us for some distance, and when it saw at last that part we must, it looked after us most wistfully and affectionately from the top of a small rock as long as we were in sight. When we reached the point where we were to descend upon the ice, we were told that we had then walked three leagues or nine miles from Chamouni, and were half way to the Jardin. We were upwards of 7000 feet above the sea level, and the place of our destination was nearly 3000 farther up. The descent was a tedious and laborious business. We had to work our way down the sides of rocks, with occasional notches cut in them to facilitate the progress, and then we had to cross the moraine of the glacier. The moraine is a heap of rubbish—if stones or rocks sometimes eighty or a hundred feet high can admit of so depreciatory an appellative—ranged, to a greater or less extent, along the side of each glacier. It is, in fact, the hard stream of ice depositing upon its border its still harder scum of rock. In the case of the Mer de Glace, the moraine is on a prodigious scale—it is a little mountain range of itself, with its valleys and precipices.

And now, letting it be understood that we have our feet on the ice, instead of detailing individually, as it occurred, every object and incident that might seem worthy of notice, I propose to give, in a few words, a collective and general view of the objects most likely to attract the attention of the traveller on the glacier. There are few readers of this narrative who will not have had an opportunity, in the columns of the publication in which it appears, of making themselves acquainted with the natural history of glaciers. They lie in those deep valleys which form grooves between the snowy summits of the higher alps, and the plains or wide valleys at their bases. The masses of congealed matter formed in the upper regions by the fall of snow and hail, and by the refrigeration of those portions of the snowy matter which may have been melted by the heat of the sun, gradually find their way into these grooves, and thus descend the mountain side, conveying an icy stream into the temperate regions below. A great proportion of the glacier is in a temperature far warmer than that of perpetual congelation, but it carries its own frost along with it. As it melts away into a river, its bulk is supplied from above; and from its great thickness, being generally from 150 to 300 feet, its own inherent coldness provides it with a local freezing temperature in all its parts, with the exception of a stratum on its upper and another at its lower surface. The former is only occasionally warmed and melted by the heat of the summer sun; the latter is kept in a perpetual state of fusion by the internal warmth or caloric of the earth. It thus happens that the lower stratum, as it were, of the ice, is perpetually losing bulk, which is supplied, by some action or other (as to which naturalists are not agreed), from the higher layers. It is believed that the lower portion of every glacier is triturated into a succession of caverns, so that the superincumbent mass, like the strata over an exhausted coal field, is supported on a multitude of pillars; but the visiters who return after a descent into these regions of ice and torrent, where death meets them in so many forms, have been too scanty to provide much information about its mysterious terrors. There are two principles of motion almost perpetually at work in the glacier; the one, the simply mechanical operation of a descent from the higher to the lower regions—a motion so slow, that it will take centuries to convey a stone for a few miles in this slothful but irresistible vehicle. The other principle of motion is in the chemical influence of the alternate freezing and solution of portions of the mass according to the change in temperature, and the subsidiary agents set at work by the same phenomena, namely, the escape of compressed air through the cracks in the ice, and the torrents set in motion by its conversion into water, &c. Those who have witnessed the effect of the crystallisation of water into ice in bursting vessels for ordinary domestic use, will readily imagine the terrific phenomena which must accompany the same agency in a mass of ice varying from 150 to 300 feet in thickness. In spring, when large portions of the ice are thawed during the day and refrozen in the night, the glacier startles the echoes of the quiet valleys around by the continued roar of its artillery. At all times, there is more or less of cracking and crashing going on, and more than once were our steps arrested by a loud report, as if a cannon had boomed forth from beneath our feet.

Independently of the moraines at its edge, great rocks, and masses of triturated rubbish, are borne along on the surface of the glacier. The methods by which it gets possession of these relics of the mountain top are two. By one process, it insidiously removes masses of rock by the expansive power of frost acting on the interstices; by the other process, it boldly knocks them down with an avalanche, and carries them off in triumph. The larger rocks, when they reach the lower part of the glacier, protect the ice immediately under them from the heat of the sun; and so, while the general surface of the glacier is becoming melted to a lower level, they become raised on the top of a pedestal, where they remain till it is too long and slender to support them, and then they fall with a crash. We saw many of these raised high in air, looking like gigantic mushrooms, or, if a more domestic simile be wanted, like stone music-stools, on which the spirit of the storm might be supposed to perform his wild symphonies. Far different is the fate of the smaller fragments. Becoming heated with the effect of the sun, they melt their way into the ice, where they make cavities, filled with translucent water. It will happen sometimes that the water collected on the surface of the ice by the operation of the mid-day sun, going about hither and thither in search of an outlet, comes to this hollow, which it immediately enlarges, and either by finding a passage through it into one of the cracks of the ice, or by working its way steadily downwards, reaches the cavernous bottom of the cake of ice, and joins the great river issuing from it. Other rills join and enlarge the torrent, and thus it happens, that what was in the morning a round hole the size of a punch-bowl, with sides of the most exquisite cerulian blue, and filled with water pellucid as crystal, becomes, ere evening, a yawning rent, hundreds of feet deep, into whose black jaws descends a fierce and roaring cataract.* As the day advanced, and the sun acted strongly on the surface, we beheld many of these wild torrents, and a fearful and exciting thing it was to look down through the pits into which they fall, and see their blue sides deepening into blackness, till the eye loses all trace of the cataract, and sees its white foam disappear in the darkness. The rents in the glacier are seldom quite perpendicular; and as a bulge on one side is met by a corresponding recess on the other, we could seldom see far into them. Even where they seemed to run straight down, however, we could never see the bottom; and it was only by toppling in the huge stones, lying in multitudes on the edges, and hearing their descent from bank to bank, that we could form an estimate of the great depth of the fissures.

Crossing a glacier with an experienced guide, we found to be by no means so difficult or dangerous an operation as we anticipated. The ice is not so compact and brittle as that formed by the congealing of pure water, but spongy and porous. The quantities of gravel and rubbish on the surface honeycomb it, each particle melting the ice it lies on by the heat acquired from the sun, and thus there is a level but rough surface, pleasant to the foot, which reminded us of an asphaltum pavement. With such a footing, if a man be strong-headed and tolerably circumspect, and if he knows how far he can leap, he need have no dread of crossing a glacier. The alpen-stock is invaluable as an instrument for balancing the person in narrow ledges, and without it, the passage of the glacier would be certainly very formidable. It often happens that the surface of the wall of ice between two chasms is not above an inch or two wide. For some feet, however, it slopes down gradually on either side, as the roof of a house does from the apex to the edge of the wall; on this slope, when the cavern is not wide, it is easy to walk with the body slanting over the abyss, and balanced by sticking the alpen-stock in the corresponding slope on the other side. A little practice makes one quite familiar with such operations. A false step, to be sure, is destruction; but in how many of the operations of every-day city life would a false step place one in imminent hazard! A slip on a flight of steps will be likely to cause the fracture of a limb; and a stumble in a crossing of the Strand would be almost certain to finish our earthly pilgrimage.

We crossed the glacier nearly in a direction from south to north, and then left it, to scramble round the rocks at the base of the Aiguille de Taléfre, which runs its sharp peak several thousand feet up. The line of glacier is continuous; but it here materially changes its level through a portion which is called the glacier of Lechaud; and for the reason already stated, instead of a tolerably flat surface intercepted by clefts, this portion of the waste of ice is a chaos of stormy-looking icebergs, rising horn-shaped and spikey, and affording no chance of a passage. While clambering among the rocks of the Taléfre, we met the only human being we saw within the region of ice—a chamois hunter following his trade. This man was a pure child of the wilderness, with all the "savage wildness" of "a dweller out of doors." One could imagine him indigenous to the snows and rocks he was surrounded by. His costume had not the fastidiousness of being even in any way national; it was a simple putting together of all convenient and accessible pieces of manufactured texture, on two simple principles—the preservation of warmth, and the freedom of motion. He had a heavy business-looking rifle, which must at one time have been a costly article. There was neither obsequiousness nor rudeness in the man's manner; he was a gentleman after his own fashion—for who could catch vulgarity by converse with the avalanches and the cataracts?—and we exchanged some compliments in reference to tobacco and the lighting of pipes, with a hearty good fellowship. Having circumnavigated, as it were, the dangerous glacier of Lechaud, we descended again upon the ice, on the glacier of Taléfre. Here, being on a higher level, from 9000 to 10,000 feet above the sea, we were within the line where the snow falls at all seasons, and, covering the openings of the rents with a thin treacherous coating, renders the services of a guide doubly necessary. At one place we passed along a steep bank where the new snow had been melted by the sun, and converted into a deep slush, which afforded a most unpleasant footing.

At length we reached the Jardin, or Garden, so called from its being the highest spot where there is a space free from snow, on which bright-coloured lichens and the smaller Alpine plants produce the effect of a garden smiling amidst everlasting winter. Here we rested and refreshed ourselves, and took a leisurely survey of the wondrous scenery by which we were surrounded. It was literally like a boundless sea of ice, from which there shot up multitudes of the spikey narrow rocks, so descriptively called aiguilles or needles. Grand, however, as were these towering rocks, we were bound to admit that they were inferior in their proportions to the giant masses of the Jungfrau, the Eigher, and the other members of the Oberland range. Mont Blanc is a higher mountain than any one of them, but it does not present anywhere at one view so large an amount of perpendicular precipice, and is much broken into details. But there was a feature of solemn grandeur here, which compensated for the difference in the size of the masses. In the Oberland, if we had snow and rocks on one side, the other might exhibit pastures, or chalets, or forests; but here, all around us was a wide ocean of ice. The guide almost startled us by remarking, how impossible it would be for us to retrace the path by which we had reached that spot. When I looked around, indeed, I felt how entirely our fate depended on the skill of our hired attendant, and that the mariner deposited on a solitary rock in the far ocean could not feel more desolate and helpless than we would have been on such a spot without a pilot. But it was getting cold, and the sun was beginning to cast his rays slantingly across the snows, so we started to our feet, and said we must return home. Yes, it was literally returning home, for now our leisure for wandering was at an end, and, some twelve hundred miles or so from our own doors, we turned our steps for the first time towards them, with the intention of returning with the utmost rapidity. It was not without some regret that we bade adieu to the wandering life we had been leading for some time past—for vagabondism has many charms.

Returning along the bank, where we had sunk nearly knee-deep in melted snow, we found the effect of the rapid operation of the frosts which, since the sun had hid his head, had made the surface slippery and brittle. As we went along, the line of the sun's rays, leaving entirely the surface of ice, climbed higher and higher up the needle-like rocks, and bathed them in a reddish-purple light, which grew warmer and warmer as the rim of shadow rose higher

* Meanwhile, by such and other means, the small stones find themselves at the bottom of the cake of ice, where they are carried about in accordance with its motions. A stone thus stuck in the lower part of a moving glacier will score the rock it moves over, just as a grain of sand stuck to the bottom of a decanter will score a mahogany table as it is pushed along. It is in this circumstance that the renowned theory of glacial scratches has had its origin.

up towards their summits. The sky at the same time astonished us by the wondrous depth and beauty of its blue. It was such a blue as I cannot describe otherwise than by saying, that any colour of sky or water I had ever seen before was muddy and opaque in comparison with its heavenly brightness. The hill side was in deep shadow when we clomb the rocky barrier of the Mer de Glace, and so varied and full of interest had been our excursion, that it was difficult to believe we had walked eighteen miles on the ice. The shade of the trees gave addition to the gloom, and we passed down the forest girdle in deep darkness. It was ten o'clock when we reached the brilliant and thronging inn at Chamouni, and we had occupied between fifteen and sixteen hours in the excursion.

Of our journey homewards through regions already described, nothing, it is presumed, need be said; and so here finishes these rough notes of our pedestrian excursion in Switzerland and Savoy.

PROPOSED FOURTH COLONY IN NEW ZEALAND.

THE New Zealand Company has now established three distinct *settlements* in that region, all of which may be presumed to be prospering, since nothing to the contrary purport ever obtrudes itself upon public notice. We have not for some time been attending to the proceedings connected with this great effort in colonisation, but we believe these have been characterised by extraordinary activity, and that the original plans of the company have been in all respects honourably adhered to. Our attention has now been drawn by the proposal of a fourth settlement, in which, it appears to us, a remarkable advance is made towards that perfect facilitation to the efflux of our population into the waste territories of the British crown, which seems to be generally held as desirable in the present posture of our affairs.

A great evil, or at least a monstrous inconvenience, has been experienced in every one of the recent Australian settlements, and all those of the New Zealand archipelago, in the arrival of great numbers of settlers upon the ground before the lands had been surveyed, or any other preparation made for them. One or two years were in general lost before the survey alone was completed; during which time, the settlers could exercise scarcely any productive industry, and were obliged to spend their capital upon high-priced articles of necessity imported from the home country. In one instance, at least, this delay gave occasion to a land-jobbing and speculative system, which has cast a shade over the first years of the colony, and laid the foundation perhaps of habits which it may require much time to get quit of. We have always felt the force of this obstruction to colonisation, but supposed that it was just one of those difficulties which could not be overcome, and which it was therefore necessary to submit to. We find, however, that this view has not been everywhere adopted. A plan for extinguishing it has been suggested by Mr George Rennie, late M.P. for Ipswich, who, we suppose, must be considered as the author of the proposal for a fourth colony in New Zealand, since he takes the lead in proposing it to the New Zealand Company. "Mr Rennie is of a family famous in the annals of Scottish agriculture—a family who have also earned a high name in science and art: he is himself a practical agriculturist, a sculptor, versed in the useful sister art of architecture, with a capacity for business, and willing to employ his capital as well as energies in a career that promises to blend public usefulness with profitable investment."* His scheme is proposed in a letter to the company, of date the 28th of July 1842.

Mr Rennie proposes that this fourth settlement shall be made upon the east shore of the Middle Island, which "presents the very important advantage of having been already examined, and found to comprise an ample extent of fertile land, and to contain several safe and commodious harbours." He continues—"An advantageous site for the new settlement being in the first instance secured, we propose that the company commence their operations by sending out a preliminary expedition, consisting of surveyors, civil engineers, mechanics, and a few agricultural labourers. On the arrival of the preliminary expedition at its destination, the surveyors should proceed to lay out the town, and the engineers to construct a landing-place, a wharf, and a road from the wharf to the centre of the town. At the same time, a portion of the mechanics should be engaged in erecting, in the immediate vicinity of the wharf, an extensive range of sheds for the reception of goods, and a spacious building, comprising a large dormitory, for the immediate accommodation of the first body of colonists on their landing. These objects being effected, a portion of the mechanics might perhaps be employed in erecting a church and a school-house. And while these several operations are in progress, the agricultural labourers should be employed in clearing and cropping an extensive suburban farm, which the company might judiciously cause to be stocked with the best breeds of cattle and sheep from the Australian colonies. After sufficient time has elapsed for the proximate completion of these important operations, or some of them, the first body of colonists, consisting of a due proportion of capitalists and labourers, should be dispatched from this country.

Under these arrangements, the new settlement will present a field for the immediate commencement of productive industry. The impediments to early progress which occurred in the first experimental colonies will be removed; the labour and cost of landing and conveying the goods of the settlers will be abridged; the settlers, on their arrival, will not be exposed to hardship and privation; they will be placed at once upon their locations, and will be enabled to purchase at moderate prices the seed and stock previously provided by the company. The capital which ought to be devoted to immediate cultivation will not be exported for the purchase of provisions. The settlement will be made from the first an appropriate residence for a civilised community."

The mode of proceeding is thus explained:—It is proposed that the company shall select 100,600 acres of land for the settlement. The 600 acres are to form a town, 200 being reserved for roads, streets, public works, &c., and 400 disposed in 1600 lots of a quarter of an acre each. To 1000 of these lots will be attached a suburban section of 20 acres, and a rural section of 80 acres, making up in all the 100,600 acres. The 600 town lots at L.25 each, and the 1000 lots of all three kinds of land at L.125 each, will bring L.140,000, which it is proposed to employ in this manner, namely, L.40,000 for defraying expenses not otherwise chargeable, for guarding against unforeseen difficulties, and for the company's commission upon the transaction; and L.100,000 for the expenses of surveys and management, the formation of roads, wharfs, bridges, and buildings for the reception of the first emigrants, and for emigration. Mr Rennie adds—"By this arrangement, after setting aside an adequate sum for the company's expenses and remuneration, the large fund of L.100,000 will be employed in defraying the expense of the surveys and management, in sending out labour to the colony, and in effecting those improvements by which labour is abridged. This arrangement will be found more beneficial to the capitalist who employs labour, than that of devoting a larger portion of the proceeds of the land-sales to emigration, as was done in the former settlements founded by the company. The quantity of work performed by two labourers, in a settlement provided with wharfs, roads, and bridges, will be greater than that which could be performed by those labourers on a settlement not provided with these important facilities for rendering industry effective. Immediate labour, when not aided by the results of previous labour, can accomplish little: when the means of communication are imperfect, a great portion of the available labour of the community must be devoted not to immediate production, but to overcoming the difficulty of transport. Estimated not by the number of hands, but by the quantity of work, the actual supply of labour will be increased by diverting a portion of the proceeds of the land-sales from emigration to the execution of works by which labour is abridged."

Mr Rennie makes his proposition "on behalf of a body of persons who contemplate the formation of a settlement" on the plan which he describes; and the company, in its answer, expresses its readiness to enter upon the scheme, provided that the government will consent to it "upon such terms as will afford a reasonable remuneration for the responsibilities and risk of the undertaking." This reservation is understood to be designed for the purpose of securing that the project shall be independent of the governor, Captain Hobson, of whose proceedings, it would appear, the company have hitherto found cause to complain. Whatever may be the arrangements made, or the success of the scheme in this particular instance, we think there can be little doubt that the scheme itself bespeaks an immense step forward in the policy of an enlarged system of colonisation, and, as such, merits the approbation of the public.

* Colonial Gazette, Aug. 17, 1842.

RECOLLECTIONS OF HOLKHAM, 1830.

Having accepted an invitation to spend the 1st of September at Holkham, we arrived there at nine o'clock, and, after being greeted with a hearty welcome by Mr Coke, were introduced to Lady Anne and her sister Lady Mary, with whom, and a party of nine gentlemen, who had been invited to meet us, we sat down to breakfast; and the kind attentions of our host and hostess soon made us feel ourselves "at home." Breakfast being finished, Mr Coke ordered his coach and four, with a barouche and a pair of horses, to convey himself and visiters on a farming tour; and as our particular object was to examine the crop of barley, every facility was afforded us by our kind conductor, whose constant endeavour appeared to be to mingle the useful with the agreeable. The postilions were first desired to stop near some beasts of the North Devon breed, which were grazing in the park. Mr Coke mentioned several facts illustrative of the superiority of the North Devons: amongst others, that he called on Mr Handcock, a butcher in London, who supplies some of the first families, and asked him if he had killed any Devon beasts; he replied, no; they were not good enough for his trade; he could only use the best Scots. Mr Coke persuaded him to try the Devons, and he so much approved of them, that he bought all Mr Coke sent to market for a considerable time—more than one hundred beasts. He also mentioned a trial between the fattening of two Devons against one short-horned beast, the two costing the same as the one; and when killed, the two weighed 140 stone, while the short-horned beast only weighed 110 stone, and it had eaten more food than the two Devons. Mr Coke considers the North Devons as by far the best for ploughing. As we passed slowly along through the park, Mr Coke gave us a very interesting account of the way in which his attention was first directed to agricultural pursuits. "When," said he, "I came to the Holkham estate, in 1776, the land had been let for two leases of twenty-one years each, at 3s. per acre; the leases came out in 1778, and I then offered the tenants new leases at 5s. per acre, tithe-free, but my offer was refused, and I was compelled to turn farmer, or take 3s. per acre. I chose the former; and having been favoured with a long life, have certainly seen the estate greatly improved. When I came to it, the rental was only L.1400 a-year, but now I make L.2500 a-year of the thinnings of my plantations; at that time upwards of 10,000 quarters of wheat were imported annually at the port of Wells, now there is full that quantity exported from the same place; at that time the population of Holkham was under 200, now it exceeds 1100, and all fully employed; at that period (1776), on 4500 acres of land, which now form Holkham Park, there were only 800 sheep kept; I have since planted 2500 acres, and now keep 2500 sheep." We were also highly amused by an account from Mr Coke of his first visit to his majesty William IV., whose hand he shook, instead of kissing it. The king gave him a hearty welcome, and then said, "Now, Coke, go home and take care of your freeholders." It is worth a journey of a hundred miles to see the village of Holkham: what a contrast does it present to that of Houghton, which we visited the day before! In Holkham every cottage is neat and clean; each cottage has a garden of considerable size, and for this neat house and garden he is charged two guineas a-year rent; it was not needful for me to ask if the poor men valued their gardens; the absence of weeds, the neat clipped hedges which surrounded them, and the excellent crops which they exhibited, told me, in language I could not misunderstand, that they were highly prized by their possessors. I wish that all those gentlemen who suffer their cottages to be without the comfort of a garden, could be prevailed upon to visit the village of Holkham, and to follow the excellent example which is there set them. In the centre of the village is a school, which is under the peculiar care of Lady Anne. Such, indeed, is the attention bestowed upon this village, such the anxiety on the part of its owner and his lady that its inhabitants should eat the bread of industry and peace, that, were I to judge only from outward circumstances, I should at once say the inhabitants of this village *must* be happy. While looking at the crops of potatoes in the gardens, we had from Mr Coke some interesting hints and observations on the culture of that useful root. He introduced it himself on the Holkham estate, but five years elapsed before he could prevail upon the poor people to eat or cultivate it, such were their strong prejudices against the stranger he introduced amongst them: he offered them land upon which to plant it without rent, but in vain, until at last he introduced the ox noble, a very large species, when they consented to raise a few, saying they might do for the pigs. Time, however, has wrought a mighty change.—*Stamford Mercury.*

TRUE HISTORY OF MACBETH.

SOME weeks since, the original story of King Llyr, or Lear, upon which Shakspeare founded his magnificent tragedy of that name, was transferred to our columns from an English version of an old Welsh chronicle. Believing that every person of literary tastes will feel it interesting thus to trace out the materials upon which the fancy of our great poet based such superb superstructures, we subjoin what appears to be the real story of Macbeth, printed from an old chronicle by Mr Collet, in his "Relics of Literature." The direct source to which Shakspeare was indebted seems to have been Holinshed, though Buchanan's history of Scotland may also have been in his hands, being published just when he was rising into manhood. Both Holinshed and Buchanan, however, simply retailed the narrative of Hector Boece. The names of all the leading persons in the play are given by Buchanan, Duncan, Malcolm, Donaldbain, Bancho, Fleance, Macduff, and Sibard (Siward), being of the number. Macbeth is called by the historian "thane of Angus." Stirred by ambition, as well as by a dream in which "three women of more than human stature appeared to him," and hailed him successively "thane of Angus," "thane of Moray," and "king of Scotland," Macbeth, according to the historian, murdered Duncan at Inverness, and seized the sceptre, the sons of his victim taking to flight. As the witches had prognosticated that the posterity of Bancho should reign, Macbeth assassinated him, but Fleance escaped. The murder of Macduff's children, the flight of that thane to Malcolm in England, the return of the two with auxiliaries under Siward, the besieging of Macbeth in Dunsinane castle, and the death of the tyrant by the hands of Macduff, are all given by Buchanan as in the play. Minor incidents, such as that of the green boughs taken by the soldiers of Malcolm, so finely woven into the plot by Shakspeare, are also noticed by the historian, and he concludes with a hint to which we may possibly owe this noble tragedy. "I omit here," says Buchanan, "a number of fables more adapted for theatrical representation than history." The direct idea of the weird sisters, we see, was derived from history. To the old play of the Witch of Edmonton, Shakspeare may have been indebted for some hints in composing his incantation scenes.

But what is probably the true story of Macbeth differs considerably from the preceding, which various annalists have repeated almost literally from Boece. "The more veracious Wyntown," says Mr Collet,

"calls Macbeth the thane of *Crumbachty*, which is the Gaelic name of Cromarty; and in the well-known story of the Weird Sisters, the chronicler makes the first witch hail Macbeth thane of Crumbachty, the second thane of Moray, and the third king. These intimations lead directly up to the several fictions of Boece, Holinshed, and Shakspeare. Macbeth was by birth the thane of Ross, by marriage with the Lady Gruoch the thane of Moray, and by his crimes the king of Scots. Finley, as we may learn from Torfæus, was maormor, or, as the Norwegian historian calls him, *jarl*, of Ross, who, at the commencement of the eleventh century, carried on a vigorous war, in defence of his country, against the incursions of that powerful vikingr, Sigurd, the Earl of Orkney and Caithness. With his dominions the district of Finley was contiguous, while the country of Angus lay southward at a great distance. Finley lost his life about 1020, in some hostile conflict with Malcolm II. This fact alone evinces that Finley would scarcely have fought with his wife's father if he had been the husband of Doada. The Lady Gruoch, when driven from her castle by the cruel fate of her husband, the maormor of Moray, naturally fled with her infant son, Lulach, into the neighbouring country of Ross, which was then ruled by Macbeth, who married her, during the reign of Duncan. We have now seen distinctly that Macbeth was maormor of Ross, the son of Finley, and the grandson of Rory, or Roderick; and that he was the husband of Gruoch, who was the daughter of Boedhe, and the grand-daughter of Kenneth IV. Macbeth thus united in himself all the power which was possessed by the partisans of Kenneth IV., all the influence of the Lady Gruoch, and of her son Lulach, together with the authority of maormor of Ross, but not of Angus. With all these powers, in addition to his own character for address and vigour, Macbeth became superior to Duncan and the partisans of his family. Macbeth had to avenge the wrongs of his wife, and to resent for himself the death of his father. The superiority of Macbeth, and the weakness of Duncan, were felt, when the unhappy king expiated the crimes of his fathers by 'his most sacrilegious murder;' and Macbeth hastily marched to Scone, where he was inaugurated as the king of Scots, supported by the clans of Moray and Ross, and applauded by the partisans of Kenneth IV. If Macbeth had been, in fact, what fiction has supposed, the son of the second daughter of Malcolm, his title to the throne would have been preferable to the right of Duncan's son, according to the Scottish constitution from the earliest epoch of the monarchy. Whatever defect there may have been in his title to the sullied sceptre of his unhappy predecessor, he seems to have been studious to make up for it by a vigorous and beneficent administration. He even practised the hospitality which gives shelter to the fugitive. During his reign, plenty is said to have abounded; justice was administered; the chieftains, who would have raised disturbances, were either overawed by his power or repressed by his valour. Yet injury busied herself in plotting vengeance. Crian, the abbot of Dunkeld, who, as the father of Duncan, and the grandfather of his sons, must have been now well stricken in years, put himself at the head of the friends of Duncan, and made a gallant but unsuccessful attempt to restore them to their rights. The odious crime, however, by which Macbeth acquired his authority, seems to have haunted his most prosperous moments. He tried, by distributing money at Rome, by largesses to the clergy, and by charity to the poor, to obtain relief from 'the affliction of those terrible dreams that did shake him nightly.' Macbeth and the lady Gruoch, his wife, gave the lands of Kirkness, and also the manor of Bolgy, to the Culdees of Lochleven. Yet the friendship of the pope, and the support of the clergy, did not insure Macbeth a quiet reign. His rigour increased with his sense of insecurity. The injuries of Macduff, the maormor of Fife, constantly prompted the son of Duncan to attempt the redress of their wrongs. With the approbation, perhaps by the command, of Edward the Confessor, Siward, the potent Earl of Northumberland, and the relation of Malcolm, conducted a numerous army into Scotland during the year 1054. The Northumbrians, led by Siward and his son Osbert, penetrated, probably, to Dunsinane. In this vicinity were they confronted by Macbeth, when a furious conflict ensued. The numbers of the slain evince the length of the battle and the bravery of the combatants. Osbert was slain; yet Macbeth, after all his efforts of valour and vigour of conduct, was overcome. He retired into the north, where he had numerous friends, and where he might find many fastnesses. Siward returned into Northumberland, and died at York in 1055. Meantime, Macbeth continued his bloody contest with Malcolm; and this uncommon character was at length slain at Lumphanan, on the 5th of December 1056, by the hand of the injured Macduff."

ROTATION OF CROPS IN GARDENS.

I have pursued with success for many years the following rotation in preparing ground, which has been almost exclusively devoted, during fifty years, to the growth of strawberries:—It was usual, in renewing the beds, to mow down the plants after the fruit was gathered, and to dig up the middle of the beds for a path, retaining the runners that had struck in the old one to bear the following season. But the ground being overrun with couch-grass, fox-tail grass, and blind-weed, I despaired of cleaning it without destroying the beds entirely. The usual plan would have been to trench the ground; but, aware that I should only increase the evil by dividing the roots of such weeds as could not be picked out, amidst an accumulation of strawberry plants, I had them mown off close to the ground, which was afterwards trenched carefully, by breaking each spadeful, and picking out every root that could be seen. It was then planted with celery, and every time the plants were moulded up, those roots which had escaped in the trenching were picked out. In the spring I again gave it a shallow trenching, to incorporate the dung in which the celery grew; and I afterwards planted the ground with early spring-sown cauliflowers, which were all cut by the middle of August. A good coat of manure was then dug in, and strawberries were planted in patches, three or five together (according to the sorts), two feet apart in the rows, which are two and a half and four feet wide alternately. These plants bore a crop the following season, equal to what they would have done had they been planted out singly the previous spring. Whenever I make a new plantation, I usually follow the same rotation, except that I have no occasion to trench the ground. Previously to making the celery trenches, I have only to strike a spade under the patches, and remove them with the few runners they have made attached; a little hoeing being sometimes necessary, if there are weeds on the ground. I annually dig amongst them; and, as soon as possible after the fruit is gathered, I remove from the patches all the runners they have made. It may be objected, that it is more difficult to keep the fruit clean than when the plants occupy the whole row; but as I can get plenty of short grass, it is easily accomplished. I am of opinion, that, if the patches had double the room, I should be no loser; for, about six years ago, I removed alternate patches from two rows of Keen's seedling—the fruit they have since borne has been very fine, and not less in quantity than there would have been had I not removed any. They continue to bear well still, but I seldom allow them to stand longer than four years. Sometimes, instead of cauliflowers after the celery, I have a late crop of peas, in which case I do not plant the strawberries till the following spring; but I cannot calculate on much fruit that season.—*James Murdoch.*

MUSINGS IN SEPTEMBER.

Out we went, we three,
In loving companie:
Faith, I mote remember,
'Twas the moneth of September!
Haws were red and fields mowne,
And the song-byrd sate lone
On the brown bough; singing, she
Made amends for companie.

By a brooke sate we,
And discoursed of destinie—
"See you now, how things change
As they draw near to die?
Man slackens in 's gait,
Hair whitens on 's pate,
Puff, goeth out 's breath!
So comes the year's death:
Verily, friends, it is strange!"

Out then spake another,
In hollow accents, "Brother,
There's a charnel for the flesh,
And a grave for all matter,
But there's what springeth fresh
From the first as the latter.
The field getteth a new green cloth,
But who knoweth how it doth?
And man quickeneth again,
How or where we seek in vain!
The life of nature it is given
To our view—our own to Heaven."

—*Colburn's Kalendar of Amusements.*

USES OF THE DAGUERREOTYPE.

[From the "Spectator."]

The Daguerreotype process, as improved by M. Claudet, can represent objects all but in motion; a momentary suspension of movement only is necessary to fix the image on the plate, and a transient expression of the countenance is rendered permanent. Several members of the corps de ballet at the Italian opera lately stood—or rather danced—for their portraits to M. Claudet, in postures that could be retained but for an instant, such as poising on one toe with the other leg extended, and resting on the points of both feet. These miniatures may be seen at the Adelaide Gallery, and very curious they are; the whole of the figure, and even groups of two or three dancers, being delineated on a plate of two or three inches high, in which the play of the features and the minutest characteristics of the dress are discernible. M. Claudet's collection of likenesses includes the queen-dowager and other distinguished personages; but the most interesting of the series to us were those of Mademoiselle Rachel, in ordinary costume, and with her habitual look when in a thoughtful state of quietude. Mind and character are so vividly and delicately pourtrayed, that we could not but wish that the great tragic actress had sat in some of those different states of emotion which her eloquent countenance can express at will with so much intensity. If there is one thing more than another that the magic power of the Daguerreotype is valuable for, it is this of limning the fleeting shades of expression in the human face: for here the art of the painter, however great his skill, is most at fault; and it is only in his happiest moments that the artist of genius can transfer to the canvass the indications of lively sensation, strong passion, and profound thought, or even of individual character in a quiescent state. Could Garrick have looked all his characters before the lens of the Daguerreotype, generation would have beheld again and again what was given to his contemporaries to see once and away. Charles Mathews, who dipped for faces behind his green table, and brought up a fresh one every time, would have had nothing to do but to present his various physiognomies successively before the Daguerreotype camera to have them reflected in that retinent mirror. We instance actors in particular, Rachel having put us on the histrionic track; and also because, their art consisting in assuming at will certain characters and feelings, the Daguerreotype is peculiarly well adapted to take their portraits in a state of emotion: orators and others could only be so taken unawares, which would be scarcely practicable except in rare instances.

But some readers, having a prejudice against the Daguerreotype miniatures, may be ready to protest against their incorrectness as well as their grimness; and this brings us to the point which we are aiming to enforce, namely, the necessity for viewing the photographs through a medium of high magnifying power, not only to correct the slight aberration caused by the diminishing lens of the camera, but to amplify their shadows so as to lessen their density and remove the harshness and blackness consequent thereon. The image is too minute for any but a microscopic scrutiny to develop all its minutiæ of form; and, looking at the plate with the naked eye, one does not perceive the object truly and completely, even in point of form. A compensating lens, through which the visiters might view the photographic limnings, and artists might copy them when required, would be a desirable addition to the new arrangements that M. Claudet is now making at the Adelaide Gallery for facilitating his operations and promoting the convenience of visiters.

The value of the Daguerreotype as an aid to artists both in landscape and portraiture, is not yet fully appreciated; nor is the practice of producing prints from photographs so general as it is likely to become. We allude not to the experiments of taking impressions from the plates themselves (which the specimens that have been shown, though very imperfect, prove to be not altogether impossible), but to copies from them. A work has been commenced in Paris, called "Excursions Daguerriennes," containing views of the principal cities and remarkable places in the world, some numbers of which we have seen in London. The engravings are very neat and accurate copies in aquatint of the plates, the size of the originals; notwithstanding the absence of very minute detail, and the inferiority of the execution to the marvellous delicacy of nature's image, they are beautiful as works of art, and of course exact representations of the places.

THE ENGLISH ABROAD.

The Russians and the English are the two great travelling nations, and they are the only two who travel in the large, heavy, family coach, though the latter seem to be giving up that heavy machine which one cannot see out of. One of these carriages arrived two nights ago, and there was an immediate wager to which it belonged, England or Russia: the former gained it. The English have little idea how everything they do and say is discussed by foreigners. They mark and remark the most trifling circumstances; everything seems of consequence; even the dress is noted in the memory. Madame —— was the *mise à merveille*," or "*comme un ours*;" and while they are going in or out, walking or talking, just as they would if they were at home, they are little aware of the construction put upon every word and action, particularly in countries where they are not much known. The want of "risibility of the countenance and flexibility of the body" is the first thing that strikes; and it may be a question, whether the general acquirement of these *agrémens* in society might not be useful, inasmuch as the first would increase our own happiness, and the last the contentment of our neighbours. All persons like to be respected; "preferring one another" is a Christian principle; and there is a pleasure in the feeling of a well-regulated mind in showing deference to others, as well as receiving it one's self; and if we do not pay it, we cannot expect to receive it. The outward attention and respect paid by foreigners to women, and the inattention to her of our lords of the creation, is evident to the most unobserving. I could give many examples of my own experience of this; but were I to mention them, it might be called vanity: however, one is vivid in my imagination. We were once in a hurry to get our passports, and, knowing there is nothing like "making a page of your own age," that is, doing your own business, I drove first to the English, then to the Austrian ambassador's; my own "countryman" received me in dishabille—civilly, however, though hurried in his movements; the passport was signed, the gentleman bowed and retired to his den, leaving the lady to make her way out as she could. I then proceeded to the Austrian ambassador, and was shown into his room, where he was writing. I ought to have mentioned, the Englishman kept me waiting some time. Monsieur received me with the grace and politeness of his nation. When he found we were going to Italy, he inquired by what route, discussed the merits of them all, gave me much information, and, when the passport was ready, accompanied me to the head of the stairs, presented it, and, with many good wishes for an agreeable journey, and as many obeisances as if we had been at court, we parted. One was an unpleasant *business*, the other an agreeable visit; and manner made the difference. If it is true that *action* is three parts of speaking, *manner* must be three parts of diplomacy.—*Lady Vavasour's Last Tour and First Work.*

CAST-IRON BUILDINGS.

Buildings of cast-iron are daily increasing in England. As the walls will be hollow, it will be easy to warm the buildings by a single stove placed in the kitchen. A three-storey house, containing ten or twelve rooms, will not cost more than L.1100. Houses may be taken to pieces, and transported from one place to another, at an expense of not more than L.25.—*From a newspaper.*

[We entertain serious doubts as to the propriety of using cast-iron buildings as dwelling-houses; the liability to attract lightning is not the least of the evils to be dreaded.]

NUMBER 559. SATURDAY, OCTOBER 15, 1842. PRICE 1½d.

SELF-IMPOSED TAXES.

IT is a great mistake to allege of mankind that they do not like taxes. There is, indeed, some truth in the allegation, but it also includes a large amount of falsehood. Mankind only do not like taxes which other people impose upon them. They are quite contented under taxes which they impose upon themselves. To speak with more rigid accuracy, no man likes taxes which others impose upon him, but every man is happy to pay taxes which he imposes upon himself. Comparative amount is of no moment. A man will pay very large self-imposed taxes with all the good humour imaginable, while he will be found to grumble at a very small rate imposed by others. Generally speaking, the voluntary taxes are greatly in excess of the compulsory, so that it may be said there is but a small proportion of truth in the allegation that mankind do not like taxes. It would be much more philosophical to say that mankind like taxes, only admitting that there was a small exception from the rule with regard to a certain way in which taxes were occasionally imposed, namely, when they were put by one man upon another.

I admit this exception to the fullest extent. I do not even deny it with regard to those instances of taxation in which a man is supposed to tax himself through the medium of representatives. Somehow, though statesmen have ever shown a great anxiety to uphold this fiction of the law, and thereby, if possible, make the public taxes seem self-imposed, there are few well-authenticated instances of individuals liking such taxes any more than those to which the dictate of a despot has subjected them. The relation between the will of the represented citizen and the order for payment which he in time receives, with due penalties specified for delay and refusal, is apt to be not very clearly perceived, and all De Lolme and Blackstone's efforts to mend the matter go much in vain. The fact, then, is certain, that men do not like taxes of a public nature. Alas, how little need is there to impress this truth! Does not almost every newspaper convey the groans and grumblings of the unfortunate public on the enormity of these imposts! How do high and low, young and old, rich and poor, and "men of all shades of political thinking," unite in detesting these at the best necessary evils! Yes, I think the proposition that men do not like public taxes will be pretty generally acceded to.

But it is quite different with the far larger class of taxes which men do really and without fiction lay upon themselves. Here all is serenity and complacency. If we consider every expense incurred under the influence of some false maxim, sentiment, or appetite, and which does not redound to real enjoyment, as a self-imposed tax, I think it will be allowed that most men pay more in voluntary than compulsory taxation; yet not a single genuine groan is ever heard about the matter. Sometimes, indeed, the voluntary is curiously mixed up with the compulsory taxation, as we shall see in the sequel; but in these cases the only remarkable thing is, that the part which is voluntary usually serves in a great measure to reconcile the sufferer to that which is otherwise—and many are so happy to pay the voluntary as to overlook the compulsory altogether.

Spontaneous taxation is of several kinds, and it would require a much more skilful hand than mine to anatomise it properly. Sometimes we see it in the whole style of a man's life, sometimes only in particular habits or particular acts. In the fashionable and affluent world, it has ever borne extensive sway. There we see men and women content to spend but a small portion of their incomes in the manner which their natural tastes would dictate, and paying nearly the whole of it away in self-imposed taxes, merely that they may appear to live as some other persons live, whose good opinion they think they are thus cultivating, while in truth nobody is ever once thinking about them. Some tax themselves in a pack with which they never hunt; some in a racing stud which they never accompany to Ascot's. Some pay a vast impost in the maintenance of a gratis hotel in the shape of a country house; some in the keeping up of an equipage which they think their rank calls for; some in a retinue of servants whom they do not need, and who are only a cumber to them, so that they may be considered as a sort of double tax. A box at the opera makes a very neat self-imposed tax of some hundreds per annum, which some persons of no particular taste for music pay with a great deal of pleasure. Private concerts, routs, and *fetes champetres*, are occasional cesses of the same kind, which many are happy to pay, taxing their own patience and spirits at the same time to entertain the company who may be assembled. In short, almost all the gaieties of the *beau monde* may be described as self-imposed taxes, for those at whose cost they are instituted obviously have very little real enjoyment in them. "I don't care for going to town next season—to tell the truth, I am tired of it—but I suppose we must go, my dear, or it would be thought very odd." So says a country gentleman to his wife, in the true spirit of submission to self-imposed taxation. And they go and pay the tax accordingly, with all the cheerfulness imaginable. Talk of self-devotion and self-sacrifice!—where is there anything of the kind comparable to a life passed in constant submission to restraints and expenses, incurred in order to carry out the idea of what is proper to one's class in the gay world?

The less affluent classes submit to their self-imposed taxes with a patience equally edifying. It is calculated that from forty-five to fifty millions, or about the amount of the whole of the public taxes of the United Kingdom, are spent in it annually on ardent spirits, beer, tobacco, and some other things which, so far from benefiting the people, do them harm. This is a splendid amount of *voluntary* taxation, and it is, of course, only a portion of the whole. Yet not a word of grumbling is ever heard from those who pay it. The expenditure on ardent spirits alone is estimated at twenty-four millions, and this at least must be regarded as a very pure tax of the voluntary kind, seeing that not an atom of utility can be attributed to the article, but much that is the reverse. Nevertheless, I now am old who once was young, and I do not recollect ever hearing any one vent a word of complaint respecting this tax. What stronger subject for indignation, it may be asked, could a poet or an orator wish for, than the well-fed, well-clad emissaries of a despot, extorting oppressive taxes from a population, such as that of Egypt, sunk into the depths of poverty? The same contrast is to be seen every day between the magnificent tax-offices called gin-palaces in all our large towns, and the poor wretches who hourly come there to pay in their spontaneous impost; but no one connected with the tax-paying class in this instance is ever seen to get warm upon the subject. In the town of Bury, which contains 25,000 inhabitants, the annual expenditure on spirits and beer is estimated at L.54,190, or about L.8 for each family, being sufficient to pay the rent and *public* taxes of comfortable houses for the whole of the population. A large proportion of the humbler classes do there live in very mean and ill-furnished dwellings, there being no fewer than fifteen hundred in which the inmates sleep more than two in a bed. Yet I venture to say, the immense self-taxation which is the chief cause of all this poverty is submitted to without a murmur. It is calculated that the town of Dundee, which contains 60,000 inhabitants, taxes itself for spirits to the amount of L.180,000 per annum: there is one parish in it which gives a new version of Falstaff's tavern bill—*a hundred and eight places for the sale of liquor to eleven bakers' shops*. Now, the angels may weep over these taxes of Dundee, but the people themselves do not. In the principal street of the old town of Edinburgh, there are upwards of a hundred tax-offices open; if there were half so many for compulsory taxes, human nature would be in constant rebellion under it; but being all for self-imposed taxes, the thing is thought nothing of. Some years ago, there was in Glasgow one office for these self-imposed taxes to every thirteen houses, and all submitted to with marked resignation. Such is the general case throughout the empire: everywhere we see numerous offices for spontaneous imposts, which the people are hourly paying without a murmur, while the smallest cess laid upon them for something really useful to them, would rouse their "ignorant impatience of taxation" in a moment. With what heroic indifference does a patriotic citizen pay out his self-imposed taxes in one of these offices on a Saturday evening, ay, even till he has denuded himself of perhaps a sixth or fifth part of his weekly earnings! Not a qualm seizes him, not a whisper of complaint escapes. But take the same citizen, and tell him that it would be well for him to pay a health rate or an education rate of the most trifling amount, and see how he would receive the idea. It is a remarkable fact, which I have often had occasion to note, that when you speak to a man about any new proposed tax of a public and compulsory nature, however small it may be, he is sure to begin a long elegy on the severity of the taxes of that kind which he already has to pay; but when he is in the way of subjecting himself to a tax of the other kind, albeit a pretty heavy one, he never says a single word about this department of his hardships. His demeanour, when paying his self-imposed taxes, is in general rather of a cheerful kind—as if they were a source of positive happiness to him, and so much to be enjoyed, that he could not bear to indulge at the moment in a single painful association.

Do not let it for an instant be supposed, that any one class of the community is more addicted to the paying of self-imposed taxes than another. It is an universally prevalent disposition, and the same essentially, whether exemplified by the gentleman whiffing at his cigar or the workman at his clay pipe, whether in the same tavern amongst mugs and jugs, or at a table where five kinds of wine and a dessert tempt to a bewailment of the unfortunate habits of the lower orders, and a general discussion of the distresses of the country. I may chance, however, to have met with an illustration amongst a humble portion of the people, better than any which have accrued from higher quarters. This illustration I here introduce, without wishing it to be supposed that it is more characteristic of one class than another. When Sir Charles Shaw took charge of the police force in Manchester a few years ago, he found the work-people in the habit of paying sixpence per week each to the old watch for calling them up in the mornings. He put a stop to the practice, as being one which interfered with the regular duties of the police, and as being founded on a habit which might be corrected. The employers, however, complained of the interruption of the practice, and requested that it might be renewed. Sir Charles, considering that sixpence was too high a charge, offered to allow the police to call up the work-

people at *twopence* per week each, provided that the masters, to save the trouble of the weekly collection, deducted the amount from the weekly wages, and paid it over to the police fund. The answer to the proposal was, that the work-people would sooner pay sixpence of their own accord than have one penny deducted from their wages by their masters. Could there be anything more pointedly demonstrative of the readiness with which imposts are submitted to, although actually severe, if they are only self-imposed?

I trust, then, that the proposition put at the head of this paper, that it is a great mistake to allege of mankind that they do not like taxes, has been satisfactorily made out. The whole matter, it will be observed, lies in the specialty as to the mode of imposition. Tax honest John Bull in the most homœopathic manner, and he roars like his namesake; but allow the worthy man to tax himself, and you cannot take any plan for making him more happy. The great error or misfortune of statesmen is, that they always leave him somebody to blame as the cause of his impoverishment: if they could so arrange the matter with the worthy gentleman as to leave him only himself for that purpose, they would find him the most gentle, submissive, forgiving, and Christian-like person in the world.

LIEBIG ON HEALTH AND DISEASE.

We said we should most likely glance at the theory of disease propounded by Liebig in his recent work on Animal Chemistry,* and we now take up the subject.

Liebig's ideas are not altogether new, but they are given in an original and forcible manner, and must prove of no small use in helping forward physiological science. He shows, as we formerly mentioned, that a principal phenomenon in the animal organism consists in the supply and waste of substance; that the vital force may be compared to a furnace which requires constant fuel—the oxygen of the atmosphere, as it were, blowing the flame, while the fuel is the food that hunger incessantly demands. Animal life, then, our author proceeds to demonstrate, is intimately associated with the mutual action of waste and supply, and that the condition of body in which these are preserved in equilibrium is what we term *health*.

The process of destruction in the animal fibre is greatly assisted by exercise or labour, and consequently so is the demand for material greater. This, indeed, is a plain truth, which every person knows—the man who toils hardest requires most food. But this general truth is qualified by circumstances; the action of supply and waste differs in degree at different periods of life from infancy to old age. In childhood, the power of assimilation—that is, transforming food into fibre—is stronger than in advanced years, and therefore proportionally more nourishment is required. We find, says Liebig, that "a perfect balance between the consumption of vital force for supply of matter, and that for mechanical effects, occurs, therefore, only in the adult state. It is at once recognised in the complete supply of the matter consumed. In old age more is wasted; in childhood more is supplied than wasted." In mechanical efforts, or labour, vital force is expended. The daily loss of a full-grown man cannot be restored in less than seven hours' sleep. "The adult man sleeps seven hours, and wakes seventeen hours; consequently, if the equilibrium be restored in twenty-four hours, the mechanical effects produced in seventeen hours must be equal to the effects produced during seven hours in the shape of formation of new parts. The body can only increase in mass, if the force accumulated during sleep, and available for mechanical purposes, is employed neither for voluntary nor for involuntary motions."

These facts respecting the supply of waste by food and vital force by sleep, bear on the theory of disease. According to Liebig—"Every substance or matter, every chemical or mechanical agency, which changes or disturbs the restoration of the equilibrium between the manifestations of the causes of waste and supply, in such a way as to add its action to the causes of waste, is called *a cause of disease*. *Disease* occurs when the sum of vital force, which tends to neutralise all causes of disturbance (in other words, when the resistance offered by the vital force), is weaker than the acting cause of disturbance.

Death is that condition in which all resistance on the part of the vital force entirely ceases. So long as this condition is not established, the living tissues continue to offer resistance.

To the observer, the action of a cause of disease exhibits itself in the disturbance of the proportion between waste and supply which is proper to each period of life. In medicine, every abnormal condition of supply or of waste, in all parts or in a single part of the body, is called disease. It is evident that one and the same cause of disease will produce in the organism very different effects, according to the period of life; and that a certain amount of disturbance, which produces disease in the adult state, may be without influence in childhood or in old age. A cause of disease may, when it is added to the cause of waste in old age, produce death (annihilate all resistance on the part of the vital force); while in the adult state it may produce only a disproportion between supply and waste; and in infancy only an equilibrium between supply and waste (the abstract state of health).

A cause of disease which strengthens the causes of supply, either directly or indirectly, by weakening the action of the causes of waste, destroys, in the child and in the adult, the relative normal state of health; while in old age it merely brings the waste and supply into equilibrium.

A child, lightly clothed, can bear cooling by a low external temperature without injury to health; the force available for mechanical purposes, and the temperature of its body, increase with the change of matter which follows the cooling; while a high temperature, which impedes the change of matter, is followed by disease.

On the other hand, we see, in hospitals and charitable institutions (in Brussels, for example), in which old people spend the last years of life, when the temperature of the dormitory, in winter, sinks 2 or 3 degrees below the usual point, that by this slight degree of cooling the death of the oldest and weakest, males as well as females, is brought about. They are found lying tranquilly in bed, without the slightest symptoms of disease, or of the usual recognisable causes of death.

A deficiency of resistance, in a living part, to the causes of waste, is obviously a deficiency of resistance to the action of the oxygen of the atmosphere. When, from any cause whatever, this resistance diminishes in a living part, the change of matter increases in an equal degree.

Now, since the phenomena of motion in the animal body are dependent on the change of matter, the increase of the change of matter in any part is followed by an increase of all motions. According to the conducting power of the nerves, the available force is carried away by the nerves of involuntary motion alone, or by all the nerves together.

Consequently, if, in consequence of a diseased transformation of living tissues, a greater amount of force be generated than is required for the production of the normal motions, it is seen in an acceleration of all or some of the involuntary motions, as well as in a higher temperature of the diseased part. This condition is called *fever*.

When a great excess of force is produced by change of matter, the force, since it can only be consumed by motion, extends itself to the apparatus of voluntary motion. This state is called *a febrile paroxysm*."

He then proceeds to show that disease in a hitherto healthy part is immediately a result of an overcharge of oxygen, and that in the same manner the whole system may become affected. "Should there be formed, in the diseased parts, in consequence of the change of matter, from the elements of the blood or of the tissue, new products, which the neighbouring parts cannot employ for their own vital functions; should the surrounding parts, moreover, be unable to convey these products to other parts, where they may undergo transformation, then these new products will suffer, at the place where they have been formed, a process of decomposition analogous to fermentation or putrefaction.

The accelerated change of matter, and the elevated temperature in the diseased part, show that the resistance offered by the vital force to the action of oxygen is feebler than in the healthy state. But this resistance only ceases entirely when death takes place. By the artificial diminution of resistance in another part, the resistance in the diseased organ is not, indeed, directly strengthened; but the chemical action (the cause of the change of matter) is diminished in the diseased part, being directed to another part, where the physician has succeeded in producing a still more feeble resistance to the change of matter (to the action of oxygen)."

The remedies for disorders of this kind are such as experience has pointed out to be useful in restoring an equilibrium in the general action. One method, as is well known, is to apply counter-irritants; and when these fail, the surgeon withdraws a portion of blood. "He diminishes, by blood-letting, the number of the carriers of oxygen (the globules), and by this means the conditions of change of matter; he excludes from the food all such matters as are capable of conversion into blood; he gives chiefly or entirely non-azotised food, which supports the respiratory process—as well as fruit and vegetables, which contain the alkalies necessary for the secretions.

If he succeed, by these means, in diminishing the action of the oxygen in the blood on the diseased part, so far that the vital force of the latter, its resistance, in the smallest degree overcomes the chemical action—and if he accomplish this, without arresting the functions of the other organs—then restoration to health is certain.

To the method of cure adopted in such cases, if employed with sagacity and acute observation, there is added, as we may call it, an ally on the side of the diseased organ, and this is the vital force of the healthy parts. For, when blood is abstracted, the external causes of change are diminished also in them, and their vital force, formerly neutralised by these causes, now obtains the preponderance."

Cold may be made available with great effect as an agent of cure, by restoring equilibrium, and changing the character of matter. It may be applied "especially in certain morbid conditions in the substance of the centre of the apparatus of motion; when a glowing heat and a rapid current of blood towards the head point out an abnormal metamorphosis of the brain. When this condition continues beyond a certain time, experience teaches that all motions in the body cease. If the change of matter be chiefly confined to the brain, then the change of matter, the generation of force, diminishes in all other parts. By surrounding the head with ice, the temperature is lowered, but the cause of the liberation of heat continues; the metamorphosis, which decides the issue of the disease, is limited to a short period. We must not forget that the ice melts and absorbs heat from the diseased part; that if the ice be removed before the completion of the metamorphosis, the temperature again rises; that far more heat is removed by means of ice, than if we were to surround the head with a bad conductor of heat. There has obviously been liberated in an equal time a far larger amount of heat than in the state of health; and this is only rendered possible by an increased supply of oxygen, which must have determined a more rapid change of matter.

The self-regulating steam-engines, in which, to produce a uniform motion, the human intellect has shown the most admirable acuteness and sagacity, furnish no inapt image of what occurs in the animal body. The body, in regard to the production of heat and of force, acts just like one of these machines. With the lowering of the external temperature, the respirations become deeper and more frequent; oxygen is supplied in greater quantity and of greater density; the change of matter is increased, and more food must be supplied, if the temperature of the body is to remain unchanged."

The section on this deeply interesting subject is closed by the following judicious remarks:—"It is only by a just application of its principles that any theory can produce really beneficial results. The very same method of cure may restore health in one individual, which, if applied to another, may prove fatal in its effects. Thus, in certain inflammatory diseases, and in highly muscular subjects, the antiphlogistic treatment has a very high value; while in other cases blood-letting produces unfavourable results. The vivifying agency of the blood must ever continue to be the most important condition in the restoration of a disturbed equilibrium, which result is always dependent on the saving of time; and the blood must, therefore, be considered and constantly kept in view, as the ultimate and most powerful cause of a lasting vital resistance, as well in the diseased as in the unaffected parts of the body."

* Animal Chemistry, or Organic Chemistry in its Applications to Physiology, by Justus Liebig. Edited by W. Gregory, Professor of Medicine, Aberdeen. London: Taylor and Walton, Upper Gower Street. 1842.

THE LIFE AND POETRY OF LUCRETIUS.

Titus Lucretius Carus was born at Rome, B. C. 95 or 96. His father seems to have been an obscure scion of an illustrious stock. The Lucretii were one of the most ancient and powerful families in the Roman commonwealth. They had been early elevated into fame by their connexion with that heroic lady whose tragic fate had changed the constitution of her country, and with it the destinies of the world.

At the time of our poet's birth, a rage for Grecian literature had spread throughout Italy. The conquerors had submitted to the schooling of the conquered, and avowed themselves as far their inferiors in letters as they had proved themselves their superiors in arms. The Achaians who had come to Rome as hostages remained as instructors, and the seminaries over which they presided were thronged with eager and delighted pupils. It was natural, however, to entertain a preference for the fountain-head of knowledge and taste. The language and learning of Greece were to be found purest and raciest at the source. Rhodes, Mitylene, but especially Athens, became, accordingly, the favourite resorts of the Roman youth. Each of these localities had associations to boast of, inexpressibly precious to juvenile enthusiasm; and the last, in particular, was holy ground. Not to speak of warriors, and statesmen, and poets, Athens was pre-eminently the home and the haunt of science. Zeno was still apparent to the second-sight of fancy, hovering beside his porch; Epicurus still uprose at every turn of the garden; the awful form of Aristotle yet lingered by the Lyceum; and the deep grove of the Academy was made still more sombre by the shade of Plato. It was thus to a spot, the richest in all the world in such inspiring recollections, that Lucretius was sent to complete his studies. Here he attended the Epicurean school, at that time taught by Zeno and Phædrus, both able and benevolent men, and imbibed the lessons of that philosophy of which he afterwards approved himself so ardent a disciple and so gifted an expounder. As his fellow-students at this seat of learning, we find a group of names which afterwards rose to rank with the proudest in their country's annals. Among them are those of Brutus, Cassius, and Cicero. With some of these remarkable young men our poet contracted warm and lasting friendships. But none of them seems to have had a place so near his heart as Caius Memmius, a high-born Roman, between whose family and that of Lucretius there subsisted an hereditary amity. He

who was writing for millions was most concerned for the applause of Memmius.

In company with Catullus, our poet, at an after-period, went with his friend to Bithynia, on his obtaining the government of that province. Into the activities of political life Lucretius himself never plunged, although, in his retirement, in the neighbourhood of Rome, he took, as a private patriot, a lively and often an indignant interest in the events of the time. His chief solace or amusement, however, was derived from the composition of his poem on the "Nature of Things." The completion of this work may be referred, with some probability, to about B. C. 58.

The little that is known of the life of Lucretius has now been told. His death is involved in mystery. Respecting two circumstances there seems to be no doubt. He became insane, and committed suicide. Whether, as some assert, he was deranged by a love-potion administered in a fit of jealousy by his wife Lucilia, or whether, as may more rationally be supposed, he was liable, like Tasso, to periodical attacks of a malady which has blighted some of the finest intellects, it cannot be questioned that he perished by his own hands. He died at the age of forty-four.

The "Nature of Things" is a philosophical and didactic poem, in six books, each consisting, on an average, of twelve or thirteen hundred lines. It is devoted to the exposition of the system of Epicurus, physical, moral, and theological, of which we may say a few words.

Philosophy, according to Epicurus, is reason applied to the promotion of happiness, which last is man's chief good, and ought to be the object of all his efforts. In order to its perfection, two things are necessary, a sound body and a tranquil mind. The great obstructions to the latter attainment are superstition and the fear of death. These, therefore, Epicurus laboured with all his might to remove. It is evident that the grand aim of his *ethics* was the emancipation of the human mind from dangerous passions and superstitious fears. Men fail of happiness either from misconceiving its nature or mistaking the means of its attainment. The definition of it given by Epicurus was, the state in which man enjoys most and suffers least, reason being the arbitress of pain and pleasure. He himself, while recognising the modifying influences of habit and temperament, was disposed to place happiness chiefly in mental tranquillity. Violent and tumultuous pleasures he regarded as, on the whole, hostile to it. To sluggish inaction he was equally opposed. The life he recommended finds its fitting emblem neither in the impetuous torrent nor in the stagnant pool, but may rather be likened to the limpid stream, passing, in cool serenity, along its appointed channel.

Virtue is to be practised as the only means of securing such felicity. The grand end of living pleasurably can only be reached by living well. All the virtues are resolvable into *prudence*. This, as applied to the regulation of the appetites, is termed *temperance*—the virtue which teaches us to enjoy present good in such proportion as to avoid entailing a future evil. In its relation to the necessary calamities of life, it becomes *fortitude*—a quality prompting to the patient endurance of whatever ills are inevitable; of the more acute, since they cannot last long; of the less considerable, because these are outweighed by concomitant pleasures. In its bearing on social relations, it is styled *justice*—a duty dictated by enlightened self-love, since strict regard to the rights of others is proved to be the only efficient safeguard of our own.

We are now prepared to pass to a rapid survey of the "Nature of Things." The poem opens with an invocation of Venus, the prolific principle of life and enjoyment, whose universal dominion is glowingly pourtrayed. The author next propounds his subject, and celebrates the triumph over superstition achieved by his master Epicurus. The mention of this foe to human happiness suggests the tragic story of Iphigenia, the virgin daughter of Agamemnon. We shall extract this beautiful episode entire. It may be remarked, that Lucretius has heightened the pathos of the incident, and brought it into far closer accordance with nature, by deviating from the track of his predecessor Euripides, who represents Iphigenia as a voluntary victim.

> Around she looked; the pride of Grecian maids,
> The lovely Iphigenia, round she looked—
> Her lavish tresses, spurning still the bond
> Of sacred fillet, flaunting o'er her cheeks—
> And sought in vain protection. She survey'd
> Near her, her sad, sad sire; the officious priests
> Repentant half and hiding their keen steel,
> And crowds of gazers weeping as they view'd.
> Dumb with alarm, with supplicating knee
> And lifted eye, she sought compassion still:
> Fruitless and unavailing: vain her youth,
> Her innocence and beauty; vain the boast
> Of regal birth; and vain that first herself
> Lisp'd the dear name of Father, eldest born.
> Forced from her suppliant posture, straight she view'd
> The altar full prepared: not there to blend
> Connubial vows, and light the bridal torch;
> But at the moment when mature in charms,
> While Hymen called aloud, to fall e'en then,
> A father's victim, and the price to pay
> Of Grecian navies, favour'd thus with gales.
> Such are the crimes that Superstition prompts.
> (*Book* I. 83-102, *Good's Version.*)

The poet next proceeds to show that nothing can spring from or be reduced to nothing—a position which may be taken as the basis of the ancient physics. The dryness of philosophical discussion is here agreeably relieved by the following exquisite lines, which are presented to the reader in our own version:—

> The drops seem lost when Father Æther pours
> In earth's expectant lap his genial showers
> But soon shall crops in golden glory spring,
> And trees abroad their branchy foliage fling;
> Up from the soil in joyous effort shoot,
> And bend anon beneath a load of fruit:
> Hence man and beast are nurtured; hence we see
> Our cities gladden'd with the urchin's glee:
> On every breeze the warbled music floats,
> And glade and grove grow vocal with the notes:
> Hence languid herds athwart the mead repose,
> And milky moisture from their udders flows:
> With feeble limbs the frolic lambkin plays,
> Quaffs the warm mother's milk, and o'er the pasture strays.
> Thus nought may perish: mighty Nature brings
> Repair from ruin through the whole of things;
> Nor suffers birth, nor yields of life the breath,
> Save from the dust of antecedent death.—(251-265.)

The poet then discourses at large on the doctrine of atoms, and the results of their infinitely-varied combinations. He attacks the opinions of several ancient philosophers regarding the first principles of things; contends that the universe and space are alike illimitable; and concludes with a brief yet sublime assertion of the *self-interpreting power of nature*, and the certainty of a rich reward to those who patiently feel their way to her august arcana. The modern reader will be amused with the following reasonings against the doctrine of gravitation and the possibility of antipodes:—

> But fly, oh! Memmius, fly the sect deceived,
> Who teach that things, with gravitation firm,
> To the vast centre of the Entire, alike
> Unerring press: the world who fain would prove
> Void of external impulse, may subsist,
> And nought its post desert, profound or high,
> Since of such gravitating power possessed.
> For canst thou deem that aught may thus sustain
> And poise itself? that aught of solid weight,
> Placed at earth's utmost depth, could upwards strive
> Reversed; and to the surface (in the stream
> As spreads the downward shadow) still adhere?
> For thus such sages hold: thus man and beast
> Subsist, they teach, inverted, earth beneath:
> From their firm station, down their deeper skies
> As unexposed to fall, as towards the heavens
> Ourselves to mount sublime: by them the sun,
> When night to us unfolds her stars, surveyed;
> And equal measuring, in alternate course
> With us, their months, their darkness, and their day.
> Such are the specious fancies error feigns,
> In idle hour, to minds perverse and vain.
> (1051-1068, *Good's Version.*)

The Stoics, whose system is thus acrimoniously repudiated, believed that the figure of the earth and of the heavenly bodies was spherical, and also held the tenet of central gravitation. When asked how it occurred—allowing this to be a fact—that the particles of earth, water, and air, attracted by such common centre, did not fly off from their own proper orbits, and, passing through the vacuum of space, approach that centre, and rest there, to the total subversion of order and the regeneration of chaos—they replied, that such would assuredly be the effect, were it not for a certain elastic or contractile power possessed by the atmosphere of every orb, which compresses its particles together, and thus prevents such a dissolution.* This elastic substance was imagined to embrace and keep compact not only each individual orb, but also the universe considered as a whole. Hence, the poets speak of the "walls of the world."

The second book of the "Nature of Things" opens with a sublime picture of the philosopher's position; surveying securely, from the heights of science, the incessant though fruitless turmoil of vulgar mortals. The poet is thus conducted to what was deemed by his master, Epicurus, an exhaustive definition of happiness—"a body disjoined from suffering, and a mind divorced from care." As the passage which follows is one of the finest in the whole range of ancient or modern poetry, we shall attempt to translate it without abridgment. The reader will note the allusion to the magnificent garniture of the Roman palaces. Their walls and ceilings were often overlaid with gold and ivory, while the pavement was formed of tesselated marble. We are told that Nero caused the roof of his dining-room to be so constructed as to shift and present various appearances during the progress of the banquet. All the furniture of the mansion was provided in a like sumptuous style. In lamps, especially, the ancients were extremely curious. No price was grudged in their purchase, and no pains were spared in their workmanship. Some of those found among the ruins of Herculaneum are ranked by Winkelmann with the most valuable spoils of the buried city.

> Obey we Nature, and her claims are few,
> Delights innumerous on our path she'll strew.
> What though, athwart the hall, no boys of gold
> Their burnish'd lamps of sunny brilliance hold—
> That flame on boards where proud patricians sup,
> And dazzle drinkers in the midnight cup?
> No massy plate in stately service come,
> No music thunder o'er the fretted dome?—
> Yet what care we, on velvet greensward laid,
> Beside some brook, beneath some beech's shade!
> The less when laughs the spring, or summer pours
> Across the verdant meads her blushing flowers.
> Yes! sultry fevers have as fierce a fire,
> And from their victim full as loath retire,
> Though broider'd purple be around him spread,
> As if he stretched him on a peasant's bed.
> Since, then, nor wealth, nor birth, nor wide control,
> Avail the body, can they aid the soul?
> Say, when thy legions bristle on the plain,
> Say, when thy navies stud the ample main,
> Doth superstition, panic-struck, depart?
> Doth dread of death forsake thy troubled heart?
> Can these bid all thy dark forebodings cease,
> And lull the tempest of thy soul to peace?
> If all be vain—if cares and fell alarms
> Fear not the gleam of spears, the clang of arms;
> If bold they thrust 'mid lords and sceptred kings,
> Unawed, uncheck'd, by all resplendent things;
> Invade the court, and cluster round the throne,
> Though gold and purple frown, and bid begone—
> Why doubt that error's films our vision blind,
> And darkness broodeth o'er the human mind?
> As children tremble in the dark, and see
> Ideal terrors, so full often we
> Indulge our baseless fears in blaze of day,
> And conjure phantoms, credulous as they:
> Nor beams material pierce the mental gloom;
> *That* not the sun's bright shafts, but reason, truth, illume.
> (*Book* II. 20-60.)

The poet then goes on to prosecute the old subject of atoms, describing their motions, figures, and other properties; explains the occasions of light and colour; discourses on the vastness of the universe; and concludes, by an induction of imaginary proofs, that this earth has reached the stage of senescence, inanition, and decay—the idea of the world being in its dotage having been a favourite of poets and moralists in all ages.

In the third book, Lucretius advances to consider the nature, seat, and destiny of the soul. At this section of his work, he stands committed to the advocacy of a creed no less unpoetical than false. The elaborate apologist of materialism is self-convicted of treason against the Muse. The dearest hopes of nature, when chilled and scared by the hard visage of scepticism, have ever been wont to find shelter in song. Like the fabled Hamadryad, whose existence was bound up in that of her connatal tree, poetry seems destined to live or perish with the faith of an hereafter.

Our limits permit only a single extract. We regret the necessary omission of a beautiful passage, occurring towards the close of the book, in which the tales of the popular mythology regarding the torments of Tartarus are described as so many allegorical exponents of the tyranny of unbridled passions and the gnawings of an evil conscience. But without leaving unquoted this and other passages almost equally fine, it would be impossible to assign anything like proportionate prominence to the remaining sections of the poem.

> Why think the soul, when desolate and bare,
> Disrob'd, unhoused, it melteth into air,
> Its fleeting being to detain hath power—
> Say—not for ever—for a single hour?
> Nor do the dying feel the spirit pass,
> Unharm'd, entire, from the corporeal mass;
> The bronchial pipe first fill, then mount the throat,
> And last, at liberty in ether float:
> No; as each sense at its appointed part,
> The central soul expireth at the heart;
> While, were the mind immortal, none would mourn
> That the dull body should to earth return;
> But gladly rather fling his garb aside,
> As aged stag his horns, or snake his scaly hide.
> (*Book* III., 602, 614.)

The first of these arguments has already been dismissed, as proceeding on the false assumption that matter is a necessary adjunct of mind, or even an aid in reaching the true notion of that existence; the second can only be fully met by a reference to the teaching of the Christian scriptures.

In the fourth book, Lucretius proceeds to discourse on the various classes of external perceptions, enlarging especially on the properties of vision, and proposing explanations of various optical deceptions. The admirer of Wordsworth will recognise in the verses on echo, rudely disguised as they are in the translation of Creech, the germ of one of his finest thoughts.

> But some parts of the voice that miss the ear
> Fly through the air diffused, and perish there
> Some strike on solid buildings, and, restored,
> Bring back again the image of the word.
> This shows thee why, whilst men through caves and groves
> Call their lost friends, or mourn unhappy loves,
> The pitying rocks, the groaning caves, return
> Their sad complaints again, and seem to mourn.
> This all observe; and I myself have known
> Both rocks and hills return six words for one:
> The dancing words from hill to hill rebound—
> They all receive, and all restore the sound;
> The vulgar and the neighbours think and tell,
> That there the nymphs, and fauns, and satyrs, dwell;
> And that their wanton sport, their loud delight,
> Breaks through the quiet silence of the night;
> Their music's softest airs fill all the plains,
> And mighty Pan delights the listening swains—
> The goat-faced Pan, whose flocks securely feed,
> With long-hung lip, who blows his oaten reed.
> Ten thousand such romaunts the vulgar tell,
> Perhaps lest men should think the gods will dwell
> In towns alone, and scorn their plains and cell.
> (*Book* IV. 572-596, *Creech.*)

We cannot present the reader with a more graceful commentary on the last extract than the following:—"Nothing is more pleasing in ancient mythology than the fanciful doctrine which peopled all earth and sea with multitudes of fair female spirits. Every hill and dale, every grot and crystal spring, every lake, and brook, and river, every azure plain and coral cave of ocean, was animated and hallowed by the presence and protection of the nymphs. Grouped in bands, they braided the flowery garlands, or wove the mystic dance, or watched the cradle of infant gods and heroes, or followed in the train of Artemis. Sometimes they shared the love of the celestials, sometimes they deigned to consort with favoured mortals, sometimes they coqueted with satyrs and sileni; but more often, alone, in maiden purity, they would wander through

* Good's note on the passage, vol. i., 165.

glade or field, and repose on sunny bank or in green-wood covert, rejoicing in the beauty and beneficence of nature. Being dispersed through all creation, the classes into which they were divided, and the epithets by which they were distinguished, are exceedingly numerous. We hear most frequently of the *Naiades*, the fountain, lake, and river nymphs; *Nereides* and *Oceanitides*, sea and ocean nymphs; *Oreades*, mountain nymphs; *Napææ*, *Dryades*, *Hamadryades*, grove and tree nymphs."* The fauns and satyrs are the rural male divinities of Italian and Grecian mythology respectively. Chief of the former is the Latin Faunus, at the head of the latter Arcadian Pan. To him were ascribed all wild unearthly sounds, all strange and sudden terrors; whence, it is worthy of being noted, the English term panic.

With an attempt to account for the phenomena of dreams, and other disquisitions which need not be particularly referred to, the fourth book closes. The fifth opens with a fresh panegyric on Epicurus, whom our poet never tires in praising. That philosopher's system of cosmogony is next explained at large; the mutability of the visible universe is asserted; chaos, the heavenly bodies, the succession of seasons, the solar and lunar eclipses, the rise of animals and vegetables, afford ample scope for interesting discussion and splendid description; and, last of all, we are presented with a delightful view of the progress of human society and the origin of the various arts. We must make room for the group of the seasons, which has been compared by Dr Warton to the exquisite designs of Guido and Carracci. Our own translation is used:—

> Spring comes and Venus; harbinger of spring,
> Comes Zephyr, trippingly, with balmy wing;
> While Mother Flora by their footsteps strews
> Flowers of delicious scents and thousand hues:
> Parch'd Summer next, and dusty Ceres come;
> The sultry blasts forsake their airy home:
> Next, Autumn marches in her mellow pride,
> While tipsy Bacchus staggers by her side:
> Behind, new tribes of tempests sally forth,
> The lurid Auster and the blustering North:
> Then Winter follows with his hoary host—
> Snow, sleet, and stormy hail, and chattering frost.
> (*Book* V. 736-746.)

The last book treats on a vast variety of natural phenomena, such as thunder, lightning, waterspouts, hurricanes, earthquakes, and volcanoes. The poet then passes to assign his reasons for the inundation of the Nile and the poisonous stench of the Averni, attempts to explain the mysteries of magnetism, adverts to endemic and contagious diseases, and closes the work by a magnificent description of the tremendous pestilence, well known from the account of Thucydides, which broke out in Athens during the first year of the Peloponnesian war. With the concluding touches of this terrific picture we now finish our selections:—

> Nor small the misery from the city oft
> That pour'd from distant hamlets; for in throngs
> Full flock'd the sickening peasants for relief,
> From every point diseased; and every space
> And every building crowded; height'ning hence
> The rage of death, the hillocks of the dead.
> * * * * *
> At length the temples of the gods themselves
> Changed into charnels, and their sacred shrines
> Throng'd with the dead; for superstition now,
> The power of altars, half their sway had lost,
> Whelm'd in the pressure of the present woe.
> Nor longer now the costly rites prevailed
> Of ancient burial, erst punctilious kept;
> For all roved restless, with distracted mind,
> From scene to scene; and, worn with grief and toil,
> Gave to their friends the interment chance allowed.
> And direst exigence impelled them oft,
> Headlong, to deeds most impious; for the pyres
> Funereal seized they, rear'd not by themselves,
> And with loud dirge and wailing wild, o'er these
> Placed their own dead; amid the unhallow'd blaze
> With blood contending, rather than resign
> The tomb thus gained, or quit the enkindling corse.
> (*Book* VI., 1257-1261, 1270-1284, *Good.*)

The "Nature of Things" exhibits to us a great poet grappling energetically with a stubborn and untractable subject. Majestic in itself, his theme was barely susceptible of the marvellous graces he has contrived to engraft on it. Lucretius had to sustain the double character of philosopher and poet. He had to do with more than the beautiful outsides of things. Reason was ever hampering and hanging on the rear of imagination. Fact was ever damping the fires of fancy. He may be enjoying, in the simple love of nature, the "angry bravery" and the rich fragrance of the rose, but must explain anon, with dull botanical accuracy, the texture of its stem, the painting of its petals, and the effluence of its odours; he may brood, with awful satisfaction, on the "disastrous twilight" which fancy associates with "perplexed monarchs," and sinking states, and impendent battles, but is suddenly recalled to his proper task—the calculation of an eclipse; he may venture, in lofty mood, into the world of spirits, and Tartarus may rise before him, peopled with shapes of terror, but these he must forthwith transmute into so many vapid allegories; or the bow of beauty may span the firmament, and there may be stealing on him the dream of "gems and gold" flashing through its limber and transparent fabric, but the darling illusion is dissipated for ever by the rude revelations of optics. Such intrusions into her own haunts the Muse loveth not, nor tolerates such tampering with her ideal sanctities.

> She loves the rose, by rivers loves to dream,
> Nor heeds why blooms the rose, why flows the stream;
> She loves her colours, though she may not know
> How sun-born Iris paints the show'ry bow.

* Notes on Ovid, Professor Ramsay, p. 368.

It is interesting to observe, in the "Nature of Things" the triumph of genius over this and other difficulties. Next to the barrenness inseparable from his subject, in the manner, we mean, in which he proposed to treat it, is to be ranked the poverty, for his purpose, of the Latin language. In getting over this obstruction, he has been successful to a surprising degree. Speech bends to his bidding; the tongue of Italy seems to become plastic and subtle as the Greek; his very harshness harmonises with the subject and the man; and his archaisms fill the ear far better than the smoother dialect of his successors. In his logical nexus—in the knitting of his propositions and the marshalling of his arguments—he often reminds us of Young; while the structure of his verse, though far more musical in its varied cadence, suggests to us occasionally the sonorous march of Akenside. But in the strength and grandeur of thought which pervade those passages, which probably drew forth from Ovid the epithet of the "sublime Lucretius," the author of the "Nature of Things" has no rival save Milton. At these seasons the thick clouds of the Epicurean philosophy are not only pervious to the radiations of his genius, but seem to fall back, as if in reverence, from around it, and impart to it a deeper and richer halo. In such moments of inspiration—to employ the words of a living scholar well qualified to pronounce such a verdict with confidence—"Notwithstanding the abstruse and technical discussions inseparable from his theme, he has lighted up his work with some of the grandest bursts of poetry to be found in any language."

"LIFE IN THE WEST."*

Such is the title of a volume through which we have picked our way, not without a share of amusement. The author is a queer independent sort of blade, somewhat confused in his ideas, but with eyes open to what passes, and too sharp to be imposed upon in his wanderings among the American borderers. He professes to have left home and betaken himself to the western regions, both in Canada and the States, in search of land on which to settle; but we do not hear much on that subject, and the bulk of the volume consists of droll sketches of adventure on board steamers, in hotels and log huts, and among parcels of Indians with whom he picks up an acquaintance in the woods and prairies.

Mr Morleigh, as we suppose he is to be called, lands at New York, and gets away westward by Troy and Lake Champlain to the lakes, loitering a good deal at different places on the journey. At Kingston, the new legislative capital of Canada, he "fell in with a lot of Irish and Scotch emigrants; they had just completed some bright deal-board houses. The men were employed by the government, and the women were washing their clothes and children. I asked several of them if they had bought any land; they said they had not, and betrayed most lamentable ignorance, not one of them knowing the name of the vast lake before them. But this did not surprise me much, as we have a wealthy Yorkshireman and his wife at our hotel, as ignorant of the country as the babes in the wood. They bore us to death with stupid and unmeaning questions. They expect to find shingle palaces in the woods, and sugar-trees, and apple-trees, and peaches, and all sorts of fruit trees, and Indian corn growing wild, and wild turkeys as easily caught as tame ones; and I verily believe, if a Yankee told them it rained 'striped pig' in the back settlements, they would believe him." A good quiz this on the ridiculous notions of many persons who emigrate.

At Toronto he finds everything to be now very dull. "There is a listlessness about this great overgrown town that displeases me. Even the plank footways cannot give elasticity to the step. One feels weighed down with the heavy air and drooping aspect of the people who have crowded into the streets and lanes of Toronto, and for what purpose I cannot divine, for there is little or no trade to induce such a swarm of people, rich and poor, to build up streets of two-storey houses here, instead of scattering themselves over the vast tracts of wild lands around them. They live huddled together, and now the seat of government is removed, the good people of Toronto look blank enough. 'It cannot be concealed,' said a tradesman, 'the *city* has been seriously injured by that blow; but we must and will have the seat of government brought back again.' Others pretend it is a great benefit that the seat of government has been taken away; for, say they, the clerks and *employés* bought up all the good town lots at exorbitant prices, but now things will find their level. Level enough, truly, thought I; for the whole town is built on a dead flat—flat as a pancake."

Here the author point blank hits upon what must be considered the grand error in all emigration systems whatsoever, that is, *the emigrants huddling up in towns, instead of boldly pushing into the country, and commencing the proper business for which they set out.* Arriving afterwards at Goderich, he makes a similar remark. At this place "I felt inclined to exclaim against the building mania that seem to possess old country people. Instead of establishing themselves in the woods, they expend their capital upon houses and stones in the town, and, so far from improving their condition by emigration, they are frequently worse off in those new colonial towns than in the old established towns at home. For my own part, I cannot conceive what the people would be at, huddling together, bag and baggage, into every bit of cleared swamp, cut up, gridiron-wise, into streets and lanes, in which the poor wretches purchasing lots are invited to build houses, and establish another thriving new town. If people must and will live together like a swarm of bees in a hive, they ought to thrust themselves into the midst of Manchester, Birmingham, or London, where they may enjoy all the bustle of life, and be fooled to the top of their bent, without running the risk of crossing the Atlantic in a rotten vessel, and seeking society in the backwoods of North America."

Getting to Wisconsin, he proceeds gaily over the open prairie in a mail-waggon to Janesville, on Rock River. The free-and-easy way in which the letters are handled is droll enough. "Secure a seat in the waggon, paying four dollars for the same; an exorbitant price for a seat in such a lumbering old concern. Only two passengers, myself and a carpenter, who carries a tool-chest big enough for a meal-chest or bacon-bin." Arrive at "Mount Pleasant post-office. Here we stop to deliver the mail, and the post-master being out, his wife asks us to enter the house and eat some wild plums while the letter-bag is emptied on the floor; and the good woman, assisted by the carrier and the carpenter, proceeds to select and sort the letters, two children playing with the same.

'Clara, miss! what are you doing? Take your blackberry-stained fingers off the letters. Do; that's a dear. Give me that letter with the red seal.'

'No I wont, ma.'

'Give it to me for this plum, dear.

'No I wont, miss; I'll keep it.'

'There, lift up the infant; don't you see the state the floor, and the letters, and the newspapers are in?' exclaimed the carrier, as the post-mistress caught up her child; and the young ladies, eating plums, held up their hands and exclaimed, 'My!'"

Starting in renewal of the journey, "we continued our route through fine rolling prairie and oak openings, quite parkish, and the oak seems to be the only tree that escapes or resists the fires; however, I observed their stunted growth and gnarled appearance bespoke the rough raising of prairie trees, exposed to winds, fires, frosts, and snows. This day we passed the debris of two houses, one a log and the other a frame house, which had been burned by prairie fires; fate of the inmates unknown, though their carelessness is manifest to all; a simple trench or ditch round their dwellings would have stopped the fire, or turned aside the destroying element."

He at length arrives at Madison, a city in expectation. "It was night before we wended our way through the magnificent streets, squares, and avenues of the young capital of Wisconsin. My companions, favoured by the darkness of the night, amused themselves by telling me the names of the various streets we passed through on our way to the hotel, while I strained my eyes into the oak openings, right and left, in quest of balconies, piazzas, stoops, and colonnades. Mr Morrison, the innkeeper, welcomed us to Madison, led the way into his bar, volunteered whisky and water, or a cobbler, to drive the night dew out of our throats. Moreover, the good man accommodated me with a single-bedded room, a luxury I had not enjoyed for some time. Sunday morning: rose refreshed, and marched out to look at the city, which had vanished like a dream, leaving that great unsightly fabric, the capitol, with its tin dome glittering in the sun, and some forty houses, of all sorts, shapes, and sizes, rained about here and there sparingly, at the corner of the *projected* streets and thoroughfares of this embryo town. Entered the capitol, which I found full of chips, shavings, and mortar: from the door and raised platform, *en revanche*, we have a splendid view of Third and Fourth lakes—for as yet the lakes have been only numbered, it would seem—and there is a chain of beautiful little lakes about Madison. There is nothing grand about the scenery, but all that quiet beauty of wood and water frequently seen in the old settled country at home."

At Madison he is fixed for five days for lack of any conveyance from it. "The only quadrupeds and beasts of burden to be seen in the streets being hogs and oxen. The hogs of the true snake-eating, half-rat, half-alligator breed, infest the doors; the oxen, worn down with toil, jingle their bells as they browse about the highways and byways." A teamster arrives to bait his weary *span*, and embracing the favourable oppor-

* Life in the West: Backwood Leaves and Prairie Flowers: Extracts from the Note-Book of Morleigh in Search of an Estate. One volume. London: Saunders and Otley. 1842.

tunity, he is once more on the road, sometimes riding, and at others sallying on foot after game. The next halting place is Prairieville, where he finds the public-house crammed full of emigrants and residents, great politicians and great wranglers. "In this place, and, indeed, all along the little Fox River, the fever and ague may be traced. Breakfast upon the game we brought in ourselves, and pursue our journey through a densely-wooded country. We have left the pure air of the prairie behind us, and now we progress very slowly over the worst road I have ever travelled; in fact, the trees have been just cut down and pulled aside, and the stumps, rocks, and ruts, render it almost impossible for the horses to tug the waggon along. This being Sunday, we have put up our guns and rifles, and walk before the waggon, perspiring at every pore, and panting for breath. From time to time we pass groups of Norwegians, who have emigrated from their own forests to locate themselves in the only difficult and impracticable belt of woods in Wisconsin. At last we catch a glimpse of the blue waters of Lake Michigan, at the end of the long avenue of dismal woods and infamous roads through which we have been wending our way for hours from Prairieville to Milwaukee. Even in that short route of fifteen miles, I suffered more from heat and fatigue than I have yet experienced in America; for what with the closeness of the air, absence of water, and—but here we are at last, crossing a good wooden bridge into quite a gay-looking town, white stoops, sign boards over stores, houses and villas perched on high banks and cheerful aspects, our waggon proudly drawn up at the door of the Milwaukee House."

Milwaukee is seven years old, and from a single farm-house and a few Indian wigwams, is now a regular town, the hotel, as usual, being the great centre of attraction. "Many of the store-keepers, clerks, and single-men lodgers, editors of newspapers, and clericos, board at our house; certes, the charge for bedroom, board, breakfast, dinner, tea, and supper is not very exorbitant, only six York shillings a-day, and everything in very good style. Finding my host civil, though not at all communicative, I resolved to stay a few days at Milwaukee, to watch the progress of men and things in this singular place. It is no easy matter to pick information out of the denizens here; in other countries, a man may pick up some knowledge, even at a *table-d'hôte;* but here every man seems wide awake, all eyes and ears, and hands and mouth full of his own affairs; his meals are dispatched with impatient haste, bordering on voracity; after meals, he swingeth upon his chair, squirting tobacco-juice, hands thrust deeply in pockets, or whittling toothpicks; he swallows a gin-sling, and flings out of the door—he's gone like a streak of oiled lightning. Whosoever thinks he receives information from one of these slick gentlemen, I say, has been, to use their own singular expression, 'sucked,' left clean as an empty egg-shell, for the rule is to 'gammon a stranger' who persists in asking questions, telling him something 'awfully musical,' and receiving as much of his plain history and adventures as he is ass enough to communicate."

Our hero having heard that there was to be a meeting of Indians to receive an annual payment from an agent of the United States government, he determines to be present, though he must perform a most tedious and fatiguing journey across prairies, through marshes, up rivers, and so on. One day he loses his track, and climbing a tree, "I looked round for miles in every direction; not a living thing seemed within sight or hearing. 'Oh, solitude! where are thy charms?' I muttered, as I resumed my march. Five miles further on, I halted again beside a clear running stream, prostrate by the side of which I enjoyed a delicious draught of the pure and unadulterated in a very primitive manner. But in the very act of swigging up the clear water, I was not a little startled to contemplate the grim visage of an Indian reflected in the flood; and starting up, lo and behold, two gaunt fierce-looking old Indians stood beside me. How the deuce they could have glided up so noiselessly I could not divine—for even the snapping of a dry stick could be heard half a mile off. But the salutation, 'Bo jou, bo jou!' showed they were friendly." Following these Indians, he is conducted to the house of Monsieur Grignon, a half-breed, and a successful trader in those parts. At this establishment he is well received, and meets with a large party going to "the payment," headed by Osh Cosh, chief of the Menomenees. Osh Cosh has not an imposing appearance; he is "a dirty mean-looking little Indian, with a large mouth, bandy legs, a quick eye, and mean-looking brow," little better than "a worshipful chimney-sweeper in an old dirty blanket. Observing that his coarse black hair hung down over his face, and his cheeks were covered with dirt, I inquired if any accident had befallen his excellency, or royal highness. The answer was brief: 'The chief is in decent mourning for one of his sons lately deceased.' I thought of the ancient custom of the Jews—how David humbled himself in sackcloth and ashes, &c." Osh Cosh, we are informed, was in a bad humour; he did not approve of the mode of taking the census of his tribe, and paying each individually; he wished the chiefs to receive the money, and divide it as they thought proper. A rude sort of entertaintment being served up in the hut, "Osh Cosh declined sitting at the table. He was served with wild-duck stew, tea, and cakes, on a stool in the chimney-corner. Tea over, Osh Cosh signified his intention to make a speech, and profound silence being observed, he stood up before the red embers of the fire, dropped his blanket from his shoulders round his loins, and raising his right hand, spoke in a deep, yet clear and somewhat sonorous voice, without stopping, for at least half an hour, my friend, the bluff Frenchman, interpreting what he said to me from time to time. The speech, from first to last, was in the declamatory style, and against whisky. He said he had seen many barrels lying in the reeds, waiting to be broached when the payment was made; but he would set his face against any such underhand proceedings. Fire-water (iscodaywabo) was the secret poison—the knife with which the Shemookmen (the American, or long knife) destroyed his young men. He would set his face against this fire-water; he would tell the agent (or money-carrier) that he would rather see all his money thrown into the river than lose a single warrior by drunkenness and brawling. He then reverted to what occurred at the last payment: 'a man, goaded to madness with fire-water, killed two women, and fired at a man; the band to which the women belonged rose to a man, and rushed upon the drunken madman; what they did you all witnessed, and, I shame to say, I witnessed also,' said the chief. 'They threw him on the great council fire, and he was burnt. The white men fled—the pale faces were filled with fear; it is not right they should bring away such evil reports. I am resolved to preserve order in the camp, and set my face against the whisky-traders.'"

The speech of Osh Cosh met with a loud and approving grunt; but we shall immediately see how his tee-total principles were acted upon. Paddling in canoes up Wolf River, the party, including our voyageur, reaches the place of assemblage. The first thing that occurs is a meeting of all the traders in front of a large round wigwam, styled the Council Lodge, and here "one and all signed a paper, or mutual agreement, not to sell whisky to the Indians till the payment has been made, and then they may all start fair. Osh Cosh and the Grignons are the prime movers of this good measure; and the better to carry it into effect, all the whisky barrels are to be stored in the bush at the other side of the river, and every drop seized on this, or the Indian side, is to be thrown into the river."

The accommodations in the Council Lodge were not first-rate, and the night was bitter cold. "The keen frosty air whistled freely through the chinks in the frail sides of our lodge; the dogs frequently broke through the mats at the door, and prowled about us. The Indians also kept up a perpetual howling, singing, and flute-blowing, round the embers of the fire in front of the wigwam. The agent, poor man, was grievously disturbed by this noise; and frequently during the night he started up from his bed, blankets, and sheets (which he had taken the wise precaution to bring along with the money boxes), and thrusting his head out of the lodge, he would roar at the Indians, 'Tell them to stop that noise! make less noise there!' Then groping his way back to bed again, he sometimes stumbled over the snoring clerk, who would awake in a great fright, and halloo, 'Thieves! mind the boxes! murder!' &c. It was next to impossible to sleep for an hour without being routed up by some vile noise either within or without, and in the morning I rose up far from being refreshed with my first night's bivouac on Indian ground.

Got some savoury stew for breakfast this morning, down town, at the sign of the 'Striped Apron,' which floated gracefully above six wigwams thrown into one, by a spirited New England pedlar from the bay. He has got together sundry cooking utensils, and a barrel of flour, some pork, and, strange to say, coffee. He thinks he will clear his expenses, and perhaps a little more, as he charges half-a-dollar a meal. The long wigwam is the rendezvous of all the traders and loafers in the place, though the Indians seldom pass the threshold."

Several days are spent in preliminary business, such as taking down names, settling qualifications, and other matters, while hunting and gambling go on among the more unconcerned spectators. Osh Cosh's excise laws are, till this stage of affairs, pretty rigorously enforced. "A negro barber from the bay has been detected selling whisky to the Indians; in his lodge he had several barrels of whisky concealed, and the appointed mixed force of traders and sage Indians, who have endeavoured most laudably to keep the peace, and prevent the sale of whisky, have seized upon this nigger's illicit store of the baneful fire-water, and the barrels having been rolled up in front of the Council Lodge, the agent and Osh Cosh are called on to decide as to its fate. Meantime the nigger goes about exciting the pestilent half-breeds and profligate Indians to rescue his whisky, using the most abusive language, saying he will get up a big fight for his whisky, wishing he had his bowie knife, and, in short, provoking some hardy pioneer to thrash him."

Several other seizures are made in gallant style; but the regulators of morals are not proof against the temptation of so much liquor. "In the midst of their seizures they could not help tasting, and from tasting went on to swigging, from swigging to tippling, and at last they cut a most ludicrous figure, marching about from lodge to lodge, and from tent to tent, in quest of whisky, inveighing against the fire-water, while they were hardly able to stand; indeed, the major who commanded seemed to think he commanded a regiment, instead of a dozen boosy traders in red and grey night-caps, and some half-dozen old Indians in blankets; he carried his cudgel like a pike; 'It looks well, at least, said my uncle Toby.' Frequently halting his men in front of the Council Lodge, he would inspect them with great severity, give them speeches upon military discipline, read what he called the order of the day, which was the old declaration of independence; then putting himself at their head, march round the whisky barrels as if they were the trophies or spoils of war, followed by a mob of drunken half-breeds and whooping Indians. But at last the whisky was given up, and I saw the poor major, flat as a flounder, his occupation gone, his band dispersed, and in a hoarse voice he exclaimed against the ingratitude of the traders, who had not rewarded him for his zeal even with a letter of thanks."

Next morning was pay-day. "The whole village was up and stirring; flags and streamers were hoisted in front of the traders' lodges. One man, to attract notice, had taken advantage of a dead tree in front of his lodge, and covered its branches with strips of red calico, blue ribbons, and gew-gaws; another hoisted a dozen striped shirts, another a red blanket, another a green blanket, and the traders strode backwards and forwards in front of the goods, bawling as loud as their lungs could bellow. While the Indians and their squaws surrounded the Council Lodge in groups, the squaws for once dressed in all their finery, and the young men vying with each other who could show most vermilion, yellow ochre, and indigo on their cheeks, and feathers—red, horse, and moose hair—on their heads, wampum and beads, bracelets and gorgets, round their arms and necks. The sun shone out gloriously, and the *coup d'œil* was most enlivening; several Indians had brought up their horses, and rode about at a break-neck rate over the stumps and logs. The Council Lodge had been metamorphosed into a pay-office; a door opened on each side, through which the Indians were to pass, and receive their pay from the agents at a long counter, upon which the contents of the money boxes, some twenty-seven thousand dollars, was piled up in goodly rows. Some of the traders, especially the Grignons, beset the door of egress, and as every Indian passed out, received the amount he owed for goods received on time. Thus it frequently happened that an Indian came away from the lodge as empty-handed as he entered it, the squaws alone hesitating, and frequently refusing to part with the dollars at once.

The moment the last dollar was paid, down went the American flag, and the agent and his men rushed to their boat, plied their oars, and sheered off from the scene of action. Then the whisky sellers took the field. The young Indians clubbed together, and bought barrels of fire-water, knocked in their heads with their clubs and tomahawks, and helped their friends all round to bowls and cups of the spirit, above proof—real fire-water.

The result may be anticipated: the whole village became a scene of riot and debauchery. I retreated to my friendly trader's lodge, and found him expostulating with a few young Indians upon the folly and wickedness of getting drunk. Indeed, this good man's words and example seemed to have considerable effect on his hearers; he begged of them to quit the village, bag and baggage, now they were paid. Several followed his advice at once, and others began to remove the mats, &c., from their lodges; while the Indians who lived in his vicinity lodged their money for safe keeping in his hands. One old trapper actually deposited forty dollars with him, but would not go home—no, he preferred plunging into the midst of the riot and revelry. Next morning I hardly knew him, as he sneaked up, all covered with dirt and blood, to ask for his bundle.

That evening the rain came down in torrents; my host stood at the door of his lodge, and endeavoured to prevail on the Indians to pass on, and go home, but their drunken friends soon found them out. They came with kettles and cans full of whisky, which they insisted we should taste. My host obstinately refused, and the result was, that a good deal of whisky was spilt, the Indians forcing cans of it against our lips, while we evaded the torrent; this was the most disagreeable part of the entertainment.

At night we barricaded the door with empty barrels and logs, but the Indians still came begging for money to buy more whisky, and the rain entered the roof and sides of our lodge. My blanket was saturated; and at midnight I sat up, finding it impossible to close an eye amidst the wild howling, terrific shouts, screams, love and war songs, of the drunken savages without. As my host observed, it was worse than bedlam broke loose—it was like hell upon earth. Crowds of unhappy children crawled round our own lodge, crying bitterly; some of them contrived to creep into the empty barrels at our door, and that barrier was broken down before morning with a loud crash.

The grey morning dawned heavily upon the Wolf River; as I went forth and looked around, not a third of the tents, lodges, and wigwams was standing; all was misery and wretchedness. The ground was covered with drunken savages, stripped of their finery, torn and tangled with filth and briars. The half-breed whisky-sellers plied their vile vocations, determined to sell every drop of liquor they brought to the ground. All the respectable traders had huddled up their goods and retreated, or prepared to start away in canoes. I was not a little surprised to see the old

squaws gliding about with rifles, war-clubs, and tomahawks, under their arms; in fact, they are the only efficient police, carrying off their husbands' weapons before a carouse, to prevent bloodshed if possible."

We have seen enough of this horrible picture, and here, with our author, close these sketches of doings in the "far west."

BIOGRAPHIC SKETCHES.

VINCENT DE PAUL.

THE name of Vincent de Paul is almost unknown to the general public of Britain. The case is very different, however, as respects France, the land of his nativity. There he holds the same rank which the Howards hold in our own country; and, like these individuals, he deserves to be known wherever benevolence is honoured and genius admired.

Vincent de Paul was born at Ranquines, a hamlet in the department of the Landes, on the 24th of April 1576. His parents were not wealthy, and in boyhood he was intrusted with the humble office of tending their sheep. At the age of twelve he was placed under the cordeliers of Acqs, in order to receive his education. He made rapid progress in his studies; and, at sixteen, had qualified himself for becoming tutor to a respectable family, in which he acquired sufficient means to recompense his parents for their past outlay, and complete his course of training for the priesthood. In 1596 he received the tonsure; and, for the next seven years, supported himself by teaching, preferring to continue the while his theological studies rather than accept a curacy, for which he conceived himself not fully qualified. A considerable sum was left to him in 1605, soon after which event, while sailing with a friend to Narbonne, he was taken prisoner by a Turkish corsair and carried to Tunis. There he was sold as a slave, and for two years endured the hardest fortunes, under successive masters. At length he fell into the hands of a Savoyard renegade, one of whose wives was of Greek extraction. This woman used to visit the fields where Vincent de Paul followed his laborious occupations, and one day she asked him to sing a hymn to that God who seemed to be so much in his thoughts. With tears flowing from his eyes, he sang to her the song of the expatriated children of Israel, commemorative of the time when they hung their harps upon the willows by Babel's streams. The Greek woman was herself far from home, and the mournful melody went to her heart. She had great influence with her husband; and the issue of her representations was, that he not only gave the French captives their liberty, but accompanied them in their flight to Avignon, where he was publicly restored to the bosom of the Christian church.

Soon after his return on this occasion, Vincent de Paul accompanied the vice-legate to Rome, and gained so much on the esteem of the Pope, and other high ecclesiastical dignitaries, that he was sent by them on a mission to Henry IV. in the year 1609. His subsequent nomination to the office of almoner to the French queen, Marguerite of Valois, exposed him to such temptations that he soon resigned the office, and sought repose of conscience in retirement. After holding a rural curacy for some time, Vincent was appointed tutor to the three sons of the Count de Joigny, absentee-governor of the convict-galleys at Marseilles; but pressed again by a tender conscience, he left for a time that household, to undertake the spiritual charge of Chatillon-les-Dombes, in Bresse. This place, notorious for the vicious habits of its population, became, under the eye of its zealous pastor, the abode of happiness and virtue. The poor and infirm were already the peculiar charge of Vincent de Paul; and it was here that he established, for their benefit, his first Fellowship of Charity (*Confrérie de Charité*), an institution which became the model of numerous others subsequently formed in France. Vincent returned to the family of De Joigny in 1617, at the pressing intreaties of the countess, who had felt his loss deeply. He now entered earnestly on the formation of missions for the religious instruction of rural places where it was greatly required. But a much more striking task to which Vincent de Paul devoted himself, was one connected with the galley-convicts. He visited the prisons where they were for a considerable time confined before being sent on board the ships at Marseilles. He then saw, to use his own words, "unfortunate beings shut up in dark and deep dungeons, devoured by vermin, attenuated by want and misery, and entirely neglected both in body and soul." This state of things excited in him the profoundest emotions of pity and sorrow, and he resolved that it should exist no longer. Receiving leave from the Count de Joigny, he commenced by purchasing, in the street Saint Honoré, a building large enough to receive all the convicts of Paris condemned to the galleys. He then made an appeal to the charity of his friends, in order to enable him to perfect that establishment for the reception of the convicts. The result was, that, by indefatigable personal exertions, he restored comfort to these unhappy persons, and converted them from reckless and blaspheming maniacs into peaceful and resigned penitents. All men marvelled at the change effected by the unwearied zeal of a solitary individual, and the king was so much struck by the spectacle that he appointed Vincent de Paul, in 1619, almoner-general of the convict galleys of France, in which office it was in his power to extend greatly the range of his benefactions. He was also intrusted with the government of the first convent of the Visitation at Paris.

The year 1622 was remarkable for one of the noblest acts which Christian charity ever prompted a human being to perform. Vincent de Paul had quitted his duties in Paris in order to satisfy himself, with his own eyes, of the condition and mode of management of the convicts in the galleys at Marseilles. To prevent prepared exhibitions, he went without warning, and unknown. In passing from rank to rank of the convicts, he came to one poor young man, who appeared far more desolate and despairing than the others. Vincent inquired into his case. He had been condemned to three years of the galleys for smuggling, and the cause of his deep sorrow was the miserable condition to which his wife and children must have been reduced by his absence. Touched to the soul by the tears of the convict, Vincent took a resolution which few men could have taken. In alleviating the sufferings of the condemned, he ever impressed upon them the necessity that existed for bowing to the laws; and he would not, even in this case, teach an opposite lesson by applying for a reprieve, but gave the laws a victim in his own person, and sustained their dignity. With consent of the superintendant, the young man was freed, and Vincent took his place. For eight months he endured all the hardships of the galleys, working daily with a chain around his leg, which left a weakness never effaced during his life. Nor was this done in ostentation. So different was the case, that, though the fact was proved on his posthumous canonisation, the probation was rendered difficult by his never having been known to talk of it during his life, even to his most intimate friends.

In 1623, Vincent de Paul established, at Maçon, two Fellowships of Charity, one for men and the other for women. The principle of these institutions was, to give alms and relief daily to certain poor persons inscribed in the list after inquiry, to give a lodging to poor travelling persons for one night, and to send them on their way next morning with a small sum of money. Such were the institutions, resembling our Houses of Refuge, which Vincent de Paul was the means of originating and spreading throughout France. For these institutions alone his country owes him a deep debt of gratitude. To understand fully the difficulties which he had to overcome, the temper of the age in which he lived must be borne in mind. "When I established the charity at Maçon," says he, "every one mocked me. I was pointed at with the finger on the streets; no person believed that I could ever attain my end; and yet, when the thing was successfully done, many wept for joy, and all combined to pay me so much honour that I was constrained to leave the town in secrecy to avoid their applauses."

Continuing closely occupied with the formation of charities and missions, Vincent de Paul, in 1625, carried out the latter object by the establishment of a great religious community in the college of the *Bons Enfants* at Paris, for the purpose of instructing rural districts, and training young men to the ministry. The great object of the founder was to take away from the church the scandal resting on the ignorance and license of the clergy. This institution, called the Congregation of the Mission, became a noble one, and its influence was felt not only over France, and in all parts of the world where they had formed settlements, but over all Catholic countries. Its great utility was acknowledged by the popes, and by Louis XIV., who assigned to it a large income.

The establishment of the order of the Daughters of Charity, so famous in France for their attention to the indigent and the sick, was the next great work of this indefatigable man, whose touching appeals moved even the most insensible to contribute to the ends of charity and benevolence. He also established the order—at first a distinct one—of Female Visitants to the Hospitals for Disease. In the war of the Fronde, several thousand Germans, who had been induced to enter France, were left by their employers to perish, and would have perished, had not Vincent stirred up a general spirit of charity in their behalf, and got them sent back, clothed and fed, to their own country. The calamities of the same war were fearful in many French provinces. Famine and pestilence ravaged the ranks of the soldiery, and the fields were covered with unburied bodies. Vincent raised twelve millions of francs, which he, with his coadjutors, carried to the relief of the sufferers, giving them food, attire, and medicine, and saving numberless lives from too probable destruction. De Paul went on his knees before Cardinal Richelieu, to intreat that minister to assent to peace. His petition was not without its effect.

During the regency of Anne of Austria, Vincent was named president of the Council of Conscience, and, in that position, brought his influence to bear on many new abuses. As one example, he procured the renewal of the ancient ordinances against duels; but the most famous of his actions was his permanently fixing the lot of foundlings in France. These unfortunate victims of error and wretchedness, for whom Vincent de Paul had already done some good, having had provision made for many of them, in various quarters, were about to be abandoned to their former misery for want of funds and sympathy. Vincent, who allowed no obstacles or toils to stop him in the cause of humanity, made exertions for the assembling of the women of Paris, of higher and lower rank; and, when they were met, addressed them in the most moving terms in behalf of the poor innocents, whom their unhappy or unnatural parents left to the mercy of chance and the pity of strangers. "These unfortunate and guiltless children," he cried, "will live if you bestow on them your charitable cares; death is their inevitable portion if you abandon them." His language so moved his auditory, that an instant subscription of forty thousand livres took place; and, ere long, an annual income of the same amount was insured for this benevolent end. The king granted a building for the reception of the foundlings, and their comfortable maintenance was placed beyond the effects of chance or change. In this instance, the effect of De Paul's efforts may be of a doubtful nature; but the excellence of his motives cannot be disputed.

Besides all these acts of benevolence, Vincent de Paul obtained numerous benefactions for existing charities in France, and otherwise improved their condition. His personal influence with courts and nobles became latterly very great; but his deeds of charity were effected chiefly by personal exertions, in which neither danger nor ridicule could make him pause. His manner was gentle and attractive, and his eloquence of that kind that alike touched the heart and convinced the judgment. In early days, indeed, the repulses which he encountered had made him harsh and rough in his address; but he detected the fault, and, by a strong effort, permanently cast it off. Vincent de Paul died at Paris in September 1660, at the age of eighty-five. He received the honours of canonisation, the highest of his church, in 1737, from Pope Clement XII.

The whole career of this estimable character affords a strong proof of what may be done by the indomitable will and untiring energies of one man.

CONTINENTAL RAILWAYS.

[From the *Times* newspaper.]

THE progress of the railway system on the continent is a subject of growing importance with this country, and, indeed, with the whole of Europe; yet it is one on which, at present, little accurate information is possessed. A work which has just made its appearance in Paris comes very opportunely to supply this deficiency. It is entitled, "Chemins de Fer de l'Allemagne et du Continent Européen," and is written by M. Bourgoing. We propose, on the score of its great utility, to set forth, in a very condensed form, the principal facts contained in this publication.

The first system of railways examined is that of Austria, where the entire direction of these enterprises has of late been taken into the hands of the government, to which effect a decree of the emperor was published, providing that all railroads should be divided into roads of the state and private roads; the first to be exclusively carried on by the state, while the second is left to the management of private companies, the plan of whose works, however, is to be drawn up by the government. Those more important branches which are at present in the hands of private companies will nevertheless remain so, and the privileges already granted strictly maintained. All matters relating to railways are referred to the Presidency of the Convention, under whom a committee is appointed to decide on the technicalities and details of administration.

The principal Austrian line is that called the Northern, or Emperor's road. This road extends from Vienna to Warsaw, with branches to Brunn and Olmutz, where the part completed at present ends. The remainder is in progress of construction. The entire length of the line from Vienna to Olmutz is twenty-eight German miles, which was performed to and fro in one day. The communication with this town, one already of great commercial consideration, is far more important than that with Brunn, as it favours the commercial relations with Silesia, Poland, and Bohemia. The next line of importance is that from Prague to Dresden, but this is only in projection; and the capitalists of Vienna who were invited to take a part in the enterprise have refused to comply until that from Vienna to Prague be established. Meanwhile, a committee has been instituted to trace out the plan of operations, and they have determined that the only suitable line would be one which should follow the course of the Elbe and the Moldau. There is no doubt but that a road will eventually be established between Vienna and Prague, and thus a system of railroads will be formed joining the north and south of Germany, which, if extended to Trieste, as it probably will be, will present a continued line from the Baltic to the Adriatic and Mediterranean. There exist other railways also, as that from Linz to Budweis, and from Prague to Pilsen, which are but ill constructed, and unfitted for steam-carriages; and one from Linz to Smunden, better constructed than the former, but still only capable of horse-conveyances. A central railway in Hungary, following the left bank of the Danube, has been authorised by the Diet, and in July 1840, all the shares, forming a capital of 8,000,000 florins, were taken. At present the only railroad existing in Hungary is that from Presburg to Tirnau, which was opened in September 1840.

The kingdom of Bavaria, where, under the auspices of the present sovereign, the arts of civilisation have, within the last thirty years, made great advances, has not been backward in appreciating the advantages of railway communication, although its railways at present exist only

in project, with the exception of one from Fürth to Nuremburg, and another from Augsburg to Munich. The first, which is two Bavarian leagues in length, was constructed by a company of shareholders, and opened in 1835. The last dividend, declared in January 1842, exceeded 16 per cent. That from Munich to Augsburg, also constructed by shares, is 16¼ Bavarian leagues in length, and cost 9,015,000 f., including a portion of the necessary implements. It was opened in October 1840, and the number of passengers conveyed during the year amounted to 253,680, the total receipts for the same period being 547,774 f.

In 1841, a convention was signed between Bavaria and Saxony, for the construction of a railway from Nuremburg to Leipsic, which is to pass through Bavaria by Erlangen, Bamburg, and Hoff, and through Saxony by Plauen and Altenburgh. The king has also determined on the establishment of a road from Augsburg to Nuremburg, and the entire line from Augsburg to Hoff will be constructed at the expense of the state. The portion which extends from Nuremburg to the frontiers is to be completed in the space of five years. Several other lines are also, though distantly, projected, namely, one striking south-west of Augsburg into the valley of Nerlach, through Kempten to Lindau, on the Lake of Constance; another to Dillingen, thence to join the railway of the Neckar and the Rhine; a third will extend to Ulm, pass through Kaustadt, Heilbronn, and Heidelberg, and join Rhenish Bavaria with Bavaria; a fourth, according to arrangements with Saxony, will diverge at Bamburg from the Nuremburg and Hoff line, extend through Coburg and Meningen, and so reach the Prussian lines. It is probable that a railway will also be established from Munich to Salzburgh and Vienna.

In the Grand Duchy of Baden, the greatest activity is at present displayed in completing a railway stretching from Mannheim, through Heidelberg, Carlsruhe, Kehl, and Freyburg, to the frontiers of Switzerland, near Basle. Its entire length comprises 62 3-10 leagues, and the total cost is estimated at 55,025,218 f.

Wurtemburg has as yet no railways either in a finished state or approaching it, but negotiations have taken place between this state and Baden, which will in all probability terminate in the commencement of a system forming a connexion between the Rhine and the Danube, which will prove of immense importance to all Germany, while at the same time it facilitates its own internal relations. Engineers have examined the country, and have concluded a plan divided into three portions. The first forming a line from Heilbronn to Kaustadt, and from Krusslingen on the frontiers of Baden to Ludwigsburg. The second would join the former line with the Danube, extending from Kaustadt through Goeppingen and Esslingen to Ulm, and consequently would require a section through a chain of the Alps. The third would effect the junction of the Danube with the Lake of Constance, passing through Biberich. This line presents greater difficulties than any of the rest, in consequence of the great heights intervening between Ulm and the Lake of Constance. The estimates for these three divisions amount to 31,430,520 f.

In Prussia, a country admirably adapted by nature for such enterprises, on account of the vast extent of its plains, the railway system is pursued with the greatest activity; and it already possesses several lines of considerable importance, while daily progress is made in the construction of others. From Berlin four lines diverge; the first to Potsdam, 3½ German miles in length; it was constructed by shares, and cost 5,090,600 f. The next extends to Frankfort-on-the-Oder, and is in process of construction by a company of shareholders, authorised by royal ordinance, and whose capital amounts to 3,140,000 f. This road, which is 10½ German miles in length, will, it is expected, be terminated at the end of the present year, when it will prove of the utmost commercial benefit. Another line proceeds to Koethen, passing through Juterbogh, touching the Elbe at Wittemberg, and after following that stream a short distance, crosses to Dessau. The length of this road is twenty German miles; it was constructed by a company of shareholders with a capital of 4,200,000 dollars, and was thrown open to the public in September 1841. The fourth line, which is now in course of construction, goes to Stettin; it is 18 German miles in length, and will cost, according to the present estimates, 9,271,400 f. The opening of this line will take place, it is anticipated, at the beginning of next year. A railroad has been completed, extending from Magdeburg through Koethen and Halle to Leipsic. It is constructed with a double track, and is 14 miles in length, which distance is performed in from 3 to 3½ hours. The plan of this road has been censured by experienced officers, in consequence of its being laid on the left bank of the Elbe, as, in case of a war with the west, it would become necessary to destroy it. It is proposed to establish a line from Halle to Frankfort-on-the-Main, passing through Weimer and Gotha, and the treaty relative to this project has already been signed by the interested states. As it is of the greatest importance, both in a commercial and military point of view, that Halle should be in direct communication with Cassel and Cologne, a railway has been projected effecting this junction. Cassel will also be placed in communication with Altenburgh, with Brunswick, and with Frankfort, and thus will become the centre of five great national lines. From Dusseldorf to Elberfeld there exists a railway four miles in length, which is now open for the conveyance of passengers. The latter town, which is now one of the most important trading centres, will shortly be joined to Cologne by a line extending through Lippstadt to Minden, and connecting the Rhine with the Weser. It will be 34 miles in length, and its cost is estimated at 22,641,000 f. Cologne has already a railway to Aix-la-Chapelle, which is 9½ miles long; it was opened in September 1841, and is in the hands of the same company as the Cologne and Minden line. Arrangements have also been made for the establishment of a railway from Minden to Magdeburg, passing through Brunswick and Hanover. Meanwhile, vigorous efforts are being made to complete the line between Aix-la-Chapelle and Liege; so that the time is not distant when a general line of communication will exist between Belgium and Prussia.

In the kingdom of Saxony, great attention has been paid, from a very early period, to the construction of railways, and no other part of Germany have they repaid with so much advantage. Leipsic, especially, has beheld its prosperity daily increasing. The railway from this down to Dresden was constructed by shares, and thrown open in 1839. It is 15½ German miles in length, and has two tracks, the second of which was completed in September 1840. For the year 1840, the receipts were 1,702,895 f., and the expenses 919,535 f., the number of travellers having been 415,135. The kingdom of Saxony, together with the Duchy of Saxe Altenburgh, has entered into an agreement with Bavaria for the establishment of a line from Leipsic to the frontiers of Bavaria at Hoff, passing through Altenburgh, Krimitzchau, Plauen, &c. The necessary capital is 6,000,000 f., one-fourth of which will be supplied by Saxony and Saxe Altenburgh, and the rest by shareholders. The shares are at present all disposed of, and the works were commenced in July 1841. Their conclusion is promised for 1847.

One of the best regulated and most conveniently constructed railways in Germany is that belonging to the free town of Frankfort. It is nine leagues in length, and extends to Wiesbaden, taking in Mentz. The cost of this line was 7,000,000 f., and the returns are now as much as 16⅜ per cent. The engineer, M. Denis, under whose direction the works were carried on, is the same who constructed the lines from Nuremburg to Furth, and from Munich to Augsburg.

The kingdom of Hanover is daily expected to conclude a treaty with Brunswick for the establishment of lines connecting Hamburgh, Hildesheim, Celle, and Brunswick; and it is also in negotiation with Bremen on the subject of a railroad to that rich and commercial town. The Duchy of Brunswick has already a railroad in a complete state from Brunswick to Huzzburg, five miles and three quarters in length; and a company is formed for the construction of a line from Brunswick to Hamburgh, passing through Heide and Luneburg, which, it is anticipated, will be extended to Wismar. The city of Hamburgh will, through the arrangements now in progress in the different states above spoken of, be placed in direct communication—1st, with Berlin, and thence with Frankfort-on-the-Oder and Stettin; 2d, with Madgeburg, and thence with Leipsic and Dresden; 3d, with Hanover, and thence with Brunswick and the Harz. The projected line from Hamburgh to Berlin is already being actively carried out. The subscription lists are closed, and the sum subscribed by Hamburgh amounts to 54,000 f., a very feeble portion of the necessary capital; but it must be considered that it has undertaken solely at its expense that part of the line requiring the most outlay—namely, from Hamburgh to Bergedorf, and which is now almost completed. Hamburgh, however, with the other free towns, Lubeck and Bremen, have not shown themselves so actively disposed to favour this project as Prussia, whose interest is far more evident in it than their own. In Denmark, it is expected that a railway will shortly be commenced from Kiel to Altona; and there is some question of one from the same town to Gluckstadt, on the mouth of the Elbe; but Denmark, who derives a large share of revenue from the tolls of the Sound, has always evinced the strongest opposition to any plans having a view to facilitate the communication by land between the Baltic and the German Ocean. Such interested motives, however, will not hold out long against the strong impulse which now animates the whole confederacy in establishing a great and general system of railway communication.

With regard to Belgium, it was natural that, with all the facilities and resources which it possesses in itself for this species of construction, it should rapidly arrive at a complete system of railways, and, indeed, little now remains to be done in that respect.

The following is a list of the lines now in full operation:—From Brussels to Antwerp, by Mechlin; from Mechlin to Ostend; from Mechlin to Aus; from Landen to St Frond; from Ghent to Courtray; from Brussels to Subise.

Holland, too, has recognised the necessity of following the example of surrounding states, and although it has but one line in a finished state, that from Amsterdam to Haarlem, it is actively engaged in forming a regular and extended system. The lines from Haarlem to Leyden, and from Leyden to the Hague, are already in process of construction, while other lines have been projected, forming a round from the Hague, through Rotterdam and Utrecht to Amsterdam, and their directions traced out. It is also projected to establish a line from Utrecht through Arnheim to Dusseldorf, there to join the Prusso-Belgian line. Four or five years, it is expected, will see this line completed. In Russia, with the exception of one short line from St Petersburg to the Imperial palace at Zarskojeselo, no railways exist; indeed, in a country where the natural facilities for conveyance are so great, the frost, during six months of the year, rendering the land hard and smooth, these modes of communication are not so desirable. It is, however, understood that a project is on foot to establish a line from St Petersburg to Moscow, which is to be undertaken by a society of foreign capitalists. The expenses of such an enterprise have been estimated at 400,000,000 roubles, and England has offered to supply the rails, of which a length of 150 leagues will be required; and although twenty per cent. above the English price has been offered to Russian forgemasters, it is probable that they will not be able to compete with us.

It is not likely that Italy will remain long without railways; in the Lombardo-Venetian states, a short line has been completed between Milan and Monza; and a series of lines will shortly unite Milan and Venice. The construction of a railway of no great length, from Castellamare to Naples, is daily expected to reach its termination; and it is already announced as certain that companies have been formed for the establishment of lines connecting Florence, Lucca, Pisa, and Leghorn. There is also some question of a railway from Rome to Civita Vecchia. With regard to Switzerland, the great difficulties which the country presents, and the obvious interest of its inhabitants in delaying travellers, will doubtless oppose an obstacle for some time to the establishment of railways. Nevertheless, a line from Basle to Zurich has been talked of.

ANCIENT WORLD.

The ancient world was only a little world. Although warlike, it derives its chief glory from the works of genius, from the writings of poets, historians, and philosophers. Viewed through this glowing but exaggerated medium, that looks great and magnificent which in reality was stinted, meagre, and desolate. Alexander vainly thought he had conquered the universe when he had only ravaged a district. Nations were then only tribes, empires cantons, and their half-savage rulers hardly more potent than emirs of Lebanon or khans of Tartary. Most of what now constitutes the earth, and fills it, was unknown; the great seas and continents were hid below the horizon of the ancients; even the swell of an ocean-tide had scarcely been felt by them; and all their conquests, battles, and bustle—the sites of their great cities and kingdoms, as well as of their histories and epic poems—never ranged far from the tranquil shores and islets of the Mediterranean lake.

The number of people corresponded to their narrow geographical limits. How, indeed, could mankind be numerous without the means of sustenance, when there was little commerce, and no manufactures; when they were strangers to the useful arts, by which a dense population can alone be fed, clothed, and lodged? All, therefore, which has been transmitted as to the extreme populousness of the ancient world, may be considered almost as deceptious as its oracles. Carthage, according to Strabo, contained 700,000 inhabitants; Athens, inclusive of slaves, about half a million; Rome, four millions. It is not improbable that in these representations there is a wrong figure or a redundant one. Statements of numbers are very liable to errors, and the errors to be copied or multiplied, as the grammatical construction does not detect them. Besides, it must be remembered of Athens and Rome, that, though termed cities, they were more properly districts or provinces walled in. The present remains of the Roman walls show that they were of vast extent; but they encompassed large tracts of country, were truly *rus in urbe*, and included in their circuit woods and water, and corn-fields, as well as mansions and spacious gardens. And Rome, as is well known, comprised the chief of Italy. Genoa, Milan, Florence, Leghorn, and other noble cities, are of recent foundation, and pertain entirely to modern history. Italy, even in the Augustan age, must have been thinly peopled, and doubtless afforded a free passage enough for those vast herds of swine (one thousand in number) of which Polybius writes, and which were guided in their pastoral migrations by the blowing of horns. The severity of the climate in the most busy regions of the Old World attests the scantiness of population. In Ovid's time, the Black Sea was often frozen, which would be quite a phenomenon at present. That Italy is warmer now than formerly, we have many testimonies. From various passages of Horace, we may suppose that the streets of Rome were full of snow; and Juvenal refers to a woman breaking the ice of the Tiber to perform her ablution. I never met with a tourist who had seen snow in Rome; and the Tiber is hardly more liable to freeze than the Nile or Ganges. This increase of temperature is satisfactory proof of an increase of people; for numbers tend much to the civilisation of climates, as of manners and institutions.—*Wade's Lecture on Ancient and Modern Society.*

AN OBJECT WORTHY OF PURSUIT.

There is but *one* pursuit in life which it is in the power of all to follow and of all to attain. It is subject to no disappointments, since he that perseveres makes every difficulty an advancement, and every contest a victory; and this is the pursuit of virtue. Sincerely to aspire after virtue is to gain her, and zealously to labour after her wages is to receive them. Those that seek her early, will find her before it is late; her reward also is with her, and she will come quickly. For the breast of a good man is a little heaven commencing on earth, where the Deity sits enthroned with unrivalled influence, every subjugated passion, "like the wind and storm, fulfilling his word."—*Lacon.*

CAPTURING OF CRIMINALS IN AMERICA.

One of the most significant signs of social improvement is the people of one country helping the people of another to put a stop to crime. It now appears that a person absconding from justice in England to America has little chance of escape, the American executive, to its credit, interposing to capture the fugitives. The following are cases in point, which we copy from the *Montreal Guzette* of the 5th of May last: for obvious reasons, we put the names in blank:—"The New York papers contain the particulars of the arrest of two persons, from England, for fraud and embezzlement, by the New York police-officers Hays and Stephens. These officers having received notice that a man named J—— P——, a clerk in the employ of a tanner near Sittingbourne, England, had embezzled a large sum of money belonging to his employer, and sailed for New York, obtained a boarding boat, and proceeded down to the Narrows, where they awaited the arrival of the ship in which P—— had taken his passage; and on her making her appearance, they immediately boarded her, and arrested the delinquent, who was a cabin passenger. The other delinquent arrested in the same way was a man named J—— T——, a cattle-dealer in the neighbourhood of Leeds, who had overdrawn his account at the bank of that place, committed forgery, and then taken his passage for New York. Intelligence of these frauds had previously been brought out by the steamers; and in both cases the agents were successful in recovering the greater part of the embezzled property."

JAMES WALLACE:

A TALE FOR BOYS.

[We extract the following tale from an American newspaper, in which it purports to be written by T. S. Arthur. The reprehensible practice of American newspaper editors of transferring literary articles without acknowledging the source whence they are derived, renders it impossible for us to say whether the tale is original or selected from a previous publication.]

"How far is it from here to the sun, Jim?" asked Harman Lee of his father's apprentice, James Wallace, in a tone of light raillery, intending by the question to elicit some reply that would exhibit the boy's ignorance.

James Wallace, a boy of fourteen, turned his bright intelligent eyes upon the son of his master, and, after regarding him for a moment, he replied, "I don't know, Harman. How far is it?"

There was something so honest and earnest in the tone of the boy, that much as Harman had felt disposed at first to sport with his ignorance, he could not refrain from giving him a true answer. Still, his contempt for the ignorant apprentice was not to be concealed, and he replied, "Ninety-five millions of miles, you ignoramus!" James did not retort, but repeating over in his mind the distance named, fixed it indelibly upon his memory.

On the same evening, after he had finished his day's work, he obtained a small text-book on astronomy, which belonged to Harman Lee, and went up into his garret with a candle, and there, alone, attempted to dive into the mysteries of that sublime science. As he read, the earnestness of his attention fixed nearly every fact upon his mind. So intent was he, that he perceived not the passage of time, and was only called back to a consciousness of where he was by the sudden sinking of the wick of his candle into the melted mass of tallow that had filled the cup of his candlestick. In another moment he was in total darkness. The cry of the watchman had told him that the hours had flown, until it was past ten o'clock.

Slowly undressing himself in his dark chamber, his mind recurring with a strong interest to what he had been reading, he lay down upon his hard bed, and gave full play to his thoughts. Hour after hour passed away, but he could not sleep, so absorbed was he in reviewing the new and wonderful things he had read. At last wearied nature gave way, and he fell into a slumber, filled with dreams of planets, moons, comets, and fixed stars.

On the next morning, the apprentice boy resumed his place at the work-bench with a new feeling; and with this feeling was mingled one of regret, that he could not go to school as did his master's son.

"But I can study at night while he is asleep," he said to himself.

Just then Harman Lee came into the shop, and approaching James, said, for the purpose of teasing him, "How big round is the earth, Jim?"

"Twenty-five thousand miles," was the unhesitating answer.

Harman looked surprised for a moment, and then responded, with a sneer—for he was not a kind-hearted boy, but, on the contrary, very selfish, and disposed to injure rather than do good to others—"Oh, dear! How wonderful wise you are! And no doubt you can tell how many moons Jupiter has? Come, let's hear."

"Jupiter has four moons," James answered, with something of exultation in his tone.

"And no doubt you can tell how many rings it has?"

"Jupiter has no rings. Saturn has rings, and Jupiter belts," James replied, in a decisive tone.

For a moment or two Harman was silent with surprise and mortification, to think that his father's apprentice, whom he esteemed so far below him, should be possessed of knowledge equal to his, and on the points in reference to which he had chosen to question him; and that he should be able to convict him of an error into which he had purposely fallen. "I should like to know how long it is since you became so wonderful wise," Harman at length said, with a sneer.

"Not very long," James replied, calmly. "I have been reading one of your books on astronomy."

"Well, you're not going to have my books, mister, I can tell you! Anyhow, I should like to know what business you have to touch one of them! Let me catch you at it again, and see if I don't cuff you soundly. You'd better, a great deal, be minding your work."

"But I didn't neglect my work, Harman; I read at night after I was done with my work; and I didn't hurt your book."

"I don't care if you didn't hurt it. You're not going to have my books, I can tell you. So do you just let them alone."

Poor James's heart sank in his bosom at this unexpected obstacle so suddenly thrown in his way. He had no money of his own to buy, and knew of no one from whom he could borrow the book that had all at once become necessary to his happiness. "Do, Harman," he said, appealingly, "lend me the book; I will take good care of it."

"No, I won't. And don't you dare to touch it," was the angry reply.

James Wallace knew well enough the selfish disposition of his master's son, older than he two or three years, to be convinced that there was now but little hope of his having the use of his books, except by stealth; and from that his natural open and honest principles revolted. All day he thought earnestly over the means whereby he should be able to obtain a book on astronomy, to quench the ardent thirst that he had created in his mind. And night came without any satisfactory answer being obtained to his earnest inquiries of his own thoughts.

He was learning the trade of a blind-maker. Having been already an apprentice for two years, and being industrious and intelligent, he had acquired a readiness with tools and much skill in some parts of his trade. While sitting alone after he had finished his work for the day, his mind searching about for some means whereby he could get books, it occurred to him that he might, by working in the evening, earn some money, and with it buy such as he wanted. But in what manner to obtain work he knew not. It finally occurred to him, that, in passing a house near the shop, he frequently observed a set of window-blinds with faded hangings and soiled colours. "Perhaps," said he to himself, "if I could do it cheap, they would let me paint and put new hangings to their blinds."

The thought was scarcely suggested when he was on his feet moving towards the street. In a few minutes he stood knocking at the door of the house, which was soon opened. "Well, my little man, what do you want?" was the kind salutation of the individual who answered the call.

James felt confused, and stammered out, "The hangings of your blinds are a good deal faded."

"That's a very true remark, my little man," was the reply, made in an encouraging tone.

"And they very much want painting."

"Also very true," said the man, with a good-humoured smile, for he felt amused with the boy's earnest manner and novelty of speech.

"Wouldn't you like to have them painted and new hangings put to them?" pursued James.

"I don't know. It would certainly improve them much."

"Oh yes, sir, they would look just like new. And if you will let me do them, I will fix them up nice for you, cheap."

"Will you, indeed? But what is your name, and where do you live?"

"My name is James Wallace, and I live with Mr Lee, the blind-maker."

"Do you, indeed? Well, how much will you charge for painting them and putting on new hangings?"

"I will do it for two dollars, sir. The hangings and tassels will cost me three-quarters of a dollar, and the paint and varnish a quarter more. And it will take two or three evenings, besides getting up very early in the morning to work for Mr Lee, so that I may paint and varnish them when the sun shines."

"But will Mr Lee let you do this?"

"I don't know, sir; but I will ask him."

"Very well, my little man. If Mr Lee does not object, I am willing."

James ran back to the house, and found Mr Lee standing in the door. Much to his delight, his request was granted. Four days from that he possessed a book of his own, and had half a dollar with which to buy some other volume, when he should have thoroughly mastered the contents of that. Every night found him poring over this book; and as soon as it was light enough in the morning to see, he was up and reading.

Of course there was much in it that he could not understand, and many terms the meaning of which was hidden from him. To help him in this difficulty, he purchased with his remaining half dollar, at a second-hand book stall, a dictionary. By the aid of this he acquired the information he sought much more rapidly. But the more he read, the broader the unexplored expanse of knowledge appeared to open before him. He did not, however, give way to feelings of discouragement, but steadily devoted every evening, and an hour every morning, to study; while all the day his mind was pondering over the things he had read, as his hands were diligently employed in the labour assigned him.

It occurred, just at this time, that a number of benevolent individuals established, in the town where James lived, one of those excellent institutions, an Apprentices' Library. To this he at once applied, and obtained the books he needed. And thus—none dreaming of his devotion to the acquirement of knowledge—did the poor apprentice boy lay the foundation of future eminence and usefulness. We cannot trace his course, step by step, through a long series of seven years, though it would afford many lessons of perseverance and triumph over almost insurmountable difficulties. But at twenty-one he was master of his trade; and what was more, had laid up a vast amount of general and scientific information: he was well read in history; had studied thoroughly the science of astronomy, for which he ever retained a lively affection; was familiar with mathematical principles, and could readily solve the most difficult geometrical and algebraic problems; his geographical knowledge was minute; and to this he added tolerably correct information in regard to the manners and customs of different nations. To natural history he had also given much attention. But with all his varied acquirements, James Wallace felt, on attaining the age of manhood, that he knew comparatively but little.

Let us now turn, for a few moments, to mark the progress of the young student in one of the best seminaries in his native city, and afterwards at college. Like too many tradesmen whose honest industry and steady perseverance have gained them a competence, Mr Lee felt indisposed to give his son a trade, or to subject him to the same restraints and discipline in youth to which he had been subjected. He felt ambitious for him, and determined to educate him for one of the learned professions. To this end he sent him to school early, and provided for him the best instruction.

The idea that he was to be a lawyer or a doctor soon took possession of the mind of Harman, and this caused him to feel contempt for other boys who were merely designed for trades or store-keeping.

Like too many others, he had no love for learning, nor any right appreciation of its legitimate uses. To be a lawyer he thought would be much more honourable than to be a mere mechanic; and for this reason alone, as far as he had any thoughts on the subject, did he desire to be a lawyer. As for James Wallace, he, as the poor illiterate apprentice of his father, was most heartily despised, and never treated by Harman with the smallest degree of kind consideration.

At the age of eighteen, he was sent away to one of the eastern universities, and there remained—except during the semi-annual vacations—until he was twenty years of age, when he graduated, and came home with the honorary title of A.B. At this time James Wallace was between seventeen and eighteen years of age, somewhat rough in his appearance, but with a sound mind in a sound body—although each day he regularly toiled at the work-bench, and as regularly returned to his books when evening released him from labour, and was up at the peep of dawn, to lay the first offerings of his mind upon the shrine of learning. But all this devotion to the acquirement of knowledge won for him no sympathy, no honourable estimation from his master's son. He despised these patient persevering efforts as much as he despised his condition as an apprentice to a trade. But it was not many years before others began to perceive the contrast between them, although, on the very day that James completed his term of apprenticeship, Harman was admitted to the bar.

The one completed his education—as far as general knowledge and a rigid discipline of the mind was concerned—when he left college. The other became more really the student when the broader and brighter light of rationality shone clearly on his pathway, as he passed the threshold of manhood. James still continued to work at his trade, but not for so many hours each day as while he was an apprentice. He was a good and fast workman, and could readily earn all that he required for his support in six or eight hours of every twenty-four. Eight hours were regularly devoted to study. From some cause, he determined he would make law his profession. To the acquirement of a knowledge of legal matters, therefore, he bent all the energies of a well-disciplined, active, and comprehensive mind. Two years passed away in an untiring devotion to the studies he had assigned himself, and he then made application for admission to the bar.

[Young Wallace passed his examinations with some applause, and the first case on which he was employed chanced to be one of great difficulty, which required all his skill; the lawyer on the opposite side was Harman Lee, who entertained for his father's old apprentice the most profound contempt.]

The cause came on within a week, for all parties interested in the result were anxious for it to come to trial, and therefore no legal obstacles were thrown in the way.

There was a profound silence and a marked attention and interest when the young stranger arose in the court-room to open the case. A smile of contempt, as he did so, curled the lip of Harman Lee, but Wallace saw it not. The prominent points of the case were presented in plain but concise language to the court; and a few remarks bearing upon the merits being made, the young lawyer took his seat, and gave room for the defence.

Instantly Harman Lee was on his feet, and began referring to the points presented by his "very learned brother," in a flippant, contemptuous manner. There were those present who marked the light that kindled in the eye of Wallace, and the flash that passed over his countenance, at the first contemptuous word and tone that were uttered by his antagonist at the bar. These soon gave place to attention, and an air of conscious power. Once on his feet, with so flimsy a position to tear into tatters as that which his "learned brother" had presented, Lee seemed never to grow tired of the tearing process. Nearly an hour had passed away when he resumed his seat with a look of exultation, which was followed by a pitying and contemptuous smile as Wallace again slowly arose.

Ten minutes, however, had not passed when that smile had changed to a look of surprise, mortification, and alarm, all blended into a single expression. The young lawyer's maiden speech showed him to be a man of calm, deep, systematic thought—well skilled in points of law and in authorities; and, more than all, a lawyer of practical and comprehensive views. When he sat down, no important point in the case had been left untouched, and none that had been touched required further elucidation.

Lee followed briefly, in a vain attempt to torture his language and break down his positions. But he felt that he was contending with weapons whose edges were turned at every blow. When he took his seat again, Wallace merely remarked, that he was prepared, without further argument, to submit the case to the court.

The case was accordingly submitted, and a decision unhesitatingly made in favour of the plaintiffs, or Wallace's clients.

From that hour James Wallace took his true position. The despised apprentice became the able and profound lawyer, and was esteemed for real talent and real moral worth, which, when combined, ever place their possessor in his true position.

Ten years from that day Wallace was elevated to the bench, while Lee, a second-rate lawyer, never rose above that position.

In the histories of these two persons is seen the difference between simply receiving an education, as it is called, and being self-educated. This fact every student, and every humble apprentice with limited advantages, should bear in mind. It should infuse new life into the studies of one, and inspire the other with a determination to imbue his mind with knowledge. The education that a boy receives at colleges and seminaries does not make him a learned man. He only acquires there the rudiments of knowledge. Beyond these he must go. He must continue *ever after*, a student, or others will leave him in the rear—others of humbler means and fewer opportunities; the apprentice of the handicraftsman, for instance, whose few hours of devotion to study, from a genuine love of learning, have given him a taste and a habit that remain with him in all after time.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 560. SATURDAY, OCTOBER 22, 1842. PRICE 1½d.

HANDLES.

THERE is a class of persons usually described by the silken tongue of polite society as persons of peculiar temper, or simply as "peculiar," but who are sometimes confidentially alluded to under much more alarming designations. The peculiarity generally consists in such qualities as fretfulness, crossness, quarrelsomeness, contradictiveness, cankeredness, and so forth, or in that summary of conditions which one describes when he says of a fellow-creature, "There is no pleasing him." The existence of such a person in a little circle—for example, one of a sisterhood of old maiden ladies obliged for economy to live together—is an evil of a very grave character, as it never fails to make a large subtraction from the comfort of all the rest. To keep that person tolerably sweet, or to avoid at least giving occasion to outbreaks of the "peculiarity," often becomes the leading business of the associated persons; and, at the best, there is amongst them a want of that serenity and ease of mind, which form so important a requisite in life, and without which, indeed, life is scarcely worth having. A terrible class, in truth, are these "peculiar" people, notwithstanding that, as Sir Walter Scott said of bores, there is generally something respectable about them—the termagant sister, for instance, being almost sure to be the best house-keeper. It becomes, of course, a serious consideration, whether there be any beneficent arrangement of Providence designed to alleviate to mankind the woes arising from these peculiar people.

I am of opinion that there is. It has often struck me that peculiar people are nearly the most manageable of all creatures, when once the moving spring of their predominant feelings is detected. Creative wisdom has furnished each of them with what vulgar parlance terms a HANDLE—a certain something in their character, which it is only necessary to manage rightly in order to avoid all that is bad about them, at the same time that we perhaps obtain the benefit of all that is good. Almost any peculiar person may be made tolerable for the common intercourse of life, if one only finds out his handle, and can use it adroitly. Sometimes the handle is curiously hidden in the mesh of character, so as not to be very easily got hold of; but when once discovered, its management is generally not very difficult. The patient may be as immoveable as was the wooden horse mounted by one of the three calenders in Arabian story; but turn one little peg—the handle!—and he springs up into the air with you in a moment. It is very favourable to the management of peculiar people, that they are usually so blind as to be in no great likelihood of discovering when any one is touching their handle, or even that they have a handle at all. Did they suspect such a thing, a pretty storm we should have of it. But the fact is, of themselves they never suspect any such thing, and no third party ever gives them a hint of it—for it is just one of the misfortunes of people of difficult tempers, that they are the objects of an universal conspiracy. Thus, if the operator does not expose himself by extremely clumsy play, or by voluntarily betraying the secret, all is safe.

There is a well-known story of an Irish pig which had a handle. Its owner, taking it to Cork, and knowing its refractory disposition, told it that he wished it to go to Dublin, when, as he expected, it immediately took the course which he desired. This story is conformable, if not to porcine, at least to human nature, as the following true anecdote will prove. David Dobie was a dyker, or builder of dry-stone enclosures, near Thornhill in Dumfriesshire. He was a passable sort of rustic in most respects, but had a strange, rough, contradictory way of speaking, especially to his wife Bet, who could not make the simplest remark, or set forth the most unpretending proposition, but he was sure to treat it as wrong and frivolous. Bet was obliged to act accordingly, whenever she wished to carry any particular point. Their son, a boy of thirteen, who assisted his father, wished to go to Thornhill fair, and to have money in his pocket when he went. He disclosed his wishes to his mother, who undertook to bring the matter about. That evening, the following conversation, which I beg leave to relate in the original Doric, took place between David and Bet:—

"Gudeman, ye'll no guess what that fulish laddie, our Robbie, has ta'en into his head?"

"'Deed, gudewife, I canna tell what either he or you would think o', ye're baith sic fules."

"Na, but, gudeman, ye ken the morn's the fair day, and nought will serve him but he wad hae me to speak to you about letting him gang to the merket, and him only a laddie o' thirteen; it's clean out o' the question. What wad a laddie like him do there?—and lose a day's wages into the bargain?"

"What's that ye say, Bet? What for no? The laddie's a bit weel-doing callan', an' works primely; an' he shall gae to the merket, 'at he shall, in spite o' your teeth. Yes shall he!"

"Aweel, aweel, David, just as ye like, ye're the best judge, nae doubt; but ae thing leads aye to anither. The laddie speaks the greatest nonsense about siller to keep his pouch in the merket; he even ventured to name a gude white shilling in my hearing; but, I trow, I soon settled that wi' the airn tangs, an' I hae na seen him sin-syne, like."

"What's that ye're saying, Bet? Did ye meddle wi' the weel-doing laddie, wha bigs stane for stane wi' me a' day, an' aye does my bidding in spite o' a' your havers? A shilling, Bet! I tell ye, woman—an' what I say's a law in this house—I tell ye, woman, he shall not only hae a shilling, but half a crown, 'at he shall. Sae shall he, e'en in spite o' you, and your airn tangs into the bargain!"

"Aweel, aweel, gudeman. Ye maun just hae your ain way o't; but ye'll see what it'll a' come to. Ye're just spoiling the laddie wi' indulgence," &c.

In this way, honest David could be made to do any thing his wife pleased, all the time that he thought himself the most incontrollable of domestic despots. A similar expedient was resorted to about fifty years ago with a nobleman who owned a park of celebrated beauty skirting the sea-coast near one of our large towns. There was a pathway through his grounds, by which his predecessors had allowed the people of a neighbouring village to pass on their journeys to and from the town. Stingy and unsocial, he determined to put an end to the privilege, although it did not interfere with the privacy of his family; and, accordingly, whenever he met any one going through the park, he turned him back. The villagers at length came to know how to *manage* the old earl; so, when walking through the park, if they saw him at a distance, they immediately turned and seemed to be going the contrary way. When he came up, he of course put them right about, and thus sent them on the way they wished to go. By this simple device, both parties were equally pleased—the villagers in escaping a circumbendibus of several miles, and the earl in the accomplishment of his resolution to *turn back* all who entered his grounds.

For every different species of difficult people, a peculiar mode of management is required. A violent man, for instance, requires submission. When he comes to the explosion, the great art is to allow it vent and free way. To expose anything to its force, by way of diminishing it, is as imprudent as it would be to go and put up a fire-screen against an igniting barrel of gunpowder. The only safety is in getting away from the Presence as quickly as possible. Passionate people, when thus treated, generally become reasonable and penitent in a short time, and are even willing to make some amends for their violence. Unless, then, they should be like Fletcher of Salton, whose anger was no sooner off than it was on again, it is possible to manage violent people to some purpose. There is a story told of a country gentleman who was liable to fall into transports of rage with his servants, in the course of which he seldom failed to inflict a cuffing or caning upon them. When his better genius resumed its sway, there was always an assythment for the injuries he had inflicted, generally in the form of some extra indulgence or present, so that in time it became rather a subject of rejoicing among the servants when their master fell foul of them. The great art was to make no resistance or complaint, but to leave it all to the worthy gentleman's own conscience. It is easy to see how this policy might be adapted to parlour life. We can imagine a lady anxious for a new drosky, of which her husband would prudently postpone the purchase, saying to herself—"Well, I am sure of it the next time George falls into a passion." Eager for a particular splendid shawl, which George thought too dear, she might bethink herself—"If he would only take one of his frantic fits, I should be sure of it." A wife of any ingenuity might in a great measure dress herself off her husband's hurricanes. But to secure such results, an absolute submission is necessary. The penitent feeling must have no consolation for itself in any recollection of an angry reply. If it have, it fixes equal guilt upon the other party, and no reparation seems necessary. Yet the submission must be well managed. Great pains must be taken to avoid the appearance of a policy in the matter. When several persons are concerned, there must be no symptom of a forethought, arrangement, or conspiracy amongst them. All must be natural and appropriate to the occasion. Then, but then only, may the proper solatium be expected.

The persons usually called *impracticable* are a large section of the class. These are usually individuals of a self-willed character, full of rooted prejudices, high in their own conceit, and strongly of opinion that all the rest of mankind are fools. Therefore, they never coalesce with other people in any common object. They never agree with any body on any question. Unless an idea has arisen in their own minds, and they believe (which, however, they are apt to do) that nobody else ever had it before or now entertains it, it is no idea for them. Such a person never belongs to any political party. He is a party of himself. Truly was it said of John Lilburn, a remarkable specimen of the class, that if he alone were left in the world, Lilburn would not agree with John, nor would John with Lilburn. "What is to be done with an impracticable man? Surely he has no handle!" Has he not, indeed? Why, there is no kind of person that has a more conspicuous handle. That very self-concentratedness which makes him an impracticable man, supplies the handle by which he is to be managed. To make such a man tolerable, his fellow-creatures generally find it necessary to study to convert everything to his own glory, and to support him in the notion that he is the centre and mainspring of everything. No one must ever pretend to have an opinion as to how anything could be best done in his presence. No one must ever recommend to

him any course of action. But even his children know that he may nevertheless be made to do anything, or take a particular view of any question, if only the idea be made to appear as proceeding from or somehow originating in himself. The gratification thus given to his predominant feeling awakens benevolence, and he becomes as pliable as could be wished. Some do not scruple to apply direct flattery, for the purpose of softening down impracticability, and it is of course generally successful, for where there is so high an inherent opinion of self, it only looks natural that the opinion of others should be high also. And thus the gods have sometimes presented to them the most ludicrous of all spectacles—an obstinate, self-willed man, thinking himself a ruler and lawgiver amongst his fellow-creatures, strutting, chin-elated, genial to others only through the gratification of his own selfish feelings, all the time that two or three persons whom he thinks insignificant are deliberately playing upon him, and secretly enjoying the intense ridiculousness to which they are subjecting him.

The handles of peculiar people are the most liable to remark; but the fact is, there is more or less of a handle attached to all persons, good, bad, and indifferent. The predominant feeling, taste, or prejudice, usually presents the handle by which individuals of all kinds are to be managed. It is a large part of the business of Tact in society, to discover this leading tendency, and to appeal to it. A thorough courtier looks for the handle of the epicure in the region of the stomach: in the amateur, author, draughtsman, and musician, he knows that it lies in the praise of his productions and performances: with the invidious, he takes care to express dislike of, and detraction from, a sufficiency of estimable people: with the bigot, he is loud in condemning opposite systems. With a lady, to admire her clergyman or her children, and be sceptical about the complexion of the lady who lives opposite, is a pretty sure card. Be it remarked that, in all human beings, whatever other handles there may be, there is sure to be one in that part of the cerebral system where lie the organs of self-esteem and love of approbation. Offend these faculties, however slightly, and the favour of that person is utterly lost: soothe them, however slightly, and it is retained and increased. Half the bad blood which exists in the world is produced by trivial offences to these feelings. It is consonant with the strictest morals, at least to be cautious against giving unnecessary offence to these feelings; nor would a benevolent code condemn a little effort being made now and then to gratify them, since the gratification tends to sweeten men so much towards each other.

As to the genuine men of handles, the peculiar people, the difficult and impracticable men, of course it is impossible to commend the practice of seeking such means of managing them. A bold honesty rather dictates that we should go the straight way to work, although with little hope of a successful result. But men are only men, and it will probably continue till the end of the world to be more or less the penalty imposed on a troublesome and disagreeable temper, that it shall expose its owner to be a standing subject of petty deception to his fellow-creatures. If any one who can make himself conscious of being so characterised, dislikes the penalty, let him endeavour to remedy the fault.

ANCIENT CEMENTS.*

NOTWITHSTANDING the great degree of perfection to which the useful arts have attained within these few centuries, it cannot be denied that there are some things in which we were excelled by the ancients, and in none more so than the art of building. The moderns are adepts in the process of cutting, fashioning, and laying blocks of stone one above another; and in these respects, therefore, there is nothing to complain of. The point upon which they are deficient is giving their buildings an imperishable degree of strength by means of proper cements or mortar. In modern house-building, the making of mortar appears always to be a second-rate consideration, being, as we believe, usually committed to the hands of the least instructed class of labourers.

The Romans—following, as may be presumed, the practice of the Greeks, with some improvements of their own—were particularly careful in the making of their mortar, which they applied in a very peculiar manner. On examination, some of their most stupendous architectural structures are found to exhibit enormous masses of masonry, consisting of pebbles and other small stones, apparently thrown together at random, and bound by a kind of mortar which has been thin enough to penetrate the smallest interstices, and thus form a solid whole throughout. The strength of this mortar, after a lapse of two thousand years, is surprising. It is harder than the stones among which it has been found, and bids defiance equally to the erosions of time and the heaviest blows of the hammer. Another of the extraordinary qualities of this cement consists in its impenetrability to water. The aqueducts of the Romans prove this most satisfactorily, being coated with no resinous substance whatever, but merely with this same cement, made a little thinner on the inside than on the outside. The Roman mode of building a strong wall was as follows. After bringing the work to the surface, they had recourse to planks made to fit into each other, successively extending them in length and in height, and binding the opposite ones at such a distance from each other, as to form the thickness of the wall, and, withal, with sufficient strength not to deviate ever so little from the perpendicular on either side. It was thus that they formed, as it were in a mould, these enormously massy walls, composed, as we have already seen, of every species of pebbles, and other small stones, which our modern architects know not what to do with for want of a mortar qualified to constitute with them one solid compact body.

We may easily conceive at what a great rate even a small number of hands, if well supplied with materials, must have been able by this means to push on any building work. For this purpose, nothing more was requisite than to have in readiness a sufficient number of troughs full of the proper mortar—throw in, at random, the pebbles and other small stones—and then saturate the latter with the former—all which might be perfectly well done, by the smallest degree of attention to get as much stones as possible into the cassoon, and then make the mortar fill up all the interstices between them; and with regard to vaulting and arching, they had their centres as well as the moderns. When they had an aqueduct to build, then, as the interior surfaces of its channel required a coating of that peculiar cement, which is still observable in them to a certain thickness, and which we have already taken notice of, they began by laying it on the planks of the interior casing and the centres, previous to the throwing in of the coarser materials; and thus formed a crust which effectually kept the water from any stones of a spongy nature that would otherwise have imbibed it. Without this method of casing, they would never have been able to construct either walls of so prodigious a thickness or channels of so surprising a thinness. In a word, the effect of this cement must have been very quick, to coalesce and set as readily as our gypses and plasters, and directly resist the pressure of the other materials laid upon it. In fact, the least shrinking or swelling must have proved fatal to works of this kind, not one of whose parts, perhaps, yielded a solid and horizontal basis to any other.

This fixedness and perseverance within the same volume constitute another important quality, which the slenderest observation must convince us the Roman cement is endued with; and being the last as yet discovered, we may proceed to sum up all the excellencies peculiar to this extraordinary composition. In the first place, then, this cement, from a liquid, turned very quickly to a solid state, and hardened with time as plaster does. Secondly, it acquired a surprising degree of tenacity, and laid such hold of the smallest stones it came in contact with, as scarce to bear being parted from them. Thirdly, it was impenetrable to water. Fourthly, it continued always of the same volume or bulk, without either swelling or shrinking. One would imagine, that so many extraordinary qualities should have secured this composition from the effects of violence and time, and kept the secret of it alive to the latest posterity. Yet, it may safely be affirmed, that this valuable secret has been lost, to all intents and purposes; and that, notwithstanding the continued and hearty sighs and researches of all Europe, nothing like it till now has been discovered by the moderns. For if in some parts the buildings are more solid than others, it is merely owing to the extraordinary goodness of the lime, sand, and other materials employed in them.

The re-discovery of this cement, so marvellous in its properties, became a subject of deep attention to Monsieur Loriot, Master of Mechanics to the King of France. This gentleman, in the course of the inquiries carried on by him in the year 1770, had the satisfaction to discover a kind of mystery in nature, which threw light on the subject under his consideration. "Taking some lime, which had been a long time slaked, out of a pit covered with boards, and a considerable quantity of earth over them again, by which means the lime had preserved all its original freshness, he made two parts of it, and plashed and beat them both perfectly well. He then put one of these parts, without any addition, into a glazed earthen pot, and in that condition set it to dry of itself in the shade. Here, in proportion as it lost its moisture by evaporation, it cracked and split in every direction, parted from the sides of the pot, and crumbled into a thousand pieces, all of them equally friable with the bits of lime dried up by the sun, which we usually meet on the banks of our lime pits. With regard to the other part, M. Loriot just added to it one-third of its quantity of powdered quick-lime, and then had the whole well kneaded, in order to make the two kinds of lime perfectly incorporate with each other. This done, he put this mixture, likewise, into a glazed earthen pot, as he had done the first; when, behold, it soon began to heat, and in the space of a few minutes acquired a degree of consistence equal to that of the best plaster when prepared in the best manner. In short, it set and consolidated almost as readily as metals in fusion when taken from the fire, and turned out a kind of instantaneous lapidification, having dried completely within a very small space of time, and that, too, without the least crack or flaw. Nay, it adhered so strongly to the sides of the pot, as not to be parted from them without breaking it.

The result of this addition of the quick-lime, surprising as at first sight it may seem, is notwithstanding so easily explained and accounted for, that it seems somewhat strange that M. Loriot should be the first to suspect and discover it. In fact, what can be plainer, than that the sudden setting and consolidating of these two substances, when thus united, must necessarily arise from the quick-lime being carried, by a perfect amalgamation or admixture, into the utmost recesses of the slaked lime, saturating itself with the moisture it there meets with, and thereby effecting that instantaneous and absolute desiccation, which, because we are so well accustomed to it, we so little mind in the use of gypses and plasters.

But the most valuable of all the extraordinary qualities in this composition is its not being liable to any cracks or flaws, when the ingredients are in the exact proportion they ought to be, or to give way, in any sense, either by shrinking or swelling, or, in short, ever undergo the least alteration from that state in which its fixing left it—a phenomenon we may account for on the same principles with the foregoing. Whereas mortar, or common cement, never dries but by the evaporation of its moisture, M. Loriot's cement becomes perfectly solid without the least evaporation; its moisture continues in and makes part of it; the desiccation is altogether intestine; and as the mass continues the same, and, moreover, the component parts of it are brought so near each other, it is impossible any cracks or flaws should ensue; for cracks and flaws can arise from nothing but the evaporation of a superfluous moisture, and the approach to each other of those parts which that moisture had till then kept asunder. M. Loriot had likewise the satisfaction to see that his composition was endued with the surprising quality of being and continuing impenetrable to water. For this purpose he made new trials; he formed with his cement some vessels of a form proper to hold water, weighed them, filled them, and after the water had stood in them a considerable time, emptied them, when, on weighing them a second time, he could not find that they weighed either more or less than before he filled them.

After several repetitions of these trials, and always with the same success, it now only remained to find out what effects, if any, time, or rather the vicissitudes of the weather, might have on this mixture of the two kinds of lime, as well as on several other compositions, in which M. Loriot had made it up, with other materials, fit for mortar; but, after making for this purpose a great number of new experiments, all the conclusion he could draw from them was, that not only the original mixture of the two kinds of lime, but every other to which he added it, instead of giving way to the greatest dryness or moisture, heat or cold, in the air, increased with age in solidity and compactness."

The mixing, then, of *powdered quick-lime* with any kind of mortar or cement made with *slaked lime*, was the operation which M. Loriot conceived to be necessary for the production of a building-cement such as the Romans used, and possessing all the advantages which architects could desire. It is of course not to be expected from us that we should positively assert the practical utility of M. Loriot's discovery. From his account, however, the cement referred to appears to possess the following qualities. The close union formed by the two kinds of lime employed, enables them also to seize and consolidate all small bodies that may be mixed with them. *Sand* and *brick-dust* are the bodies most suitable for this purpose. In forming a cement, therefore, M. Loriot desires builders to take "any quantity of very fine brick-dust, and twice as much fine river sand, the former well sifted, and the latter well screened, with a sufficient quantity of old slaked lime to form, with water, an amalgam as usual, but withal wet enough to slake a quantity of quick-lime equal to one-fourth of the brick-dust and sand taken together; then add the quick-lime in powder to the brick-dust and sand; incorporate them well, without loss of time, and use them directly, as the least delay may render the use of them defective or impossible. A coating of this mixture applied to the bottom and sides of a canal basin, or any other kind of building which is to contain or stand over water, has the most extraordinary effects, though laid on ever so thin. What wonders, therefore, might we not expect from this cement, were such buildings to be originally constructed with it.

The dust of charcoal incorporates very kindly with the same materials, in a quantity equal to that of the quick-lime; and though the lead colour, which arises from this addition, makes no essential part of the mixture, it may still have its uses on certain occasions. But it is otherwise with regard to the bitumen contained in the charcoal; since this substance cannot but form a rampart extraordinary against the water, no way inferior to that afforded by the other materials with which it is made up.

If all we want is a strong coating, then, by adding to the common mortar, consisting of slaked lime and sand, one-fourth its quantity of quick-lime, we shall have one which, within four-and-twenty hours, acquires a greater degree of consistence than the common kind in several months. Two parts of air-slaked lime, one of sifted plaster, and a fourth of quick-lime, made up into an amalgam of the consistence of common mortar, afford a coating no less fit for the inside of buildings than tenacious and incapable of cracking or flawing."

Dry freestone, or other stones, pounded and sifted,

* We gather the materials of this article from a paper in the Annual Register for the year 1774, itself founded on an essay by Monsieur Loriot, Master of Mechanics to the King of France.

are also pointed out by M. Loriot as likely to be useful ingredients in such cements, and he advises small quantities of these to be made at a time when they are to be used. The directions of M. Loriot are so pointed that they may be given here, even at the risk of repeating part of what has been said. There are two ways of making the cement. "The first is, to mix up very well, with water and slaked lime, the sand, brick-dust, or other materials you choose to employ for the purpose, to the consistence already prescribed, that is, somewhat thinner than usual; then sprinkle into the mixture your powdered quick-lime; and, lastly, incorporate the whole well together to be used directly. The second way is to mix up the sand, brick-dust, and powdered quick-lime by themselves in the proportion prescribed; then adding to them, just as fast as you want your cement, the proper quantity of slaked lime and water, work the whole up well with the trowel. In this way, the sand, brick-dust, and powdered quick-lime, may be kept ready made up in sacks, large enough to fill one or two troughs, so as scarce to leave the workmen any room to fail in the operation, let them be ever so ignorant or careless about it."

The permanency and stability given to buildings by this cement were proved in France by many trials; and if the facts be as stated, the attention of architects may yet be most usefully directed to this subject. In the case of vaults, arches, aqueducts, canal basins, and other structures peculiarly exposed to water and weather, the cement of M. Loriot appears to have proved most effective. "Every kind of subterraneous construction, whether civil or military, may, by means of this cement, be rendered not only habitable, but even infinitely more healthy than they generally are, and that, too, though surrounded by water; so that our cellars, especially those under court-yards, and other open places, as likewise our necessaries—all now so subject, the former to be deluged on every rising of the neighbouring rivers, &c., the latter to convey infection to a great distance by their contents oozing through the adjacent earth—all these works, I say, may be easily cured by means of this cement, equally proper to keep water in or out. In short, what is it we may not make of, or with the assistance of, this proteus matter, and that at one cast? Watering-troughs, ponds for stable and poultry yards, reservoirs against fire, wholesome cisterns in fortified and other places, where no running or well water is to be had."

The cement described may be also effectively cast, according to the accounts given, into pilasters and the like for the support of buildings. There are few architectural purposes, indeed, to which a little ingenuity may not apply it. The end which it seemingly answers is one of the most important kind. The stability and durability of our habitations and public erections are matters which cannot be overrated; and a comparison of old with modern buildings in these particulars throws a reproach on the increased resources of our times, which it would be well to wipe away.

POPULAR ENGLISH FESTIVALS.

MICHAELMAS DAY

Michaelmas Day, the 29th of September, properly named the day of St Michael and All Angels, is a great festival of the Church of Rome, and also observed as a feast by the Church of England. In England, it is one of the four quarterly terms, or quarter-days, on which rents are paid, and in that and other divisions of the United Kingdom, as well as perhaps in other countries, it is the day on which burgal magistracies and councils are re-elected. The only other remarkable thing connected with the day is a widely prevalent custom of marking it with a goose at dinner.

Michael is regarded in the Christian world as the chief of angels, or archangel. His history is obscure. In Scripture he is mentioned five times, and always in a warlike character; namely, thrice by Daniel as fighting for the Jewish church against Persia; once by St Jude as fighting with the devil about the body of Moses; and once by St John as fighting at the head of his angelic troops against the dragon and his host. Probably on the hint thus given by St John, the Romish church taught at an early period that Michael was employed, in command of the loyal angels of God, to overthrow and consign to the pit of perdition Lucifer and his rebellious associates—a legend which was at length embalmed in the sublimest poetry by Milton. Sometimes Michael is represented as the sole archangel, sometimes as only the head of a fraternity of archangels, which includes likewise Gabriel, Raphael, and some others. He is usually represented in coat armour, with a glory round his head, and a dart in his hand, trampling on the fallen Lucifer. He has even been furnished, like the human warriors of the middle ages, with a heraldic ensign, namely, a banner hanging from a cross. We obtain a curious idea of the religious notions of those ages, when we learn that the red velvet-covered buckler worn by Michael in his war with Lucifer used to be shown in a church in Normandy down to 1607, when the bishop of Avranches at length forbade its being any longer exhibited.

Angels are held by the Church of Rome as capable of interceding for men; wherefore it is that prayers are addressed to them and a festival appointed in their honour. Wheatley, an expositor of the Book of Common Prayer, probably expresses the limited view of the subject which is entertained in the Church of England, when he says, that "the feast of St Michael and All Angels is observed that the people may know what blessings are derived from the ministry of angels." Amongst Catholics, Michael, or, as he has been named, St Michael, is invoked as "a most glorious and warlike prince," "chief officer of paradise," "captain of God's hosts," "receiver of souls," "the vanquisher of evil spirits," and "the admirable general." It may also be remarked, that in the Sarum missal, there is a mass to St Raphael, as the protector of pilgrims and travellers, and a skilful worker with medicine; likewise an office for the continual intercession of St Gabriel and all the heavenly militia. Protestant writers trace a connexion between the ancient notion of tutelar genii and the Catholic doctrine respecting angels, the one being, they say, engrafted on the other. As to the soundness of this view we do not give any opinion, but it seems certain that in early ages there was a prevalent notion that the affairs of men were much under the direction of angels, good and bad, and men prayed to angels both to obtain good and to avoid evil. Every human being was supposed to have one of these spiritual existences watching over him, aiming at his good, and ready to hear his call when he was in affliction. And however we may judge this to be a delusion, we must certainly own that, as establishing a connexion between the children of earth and something above and beyond the earth, as leading men's minds away from the grossness of worldly pursuits and feelings into the regions of the beautiful and the infinite, it is one of by no means the worst tendency. We must be prepared, however, to find simplicity amidst all the more aspiring ideas of our forefathers.

In time, the sainted spirits of pious persons came to stand in the place of the generally nameless angels, and each place and person had one of these as a special guardian and protector. Not only had each country its particular patron or tutelar saint, but there was one for almost every town and church. Even trades and corporations had their special saints. And there was one more specially to be invoked for each particular ail that could afflict humanity. It will be curious here to descend a little into particulars. First, as to countries, England had St George; Scotland, St Andrew; Ireland, St Patrick; Wales, St David; France, St Dennis and (in a less degree) St Michael; Spain, St James (Jago); Portugal, St Sebastian; Italy, St Anthony; Sardinia, St Mary; Switzerland, St Gall and the Virgin Mary; Germany, St Martin, St Boniface, and St George Cataphractus; Hungary, St Mary of Aquisgrana and St Lewis; Bohemia, St Winceslaus; Austria, St Colman and St Leopold; Flanders, St Peter; Holland, St Mary; Denmark, St Anscharius and St Canute; Sweden, St Anscharius, St Eric, and St John; Norway, St Olaus and St Anscharius; Poland, St Stanislaus and St Hederiga; Prussia, St Andrew and St Albert; Russia, St Nicholas, St Mary, and St Andrew. Then as to cities, Edinburgh had St Giles, Aberdeen St Nicholas, and Glasgow St Mungo; Oxford had St Frideswide; Paris, St Genevieve; Rome, St Peter and St Paul; Venice, St Mark; Naples, St Januarius and St Thomas Aquinas; Lisbon, St Vincent; Brussels, St Mary and St Gudula; Vienna, St Stephen; Cologne, the three kings, with St Ursula with the eleven thousand virgins.

St Agatha presides over nurses. St Catherine and St Gregory are the patrons of literati and studious persons; St Catherine also presides over the arts. St Christopher and St Nicholas preside over mariners. St Cecilia is the patroness of musicians. St Cosmas and St Damian are the patrons of physicians and surgeons, also of philosophers. St Dismas and St Nicholas preside over thieves; St Eustace and St Hubert over hunters; St Felicitas over young children. St Julian is the patron of pilgrims. St Leonard and St Barbara protect captives. St Luke is the patron of painters. St Martin and St Urban preside over tipsy people, to save them from falling into the kennel. Fools have a tutelar saint in St Mathurin, archers in St Sebastian, divines in St Thomas, and lovers in St Valentine. St Thomas Becket presided over blind men, eunuchs, and sinners, St Winifred over virgins, and St Yves over lawyers and civilians. St Æthelbert and St Ælian were invoked *against* thieves.

Generally, the connexion of these saints with the classes of persons enumerated took its rise in some incident of their lives, and in the manner of their deaths; for instance, St Nicholas was once in danger at sea, and St Sebastian was killed by arrows. Probably, for like reasons, St Agatha presided over valleys, St Anne over riches, St Barbara over hills, and St Florian over fire; while St Silvester protected wood, St Urban wine and vineyards, and St Osyth was invoked by women to guard their keys, and St Anne as the restorer of lost things. Generally, the patron saints of trades were, on similar grounds, persons who had themselves exercised them, or were supposed to have done so. Thus, St Joseph naturally presided over carpenters, St Peter over fishmongers, and St Crispin over shoemakers. St Arnold was the patron of millers, St Clement of tanners, St Eloy of smiths, St Goodman of tailors, St Florian of mercers, St John Port-Latin of booksellers, St Louis of periwig-makers, St Severus of fullers, St Wilfred of bakers, St William of hatters, and St Windeline of shepherds. The name of St Cloud obviously made him the patron-saint of nailsmiths; St Sebastian became that of pin-makers, from his having been stuck over with arrows; and St Anthony necessarily was adopted by swineherds, in consequence of the legend about his pigs. It is not easy, however, to see how St Nicholas came to be the presiding genius of parish-clerks, or how the innocent and useful fraternity of potters obtained so alarming a saint as "St Gore with a pot in his hand, and the devil on his shoulder."

The medicating saints are enumerated in the following passage from a whimsical satire of the sixteenth century:—

To every saint they also do his office here assign,
And fourteen do they count, of whom thou may'st have aid divine;
Among the which *Our Lady* still doth hold the chiefest place,
And of her gentle nature helps in every kind of case.
St *Barbara* looks that none without the body of Christ doth die;
St *Cath'rine* favours learned men and gives them wisdom high,
And teacheth to resolve the doubts, and always giveth aid
Unto the scolding sophister, to make his reason staid.
St *Apolin* the rotten teeth doth help when sore they ache;
Otilia from the bleared eyes the cause and grief doth take;
Rooke healeth scabs and mangins, with pocks, and scurf, and scall,
And cooleth raging carbuncles, and boils, and botches all.
There is a saint, whose name in verse cannot declared be,*
He serves against the plague and each infective malady.
St *Valentine*, beside, to such as do his power despise
The falling sickness sends, and helps the man that to him cries.
The raging mind of furious folk doth *Vitus* pacify,
And doth restore them to their wit, being called on speedily.
Erasmus heals the colic and the griping of the guts,
And *Laurence* from the back and from the shoulder sickness puts.
Blaise drives away the quinsy quite with water sanctified,
From every Christian creature here, and every beast beside.
But *Leonard* of the prisoners doth the bands asunder pull,
And breaks the prison doors and chains, wherewith his church is full.
The quartan ague, and the rest doth *Fernel* take away,
And *John* preserves the worshippers from prison every day;
Which force to *Bennet* eke they give, that help enough may be,
By saints in every place. What dost thou omitted see?
From dreadful unprovided death doth *Mark* deliver his,
Who of more force than death himself, and more of value is.
St *Anne* gives wealth and living great to such as love her most,
And is a perfect finder out of things that have been lost;
Which virtue likewise they ascribe unto another man,
St *Vincent*; what he is I cannot tell, nor whence he came.
Against reproach and infamy on *Susan* do they call;
Romanus driveth sprites away and wicked devils all.
The bishop *Wolfgang* heals the gout, St *Wendlin* keeps the sheep,
With shepherds and the oxen fat, as he was wont to keep.
The bristled hogs doth *Anthony* preserve and cherish well,
Who in his lifetime always did in woods and forests dwell.
St *Gertrude* rids the house of mice, and killeth all the rats;
And like doth Bishop *Huldrick* with his two earth-passing cats.
St *Gregory* looks to little boys, to teach their *a*, *b*, *c*,
And makes them for to love their books, and scholars good to be.
St *Nicholas* keeps the mariners from dangers and disease,
That beaten are with boisterous waves, and toss'd in dreadful seas.
Great *Christopher* that painted is with body big and tall,
Doth even the same, who doth preserve and keep his servants all
From fearful terrors of the night, and makes them well to rest,
By whom they also all their life with diverse joys are blest.
St *Agatha* defends the house from fire and fearful flame,
But when it burns, in armour all doth *Florian* quench the same.

It will be learned, with some surprise, that these notions of presiding angels and saints are what have led to the custom of choosing magistracies on the 29th of September. The history of the middle ages is full of curious illogical relations, and this is one of them. Local rulers were esteemed as in some respects analogous to tutelar angels, in as far as they presided over and protected the people. It was therefore thought proper to choose them on the day of St Michael and All Angels. The idea must have been extensively prevalent, for the custom of electing magistrates on this day is very extensive.

September, when by custom (right divine)
Geese are ordained to bleed at Michael's shrine—

says Churchill. This is also an ancient practice, and still generally kept up, as the appearance of the stage-coaches on their way to large towns at this season of the year amply testifies. In Blount's Tenures, it is noted in the tenth year of Edward IV., that John de la Hay was bound to pay to William Barnaby, lord of Lastres, in the county of Hereford, for a parcel of the demesne lands, *one goose fit for the lord's dinner*, on the feast of St Michael the archangel. Queen Elizabeth is said to have been eating her Michaelmas goose when she received the joyful tidings of the defeat of the Spanish Armada. The custom appears to have originated in a practice among the rural tenantry of bringing a good stubble goose at Michaelmas to the landlord, when paying their rent, with a view to making him lenient. In the poems of George Gascoigne, 1575, is the following passage:—

And when the tenants come to pay their quarter's rent,
They bring some fowl at Midsummer, a dish of fish in Lent,
At Christmas a capon, *at Michaelmas a goose*,
And somewhat else at New-Year's tide, for fear their lease fly loose.

We may suppose that the selection of a goose for a present to the landlord at Michaelmas would be ruled by the bird being then at its perfection, in consequence of the benefit derived from stubble feeding. It is easy to see how a general custom of having a goose for dinner on Michaelmas day might arise from the multitude of these presents, as landlords would of course, in most cases, have a few to spare for their friends. It seems at length to have become a superstition, that eating of goose at Michaelmas insured easy circumstances for the ensuing year. In the "British Apollo," 1709, the following piece of dialogue occurs:

Q.—Yet my wife would persuade me (as I am a sinner)
To have a fat goose on St Michael for dinner:

* Probably St Roque.

And then all the year round, I pray you would mind it,
I shall not want money—oh, grant I may find it!
Now several there are that believe this is true,
Yet the reason of this is desired from you.

A.—We think you're so far from the having of more,
That the price of the goose you have less than before:
The custom came up from the tenants presenting
Their landlords with geese, to incline their relenting
On following payments.

MASSON ON AFFGHANISTAN.*

BEFORE us lies another new work on the subject of Affghanistan and the adjacent countries on the Indus, so lately treated of by the ill-fated Burnes, and by other writers of whose works we have taken notice. The subject is one, however, of which the interest is not easily exhausted under present circumstances, and the three volumes now in our hands contain, besides, a very considerable amount of fresh matter. The writer, Mr Masson, spent a number of years in the districts which he describes, in what capacity we cannot precisely learn from the preface. The writer, we may observe by the way, shows himself in his least agreeable phase in his prefatory address, and throws out remarks, defensive and offensive, upon the late managers of British affairs on the Indus, which the general reader must deem out of place, to say the least of it, in such a work.

Nevertheless, as has been said, there is good matter in the volumes of Mr Masson. He starts at once, and without circumlocution, with an account of his stay in Bahawalpur, a town on the Sutlege, one of the chief feeders of the Indus. It is impossible, however, for us to follow him in his movements from place to place, or to discriminate between the numerous khans and rajahs with whom he comes in contact. We must merely take snatches here and there; and, firstly, we may give a portrait of one of the small despots of these regions, who, when not engaged in war, live solely for sensual pleasure. "The Nawab Shir Mahomed Khan is about thirty-five years of age. Although believed to feel keenly his dependent situation on the Sikhs, his chagrin does not prevent him from being corpulent, as becomes a nawab, or from amusing himself with many childish diversions. Indeed, it seems the principal business of those about him to find subjects fit to excite his mirth, and to enable him to while away his existence. Hence, he entertains fiddlers, wrestlers, keepers of bears and of monkeys, and often enjoys the sight of ponies fighting in his flower-gardens. When one of the animals gives the other a good shake of the neck, the nawab claps his hands, and cries, 'Wah! wah!' His attendants do the same, and the apartments resound with clappings of hands and shouts of 'Wah! wah!' It is wonderful how all seem to delight in the sport. He is fond of hunting, and is very dexterous with his bow. He also prides himself on his strength, and, it is asserted, can break the horns of an ox from the living animal. Overlooking these foibles, he is kind and good-natured, and pays great attention to his mother."

Such despot chiefs, taking all they can from those around them, encourage their subjects in like manner to plunder whenever a chance occurs. Our author walked alone on many of his journeys, and on one occasion, he tells us, came up to two mere youths. But young as they were, the spirit of the region was in them. "I made towards them; and as I neared them, they were evidently surprised both at my presence and appearance. The younger lad was inclined to run, but the elder staid him, and awaited me. I could not very well understand them, but saw that my colour was the cause of terror. The younger seemed to think I was a *dev*, and would by no means approach me, although assured by the other that I was only a man, and there was no reason to fear. The latter asked me to extend my arm, and, as I thought he did so with a view of assuring his companion, I complied, when he seized my wrist, and wrenching it round, brought me, without power of resistance, to the ground. He called upon his friend to come and examine the bundle I carried on my back, but no persuasion could remove the fear of the lad, and he kept aloof. The fellow wrenched my wrist more and more, until I roared out that I was the *nawab's nukar*, or servant; at which he suddenly relinquished his hold and retired, allowing me to recover my feet. Seeing the mention of the nawab terrified him, I denounced all vengeance on him, when he pointed to his camels, and asked me if I would drink some milk. I asked whether he had a *piala*, or bowl, and found that he intended to milk into my hands, which I declined, as I should have placed myself in a position which might have disposed him to take another advantage." The author got free of them, but made a narrow escape, on the whole, from perishing unheard-of by the hands of a reckless boy, and leaving his bones to bleach in some nook of these perilous plains.

The city of Kandahar (or Candahar) having acquired fresh eminence lately as one of the capitals of the district of Cabul (or Kabal, as our author calls it), his account of it may prove not uninteresting. "The city of Kandahar is surrounded by mud walls, which have a circumference of three miles. There are, I believe, seventeen towers on each face, besides the angular ones; and a trench was carried round, under the direction of the late Sirdar Shir Dil Khan. Its situation is convenient, as it is on no side commanded; and it has five gates, one of which opening upon the *id-gah*, and leading into the citadel, is generally closed up. The citadel occupies the north-west quarter of the city, and is said to have been built by Shahzada Kamran, who formerly held the government of the city and country. The principal bazaars are wide and spacious, and had originally avenues of trees and canals leading along either side of them, but they are not now well preserved. No city can be better supplied with water, which is brought by large canals from the Arghassan river, and then distributed by so many minor ones, that there is perhaps no house which has not one of them passing through its yard. There are also many wells, and the water is considered preferable to that of the canals as a beverage.

Of the area included within the city walls, so much is spread over with ruinous and deserted houses, extensive courts, gardens, and ranges of stabling, that it is probable there are not above five thousand inhabited houses, by which estimate the population would be from twenty-five to thirty thousand souls. Notwithstanding, the city is acknowledged to be the *takht*, or metropolis, of the Duranis. The public mosques, and other buildings, are by no means handsome, arising principally, perhaps, from a deficiency of materials; and this evil has been detrimental to the substantial erection of the city generally, the houses being almost universally built of unburnt bricks, and covered with domes, there being no fuel to burn bricks, and no timber to make flat roofs.

The residences of the sirdars, while large and sufficiently commodious, display no architectural taste or beauty; the balconies of their *balla khanas*, or upper rooms, are, indeed, curiously carved in wood, and constitute their chief ornamental appendages. The *arg*, or citadel, being constructed of kiln-burnt bricks, appears to advantage from the exterior, and the entrance is somewhat imposing. Within, the palaces of the former kings, with their painted chambers, are desolate, or occupied by the menials of the present rulers, who seem studiously to avoid residing in them.

The bazaars are well supplied with good and cheap provisions, and with a great abundance of excellent fruits. Kabal is famed for the quantity, Kandahar for the quality, of its fruits; yet I found them so reasonable that a *maund*, or several English pounds of grapes, was purchased for a *pais;* and figs, plums, apricots, peaches, pears, melons, and almonds, were nearly as cheap. The pomegranates of Kandahar are, perhaps, unsurpassed, and justly enjoy a great repute in these countries. Meat, while very good, is not perhaps so cheap as at Kabal, but *roghan*, so generally used, and bread, are cheaper, as are curds and eggs; of the latter ten or twelve being sold for one pais. It is a great blessing to these countries that subsistence is so cheap, and that the poorer classes are, consequently, little affected by the struggles for political ascendancy amongst the chiefs. Fuel is one of the articles considered dear, and is brought from a distance." If we persist in forcing a settlement to the west of the Indus, Kandahar must become one of the main stations for the maintenance of our power and the prosecution of our industry. "Kandahar," says our author, "contains, in its fertility and resources, all the elements of a powerful state." But, as hinted in a late article in this Journal, everything seems to indicate, that the wisest plan for Britain to pursue at present would be to keep to the east of the Indus, and settle her power safely there.

Another specimen of the mode of treating unprotected travellers on the Indus, may interest the reader more than any descriptive extract. Shortly after leaving Kandahar on foot, Mr Masson encountered a camel-caravan, the men accompanying which were settled for the evening. "Found about one hundred and twenty tents, arranged in a semicircular form; in front of which were two spots, enclosed by stones, which served as *masjits*. It being the time of evening prayer, I went up to one of these, and saluted with the usual *salam alikam*, and was invited to sit down. When prayers were finished, one of the men, decently apparelled, said to me, '*Doudi kouri dil ter razi*,' which signifies, 'If you will eat bread, come here.' I accepted the invitation, and accompanied him to his tent, which was well furnished, after the fashion of the country; and before the entrance were picqueted three tolerable horses. The whole had an appearance of easy circumstances, indeed of comparative opulence. Bread was cooked expressly for me, water was brought to wash my hands before eating, and I was encouraged to eat heartily. I felt perfectly at ease, and was doing justice to my entertainment, having fasted throughout the day, when another man came in, and seated himself by my side. The repast being finished, the new visitant applied a rather rude slap on my cheek; at which I merely smiled, presuming it was intended as a joke, and although a severe one, yet, as these savages understand little of decency, and being alone among so many, it was but common prudence to pass it off lightly. He then asked me for my upper garment. This I refused, still thinking him disposed to be merry. I, however, found, to my cost, he was not trifling, for he despoiled me of it by force, as well as of my headdress, &c.; in short, left me nothing but my perjamas and shoes. He also applied two or three additional slaps on the cheek, and a liberal allowance of terms of abuse in Persian, which was all he knew of that language. This he did in ridicule of my ignorance of Pashto, which he was continually urging me to speak. During this time, my worthy host, the master of the tent, encouraged and abetted my despoiler, and received some pais which were in a pocket of my upper garment. The clothes were detained by the other ruffian, who, after a while, conducted me to his tent, one much smaller, and of mean appearance. He bade me sit down by the fire and warm myself, and in due time spread felts on the ground by the fireside, which were to serve me for a bed, and informed me I might repose myself; cautioning me, as I understood him, not to attempt to escape during the night, for I should be certainly seized by the dogs. I stretched myself on my sorrowful bed, and ruminated on my deplorable situation—consoling myself, however, that it did not appear the intention of my friend to despoil me of my perjamas, in the web-cord of which was my small stock of money; and calculating on certainly reaching the kafila the next day, if allowed to depart in the morning, and if I should be able to repair my deficiency of raiment. Still my situation was sufficiently wretched; yet, from the fatigue of the day's march, the power of a naturally strong constitution, and the presence of the fire, I shortly fell asleep, and enjoyed uninterrupted repose during the night, awaking only in the morning when kicked by my host, who called me a *kafir*, or infidel, for not rising to say prayers, which he presently repeated in the very clothes of which he had despoiled me the preceding evening. I was now led into the tent in which I had been originally entertained, where several other men were assembled. Here I was beat with sticks and cords, and had some large stones thrown at me. I made no doubt but it was intended to destroy me; I therefore collected my spirits, and resolved to meet my fate with firmness, and betray no marks of weakness or dejection.

While a stone is within reach, the Patans of these countries are never at a loss for offensive weapons. I have seen severe wounds inflicted by these missiles. They assert that Cain killed Abel with stones, which appears to have established a precedent for their use.

One of the camel-drivers told me to mount a camel, but I could not catch one. I learned that they were proceeding to Robat. They were those I had passed the day before. We marched four or five *koss*, when they halted, and told me that in the evening they should go to Robat. I would have continued my journey, but, alas! I was to encounter robbery anew. My clothing and money were now taken, and I was entirely stripped. In return for my perjamas, they gave me a ragged pair, which did not cover my knees; my shoes alone escaped, being either too large or too small for their several feet. I did not part with my money or apparel very willingly or very peaceably; in fact, one of the ruffians unsheathed his sword, but the others forbade violence. I appealed to them as men and Mussulmans, but this only excited their laughter." Mr Masson, however, got into the train of a kafila or travelling band, and, though suffering greatly, contrived to creep along with them till he obtained help and means.

* Narrative of Various Journeys in Balochistan, Afghanistan, and the Panjab; including a residence in those countries from 1826 to 1838. By Charles Masson, Esq. London: R. Bentley. 842.

GLASGOW WATER-WORKS.

WHILE on a late visit to Glasgow, we were much pleased with the manner in which that large and populous city was supplied with water. Although situated on the margin of a fine flowing river, the town, in comparatively recent times, was exceedingly ill supplied with that necessary article. A century ago, or less, the only water procurable in the streets was from wells, a few of which still exist, and are held in peculiar favour by some of the citizens. The first incentive to establish a public water-company was given, in 1804, by Mr William Harley, who constructed a reservoir at Willow Bank. The building is still standing, with the golden fish on its apex. He supplied it with spring-water from the adjacent lands, which he dispensed to the inhabitants at a small price, through the medium of water-butts carried from street to street. The success which attended this experiment gave rise to the Glasgow and the Cranston-hill water-companies. The former was incorporated by act of parliament in 1806, for the purpose of supplying the city, for the first time, with filtered water from the Clyde; the latter, having a similar object in view, was incorporated in 1808. During a number of years, these bodies went on independently; but afterwards a junction was formed between them, which received the sanction of parliament in 1838. The proprietary of the united company, which is very numerous, embraces a large majority of the monied men of the west of Scotland, and is possessed of great local influence.

The works of the company are very pleasantly situated on the banks of the Clyde, about two miles above the city. In proceeding towards them, our path lies through the "Green"—a splendid and favourite arena for recreation, health, and pleasure—scarcely surpassed, indeed, by any of the parks of London. It comprises about 140 acres of fine grass land, skirting the northern bank of the river. Under the auspices of the late Dr Cleland, the whole superficies has been levelled and beautified, and a fine carriage-drive formed, nearly three miles in length, which is frequently used by pleasure parties, on horse-

back or in carriages. Here all military displays and extraordinary meetings take place. Near the entrance at the west end stands an obelisk, erected to the memory of Lord Nelson.

The Clyde in this vicinity forms the great public bath of the city, to which the inhabitants have at all times free access. In the course of one day, no fewer than 2000 persons have been observed to bathe here. It is matter of deep regret, however, that in a crowded city like Glasgow, teeming as it does with a dense manufacturing population, so little attention should be paid by the public authorities to the establishment of suitable baths. Our continental neighbours are far before us in this respect.

After a delightful walk along the margin of the river, we reached the water-works, which we found to occupy both sides of the stream, the motive-power being on the one side, while the aqueducts and filters are on the other. Our attention was directed, in the first instance, to the works on the northern bank. These consist of a series of buildings occupied by nine large steam-engines, two of which, called Goliah and Sampson, are of great magnitude and power, and well merit the names which have been given them. They were made in 1839 by the Neath Abbey Iron Company, Glamorganshire, and have each a 72-inch cylinder, with a 10-feet stroke. They are kept in excellent order, and present the finest and most elegant specimens of workmanship of the kind we have ever had the pleasure of inspecting. The room in which they perform their Herculean labours is tastefully painted and papered, and entirely free from disagreeable effluvia. The erection of these magnificent machines, with their appurtenances, cost the company L.20,000. Four of the other engines, possessing 54-inch cylinders, with an 8-feet stroke, have received the appropriate names of Jupiter, Saturn, Achilles, and Ajax. At Cranston-hill works, which we did not visit, there are also four steam-engines in constant operation. The aggregate amount of motive-force thus at the disposal of the company, is estimated at about 700 horse-power. Attached to the walking-beam of each engine is a very ingenious piece of mechanism, with seven dials, resembling clock-work, and furnished with a pendulum which vibrates in unison with every stroke of the engine, and registers, with amazing accuracy and precision, the number of strokes given in the course of an hour, a week, a month, &c. The superintendant has only to consult this self-acting index to ascertain the quantity of water thrown into the city by each engine during any given period. Connected with the water-pipes we observed mercurial pressure-gauges, of very fine workmanship, for indicating the height to which the water is raised in the city, where corresponding gauges are kept in the engineer's office, by which it can be known at a glance how the supply is maintained by the engines, though in operation at the distance of nearly three miles. The quantity of water furnished by the works daily amounts to upwards of 8,000,000 gallons, besides about 600,000 gallons of unfiltered water, raised directly from the river for the use of several public works. At one period, double this quantity was used; but the factories seem now to prefer filtered water, though at a higher rate.

Having examined the varied and ingenious means and appliances on the northern bank for propelling and conducting the water through the city, we were carried across the stream in a boat, to inspect the aqueducts and filters on the other side. These occupy a triangular peninsula, of a honey-comb-like structure, washed on two sides by the Clyde, and perforated in various directions by water-channels. The principal aqueduct or filter consists of an elliptical tunnel 7½ feet in diameter, and upwards of 600 yards in length, sunk ten feet lower than the level of low water, in a bed of sand and gravel, through which the water filters naturally. This tunnel forms a curve parallel with the bed of the river, at about 50 feet from its margin. There are, besides, about eight acres of meadow land, and nearly two of sand-filter, on which the water is raised by steam-power. The whole water produced by these filters is conveyed through a gravelly subsoil into the tunnel above mentioned. The water thus purified is brought across the stream through four suction-pipes, laid in the bed of the river, and connected with the engines on the northern side. It is worthy of remark, that two of these pipes were designed and laid under the direction of the celebrated James Watt, whose genius and skill triumphed over the first difficulty which presented itself, arising from the bend or curve in the bed of the river, by devising a flexible main or tube, constructed of iron pipes, and so connected by moveable joints and hinges as to adapt its form to the bottom of the Clyde. The water is conveyed into the city through the medium of four principal pipes or *mains*, as they are called, respectively of 14, 21, 25, and 36 inches diameter. As the ground on which Glasgow is built is of great variation of elevation, four intermediate stations or reservoirs have been formed, into which water is raised to the elevation requisite to supply the several districts, and no more; thus economising the power required to be exerted by the steam-engines, and furnishing, at the same time, an abundant supply to those who occupy the highest houses. Besides these reservoirs, there are two others now in course of erection at the west end, to meet the increased demand arising from the rapid extension of the city in that direction. One of these is an extremely handsome massive structure, and harmonises admirably with the elegant buildings by which it is surrounded. It is lined throughout with cast-iron plates, and is 123 feet in length by 84 in breadth, and 10 in depth. The whole extent of pipes, with their varied ramifications throughout the city, amounts to upwards of 140 miles.

The supply to the inhabitants, we were informed, begins about six in the morning, and is continued without intermission throughout all the pipes, till from eight to ten in the evening. The population of Glasgow, according to the last census, is nearly 300,000; and these works pour unceasingly, like the heart in the human system, the life-blood of a city—WATER—through a thousand channels, until it reaches the most distant and obscure member of the community. One has only to witness, for a brief period, the effect of a partial suspension of the works, to be convinced of the incalculable benefits they confer upon such a city. Time is economised, habits of cleanliness are formed and cherished, and the sum of domestic happiness is increased. The "well," indeed, has been brought to almost every fireside, and fountains made to flow in every alley. Fires, too, those dreadful scourges of a manufacturing community, are extinguished by the same means; and large factories are sustained in localities where there is no water, and where, of course, they could not have been erected.

INSURRECTIONS AT LYONS.

INSURRECTIONS, mobbings, and all other commotions for the purpose of raising the rates of wages, have invariably ended in misery and disappointment to the parties concerned; for the simple reason, that they discourage the adventuring of capital, and paralyse the very moving springs of employment. Their fatal effects have in no instance been seen more conspicuously than at Lyons a few years ago. The history of the great insurrection at that city is interesting, and may yield an instructive lesson. It was originally told by M. Monfalcon, a physician of Lyons, whose narrative is here given in an abridged shape.

The silk manufacture, introduced from Italy in the fifteenth century, forms the great spring of industry and wealth in the city of Lyons, a town happily situated on a peninsula formed by the junction of the Saone and Rhone, in the south-east of France. It is the second city of that country, and contained, about the year 1830, a population of 140,000 persons. Of these fully 30,000, including men, women, and children, may be computed to have been engaged, at the same period, in the silk manufacture; and the quantity of silk manufactured may be reckoned, in round numbers, at 700,000 kilogrammes, a kilogramme being equal to 2 lbs. 8 oz. and 3 dwts. of troy weight. The money turned over at Lyons by the silk trade is estimated by M. Monfalcon at 200,000,000 francs annually. "The exportation of the article is greater, by one half," he says, "than the exportation of all the other manufactured productions of the whole of France put together." As the great, though not the sole seat of a manufacture so important to the national wealth and welfare, Lyons, it may be imagined, is a place viewed with deep interest by the entire people of France.

The parties engaged in the silk manufacture may be divided into two principal classes; namely, the masters, who have several silk-looms of their own, usually from three to eight, and have a fixed residence; and the class called *compagnons*, who work some of the looms of the masters, and receive half of the money gained by these looms, without having responsibility of any sort upon their heads. When the silk-trade is dull, these latter persons turn their hands to something else, and the instability of their position forms a great evil in the manufacturing system of Lyons. Generally speaking, the compagnons are improvident persons, and their habits are immoral. They dissipate upon foolish or injurious luxuries much of the means which they gain by working five days in the week with diligence. They live poorly, their houses are crowded and unhealthy, and sometimes large families are crowded together in single ill-ventilated apartments. Their children, boys and girls, are usually brought up to the silk-trade like their parents, and the youths of the male sex may be said to be the most dangerous portion of the population of Lyons. The elder among them, youths from fifteen to twenty, are called apprentices, and the younger are called *lancers*, their task being to throw (*lancer*) the shuttle in certain pattern-silks. For the most part, M. Monfalcon assures us, "neither apprentices nor lancers have received the slightest education. They are turbulent on days of riot and revolt, through a mere love of noise. But these boys were seen, during the days of disturbance, creeping among the horses, and aiming blows at the dragoons, which were so much the more dangerous, as it was impossible to foresee them." They were even provided with fire-arms, he continues, and showed an utter contempt of danger.

Such is the character of the class of artificers among whom, in 1831, a spirit of disorder insinuated itself, in consequence partly of the agitating influence of the Three Days of the preceding July, and partly from the effect on the French silk-trade of the increasing competition of Prussia, Switzerland, and, above all, Great Britain. The influence of the latter cause should have rendered them more prudent and industrious than formerly. Feeling a change for the worse, though to no great extent, they adopted a very opposite course, charging the evil upon their guiltless and equally suffering employers, and demanding terms which could never be acceded to. In the autumn of 1831, even while business was getting brisker, the workmen, or the agents of the unions which they had formed, required the adoption of an unvarying scale of prices, and resolved upon a general turn-out in the event of non-compliance. By this scale, or tariff, the silk-weavers determined to stand, never reflecting, apparently, that it was absurd to call upon the employer, himself suffering from all changes in the market, to insure the workmen from the chances of suffering from the same cause. Early in October 1831, the weavers, pursuing their object, laid the scheme of a wage-tariff before the mayor and authorities of Lyons. The latter, intimidated seemingly by so numerous a body, received the application, and called on the master-manufacturers to send delegates to meet those of the workmen on a certain day. M. Dumolart, Prefect of the Rhone, rashly yielded to this arrangement. "The definitive convocation of the delegates of the working-men and of their employers took place in M. Dumolart's drawing-rooms. While the opposing interests were engaged in debate, an immense multitude of the workers in silk, organised in troops and cohorts, advanced from the suburbs to the square of Bellevue and the square of La Préfecture, immediately in front of M. Dumolart's house. They were then without arms, without sticks, and they marched in silence and in perfect order. Their chiefs carried wands in their hands as signs of their authority; and the multitude, rallying round the tri-coloured flag, remained inoffensive and mute. That day (the 25th of October) presented a singular spectacle: a perfect order reigned in the disorder—there were no tumultuous cries—no provocations; the working-men satisfied themselves with making a demonstration of their forces. A great number of them, however, penetrated into the court-yard of the Préfecture, and stationed themselves immediately under the apartment where the tariff was regulating. At last, one of their delegates left the assembly, walked down to the square in front of the Préfecture, and commanding silence, said —'My friends, people are busy up there about your interests—all goes on well—retire!' At the instant all that host of working-men quietly retreated in the same order in which they had advanced. At two o'clock in the afternoon, the civil authorities of Lyons announced that the tariff was agreed upon and finally settled. This news was received by the weavers with the most lively demonstrations of joy. A tariff had been established on paper, but it remained to be seen if it would work. The men had fixed that work was only to be done at certain prices, but they could not compel masters to give them work at those prices, if the latter should find it ruinous to do so. Clearly, the right of considering whether they were to give work at the prices fixed upon remained with the manufacturers, if liberty and right were to be anything more than mere names in the country. To pursue the narrative of M. Monfalcon—"Scarcely was the tariff promulgated in Lyons, when many commercial houses, alarmed at the prospect of the future, or finding it impossible to pay the high prices demanded by the weavers, came to a determination to suspend all their operations. The great fault of M. Dumolart had placed our capitalists in a frightful position—many thousand looms were at once left without work.

A dreadful fermentation agitated the working-classes during the first weeks of November. They demanded the execution of the tariff, and showed the most deadly animosity against the manufacturers. Mobs gathered in the streets, squares, and suburbs; La Croix Rousse (a large dependent town, rather than a suburb) was up in arms, and a hostile collision seemed inevitable. A grand review of the national guard took place on Sunday, the 20th of November, for the installation of its chief, old General Ordonneau. Ten thousand men were present beneath the national flag, and had these men been decided in their wish of maintaining order, no troubles could have happened. But it was easy to see, by the alarming countenances of all the companies from the suburbs, and by the apathy of the majority of that armed militia, that some great event was preparing. The citizens of Lyons were left a prey to the most acute anxiety, and people ran everywhere inquiring what would be the probable result of this cruel situation. They were not left long in this state of uncertainty."

The result was a dreadful conflict, which lasted for three days, and watered the streets of Lyons with the blood of its citizens. Hundreds of lives were lost, and, as takes place in every similar scene of confusion, the innocent suffered alike with the guilty. It was on the morning of Monday, November 21, that the weavers of La Croix Rousse placed themselves in an attitude of open insurgency, raised barricades, and planted above their heads a black standard, with the pointed inscription—"We will live working, or die fighting!" They cut the silk from looms, and forced the peaceable to join them or perish. They had abundance of arms and ammunition, and even two pieces of artillery. The civil and military authorities knew all this, and they had force sufficient, of regular troops, to restore order. But they sent, at the outset, only sixty men of the national guard, with arms, but *without ammunition*, to march upon the barricaded position. "A shower of stones gave them their welcome; many of them were wounded, and the detachment was compelled to make a hasty retreat. Then, indeed, some attacks were made by the troops of the line, but with

feeble means, and not upon one but different points: thus they all failed. An officer was wounded in the thigh—a drummer shot through the shoulder. These first successes encouraged the insurgents; the working part of the population rose like one man."

All classes of mechanics were now involved in the affair, and seized the opportunity to demand wage-tariffs. Dumolart, the Prefect, and General Ordonneau, went to speak to the insurgents; they were seized and made prisoners. General Roguet, commander of the garrison, a veteran but invalid soldier, was the only man now found to direct a force against the insurgents. But the latter, secure in the lofty firm-built houses of La Croix Rousse, repulsed all attacks, though at the cost of much bloodshed. On the second day, the soldiers were in possession of but one square, in the whole of the great city of Lyons. They had fought with courage; "but what could cavalry do in a war of streets, under the fire of enemies that were carefully concealed behind gates and chimneys? Many of them were dismounted, wounded, or killed; and several, who were thrown or fell from their horses, were dispatched by the women and children of the weavers."

The insurgents fired on all flags of truce sent to them. True, they liberated the Prefect and General Ordonneau, but only because they saw their victory almost secured. And in reality, the despairing magistrates thought it best to yield, and send away the soldiers. "At two hours after midnight," says our author, "on the morning of the 23d of November, General Roguet yielded to the representations of the civil authorities, and resolved to quit the town with the remainder of the troops he commanded. * * * He was followed and assisted by a few men of the national guard. But the insurgents were aware of his movements, and established a strong post at the barrier of St Clair, with the view of intercepting his retreat. A single piece of artillery, and a general fire from the troops of the line, presently forced a passage there. The soldiers, formed in close columns, then cleared with courage and rapidity three barricades that had been raised between St Clair and La Boucle, and beat and threw into perfect disorder the posts of working-men that guarded them; and in spite of a running fire of musketry, and stones and tiles that rained upon them from the houses, they made good their retreat to Montessuy, Caluire, and La Pape, after having lost a number of men. The dragoons, who performed several brilliant charges, suffered the most. A battalion of the 40th closed the retreat, and fought with courage for its protection. But the unfortunate wounded soldiers left behind were stripped, dispatched, and thrown into the Rhone, by a set of weavers, whose fury had obliterated every feeling of humanity. General Fleury was wounded and dismounted in the fatal retreat, and one of his aides-de-camp was killed by his side."

Intoxicated with their victory, the workmen now gave themselves up to riotous indulgence, and went about the streets, hugging one another, and crying, "Les Braves!"—("The Heroes!") They were reeking even then with the blood of their countrymen. But the removal of all opposition restored them, in some measure, to reason. Much property was burned and destroyed; but at length they stood still, as if sensible that wanton destruction could do nought else than bring ruin and famine on themselves. The municipal authorities began to regain some portion of their authority. The population retired to their houses, and, willing to return to work, became aware of the obstacles which their own insane conduct had thrown in the way of their peaceful maintenance. On the 27th of November, four days after the retreat of the troops, General Roguet was asked by the authorities to return with them. He found a humbled population in Lyons. Men were praying for work and food. Revenge might readily have been taken upon them, but happily another course was pursued. Louis Philippe's eldest son, the Duke of Orleans, was to visit the city with Marshal Soult, and he did so on the 3d of December, when he was received with great acclamations. A powerful force accompanied him; the citizens received all not only without resistance but with joy. "And thus," says M. Monfalcon, "finished the history of the three days of November, and such was the winding up of the working-men's victory. Much blood was shed; brave French soldiers received their death; the first manufacturing city in France was a prey to the most frightful disorder: and for what end? Had the condition of the working-classes been improved? Had they succeeded in forcing their employers to adopt the tariff? No. The principle of that scheme was absurd, and could never be acknowledged by the government. Had they succeeded in raising the price of their labour? No. Trade can flourish only when no blows are aimed at the liberty and tranquillity of its transactions; and their revolt paralysed it, and condemned the silk manufacture to a long period of inactivity. Had their easy and short triumph attracted the public interest to their cause?—was their country indebted to them for what they have done? Alas! no. They attacked with an armed hand the institutions of their country—trod her laws under foot, expelled the legitimate authorities, and threw our city into an abyss of misery. The brutal employment of force to resolve a question of trade and industry is equally absurd and criminal, whether it proceed from the working-man, his employer, or the government. But some will say, the insurgents did not abuse their victory. Yes; we must, without doubt, to a certain point, be grateful to them for not having proceeded to extremes and the most horrid excesses, which, however, would have brought down a fearful and inevitable vengeance on their own heads. They did not do to Lyons, and to the capitalists and manufacturers of Lyons, all the mischief that they might have done; but ought this negative merit to make us forget the crime of their impious aggression, the horrors of a civil and civic war of three days, and the deplorable consequences that resulted therefrom?"

Notwithstanding the lesson given by the results of this senseless resort to violence and bloodshed, the workmen of Lyons did not then learn the wiser part. In a second article, we shall advert to the scenes which were presented in that city in 1834, originating in the same, or nearly the same, cause.

A STORY OF LONDON LIFE.

It was on a winter's evening, in the year 18—, that in the small parlour of a small house, in a narrow and confined street of the dense metropolis of Great Britain, was seated a very every-day sort of group. It consisted of Mr Beaufort Dawkins and his family, the latter comprising a lady who certainly considered herself a "better half," and two daughters of the respective ages of seventeen and fifteen. An important event had that day taken place—nothing less than the formal and legal admission of Mr Dawkins as junior partner in the house of Altamont, Dobson, Smith, and Jones, to whom he had been confidential clerk for more than twenty years. The five o'clock dinner was finished, and a bottle of wine was being discussed, the whole party having drawn round the fire, while in the manner of each were many signs of complacency. There is vast expression in the figure—in attitude, ay, even in a finger—and the most uninitiated would never have mistaken the prevailing sentiment, as Mr Dawkins leaned back in his arm-chair, stretching a very dirty pair of boots towards the fender, and slightly compressing his lips as he brought a glass of ruby wine admiringly between his own vision and the bright flame. He felt that he had achieved greatness, and it is very doubtful whether Newton, after one of his profound discoveries, or Shakspeare after the embodiment of some everlasting truth, evinced so much self-satisfaction. Neither was there much likelihood of any error about the lady's feelings. She had disdained, on this important evening, to ply her needle, as she was in the habit of doing; so, for want of better employment, she twirled her restless fingers in the faded strings of a very fine but rather dirty cap; and in her endeavours to assume a dignified deportment, fidgetted about in a manner which would have been very trying to nervous persons. But dignified repose is difficult for the unaccustomed to assume. Of the two girls, Matilda, the elder, was acknowledged to be the more attractive. Already of a commanding height and figure, with features beautiful and finely chiselled, she was indeed eminently handsome; though perhaps a physiognomist would have regretted a certain vacancy betrayed by the mouth. Yet, withal, there was that self-possession which, with mind and decision, would have formed pride, but, as it was, only constituted vanity. Susan, the younger, formed a perfect contrast to her sister, for her features were anything but regular, and her figure *petite*. Still, there were people who had the extraordinary taste to admire her; who forgave a mouth they acknowledged was too large, in consideration of the teeth it revealed, and the dimple a smile displayed; and who thought a pair of soft hazel eyes, shaded by a jetty fringe when they were raised and did sparkle, were not to be exchanged for Matilda's dazzling complexion. Susan was the only one of the party who was occupied, and she was hemming diligently a gentleman's silk handkerchief. Matilda was the first to break a short pause, by exclaiming—

"Well, now, papa, I hope you will let me have some lessons in singing."

"Wait, my dear, till we have got into the new house," observed Mrs Dawkins; "I should not choose Signor Crocchini to attend you here;" and the lady looked round with considerable scorn on the house of the last ten years, where she had drudged, and coaxed, and scolded by turns, but where she had passed, notwithstanding, a very happy period of her life.

"And my dear Dawkins, my dear Beaufort," she continued, "do not let us think of staying here until the notice expires. What *is* a quarter's rent compared to the appearance of the thing. Now that you are really in the firm, it is due to yourself and your family that you consider these things. And, my love, I have been thinking a great deal of the new house and all our fresh arrangements, and I am sure we must have a man-servant."

"My dear, I cannot afford it."

"Well, at any rate, a boy—really a youth—tall of his age, of sixteen or so, in a good livery, gives the same air of respectability to a family that a man-servant does."

Mrs Dawkins knew her own power. From long experience, she was aware that in arguments with her spouse perseverance was the one thing needful. True, she did not generally gain entirely the point from which she started, but for this, of course, she made all due allowances. In suggesting the necessity of a man-servant, therefore, she only expected to gain Mr Dawkins's consent to her hiring "a youth;" and had she lived in the later days of "pages" and biped "tigers," she might with yielding amiability have suffered her aspiring desires to dwindle from six feet two to four feet nothing. Thus a quarter of an hour was well bestowed in settling this important question, and about as much time was devoted to arranging some comparatively trifling matters in a similar diplomatic fashion. A visiter, however, disturbed the party.

"Why, that is Herbert Forster's knock, I declare!" exclaimed Mrs Dawkins; "who would have thought of his coming on such a wet night; did you expect him, my dear?"

"Not I; though, by the way, I have not seen him to-day, and perhaps he has brought me some papers I asked him yesterday to arrange."

Meanwhile, Matilda, with rather a sharp "give it me," had taken the work from her sister's hand, and in twenty seconds had arranged herself with wonderful composure at the table, with the whole apparatus of scissors and threads, &c., before her, a very pattern of neatness, precision, and industry. Susan said not a word, though the faintest smile in the world might have been observed on her countenance, as she raised her large eyes to her sister's face. A slight blush suffused Matilda's cheeks; but as she knew this was very becoming, she did not by any means withdraw from the light which fell full upon her, and she was the last to rise and greet the visiter.

Herbert Forster, though only a clerk in the house of Altamont, Dobson, Smith, Jones, *and* Dawkins, was an orphan, distantly related to several noble families, and had passed the years of childhood amid all the tenderness of affection and the luxury of affluence. His father had been Mr Dawkins's earliest benefactor, and on the severe reverses which preceded Mr Forster's death, Mr Dawkins was in some measure enabled to return the obligations he was under, by procuring for Herbert, at a good and increasing salary, the situation of foreign correspondent (for which his knowledge of languages qualified him) in the mercantile house to which we have alluded. Though humbled in fortune, he was in every other respect so greatly superior to the circle in which the Dawkinses moved, that there is no wonder that Matilda—a coquette by nature—was willing to try what power she could gain over him; indeed, he was nearly the first "quarry" for whom she prepared the manifold weapons contained in a coquette's quiver. Latterly, however, he had, to her great dismay, transferred all those trifling attentions which are felt rather than described to Susan, for whom, of course, she, as an elder sister, entertained a due degree of contempt.

So much for the relative positions of the younger members of the party. As for the lady-mother, she liked Herbert Forster pretty well; though, notwithstanding his frequent visits and extreme intimacy, she had not as yet dreamt of any falling in love, either on his part or that of her daughters. The feelings of Mr Dawkins, however, were of a much warmer character; for he loved him almost as well as his own children, and though not a man of talent himself, he had sufficiently the power of appreciation to recognise the superior mind and acquirements of Herbert, and to feel a strong confidence that he would be successful in life. Perhaps the only one talent in which Mr Dawkins excelled (and which, indeed, had been the means of raising him to his present exalted position) was the one in which Herbert Forster was most deficient, namely, what phrenologists call the organ of number. He was, indeed, a first-rate accomptant—a talent, by the way, which seldom accompanies a brilliant and imaginative mind, though, if it do, it makes the intellect stupendous. Even on that memorable evening the bent of his mind might have been observed when he interrupted an animated conversation between Herbert and Susan on a point of history, to request the former to go over with him some abstruse calculations; and when these were finished, he proposed a family "rubber,"—more, it is not uncharitable to presume, to enjoy the often-repeated triumph of astonishing the uninitiated by calling the last cards from every hand, than from any other motive.

Kind reader, pass over with me all the bustle, and excitement, and confusion of the Dawkinses removal to the "new house." I must beg you even to imagine their first immersion into a new sphere of society. By small degrees, and in the short space of three years, so great a change was effected in the Dawkins family, that they seemed to form quite a new species of the genus to which they belonged. It is true Dawkins *père* was still an "every-day person," for the lion changes not his skin, nor the leopard his spots; yet, from the friction of more refined society, into which he and his had struggled, he had acquired some polish, but being naturally a reserved man, circumstances had rendered him less communicative than ever. Assuredly there was a mystery connected with him. Some people talked figuratively of a mine he had discovered, and others of a lottery-ticket turned up a prize. These rumours might be nonsense; but the world always looks with suspicion on unaccounted-for wealth.

But where did the money come from? Ah! that is the question. The Dawkinses now had a really good house, well furnished, and with family arrangements better conducted than might have been expected. The "boy" had long since made room for a substantial

full-grown servitor; dashing parties were given; and even a carriage was kept exclusively for the ladies. And all this was to be supported by the junior partner in the house of Altamont, Dobson, Smith, Jones, and Dawkins, whose share of the profits averaged something less than five hundred a-year. When his partners asked questions, they were satisfied by the rather unsatisfactory answers he gave, implying that his long head enabled him to make fifty per cent. of his own money.

Meanwhile, three years had added many graces to Susan, and had certainly not taken from the personal attractions of her sister; but the mind of each had advanced, and their faint and child-like shades of character had assumed a deeper and more decided hue. They were consequently more different than ever. And Herbert Foster!—— But he shall speak for himself.

The scene was no longer the "small parlour," but a handsome drawing-room in G—— Street. The season the latter end of May, when the thermometer of London gaiety stands at the highest. The time was between three and four in the afternoon, the day Sunday; Venetian blinds softened the bright sunshine which would otherwise have streamed into the room—a room altogether pervaded by an air of comfort, almost of luxury. Its only tenants were Susan and Herbert, and both had remained for some minutes so silent, so motionless, that they looked more like statues than breathing, feeling, beings. Herbert's face was buried in his hands, while Susan, who sat at a little distance, gazed at him with an expression of fixed though tearless agony. At last she rose, and timidly threw one arm across his shoulder; he drew it round his neck, and pressed her yielding form in a long and passionate embrace.

"Dearest, you are right," he exclaimed, after a moment's pause; "while we are true to one another, we cannot be quite wretched. But then—ay, that is the thing that embarrasses me—I am poor!"

"Herbert, I do not feel that you are poor. Your small but certain income would suffice for more than my unambitious wants. Oh! if you knew how sick at heart I feel of the false and hollow life we lead, you would better understand how I yearn for quiet and content. But you do know; you must have seen the miseries which this struggling life has engendered; the tempers and caprice with which I have to bear, and which have shaken my nerves and undermined my health. And really, dear Herbert, you owe it to me now to be my consolation, seeing that it must have been your love and your instructions which have made me think differently from Matilda, and have rendered me incapable of loving any one less noble, less *perfect*, than yourself." She tried to be gay, though she was earnest; for hers was real woman's love, which cannot exist, in its depth and purity, without a large share of spiritual adoration to its object—the natural religion of a woman's heart. And perhaps when Herbert answered, "Foolish girl, you make me angry," he did not feel much displeased.

"And yet," he continued, "what avails it that I deserve you? (She pressed his hand.) Not, dearest, for partly leading out of darkness the blossom which naturally struggled into light, but because my heart is so wholly, so unutterably yours, that it does deserve your own, yourself in return. But what avails it if they will not give you to me—if they have loftier views for you? How frequently do I feel that we were all happier when you lived in the old house, and your father was only a clerk!"

"Oh! how much happier! Even his countenance betrays that he is wretched. He looks a dozen years older; and in three years his hair has become perfectly white. I am sure there is some mystery. Where does the money come from which *is* spent, though we are so harassed by debts?"

"By debts?"

"Oh! yes; and by having everything on long credit we pay most dearly. Think, dear Herbert, of the delight of feeling we did not owe a penny; and you know we should manage that even on your two hundred a-year."

"I hope so, though not, I fear, without some self-sacrifices from you."

"None—none—nothing would be too great a sacrifice by which to escape the horror of debt. But where does the money come from which, after all, is spent?"

"If I tell you, Susan, what the world says, it is that Mr Dawkins is a successful gambler."

"A gambler! Why now, he seldom touches a card."

"Not at home, perhaps, and this may well be the case. If the report be true, it is not surprising that sixpenny whist should have lost its interest, or that he refrains from joining a card-table even at your parties."

"Oh! what a dreadful life!—and what a false and wretched family we are! But do you believe it, Herbert?"

"I fear I must. It is better, Susan, with your energy and strength of mind, that you know the truth, at least as much as I can tell you. This very day, while loitering till the hour I knew your mother and Matilda would be out riding, I saw Mr Dawkins enter a well-known gambling-house."

"What! in the day-time—on a Sunday?"

"Even so. And, trust me, I would be the last to tell you such things are; for I deeply feel, that to the innocent and pure vice should still retain the veil with which shame has covered it; but there are circumstances to which 'nice customs must courtesy,' and I think ours are of the number."

"It is all true—I feel it is all true," exclaimed Susan, bursting into tears; "and it accounts for so much misery—for the care-worn brow and irritable temper—for our uncertain means and our wretched existence. And yet, Herbert, he can be kind, and just, and right-thinking too; and on his consent I rest all my hopes. And Matilda, I wish she would choose one of her lovers. I think she would be much happier than she is at present."

"Or rather you wish," returned Herbert, "that one of them would choose her."

"Choose her! why, she says there are three or four anxiously and ardently awaiting her decision."

"She says—but I fear we must not quite believe her—though I will grant that she is so blinded by vanity that she is the victim of self-deception, and really does consider herself the irresistible being she describes. It is a very common delusion, I assure you. Matilda is admired for her beauty, but I fear little respected."

This was indeed too true. Neither was Matilda nor her mother surrounded by any adventitious circumstance or connexion that could lend to either of them a borrowed lustre. As for Susan Dawkins, she was like a sweet violet, not really the less to be prized because rank weeds grew around; or like a pure gem, not the less precious because fate had cast it among a heap of rubbish. The rest of the family were deceived precisely as persons so acting and so circumstanced almost always are. Now, in English society—even in what we may only call the upper grade of the middle classes—there are circles within circles, each progressively more picked or sifted than its predecessor. Talent *with* character, or wealth *with* character, may pierce to the very centre; and there will be found a sweet and full reward for any exertion the endeavour may have cost—a full and sweet reward which, once tasted, will always be recognised, though perhaps it is not very easily to be described. Certainly the outer circle is a very wide one. It consists of folks who are called "dashing," who accomplish that feat which, taken literally, is an achievement at least as prodigious as would be the discovery of the philosopher's stone; namely, they spend twice their income. In this circle may be included often people of talent, but with soiled reputations, and the riff-raff of many grades and descriptions of people; and it is remarkable that the members of this circle seldom or never advance to the inner and more select ones, though they occasionally drop off into the immensity of space beyond. The next circle is less brilliant but more solid, for it is capable of being cemented by honesty and friendship; and altogether, between the two extremes, there is about as much difference as between the sweet walnut and its outer soiling shell. Surely there is no need to hint that the Dawkins family, neglecting the real respectability and quiet happiness which might have been within their reach, had stepped, instead, into the dangerous vortex of that meretricious circle to which I have alluded. So much for the slippery path of error; for perhaps it was not among the least mournful results that "Matilda was but little respected."

But the half-sweet half-bitter tête-à-tête of the lovers was interrupted by the arrival of Mr Dawkins. Not that he entered the drawing-room, but they knew he had come home, and that he had ensconced himself in his own sanctum, a room called, by courtesy, the library. To their anxious hearts the present moment seemed a very favourable one, the absence of Mrs Dawkins and Matilda being extremely propitious. To seek Mr Dawkins at once, and to rely on the force of truth and the eloquence of sincerity, was a plan so natural and simple, that they felt it did not deserve to be called a scheme; and strong in their own deep feelings, and believing that the realisation of their dreams was at stake, five minutes more found them, certainly with changing cheeks and quickened pulse, at the door of "the library." Susan knocked lightly, but almost before she could listen to the anticipated "come in," her hand had turned the lock. For a moment she was startled by the scene which met her view. A heap of sovereigns, seeming to her an unimagined sum of money, was only partially covered by open papers, with which her father appeared in the act of concealing it. Writing materials were before him, and something like a check-book in his hand, while his countenance was so livid, and his eyes so glassy, that Susan involuntarily started forward, believing he must be ill. In a few minutes, however, he recovered his composure, and listened with even more patience and kindness than his daughter had dared to hope for, to the intreaties and arguments of Herbert Forster. Susan had seated herself on a low stool beside her father, as if thus placed, her agitation would be less perceptible; while with one hand she grasped that of his, and with the other pressed against her brow, she in some measure shaded her face. It was Herbert who chiefly spoke, but a pressure of the hand may be very eloquent! That was a strange and ever-to-be-remembered interview, during which, in truth, though unprofessedly, the young were monitors of the old; for they talked of principle to him who had been found wanting, and of contentment and moderate desires and truth to a parent who for long years had scarcely recognised one of them.

That brief half hour was a golden one to Herbert and Susan, for in it they won a father's consent to their union. And when shedding grateful happy tears, she threw herself into his arms, he strained her to his heart, more fondly, more proudly, with more self-satisfaction, than he had done for years. But he bade them leave him, and be happy, for he had writing to do, letters to transmit, and at six they would meet again at dinner. They left the room, and Herbert quitted the house, for he felt it would be scarcely delicate to meet Mrs Dawkins until she had been apprised of the happy determination in his favour. For a short interval we must return to the library. The door was now locked; but no matter through what crevice we peep. Again Mr Dawkins was seated at the table, again was his face livid and his eye glassy, though fixed intently on some strips of paper which lay before him. He then wrote slowly, with precision, carefully as ever schoolboy penned a copy; but the writing did not please him, for, after a moment's hesitation, it was torn into innumerable fragments and cast aside. Again and again the attempt, whatever it might be, was made, and at last, we may presume, he was successful, for some scraps of paper he put contentedly into a note-case, and others he locked up in his escritoir. Then placing the sovereigns in a canvass bag, and the canvass bag in his pocket, he took up his hat, stepped softly along the hall (just noticing the dial, which pointed to a few minutes past four), and stealthily opening the street door, went out, closing it by means of a latch-key also, without noise. Neither Susan nor any of the servants had the slightest suspicion of his absence, though, by a singular accident, Herbert Forster saw him a second time enter the house to which he had before alluded.

The life of Dawkins was a mystery which seemed to warp the fate of all about him, and his increasing distresses delayed the marriage of the amiable Susan. Six months after the explanations in the library, Mrs Dawkins died; and shortly afterwards, a still greater blow overtook the family, in the elopement of the elegant and heartless Matilda with a personage, an occasional companion of the father; in short, no less dignified a being than the Count de Truccelini.

Alas! for the bereaved father. The wretch who had called himself the Count de Truccelini Mr Dawkins knew to be a gambler and swindler, besides more than suspecting him to be already a married man! And this was the associate to which vice had linked him—the man he had suffered to pollute his pure domestic hearth. With a handsome person and specious address, there could be very little wonder at his gaining influence over the weak minds of Matilda and her mother, to whose ears, also, the empty title he possessed *or* assumed had a strange fascination. Oh! ye ignorant few, whose band, thank heaven, is every day decreasing; ye who dread enlightened minds in women, and would keep them in darkness akin to your own, will ye not understand that the mind requires light and nourishment, and that if ye will not give it wholesome food, it must grovel in the mire, or seek at best the flaunting weeds which have root there! The wretched father felt that his child was lost, and yet was he fain to try by any desperate measure to save her. He thought he had a faint clue by which to trace the fugitives; and waiting only to write three or four letters on business, he started with post horses in pursuit. One of these letters was addressed to Herbert; but when opened, he found it had been misdirected, being evidently intended for some one else, though whom he could not make out. At all events, it seemed unimportant, though naturally he was much annoyed at thus missing some instructions on business matters which must have been intended for him; but he felt that the haste and excitement under which Mr Dawkins had written, easily accounted for the mistake.

It is not worth while to follow Mr Dawkins closely on his journey. Enough, that with unwearied steps he pursued the pair, and it would seem did at last discover them in an obscure French town. His own movements were so rapid and uncertain, that he was unable to receive any intelligence from home, and the letters he addressed to poor Susan only served to confirm their worst fears. But at home, oh! how serious were the scenes enacted during the interval of that chase upon the continent.

It was a sharp frosty moonlight evening at the end of December, within a day or so of the close of the year, when a traveller alighted in the city from a Dover coach. He called a street-coach immediately afterwards, and ordered the coachman to drive quickly to —— street. Mr Dawkins, for the traveller was our old acquaintance, soon reached the door of his home. To his surprise, however, he found some difficulty in getting an answer to his repeated summons for admittance. He began to tremble. Wayworn and depressed in spirits, he had expected to find the arms of one kind child at least open to receive him, and to meet from her with those consolations which the conduct of Matilda had rendered only too necessary. But in place of Susan, an old woman—the sole remnant, seemingly, of his lately well-served household—appeared at length in answer to her master's summons. "Where is Susan?" cried Dawkins, hastily; "where is my daughter?" The faithful old servant looked at him with anxiety, almost with fear, in her aspect. "Oh! sir," said she, "have you just newly arrived?—have you heard nothing?" "Nothing—not a word," answered the alarmed Dawkins; "since my departure I have scarcely been an hour in one place, and have, therefore, not heard a syllable from England. No letters *could* reach me!" He had entered the parlour by this time, and sunk into a chair. Some moments elapsed ere he could ask the question that most naturally formed itself in his mind. "Is Susan ill—dead?" "Oh! no, sir," answered the woman; "Heaven be praised, she is well in health; but she has gone for some time to live with a friend. She has gone in order to be near the prison."

"The prison!" repeated Dawkins, growing pale as death.

"Yes, sir, continued the old woman. "Oh! Mr Dawkins, have you not heard of the misfortune of poor Mr Forster? He has been accused and found guilty of forgery." "Forgery!" muttered Dawkins faintly, as he started to his feet. "Yes, sir, the firm—your partners—discovered that they had been defrauded, and they said, though he denies everything, that he had done it. But my dear young lady will not believe a word against Mr Herbert, and she is always with him when they will allow her."

Dawkins stood for a time as if stupified. Suddenly, however, he changed his manner, and, with a hasty hand, took out and examined some papers from his bag. Placing these in his pocket-book, he seized his hat, and, without a word to the servant, quitted his now desolate house. When in the street, he again called a coach, and ordered the conductor to drive to —— street, the site of the city mansion of the head partner of the firm of Altamont, Dobson, Smith, Jones, and Dawkins.

On that evening, Sir John Altamont was called from the presence of a party of his friends to witness a scene which the dullest brain was not likely to forget during a lifetime. The man who burst in upon him was his own partner, but so changed, as scarcely to be recognisable. "You have prosecuted Herbert Forster for for-

gery," said Dawkins, with agitated abruptness; "for the love of Heaven fly without delay and liberate him! *I am the guilty man.* Here—here are the proofs!" And he took hurriedly from his pocket a mass of papers which the merchant, startled and confused as he was, soon recognised to be connected with the forgeries, and as supplying a missing link which had alone thrown doubt on Forster's criminality. In short, the papers were convincing. Dawkins, meanwhile, watched the face of Altamont with eager anxiety; and when he saw that the other seemed to be satisfied, he again cried—"Fly to save him! I have retained the coach for the purpose. There should be no delay in clearing the innocent. The life of my child—now my only child—hangs on that of the guiltless young man!" The alderman, who was sheriff for the time, and was the very person to be of use in such a case, had risen to his feet, and Dawkins observed a confused glance cast on himself. He understood its meaning. "In the name of our common Father," he again cried, "answer me—are you satisfied, from these papers, of that guilt which I again solemnly avouch and admit with my tongue?" Altamont replied gravely in the affirmative. "Then I know you to be a just and a merciful man; I know that you will do your duty," said Dawkins. "For me—may God forgive me! Oh, may God forgive me!" With the words, and ere the alderman could interfere, the unhappy man drew out the hand which he had for some time held in his breast—it grasped a pistol; and, in one instant, he lay dead on the floor, shot through the heart!

We need not dwell on the consequences of this event. Sir John Altamont—for, as sheriff, he had been knighted—drove immediately to the Home-Secretary, whom he made acquainted with the important discovery related. The ultimate consequence, of course, was the complete exculpation and liberation of Herbert. The general public rejoiced deeply in the escape of the innocent young man. More deeply did they rejoice when the rumour afterwards went abroad that Herbert Forster had nourished vague suspicions of the truly guilty party, but that, being uncertain of the truth, he could not and would not step forward to throw a shade on the name of the father of her whom he loved.

Not long after the events related, Herbert Forster might have been found in the respectable situation of British Consul at a foreign port of some eminence. With him was his wife, Susan Dawkins, or she who had borne that name. While Herbert had lain in prison, with a sudden and shameful death before his eyes, she had been his constant attendant, his sole consolation, and he repaid her love by the after devotion of a lifetime. The pair had the sad consolation of giving a refuge to the deserted Matilda, humbled by suffering into something better than she had been in her earlier years.

POOR JOHN FITCH.

Judge Hall, in his "Notes on the Western States of America," thus speaks of this unfortunate projector:—"In 1785, John Fitch, a watchmaker in Philadelphia, conceived the design of propelling a boat by steam. He was both poor and illiterate, and many difficulties occurred to frustrate every attempt which he made to try the practicability of his invention. He applied to Congress for assistance, but was refused; and then offered his invention to the Spanish government, to be used in the navigation of the Mississippi, but without any better success. At length, a company was formed, and funds subscribed, for the building of a steam-boat; and in the year 1788, his vessel was launched on the Delaware. Many crowded to see and ridicule the novel, and, as they supposed, the chimerical experiment.

It seemed that the idea of wheels had not occurred to Mr Fitch; but instead of them, oars were used, which worked in frames. He was confident of success; and when the boat was ready for the trial, she started off in good style for Burlington. Those who had sneered began to stare, and they who had smiled in derision looked grave. Away went the boat, and the happy inventor triumphed over the scepticism of an unbelieving public. The boat performed her trip to Burlington, a distance of twenty miles, but unfortunately burst her boiler in rounding to the wharf at that place, and the next tide floated her back to the city. Fitch persevered, and with great difficulty procured another boiler. After some time, the boat performed another trip to Burlington and Trenton, and returned in the same day. She is said to have moved at the rate of eight miles an hour; but something was continually breaking, and the unhappy projector only conquered one difficulty to encounter another. Perhaps this was not owing to any defect in his plans, but to the low state of the arts at that time, and the difficulty of getting such complex machinery made with proper exactness. Fitch became embarrassed with debt, and was obliged to abandon the invention, after having satisfied himself of its practicability.

This ingenious man, who was probably the first inventor of the steam-boat, wrote three volumes, which he deposited in manuscript, sealed up, in the Philadelphia library, to be opened thirty years after his death. When or why he came to the west we have not learned, but it is recorded of him that he died and was buried near the Ohio. His three volumes were opened about five years ago, and were found to contain his speculations on mechanics. He details his embarrassments and disappointments with a feeling which shows how ardently he desired success, and which wins for him the sympathy of those who have heart enough to mourn over the blighted prospects of genius. He confidently predicts the future success of the plan, which, in his hands, failed only for the want of pecuniary means. He prophesies that in less than a century we shall see our western rivers swarming with steam-boats; and expresses a wish to be buried on the shores of the Ohio, where the song of the boatmen may enliven the stillness of his resting-place, and the music of the steam-engine soothe his spirit. What an idea! Yet how natural to the mind of an ardent projector, whose whole life had been devoted to one darling object, which it was not his destiny to accomplish! And how touching is the sentiment found in one of his journals:—'The day will come when some more powerful man will get fame and riches from my invention; but nobody will believe that *poor John Fitch* can do anything worthy of attention.' In less than thirty years after his death his predictions were verified. He must have died about the year 1799."

GOD IN THE STORM.

BY MISS PARDOE.

"Did you hear the storm last night, my child,
As it burst o'er the midnight sky,
When the thunder rattled loud and wild,
And the lightning flicker'd by?"
"I heard no tempest, mother mine—
I was buried in slumber sweet;
Dreaming I stood in the soft moonshine,
With flowers about my feet."

"Can it be, my child, that you did not hear
The roar of the tempest-breath,
As it scatter'd the rent leaves far and near
In many an eddying wreath?"
"No, mother; my happy sleep was full
Of gentle and holy things—
Shapes that were graceful and beautiful,
And the music of angels' wings."

"Yet the storm was loud, my darling child—
There was death on the hurrying blast;
And vapours dark over-head were piled,
As the hoarse wind bellow'd past."
"I thought not of clouds, my mother dear,
When I rose from my nurse's knee:
You taught me that God is for ever near,
So what danger could I see?"

"I taught you well, my sinless one;
Yet my own weak spirit quail'd,
As the midnight blast roll'd madly on,
And the moon's calm lustre fail'd."
"Were you wrong, then, mother, when you said
That God's eye turn'd not away,
But in darkness watch'd about my bed
As it did on my path by day?"

"I am rebuk'd!" was the meek reply,
As the mother bent her knee;
"On the lip of babes may a lesson lie—
I have learnt one, child, from thee:
His wrath, which makes the sinner weep,
By a guilty conscience vex'd,
Does but deepen the sinless infant's sleep,
And rock it to gentler rest.

And while thunders hoarsely peal around,
Speaking woe to the worldling's ear,
The Lord in his mercy stills their sound,
When innocence is near:
And while his living fire appals
The guilty here below,
The shadow of the Saviour falls
On childhood's sleeping brow."

MANUFACTURE OF TAPESTRY.

The first manufactories for weaving tapestry which acquired reputation in Europe were those of Flanders, and they appear to have been long established in that country, principally at Arras, before they were introduced either into England or France: the precise period when they were first manufactured by the Flemings is uncertain. Guicciardini, in his "History of the Netherlands," published at Antwerp in 1582, ascribes to them the *invention* of tapestries, but without mentioning any particular date. Whether the Flemings did or did not derive their knowledge from the east, to them is certainly due the honour of having restored this curious art, which gives a life to wools and silks, scarcely, if at all, inferior to the paintings of the best masters. The weaving of tapestry was first introduced into England in the time of Henry VIII. by William Sheldon; but it was not until the reign of James I. that it acquired any particular reputation. This monarch greatly patronised the art, and gave the sum of L.2000 towards the advancement of a manufactory, which was established by Sir Francis Crane, at Mortlake, in Surrey. The patterns first used for making these fabrics in England were obtained from pieces which had already been worked by foreign artists; but as the tapestries produced in this country acquired greater celebrity and perfection, the designs were furnished by Francis Cleyn, who was retained for that purpose. There is extant in "Rymer's Fœdera," an acknowledgment from Charles I., that he owed Sir Francis Crane the sum of L.6000 for tapestries, and that he grants him the annual sum of L.2000 for ten years, to enable him to support his establishment. To France, however, we are indebted for the great perfection to which this curious and costly art has been brought. Henri Quatre first established a tapestry manufactory at Paris about the year 1606, which was conducted by several clever artists whom he had invited from Flanders; but this, like many similar institutions founded by that monarch, was greatly neglected at his death, and would probably have been entirely so, had not Colbert, the minister of Louis XIV., with a view of providing the costly and magnificent furniture for Versailles and the Tuilleries, again remodelled it upon a more secure foundation, and from that period the royal manufactory of the "Hôtel des Gobelins" dates its origin. The working of tapestry, although a species of weaving, is nevertheless so closely allied to the achievements of the needle, that a brief description of the "Manufacture Royale des Gobelins" may not be considered uninteresting or out of place in a treatise on the art of needlework. As early as the fourteenth century, dyers of wool were settled in the Faubourg St Marcel, at Paris, on the banks of the Bièvre, the waters of which stream were considered as favourable to the process of dyeing. One of these, named Jean Gobelin, who lived in 1450, amassed considerable wealth, which his descendants increased, and at length, renouncing the business of dyers, filled various offices in the state. The Gobelin family were succeeded by Messrs Canaye, who, however, did not confine their attention to the dyeing of wool; but under the patronage of Henry IV. commenced the working of tapestry, which, until that period, had been confined to the Low Countries. To these succeeded, in 1655, a Dutchman named Glucq, and one Jean Lianson, a workman, and a great proficient in the art. Louis XIV., at the suggestion of his minister, Colbert, afterwards purchased the buildings and gardens which were still the property of the Gobelin family, and established them as a royal manufactory. In a charter which was drawn up at that time, the building is called the "Hôtel des Gobelins," from which circumstance the tapestry made there has ever since been known as "Gobelin Tapestry." Skilful artists, weavers, and dyers, were brought from Flanders, and attached to the establishment; and in 1667, the celebrated painter Le Brun was appointed chief director of the Gobelin manufactory, to which he communicated that beauty and grandeur his admirable talents were so well calculated to produce.—*Hand-Book of Needlework.*

NOBLE CONDUCT.

M. Dugar, provost of the merchants in the city of Lyons, was a man remarkable for the strict and impartial administration of justice. The bakers flattered themselves that they could prevail upon him to be their friend, at the expense of the public. They waited upon him in a body, and begged leave to raise the price of bread. He told them that he would examine their petition, and give them an answer very soon: before they left the room, they contrived slily to drop a purse of two hundred louis d'ors on the table. They soon called upon the magistrate for an answer, not in the least doubting but the money had effectually pleaded their cause. "Gentlemen," said M. Dugar, "I have weighed your reasons in the balance of justice, and I find them light. I do not think the people ought to suffer under a pretence of the dearness of corn, which I know to be ill-founded. As to the purse of money which you left with me, I am certain that I have made such a generous and noble use of it, as you yourselves intended; I have distributed it among the poor objects of charity in our hospitals: as you are *opulent enough* to make such *large donations*, I cannot possibly think you can incur any loss in your business, and I therefore shall continue the price of bread as it was before I received your petition."—*Flowers of Anecdote.*

AFFECTATION OF SUAVITY.

There are some who affect a want of affectation, and flatter themselves that they are above flattery; they are proud of being thought extremely humble, and would go round the world to punish those who thought them capable of revenge; they are so satisfied of the suavity of their own temper that they would quarrel with their dearest benefactor only for doubting it. And yet so very blind are all their acquaintance to these their numerous qualifications and merits, that the possessors of them invariably discover, when it is too late, that they have lived in the world without a single friend, and are about to leave it without a single mourner.—*Lacon.*

NEW WORK OF MESSRS CHAMBERS.

THE "INFORMATION FOR THE PEOPLE," which was to consist of 100 numbers, being now on the eve of completion, Messrs CHAMBERS respectfully announce that they design commencing the publication of a new work on Saturday the 3d of December, being the week following that in which the "INFORMATION FOR THE PEOPLE" terminates. The title of this new work will be

CHAMBERS'S
CYCLOPÆDIA OF ENGLISH LITERATURE,

CONSISTING OF A SERIES OF SPECIMENS OF BRITISH WRITERS, IN PROSE AND VERSE, CONNECTED BY A HISTORICAL AND CRITICAL NARRATIVE.

In the "INFORMATION FOR THE PEOPLE," the Editors aimed at presenting a body of scientific and general knowledge suitable to the wants of the middle and labouring classes. While that work may serve to instruct, there is need for another which may tend to refine. In the Literature addressed at the present time to the People, there appears, generally, a lack of something to awaken the higher powers of thought—reflection, imagination, and taste—and to nourish at the same time the finer of the moral feelings. These objects Messrs CHAMBERS believe will be in some measure accomplished by the work now announced; in which will be concentrated the most exquisite productions of English intellect, from Anglo-Saxon to the present times, in the various departments headed by Chaucer, Shakspeare, Milton—by More, Bacon, Locke—by Hooker, Taylor, Barrow—by Addison, Johnson, Goldsmith—by Hume, Robertson, Gibbon—*set* in a biographical and critical history of the Literature itself. For the self-educating everywhere, such a work will be as a whole English Library fused down into one cheap book. For the more fortunate youth who are undergoing a regular education, it will be that and something besides—an Introduction to the Pantheon of English Writers, serving, but in a more systematic way and less exclusive taste, the purpose so long served by Dr Knox's "Elegant Extracts."

The "CYCLOPÆDIA OF ENGLISH LITERATURE" is under the care of Mr ROBERT CHAMBERS, assisted by several gentlemen of suitable qualifications, amongst whom may be mentioned Mr ROBERT CARRUTHERS of Inverness. It will be embellished with Wood Engravings of the heads of the principal authors, and objects connected with their history.

The work will appear in weekly numbers, consisting of a single sheet in royal 8vo., double columns, uniform with the "INFORMATION FOR THE PEOPLE," and costing *three halfpence*; and in monthly parts at *sevenpence*. It will consist of not more than 100 numbers, forming two massive and handsome volumes.

EDINBURGH, *September* 20, 1842.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 561. SATURDAY, OCTOBER 29, 1842. PRICE 1½d.

A DAY IN THE EAST OF FIFE.

IN one of the fine mornings of the by-past month, I left St Andrews on an excursion, which I designed should comprehend three or four places with which sundry historical and poetical associations were connected. The sun towered brightly above the German Ocean as our little party drove out of the long and silent, but not unimposing street of the ancient city, and took their way along the open country to the west, where stacked fields proclaimed the triumph of a summer which has left even the querulous farmer not one word to say in its disparagement. As we went along, our hearts "rejoiced in nature's joy;" but it was not to indulge in fond musings over fine natural scenes that I, at least, had undertaken the excursion. My thoughts were with the days of other years, the desolate halls and mouldering sepulchres of men of name, and places upon which the deeds of a former age, whether good or bad, have stamped an imperishable interest. The first few miles of our drive presented us one of these places, which, however, we did not on this occasion stop to survey, namely, the scene of the assassination of Archbishop Sharpe. How strange it now seems, twenty minutes after leaving a populous town, to pass a place where one of the first dignitaries of the country was mercilessly butchered in open day! Magus Moor, famed as the scene of this deed, is now a mixture of corn-fields and thriving plantations; and almost the only feature of the locality which existed at the time, and still survives, is a solitary ash-tree beside the farm-house of Magus, the same which figures in a sculptured representation of the murder upon the archbishop's monument in the church of St Andrews. Another memorial of the deed is a small upright slab, erected, by Presbyterian hands, in honour of a Covenanter who, with five others, was executed at this place as an offering to the manes of the slaughtered prelate. This is now surrounded by a plantation, and is not easily reached. It is exactly one of those tablets of the wilderness which persecuted Presbyterianism has made so numerous throughout Scotland, and which, with all their heterography and doggrel, tell so strikingly, by their pure earnestness, on every pilgrim beholder. The murder of Sharpe was perpetrated by nine persons, some of whom were of the rank of gentlemen, between twelve and one o'clock, on Saturday the 3d of May, 1679. Though they remained to wreak their vengeful feelings on his body, and to rifle his papers, they all escaped unnoticed, nor were any of them ever discovered or brought to justice; but the deed was bitterly enough expiated otherwise, as such *blunders* generally are.

A few miles brought us to the rural village of Ceres, a pleasantly situated place, with a neatly-kept rivulet-bordered green, such as every village *ought to* have, though in our northern land this is the good fortune of very few. I had often heard of the burial vault of the noble family of Crawford Lindsay, as being a sight worth seeing at this village, and to this object we lost no time in directing our steps. Close beside a large modern church of homely appearance, situated on the top of a high bank, is a small tile-covered building, which the grave-digger tells you is the tomb of the Lindsays! It was once a wing of the church, with a gallery for the use of the living family above, but is now disjoined; and it is accordingly to something like a potato-house that the pilgrim is directed as the last home of a family of twenty descents, two earldoms, and a viscountcy—a family which has filled Scottish history with its greatness and its deeds, from the time when the "Lindsays light and gay" fought at Otterbourne, and two centuries before that time to boot, down to Dettingen and Fontenoy. We entered this poor earth-floored shed—for it was nothing better—and there found a few objects which I shall describe in order. Beside the wall, on the left, lay a full-sized stone figure of a gentleman in armour, supposed to be a distinguished member of the family who lived in the fourteenth century. Excepting in being broken through at the waist, it was in good condition, and a faithful memorial, no doubt, of the accoutrements of a warrior of that period. It formerly lay in the church, from which it was removed hither nearly forty years ago. The only other objects of a conspicuous nature were two frames or cases raised above the ground on skids, and which contained the remains of John Earl of Crawford, the famous general of George II., and his wife. The lid of the larger case being raised, disclosed the top of a coffin covered with crimson velvet, and presenting a brass plate with the following inscription:—"John Earl of Crawford, born 4th October 1702, died 25th December 1749, in the 48th year of his age." The lid of the coffin itself being raised, we saw a close coffin of lead, in which it is believed the embalmed body remains entire. It was with feelings which I should vainly attempt to describe that I felt myself in the bodily presence of the gallant and accomplished soldier, whose history I had so often read—who, in the service of Russia, astonished even the Cossacks by his horsemanship—who, commanding the life-guards at Dettingen, cried out, "My dear lads, trust to your swords, and never mind your pistols," and charged to the time of *Britons, strike home*—who kept the passes into the Lowlands while poor Charles was staking all his hopes at Culloden; and on many other occasions acted a conspicuous part in an age of which hardly any living specimen can now exist. And his countess, the elegant Lady Jean Murray, who left him after only six months of wedded happiness, before she had completed her twentieth year, and whom his affection caused to be embalmed, and sent from Aix-la-Chapelle, where she died, to this place—what of her? A dusky, battered, metal cover, bearing the letters L. J. M., with a coronet, being lifted up from the case beside his lordship's coffin, we beheld beneath a quantity of mere rubbish, a mixture of decayed wood and bones, constituting all that now remains of "what once had beauty, honours, wealth, and fame," and was, besides, an object of the fondest solicitude to the best and bravest of men.

> "How loved, how honour'd once, avails thee not,
> To whom related, or by whom begot;
> A heap of dust alone remains of thee—
> 'Tis all thou art, and all the proud shall be."

A singular looking object attracting our attention amidst this wreck of humanity, the grave-digger took it up, and showed us more nearly what proved to be a portion of the skull, containing a piece of sponge which had been substituted for the brain by the embalmer. Think of the head of this young, beautiful, and many-titled lady, that head for which affection could once scarcely get a smooth enough pillow, *now* lifted and handled by the coarse hands of an unthinking rustic! The vault, so called by courtesy, presented no other objects but a small square case containing the intestines of the earl, and a few fragments of old tomb-stones, which had been taken from amidst the rubbish of the former church. Of all the other members of this ancient family buried here, no memorial remains, excepting three slab tomb-stones placed at the end of the vault on the outside, and which we found deeply covered with rubbish. Having got them cleared, I easily read upon one, "HIC JACET JOANNES LINDSAY DOMINUS DE BYRES," with the date of his death, 1562. The person referred to was John, fifth Lord Lindsay of the Byres, who commanded the Scottish army at the battle of Ancrum Moor, and was the father of that fierce reforming lord whom Scott describes in such lively terms in "the Abbot," as forcing Queen Mary at Loch Leven to resign her kingdom by sternly griping her arm. On the only other stone containing anything intelligible, I read the words EUPHAM DUGLIS. It was the monument of the wife of that savage lord, a daughter of the knight of Loch Leven, Queen Mary's jailor, and sister of the Regent Moray. Probably the other stone, as they were all of a size and similar in style, was the monument of Lord Patrick himself. These monumental slabs had once formed part of the floor of the church, but had been removed when that edifice was renewed in 1806; to such contingencies are the memorials of greatness exposed when a few ages have passed away. The line of these Lords Lindsay terminated in the great general above mentioned, who was fourth Earl of Lindsay, and eighteenth Earl of Crawford. Now that great family has no acknowledged male representatives, their lands are in the possession of others, and of their house of the Struthers, near Ceres, where they once lived in splendour, only a gable wall or two remains.

Having seen all which was to be seen at Ceres, we remounted our drosky, and proceeded in a westerly direction, for the purpose of visiting the old tower of Scotstarvet. Passing the modern house of Wemyss Hall, delightfully situated at the bottom of a south-sloping hill, forming a beautiful pleasure-ground, we quickly approached the ancient seat which we were anxious to examine. Scotstarvet is a tall narrow tower, occupying the highest ground in an opening of the hills, through which we obtain a peep of the fine vale of the Eden. It is evident that the situation has occasioned the name, for tarbet, or tarvet, is a Gaelic word for an isthmus, or passage between hills. The tower is conspicuous from a great distance, relieved against the sky as it is approached, and its appearance is the more striking by reason of an ash-tree which springs out of the battlements, like a feather in a soldier's cap. We found the tower, on a near view, to be one of those wonders, a building of the middle ages, as straight, compact, and sharp, as the day it was finished. It is merely a tower of three vaulted storeys, the two upper of which have been inhabited by human beings, while the lowest has been a kitchen. A winding stair, contained in a square projection at one of the angles, gives access to the various rooms, and to the battlements, above and within which rises an additional room, in the form of a small slope-roofed house. Large modern additions to the tower existed till about fifty years since, but have since then been entirely removed. I visited Scotstarvet as classic ground, though probably few who now live have the faintest notion of the connexion of the place with anything superior to the commonplace affairs of mortals. The owner of this house two hundred years ago was Sir John Scott, director of the chancery, and a judge of the Court of Session, a man of remarkable talents and learning, and an eminent patron of literature, when most of his countrymen were absorbed in barbarous controversies. To his munificence we owe the publication of an elegant collection of the Latin poetry produced in that age by Scottish authors,* as well as the production of an atlas of Scotland,† which he himself helped to prepare and to illustrate by historical matter. A man like this is as a light to a traveller in a dark night, or a

* Entitled *Deliciæ Poetarum Scotorum*, published at Amsterdam, in two volumes, in 1637.

† *Theatrum Scotiæ*, in 46 maps, published by Bleau of Amsterdam, in 1654.

refreshing spring in the midst of a parched land. He flourished in public life in Scotland, from a period not long after the accession of James VI. to the English throne, down to the reign of Charles II., steering his way prudently through all the troubles of his time, and never wanting in the means to gratify his refined tastes. Sir John's first wife was a sister of the poet of Hawthornden, who often lived here. Amongst Sir John's other visiters at Scotstarvet, were Sir James Balfour, the Lord Lyon and author of the "Annals," the two Johnstons the poets, and Sir Robert Kerr of Ancrum, also a poet. Ascending to the bartizan, we found over the door leading upon it from the stair, a stone containing the sculptured arms of the learned knight, together with his initials, "S. J. S.," and those of Dame Anne Drummond, his wife, "D. A. D.," with the date 1627, being probably that of a repair of the edifice. Here, besides the ash-tree, which is rooted firmly in the building, we found a gooseberry bush springing from the wall below the battlements. The people, it seems, have a notion that, when this bush dies, or is removed, something very sad will befall the owner of the mansion.

The Scotts of Scotstarvet were considered the first cadets of Buccleugh, and for several generations were remarkable for ability. A grand-daughter of Sir John, marrying Viscount Stormont, is believed to have been the means of inoculating that family with talent, of which one remarkable example is to be found in one of her sons, the first Earl of Mansfield. The family terminated in General Scott, father of Viscountess Canning and of the Duchess of Portland; and the property is now in other hands.* Here, also, there was room for a fond imagination to indulge in musings over days and things gone by. I lingered in the dismantled rooms of the old chateau, eagerly endeavouring to realise the clever old knight and his friends, and reviving all I could remember of their intellectual labours. Could it be in this deep recessed window, where two fixed *vis-a-vis* seats still exist, that Sir John would employ his last days in chronicling all the disasters of the public men of his time, in that strange little book which did not till long after see the light, the "Staggering State of Scots Statesmen!" from which it was made to appear that scarcely a single man had held public employment in Scotland between 1550 and 1650, who had not, though for a time flourishing, come to wreck and ruin, or whose children at least had not done so. The tone of this book is sharp and biting; the venerable knight had himself suffered sorely under Cromwell, and was not too well treated at the Restoration; it is not *very* uncharitable to suppose that he might feel a slight consolation for his own misfortunes in contemplating those of his neighbours—a source of comfort oftener experienced than acknowledged amongst the children of men. However this may be, the Staggering State is a curious record of the personal characters and familiar actions of the men of that age, and conveys a strong impression to the reader, that its author, as he sat and talked in the flesh at his own table, or by his own fireside, must have been one of the most entertaining of companions. Drummond, too, in whose classic shade in Lothian Jonson had sat, must have often sat in the scarcely less classic shade of Scotstarvet, perhaps detailing to the greedy ears of his sister and brother-in-law the last visit he made to the wits of the south, and all the racketings he had with them at the Angel and the Mitre, or regaling them with some of the latest productions of the muse of Massinger, Ford, or Webster. Here, without doubt, he must have composed his whimsical poem entitled "Polemo-Middinia," for it relates to a familiar occurrence at Scotstarvet, and looks entirely as if written the evening after to amuse the particular circle there assembled. Grotesque as the subject is, I could not survey the fields around this now desolate tower, without investing them with a lively feeling of interest, as I considered that they had once been animated by the rustic bustle which the slip-shod muse of Drummond has there described. This poem is what is called macaronic, that is, a mixture of two languages, the most of the words being Scottish, but wrought up with Latin, and put into an appearance of Latin hexameter verse. It relates to a quarrel which the author's sister, Lady Scotstarvet (Vitarva), had with a neighbour styled Lady Newbarns (Neberna), and describes a conflict which took place between the servants of these two gentlewomen, in consequence of the former endeavouring to put a resentful indignity upon the latter. Let not the gentle reader be unduly startled, when I mention that this indignity consisted in causing all the Scotstarvet dung-carts to be led past the windows of Lady Newbarns. The transaction is described by Drummond in a breadth of style suitable to the nature of the incidents, and it is not difficult to conceive the roars of laughter with which it must have been received in the hall of Scotstarvet, where the characters which it so ludicrously reflected were all of course intimately known. I am tempted to make an endeavour to convey some notion of this poem to the unlearned reader, by means of a few passages with an interlined translation. Vitarva first calls her forces about her, and gives them their commission, telling them that if Neberna should come out and challenge them for what they did, she would warrant and defend them.

Hic aderant Geordy Aikenhedius et little Johnus,
Here came Geordy Aikenhead and little John,
Et Jamy Richæus, et stout Michael Hendersonus,
And Jamy Ritchie, and stout Michael Henderson,
Qui jolly tryppas ante alios dansare solebat,
Who was accustomed to dance jolly trips before all others,
Et bobbare bene, et lassas kissare bonæas;
And to bob well, and kiss the bonny lasses;
Duncan Oliphantus, valde stalvartus, et ejus
Duncan Oliphant, a very stalwart man, and his
Filius eldestus, jolly boyus, atque oldmoudus,
Eldest son, a jolly boy, and an old-mouthed one,
Qui pleugham longo gaddo dryvare solebat;
Who was wont with a long gad to drive the plough;
Et Rob Gib, wantonus homo, et Oliver Hutchin,
And Rob Gib, wanton man, and Oliver Hutchin,
Et plouky-faced Watty Strang, atque in-kneed Elshender Aitken,
And plouky-faced Watty Strang, and in-kneed Elshender Aitken,*
Qui tulit in pileo magnum rubrumque favorem,
Who bore in his bonnet a great red favour,
Valde lothus pugnare, sed hunc Corngrevius heros
Very loth to fight, but him the Corngrieve hero
Nouthe adum vocavit, atque illum forcit ad arma.
Called Nott-head, and forced to arms.
Insuper hic aderant Tom Taylor et Hen. Watsonus,
Here also came Tom Taylor and Henry Watson,
Et Tomy Gilchristus, et fool Jocky Robinsonus,
And Tommy Gilchrist, and fool Jocky Robinson,
Andrew Elshenderus, et Jamy Tomsonus, et unus
Andrew Elshender, and Jamy Thomson, and one
Norland bornus homo, valde valde anti-covenanter,
A Norland born man, a dreadful anti-covenanter,
Nomine Gordonus, valde black-moudus, et alter,
Gordon by name, very black-mouthed, and another,
(Deil stick it! ignoro nomen) slav'ry beardius homo,
(Deil stick it! I've forgot his name), a slavery-bearded man,
Qui pottas dichtavit, et assas jacerat extra,
Who cleaned pots, and threw out ashes.

The unsavoury procession sets out amidst great din, with Piper Law playing "the Battle of Harlaw" before it, and the insult to Lady Newbarns is accomplished — which lady, however, comes out in great rage, and calls forth her barrowmen and lads, and her jack-man, hire-men, plough-drivers, and ploughmen, tumbling-boys from the reeky kitchen, wide-breeked fishermen, and coalmen and salters as black and ugly as a certain personage, and also the servant-women—for instance,

Maggæam magis doctam milkare cowæas,
Maggy better skilled in milking cows,
Et doctam sweepare flooras, et sternere beddas,
And sweeping floors, and making beds,
Quæque novit spinnare, et longas ducere threddas;
Who knew also to spin, and draw out the long threads;
Nansæam, claves bene quæ keepaverat omnes;
Nanse, who carefully kept all the keys;
Yellantem Elpen, longo bardamque Anapellam,
Yelling Elspeth, and long-bearded Annaple,
Egregie indutam blacko caput sooty clooto;
Whose head was signally clothed in a black sooty clout;
Quæque lanam cardare solet greasy fingria Betty.
And greasy-fingered Betty, accustomed to card wool.

Neberna feeds her troops well, and sends them to the combat, which rages intensely on a field neither dry nor clean, and during which many incidents take place in the style of the Iliad and Æneid, until, as in the Homeric and Virgilian battles, attention is concentred upon one pair of combatants, namely, a savage maid of Neberna's styled Gilly, and a carter of Vitarva's, whose name is not given, and who had offered a particular insult to her mistress:—

Extemplo Gillæa ferox invasit, et ejus
Quickly fierce Gilly attacked him, and
In faciem girnavit atrox, at tigrida facta,
Savagely grinning in his face, and, tiger-like,
Boublentem grippans beardam, sic dixit ad illum:—
Gripping his trickly beard, thus said to him:—
"Vade domum, filthæe nequam, aut te interficiabo!"
"Gang hame, ye filthy gude-for-naething, or I'll be the death o' ye!"
Tunc cum gerculeo magnum fecit Gilly whippum,
Then with a jerk Gilly gave him a good whip,
Ingentemque manu sherdam levavit, et omnem
And taking up a large shard,
Gallantæi hominis gash beardam besmeariavit
Besmeared all the gash beard of the gallant man;
"Sume tibi hoc," inquit, sneezing valde operativum
"Take that till thee!" she said, sneezing violently,
"Pro premio, swingere, tuo;" tum denique fleido
"For thy reward;" then to the frightened fellow
Ingentem Gilly wamphra dedit, validamque nevellam,
Gilly-wamphry gave a good heavy knevel, †
Ingeminatque iterum, donec bis fecerat ignem
And repeated it till twice she made the fire
Ambobus fugere ex oculis; sic Gylla triumphat.
Fly from both his eyes; and so Gilly triumphs.
Obstupuit bumbaizdus homo; backumque repente
Astonished stood the bumbaized man, and suddenly
Turnavit veluti nasus bloodasset; et, "O fy!"
Turned back as if his nose had been bleeding, and, "O fy!"
Ter quater exclamat, et O quam fœde neezavit!
He three or four times cried, and O how dreadfully he sneezed!

Enough, perhaps, of this homely stuff, which, however, I may say in my own defence, a bishop was the first to give to the world. And so turn we the back of our drosky to the old tower of Scotstarvet.

Descending the slope towards Cupar, we had full in front the rich vale of the Eden, thickly bedecked with elegant modern mansions, amongst which the Priory, the seat of the late Lady Mary Lindsay Crawford (the last of the Crawford Lindsays), shone conspicuous. Right opposite rose a beautiful wooded hill, having an obelisk on the top, to the memory of John Earl of Hopetoun, a distinguished soldier of the Peninsula. This is *the Mount*, once the property and residence of the poet of the Scottish reformation, Sir David Lindsay. We designed to climb its sides, and visit the spot where the worthy Lord Lion, King at Arms, had lived; but, on reaching Cupar, finding the distance greater than we had calculated upon, we were obliged to give up the intention. I may here, nevertheless, state that, where the baronial mansion of Sir David once stood, there now only exists a farm-house, having two sculptured stones of the old house built into it, one of them presenting the initials of Sir David and those of his wife, in this form—

S
D L
D
G *

the other presenting the arms of one of his successors of his own family, with the date 1650. The ground has been alienated from the name of Lindsay for more than a century, and now belongs to General Sir Alexander Hope of Rankeillour. In 1806, a farmer of patriarchal age, who had dwelt seventy years on the spot, pointed out to a correspondent of Mr George Chalmers "a shaded walk on the top of the Mount, where Lindsay is said to have composed some of his poems. It was called, in the youth of this aged man, Sir David's Walk; and in 1801, when the woods of the Mount were cutting, the same venerable enthusiast interceded with Sir Alexander Hope for three ancient trees, which stood near the castle, and were known by the name of Sir David's Trees. The liberal spirit of that gentleman probably needed no such monitor; but the trees were spared. It is likely they still remain, and the literary pilgrim may yet stand beneath their shade, indulging in the pleasing dream that he is sheltered by the same branches under which the Lord Lion was wont to ruminate, when he poured forth the lays which gave dignity to the lessons of experience, and accelerated the progress of the Reformation."*

In the thriving town of Cupar, to which we now proceeded, we went to see the castle-hill, on whose esplanade Sir David's extraordinary *Satire of the Three Estates* was acted in the open air during his life-time. The spot is now occupied by school-rooms, but it is still possible to form some notion of this open-air theatre and its assembled audience, grinning at the jests directed by pardoners, paupers, and sutors, by Dissait, Flattrie, and Wantonnes, against the vices of the contemporary clergy. In English literary history, the satire is a piece of some distinction, as the last specimen of the class of plays called *Moralities*, in which the chief characters were abstract qualities personified. Its clever raillery is mingled with grossnesses of speech and act, the repeated witnessing of which by a king, queen, and court, cannot but excite the greatest surprise in the present age. When our horses had rested a due time at M'Nab's, we recommenced our journey, which was now almost directly homeward. In the course of the drive we saw a few more sights, not unworthy to be told to the gentle reader; but, like the sultaness Schecherazade, I am clear for not telling too much at once, and so, for the present, I make my bow

INSURRECTIONS AT LYONS.

SECOND ARTICLE.

CIRCUMSTANCES soon occurred to prove that the working-men of Lyons had derived no effective warning from their futile and blood-spilling outbreak in November 1831. The miserable tariff for which they had held out having been given up at the time with perfect indifference, a new plan was tried, with full consent of both masters and men. This consisted in the establishment of a tribunal, called *L'Institution des Prud 'hommes*, and composed of an equal number of manufacturers and delegated workmen, whose business it was to arrange the scale of wages for regular periods. It was hoped that this council would prove one of amity and concord; but it speedily proved to be a very pandemonium of confusion and anarchy. The representatives of the working-men carried their prejudices and passions with them, and acted not as the colleagues, but as the constant and bitter rivals of the master-deputes, interrupting debates, and annulling decisions at will. A mob was, moreover, admitted to the place of meeting, and there hooted and threatened all who displeased them. Harmony was farther distant than ever.

Nor did the evil rest here. The disturbances of 1831 had drawn upon Lyons the attention of all the wild speculators in politics, morals, and religion, whom Paris or France contained; and preachers and lecturers of all denominations accordingly flocked to the unfortunate city. Before the outbreak of 1831, the weavers of Lyons had been remarkably indifferent to all sorts of politics and political discussions. A few months sufficed to change their feelings. As was to be expected in a place where so much ignorance prevailed, the adventurers who preached republican opinions found most converts in the workshops of Lyons, outstripping all their competitors, from Carlists to Saint-Simonians. Ere long, the workmen chose to have a newspaper purposely for themselves; and this journal, called the *Echo de la Fabrique*, had for its auxiliaries other papers, which openly advocated a revolution and a republic. By such combined causes were the uninstructed weavers of Lyons worked up to, and kept continuously in, a state of frenzy. "The great weapons of the publications described were, of course, calumny and personal defamation. Any manufacturer or merchant who did, or even said, anything considered unfavourable to the cause of the people,

* Excepting the patronage of the chair of Roman literature at St Andrews, founded and endowed by Sir John: this remains with the Duchess of Portland. It is interesting to find the only connexion between the descendants of this elegant person and the county where he once had so much property, is by a link of such a nature.

* Pimpled. † Blow.

* Mr Tytler's Scottish Worthies, Family Library.

was at once accused of every vice and crime, and held up as a monster to popular execration."

M. Monfalcon, the writer now quoted, states that, during the thirty months intervening between November 1831 and April 1834, "Lyons never at any time enjoyed fifteen days of tranquillity." The numerous and sometimes conflicting sources of agitation tended, for a part of that period, to prevent any great or combined movement towards a new insurrection. But at length certain gentlemen, calling themselves Propagandists of the Society of the Rights of Men of Paris, came to the city of Lyons to lend their generous assistance in throwing the confused mass of mischief into a proper shape, and in giving it an impulse toward its destined end. Under their auspices, unions were formed, and laws and bye-laws concocted. The two great unions were, that of the *Mutuellistes*, or weavers who had looms of their own; and that of the *Ferrandiniers*, or weavers who had no looms. The constitution of these unions was nearly the same. The Mutuellistes had one hundred and twenty-two lodges, of twenty members each, and with a president in each. From the united body of presidents were formed twelve central lodges, each of which named three members to form an executive commission, which thus consisted of thirty-six members. This commission again resolved itself into a permanent directory of three members. Each member of the union paid five francs on admission, and one franc per month regularly. The money here was the important matter, fine though the lodge-scheme looked. The money was the thing which sustained such men as struck or wanted work; and the money kept up the *Echo de la Fabrique*, as well as the *Echo des Travailleurs*, a rival which sprang up in due time.

Though dissensions soon occurred among these unions, yet they so far worked out their unhappy ends as to give a stronger aim to the mischievous elements existing in Lyons. From the middle of 1832, the city not only never enjoyed fifteen days of peace, but a month never passed without an open attempt at insurrection. These would have been much more quickly and decisively destructive than they really were, but for the wise measures taken by the French government immediately after November 1831. They then commenced to fortify the city, and in less than two years a number of forts, connected partly by entrenchments, had arisen around Lyons, while a strong barrack was built in the square of the Bernardines, commanding the always turbulent quarter of Croix Rousse. The erection and completion of these works, with the number of forces in the city, doubtless kept down the insurrectionary spirit to a certain extent. But it grew in strength and audacity till it became ungovernable. At the close of 1833, scarcely a day passed without a riot, more or less serious. Mingling political with commercial matters, the weavers publicly sang republican hymns at the same time with psalms about the tariff, the cry for which revived in double force; and "Down with Louis Philippe!" "Long live the guillotine!" "Down with the aristocrats!" were also common cries on the streets of Lyons.

In consequence of these mad dissensions, the silk trade was in a languishing state in February 1834. The natural result was, an inability on the part of the manufacturers to pay the wages given before. Blind to the fact, that their own previous insane conduct had the inevitable tendency to cause this fall, the Mutuellistes, by a majority of 2341 over 1290, resolved on a strike. Next day not a loom in Lyons was at work, the minority remaining idle under compulsion. From the 12th to the 22d, the weavers held out, making senseless and vain demands; but after the eight days had elapsed, they returned to their work, having gained nothing. But it was calculated *one million of francs* (L.40,000 sterling) *were lost to Lyons during these eight days*. And, moreover, a "great number of families left the town, and terror became general among the manufacturers. Most of them concealed their goods or packed them up and exported them, and then getting their own passports, hurried from Lyons as fast as they could. Considerable amounts of capital thus left the city. Some first houses were shut up and abandoned."

It seemed, however, as if nothing but bloodshed—bloodshed once more—could quell the mad spirit of insurgency in these ignorant and misguided men. On Saturday the 5th April, six men belonging to the Mutuelliste Society were to be brought to trial for various acts of riot. An enormous multitude of the weavers assembled in and around the court, and the result was an attack upon the assembled officials, from which the judges, the attorney-general, and the commissaries of police, only escaped by making their exit through a concealed door and a hayloft. A body of sixty foot soldiers marched out to check the riot, but though the weavers parted without further mischief, the discovery that the muskets of the soldiers were unloaded did much harm, leading the people to believe that the soldiery would not act against them.

Next day eight thousand weavers turned out to attend a workman's funeral, and in the evening the streets were crowded with men singing the Marseilloise hymn, and shouting republican and seditious cries. This state of things led to the instantaneous departure of many other capitalists and manufacturers from the city. It was now evident that Lyons was clearing, to become once more a field of battle. In the weaving lodges, the question was openly debated, how and when a revolt, political and commercial, might be best effected. The actual determination to revolt was taken, and the workmen were confident of success, though the troops in the city amounted to 10,500 men. The rioters deemed the troops friendly, however, and there committed a great and fatal mistake. The 9th of April, the day fixed for resuming the trial of the six Mutuellistes, was looked on by the authorities as the perilous moment, and justly, as it proved. "On Wednesday, the 9th of April," says M. Monfalcon, "at seven o'clock in the morning, the soldiers were at their posts with loaded muskets, cartridge-boxes filled, their knapsacks on their shoulders, and with rations for two days. They were disposed in four separate divisions. General Fleury was at La Croix Rousse; Colonel Dietzman at the Hotel de Ville; General Buchet at the archbishop's palace; Lieutenant-General Aymard, the commander-in-chief, at the square of Bellecour. At eight o'clock, M. B—— informed M. Gasparin, the prefect, that the chiefs of the section of the Society of the Rights of Man were assembled at a house close by. He, moreover, brought a heap of republican proclamations wet from the press. A member of the municipality proposed the immediate arrest of men whose intentions were no longer doubtful to any one; but another member of the same body showed the disadvantage there would be in exercising such an act of authority before the commencement of hostilities by the insurgents in the public streets. It was therefore agreed that the republicans should be left to act.

At half-past nine o'clock, the mob began to fill the streets and squares. The authorities were again asked to order the arrest of some of the chiefs of the associations, who were abroad with the crowd. The answer was, 'No! as yet they have committed no disorder, and the authorities ought to avoid even the appearance of aggression—they must not be struck before they strike.' A man placed himself in the midst of the square of St Jean, and read a republican proclamation addressed to the *soldiers* and the working-classes. The colonel of the gens-d'armes, passing at the moment, tore the proclamation from his hands, and arrested the reader. Shortly after, the crowded square of St Jean was suddenly and completely evacuated; not a republican, not a single weaver was to be seen. The most absolute solitude and perfect silence reigned there.

But the insurgents had begun to raise their barricades in the street St Jean, and in all the streets and lanes that opened upon the square. The scaffolding and materials of some houses that were building—beams, planks, stones, carts, and overturned carriages—served to form these lines of defence, and the pavement was taken from the streets to be thrown at the soldiers. When informed that a second, a third, and a fourth barricade was thus rising, General Buchet ordered half a battalion of infantry and a platoon of gens-d'armes to clear the public way, but to refrain from firing until an act of open hostility was committed. A few soldiers and some policemen rushed against the first barricade, and attempted to overturn it; they were instantly assailed by heavy stones, thrown by the insurgents from the gates, windows, house-tops, &c. Here, then, was not only a resistance but an aggression—a carbine was discharged from the detachment of troops—the gens-d'armes commenced the fire.

During this time, the trial of the six Mutuellistes had begun. At the report of the first shot, the advocate for the accused, M. Jules Favre, stopped short; he could not, he said, continue to plead whilst the citizens were slaughtered in the streets. The whole audience was violently excited. M. Pic, the president, broke up the court. The next moment judges, magistrates, advocates, officers, and all, rushed pell-mell out of court, and endeavoured to gain their different homes before the scene of warfare should have time to extend itself."

A fearful combat now began. Barricades rose in all directions, and the soldiers fought hand to hand, with shot and steel, against the insurgents. The latter enjoyed, as formerly, great advantage from the shelter of the houses, till the soldiers began to blow up the doors with petards. The city was soon set on fire in various places in consequence. Hundreds of peaceable citizens perished in consequence, and, when artillery began to play on the strong positions of the workmen, then the aged and the young fell alike. The insurgents were driven, on the first day, into the long narrow streets of the interior of the city, the soldiers, by whose side the authorities fought on foot, having carried every position attacked by them.

But the spirit of the misguided workmen was unbroken. "On the second day, they challenged a renewal of the combat at six A.M., by ringing the tocsin from St Bonaventure and other churches. The firing, however, did not begin till eight o'clock. The street warfare presented much the same character as the preceding day; but at La Guillotière the battle became still more furious. A multitude of working-men, placed on the roof-tops and behind chimneys, fired incessantly on the troops; consequently whole batteries of artillery thundered on that populous suburb, and soon wrapped many houses in flames. The main street was literally swept by the cannon. A large and beautiful house, situated at one corner, was set on fire—the flames rapidly spread from house to house, and in a short time all that part of La Guillotière was nothing but a heap of smoking ruins. At another point near the hospital, the troops kept up a tremendous fire of musketry against a party of working-men who lay there in ambush behind a barricade. The balls rebounding (*par ricochet*), entered in at the windows of the houses, and wounded many females. At noon, the black flag floated over the church of St Polycarpe, at L'Antiquaille, at Fourvières, at St Nizier, and at the Cordeliers. The stunning tocsin resounded on all sides. Colonel Mounier, at the head of some grenadiers, ordered the destruction of a barricade in the street of St Marcel. The colonel directed the attack in person. He wanted to show his men how easy it was to carry such a defence; he jumped upon the barricade, and was shot dead by a musket fired point-blank. The death of that brave officer infuriated the grenadiers; they threw themselves upon the barricade, scaled it, beat it to the ground, and pursued the insurgents, who fled in all directions. A few of the soldiers saw some of the republicans seek refuge in a corner house; it was from that direction that the fatal shot which killed poor Mounier was fired. With blind fury the grenadiers rushed into the house, ran up the stairs, forced open the room doors, and discharging their pieces, killed, among others, one of the most honourable and esteemed citizens of Lyons, M. Joseph Rémond. Thus, the death of the brave Colonel Mounier was followed by a not less deplorable accident! Mournful results of civil wars are these, where the lives of so many innocent persons expiate the offences of the factious, who themselves often escape unpunished! During this day, the buildings of the College were set on fire three times, and three times the fire was extinguished; the library was threatened with destruction, but fortunately that rich literary treasure did not sustain the least injury. At the end of this day, if the garrison had obtained no decisive success, it had at least lost none of its advantages. The insurgents had nowhere gained ground, though they had fought with more obstinacy than had been expected."

It would be painful to follow this insurrection through all its details. The plan of action pursued by the military, consisting chiefly in discharges of artillery, was prudent as regarded themselves, but awfully destructive as respected life and property in the insurgent streets. The soldiers took care not to enter the long narrow streets, where escape with life was almost impossible. Four days the warfare continued unabated. On the evening of the fourth day (12th of April), however, the troops were in possession of nearly the whole city, and peaceful citizens began to breathe freely. Physicians for the first time dared to visit the sick and wounded. Still there was a little fighting on Sunday the 13th, but on the 14th the contest ended. On that day, the last lanes in La Croix Rousse were taken, and nearly every insurgent in them was shot or bayonetted by the troops. It was only then that the true authors of the evil were exposed to and met the fate which they had provoked.

By these six days of commotion, Lyons was left nearly in ruins. The destruction of property was enormous, and the loss of life also very great, though not proportionate. The results of the whole was an almost total stoppage of the silk trade in Lyons. Capital was taken from it to an immense amount, and its owners settled in more tranquil scenes. For years to come, the effects of these riots must be felt in the trading concerns of the city.

BIOGRAPHIC SKETCHES.

JOHN KEPLER.

After Copernicus and Galileo, the history of astronomy does not present a more illustrious name than that of John Kepler, the "Legislator of the Heavens," as he has been somewhat rashly called, from the splendid discoveries which he made respecting the movements of the planets. He was born in 1571, near Weil, in Wirtemberg, of which place his paternal grandfather was burgomaster. The father of the great astronomer was an improvident man, who left sober pursuits to be a soldier under the infamous Duke of Alva in the Netherlands: his mother was illiterate and of disagreeable temper. Being born in the seventh month, he was at all periods of his life small and of a weakly frame of body. His early education was repeatedly interrupted by his being put to humble rustic occupations; but his abilities, nevertheless, became so conspicuous, that it was resolved, more particularly considering his want of personal strength, to bring him up to the church. The education necessary for this purpose was begun in a school at Maulbronn, at the expense of the Duke of Wirtemberg, and completed at the college of Tubingen, an eminent Lutheran seminary, remarkable for its advocacy of the doctrine of the omnipresence of the body of Christ. There he took his degree of Master of Arts in 1591, on which occasion only one person stood above him in the list.

The professional prospects of Kepler were blighted by the freedom which he assumed in judging of religious doctrines, and particularly that which was so much a favourite with his college. Finding himself, for this freedom, abused as "a self-seeker, a hypocrite, a heretic, and an atheist," he was glad to accept an invitation from the States of Styria, to take the astronomical lectureship in the gymnasium at Gratz. He was now in his twenty-second year, and had not as yet turned his mind particularly to astronomy, al-

though, at Tubingen, his mathematical teacher had been Michael Mastlin, an able man, who had given much attention to that subject, and is said to have been the converter of Galileo to the Copernican system. Kepler undertook the office, because he thought himself bound to become useful as soon as possible; but having, even at this early period, ambitious wishes, he thought proper to reserve his right to enter upon any more brilliant career that might present itself. Here, by his very first act, he had the misfortune further to inflame the divines of Tubingen against him. The delinquency consisted in drawing up an almanac for Styria, in which, according to the fashion of the country, he adopted the *new style*—a thing correct in itself, but for which Europe had been indebted to a pope. "The new calendar," said the Tubingen sages, "has manifestly been devised for the furtherance of the idolatrous popish system." Kepler, on the other hand, thought it "a disgrace for Germany to be alone without that correction which the sciences desire." This strange trait of jealousy in the German university conveys a strong impression of the keenness with which religious differences were felt in the sixteenth century.

Kepler had been well grounded at school in figures, numbers, and proportions. He had also given his thoughts to the "examination of the nature of heaven, of souls, of genii, of the elements, of the essence of fire, of the cause of fountains, the ebb and flow of the tide, the shape of the continents and inland seas, and things of this sort." Investigations of nature were then mixed up with superstitious notions derived from the vulgar, and genuine light was only breaking, in faint streaks, through the mass of ignorance and delusion. The Copernican system had been promulgated, but existed only as an obscure heresy, patronised by a few. Kepler had been taught by Mastlin to look favourably upon it; but at such a stage in the progress of new ideas, even powerful minds are apt to concede more to old and respectable error than to an innovating truth. Kepler had now devoted himself for some time to astronomy; but his mind was naturally ingenious and fanciful rather than philosophical in the proper sense of the word. His favourite plan of investigation, not only at this period, but throughout his whole life, was first to conjecture, and then to endeavour to make good his conjectures by laborious calculations shaped for that end. He was chiefly bent on discovering analogies in nature. The most remote things he endeavoured to reduce to some sort of resemblance. He was particularly anxious to find mathematical proportions in the orbits of the different planets, or rather in their spheres; for, as yet, each planet was supposed to be fixed or set in a hollow sphere in which it revolved. He first tried if their various distances were multiples of each other, in which he completely failed. Then, by one of those happy strokes of daring which distinguished him, he inserted a new planet between Jupiter and Mars, where it latterly has been found there is a group of small ones; but still this did not help him. In some subsequent conjectural calculations of a geometrical kind, he was struck by the appearance of a proportion between the circle inscribed without and that described within a triangle, and the orbits of Saturn and Jupiter; and following out this idea of measurement in reference to the other planets, he imagined that he had accounted for the five solid figures of geometry, and detected the secret of the planetary arrangements, whereupon his joy was boundless. In a small work, entitled "Prodromus," in which he explained his theory, he says—"The intense pleasure I received from this discovery can never be told in words. I regretted no more the time wasted; I tired of no labour; I shunned no toil of reckoning; days and nights I spent in calculations, until I could see whether this opinion would agree with the orbits of Copernicus, or whether my joy was to vanish into air. * * As men," he continues, "enjoy dainties at the dessert, so do wise souls gain a taste for heavenly things when they ascend from their college to the universe and there look around them. He who has discerned the frailty of human affairs, will aspire heavenward from earth. He will begin to set less value on what once appeared to him the most excellent. He will esteem God's works above all things; and, in the contemplation of them, he will find a pure enjoyment. Great Artist of the world! I look with wonder on the works of thy hands, constructed after five regular forms, and in the midst the sun, the dispenser of light and life. I see the moon and stars strewn over the infinite field of space. Father of the world! what moved thee thus to exalt a poor, weak, little creature of earth so high that he stands in light a far-ruling king, almost a god, for he thinks thy thoughts after thee!" This sublime exultation was soon found to be premature, for the theory of the five solid figures did not prove true; but Kepler in time made it all appropriate. The ingenuity displayed in his little work was universally admired.

In 1597, Kepler married Barbara Müller, a lady of noble family, who would not ally herself to him till he had first proved his own descent from a noble ancestry. She possessed some fortune, which he expected would leave him at ease to pursue his favourite studies; but this prospect was blighted by a persecution of the Protestants which the Duke of Styria now commence, and which led to the retirement of our philosopher from the country, after selling his estate at a great disadvantage. He condescended to intreat protection and aid from the college of Tubingen; but his heterodoxy on the Omnipresence forbade them to do anything in his behalf. His book had attracted the favourable opinion of Tycho Brahe, the celebrated Danish philosopher, who, banished from his own country, had found a refuge at Prague, where he pursued astronomical observations with a set of instruments far superior to any of the kind as yet in existence. Tycho's theory of the planets was allied to the old one of Ptolemy, and opposed to that of Copernicus. He wished Kepler to set his calculating mind in action on the Tychonic theory as he had done on the Copernican. He, therefore, with the sanction of the Emperor Rudolph, invited the German philosopher to join him at Prague. Kepler, at a loss for an asylum, and eager to have the benefit of Tycho's splendid instruments, consented, and he and his family removed thither in 1600. The association was not a happy one, for Tycho was proud, and Kepler, with a sufficiency of pride, was poor and dependent. But their quarrels were put an end to by the death of the illustrious Dane in October 1601, when Kepler was appointed to succeed him as the imperial mathematician, with a salary of fifteen hundred gulden per annum.

If this salary had been regularly paid, Kepler would have been a happy man; but the government finances were in a bad state, and Kepler could only now and then obtain a little money at the sacrifice of half his time in court attendance. To induce the emperor to continue to patronise astronomy, he was obliged to gratify him by acting as an astrologer, and he was fain to cast nativities for any one who would employ him, for the sake of daily bread. These proceedings, together with the countenance which he seems to give to astrology in some of his writings, have caused him to be represented as a believer in that false science; but, when his writings are rightly read, we can see that he regarded astrology, and the necessity he was under of dabbling in it, with the loathing of a virtuous and philosophic mind. Struggling with poverty, obliged, as it were, to dance before the Philistines for sport, delicate in health, and of weakly eyesight, provided only with rude and defective instruments, he persevered in his investigations of a science, in which, we must remember, some of the most important truths, as gravitation and the arrangement of the planets, were as yet unascertained. It now appears pretty clearly,* that, throughout his whole career, he also met with no small amount of trouble on account of his religious views; not that he doubted any of the prime doctrines of Christianity, but merely disavowed a particular local view of Christ's body in the Eucharist, and patronised the Gregorian calendar.

Notwithstanding all difficulties, he persevered as assiduously in his labours as circumstances permitted, and, amidst a thousand erroneous conjectures, lighted upon a few important truths. He gave out the mode of calculating eclipses which is still in use, and, with a *camera obscura*, was the first to observe the spots on the sun. It was a remarkable and noble trait of Kepler's character, that he was always ready to acknowledge any error he had committed, and to quit one line of investigation, proved false, for another. He was the most candid of philosophers; and to this may in fact be attributed in no small measure the success which ultimately crowned his labours. There was also great magnanimity in his nature. When the time came for publishing an elaborate set of tables which he had constructed from the observations of Tycho, the emperor Rudolph had sunk into universal contempt and quitted the stage of life. It might have been expected that Kepler, who was so dependent, would have courted his successor Matthias, by conferring his name on the tables; but he reflected that they had been prepared under the patronage of the late unfortunate emperor, and the *Rudolphine Tables* they accordingly became. The splendid discoveries of his contemporary Galileo excited only the admiration and attracted the friendship of Kepler.

It was in the course of some laborious researches respecting the motions of the planet Mars, that he lighted upon the two first of the grand astronomical laws which bear, and must ever bear, his name. Having attempted in vain to explain their motions upon the usual supposition of a circular orbit, he was at length led to surmise that the planet described curves of some other kind, and, going on from one step to another (to us the difficulties of such steps are unimaginable), he finally came to see that every difficulty vanished when he supposed an oval or elliptical orbit, having the sun placed nearer to one end than the other. He then determined the dimensions of the orbit of Mars; and, by comparing together the times employed by the planet in completing a revolution, or any part of a revolution, discovered his second law, that the planet, increasing its rapidity the nearer it approached the sun, went through the parts of an imaginary correct circle round the sun in the same times, so that, if there had been a radius from the sun to the planet, that radius would have moved with uniform rapidity. Kepler quickly found that these laws applied to the orbits of all the planets, and also of the satellites. He announced the discovery, with an explanation of all the speculations, erroneous and otherwise, which led to it, in a volume entitled *Astronomia Nova*, published in 1609.

In 1612, after the death of Rudolph, Kepler accepted a professorship in the University of Linz, to which he then removed. Not long after, he had the misfortune to lose his wife; but he soon replaced her with a second, by name Susanna Rettinger. By these ladies he had a considerable number of children; but all except two predeceased him, and it is acknowledged that no descendants of his exist. About two years after his second marriage, his peace was disturbed by a cause for which the reader will be little prepared—a charge of witchcraft against his mother. We learn, with feelings of an extraordinary kind, that during the ensuing five years, while engaged in those researches which established some of the most important truths in astronomy, this illustrious man had to give much of his time, thoughts, and labour, to the defence of an aged parent against one of the most ridiculous of accusations. At length, in 1618 (we learn from himself that it was on the 15th of May), he discovered his third law, that the squares of the times of the revolution of the planets are as the cubes of their mean distances from the sun; thus making out, not a musical harmony, as he once supposed, in these celestial objects, but a mathematical unity and fellowship quite as sublime and wonderful. This law was given to the world in a work entitled *Harmonices Mundi*, which he published in 1619, and dedicated to James I. of England. We grieve to say that in this volume there are also contained some of the most monstrous fancies that ever entered the brain of a living man; as, for instance, that the globe which we inhabit is a sentient being, capable of being roused to passion (storms and earthquakes being the expressions of its rage) by such offences as throwing a stone into a lake or a deep cleft, as a bull or an elephant would be roused by a straw tickling its ear. Nor was his idea of the analogy between the planetary arrangement and musical tones much less ridiculous, Saturn and Jupiter being represented in his scheme of mundane harmony as taking the bass, Mars the tenor, the Earth and Venus the counter-tenor, and Mercury the treble. The terms in which he speaks of his third law show, however, how deeply he felt a real triumph in science. "It is now eighteen months," says he, "since I got the first glimpse of light, three months since the dawn, very few days since the unveiled sun, most admirable to gaze upon, burst upon me. Nothing holds me; I will indulge in my sacred fury; I will triumph over mankind by the honest confession that I have stolen the golden vases of the Egyptians, to build up a tabernacle for my God far away from the confines of Egypt. If you forgive me, I rejoice; if you are angry, I can bear it; the die is cast; the book is written—to be read either now or by posterity, I care not which: it may well wait a century for a reader, as God has waited six thousand years for an observer." At the conclusion of the work he thus expresses himself: "I give thee thanks, Lord and Creator, that thou hast given me joy through thy creation, for I have been ravished with the work of thy hands. I have revealed unto mankind the glory of thy works, as far as my limited spirit could conceive thy infinitude. Should I have brought forward any thing that is unworthy of thee, or should I have sought my own fame, be graciously pleased to forgive it me." With reference to the opposition which his discoveries had met with, he adds:—"The day will soon break, when pious simplicity will be ashamed of its blind superstition, when men will recognise truth in the book of nature as well as in the Holy Scriptures, and rejoice in the two revelations."

After this period, Kepler chiefly devoted himself to the completion of the Rudolphine Tables, and to the steps necessary to accomplish their publication. The resources of the empire were at this time engrossed by the thirty years' war, and Kepler found the greatest difficulty in obtaining the means of giving this splendid production to the world. His own salary was also constantly in arrear, and he and his family suffered much at this period from poverty. Nevertheless, it was at his own expense that the types necessary for the tables were cast. This great work at length appeared in 1627, and completed his fame. Amongst the honours paid to him on account of it, he received a present of a gold chain from the Grand Duke of Tuscany, probably through the influence of Galileo. Soon after, by the permission of the emperor, whose patronage had never been steadily lucrative to Kepler, he attached himself to the service of Wallenstein, Duke of Friedland, the celebrated imperialist commander in the thirty years' war, who was at all periods of his life a firm believer in astrology. Wallenstein probably desired to have Kepler near him, that he might interpret the bearing of the stars upon his extraordinary fortunes, and it was no new idea to the philosopher to look to the false science for the means of studying the true. Although comparatively well supported in this situation, Kepler was anxious to realise a large arrear due to him by the imperial treasury, and for this purpose he went to Ratisbon in 1630. The fatigue of the journey and the vexation attending its ill success brought on a fatal illness, and Kepler died in that city on the 15th of November, in the fifty-ninth year of his age, leaving his family in very poor circumstances, though it appears that one of his children afterwards obtained payment of some part of his claims on the government. He was buried in St Peter's Church, under a tomb inscribed with his name, which not long after was destroyed in the course of the wars then raging; but, since the beginning of the present century, a very elegant monument has

* Baron Breitschwert's Life and Labours of Kepler. Stuttgart. 1831.

been erected to this illustrious man in the Botanical Garden of Ratisbon, near the place where his mortal part reposes.

SUBJECTS FOR PAINTERS.

Thomas Hood, who, though not professionally a painter, has had no lack of experience in the sketching department, at least, of the art, makes a feeling complaint, in his own style, respecting the scarcity of proper subjects for artistical handling. He exclaims, in the verses headed "The Painter Puzzled"—

> "In vain I stare upon the air—
> No mental visions dawn;
> A blank my canvass still remains,
> And worse—a blank undrawn;
> An aching void that mars my rest
> With one eternal hint;
> For, like the little Goblin Page,
> It still keeps crying, 'Tint!'
> But what to tint? Ay, there's the rub
> That plagues me all the while,
> As, Selkirk-like, I sit without
> A subject for my *isle*."

Seriously speaking, though Hood touches on the point only for the sake of a jest, we believe that, in these days of ours, when novelty is at once growing more and more in demand, and more and more difficult of attainment, the painter must often be puzzled for want of good subjects. It also seems to us, however, that the difficulty might in part be removed, were artists oftener to turn their attention to the verbal pictures of the *poets*, and particularly those among them who have displayed invention and fancy in the highest degree. Wordsworth pointedly declares the callings of the poet and the painter to be one and the same—

> "Creative art,
> Whether the instrument of words she use,
> Or pencil pregnant with ethereal hues."

Conscious of this, painters have no doubt resorted frequently to the poets for subjects; as, for example, to Spenser, whose taste for allegory and personification has rendered his "Fairy Queen" nothing else than a vast gallery of magnificent pictures. But it appears to us that there are other poets, rich in treasures of a similar description, who have, as yet at least, been in a great measure overlooked by artists. To one case, in particular, we shall point attention on the present occasion.

The "Hyperion" of Keats abounds in materials for works of art of the highest order. The fancy of that poet seems to have been vivid to a wonderful degree. Every form and scene described by him, is presented with such distinctness as to make it apparent that he must have been able, in the first place, to call each up before his own mind's eye in its minutest shades and lineaments. In "Hyperion," his fancy had to work on grand objects, namely, the Titans—the oldest gods of the Greek mythology—beings gigantic in form and terrible in strength. The opening lines of the poem present a noble picture, equal in many respects to Dante's sketch of Ugolino, which both Reynolds and Fuseli thought worthy of embodiment on the canvass. It is the portrait of the god-chief of the Titans, Saturn, whom his own son, Jupiter, had just dethroned:—

> "Deep in the shady sadness of a vale
> Far sunken from the healthy breath of morn,
> Far from the fiery noon and eve's one star,
> Sat grey-hair'd Saturn, quiet as a stone,
> Still as the silence round about his lair;
> Forest on forest hung about his head,
> Like cloud on cloud. * * * *
> A stream went voiceless by, still deaden'd more
> By reason of his fallen divinity,
> Spreading a shade; the Naiad 'mid her reeds
> Press'd her cold finger closer to her lips.
> Along the margin-sand large footmarks went,
> No further than to where his feet had strayed,
> And slept there since. Upon the sodden ground
> His old right hand lay nerveless, listless, dead,
> Unsceptred; and his realmless eyes were closed."

The fallen giant-god—the gloom, the forests, the large foot-prints, the deadened stream, and the lip-pressing Naiad—these certainly form a verbal picture, at least, of a sublime order.

Comes there to Saturn a Titaness, a goddess of the infant world—

> "With face as large as that of Memphian sphynx,
> Pedestal'd, haply, in a palace-court,
> When sages looked to Egypt for their lore.
> But oh! how unlike marble was that face!
> How beautiful, if Sorrow had not made
> Sorrow more beautiful than Beauty's self!"

She strives to arouse Saturn, but in vain; and then—

> "in tears
> She touch'd her fair large forehead to the ground,
> Just where her falling hair might be outspread
> A soft and silken mat for Saturn's feet.
> One moon, with alteration slow, had shed
> Her silver seasons four upon the night,
> And still these two were postur'd motionless,
> Like natural sculpture in cathedral cavern."

The genius of the poet seems to us finely displayed here, in his equalising the duration of their motionlessness, "one moon," with the grandeur of the parties. Proportions are splendidly maintained. Altogether, this scene seems to afford materials for a second great picture. Passing over the fine sketch given of the yet undispossessed god of the sun, Hyperion, when, frenzied with dread of the fate which had befallen his brother-Titans—

> "Along a dismal rack of clouds,
> Upon the boundaries of day and night,
> He stretch'd himself in grief and radiance faint,"

we come to another, yielding noble scope for the pencil of the artist. The band of the bruised Titans is described as lying in a dark and vast mountainous recess, in the state in which they were left at the time of their overthrow. Around and above them—

> "Crag jutting forth to crag, and rocks that seemed
> Ever as if just rising from a sleep,
> Forehead to forehead held their monstrous horns;
> And thus in thousand hugest phantasies
> Made a fit roofing to this nest of woe.
> Instead of thrones, hard flint they sate upon—
> Couches of rugged stone, and slaty ridge,
> Stubborn'd with iron."

The unfortunate group are described generally in imagery which may give to the painter a striking idea of their bulk and dreariness—

> "Scarce images of life—one here, one there,
> Lay vast and edgewise; like a dismal cirque
> Of Druid stones upon a forlorn moor."

Fine descriptions, again, are given of the posture of individuals—

> "Creus was one; his ponderous iron mace
> Lay by him, and a shatter'd rib of rock
> Told of his rage ere he thus sank and pined.
> Iapetus another; in his grasp
> A serpent's plashy neck, and all its uncurl'd length,
> Dead * * * * * *
> Next Cottus; prone he lay, chin uppermost,
> As though in pain; for still upon the flint
> He ground severe his skull, with open mouth,
> And eyes at open working."

There are others, some of them Titanesses; but we cannot carry our extracts further. If an artist wished for *light* to irradiate this gloomy scene, let him take another part of the poem, and he will find it. We shall give a long extract here; for it seems to us that every artist must be delighted with the manner in which the painter-poet has cast illumination on these fallen giants in their rugged retreat. Saturn had previously joined them, and the huge Enceladus is "on his feet," attempting to rouse them to vengeance. He cries—

> "'And be ye mindful that Hyperion,
> Our brightest brother, still is undisgraced—
> Hyperion, lo! his radiance is here!'
> All eyes were on Enceladus's face,
> And they beheld, while still Hyperion's name
> Flew from his lips up to the vaulted rocks,
> A pallid gleam across his features stern:
> Not savage, for he saw full many a god
> Wroth as himself. He look'd upon them all,
> And in each face he saw a gleam of light,
> But splendider in Saturn's, whose hoar locks
> Shone like the bubbling foam about a keel,
> When the prow sweeps into a midnight cove.
> In pale and silver silence they remain'd,
> Till suddenly a splendour, like the morn,
> Pervaded all the beetling gloomy steeps,
> All the sad spaces of oblivion,
> And every gulf and every chasm old,
> And every height, and every sullen depth,
> Voiceless, or hoarse with loud tormented streams:
> And all the everlasting cataracts,
> And all the headlong torrents far and near,
> Mantled before in darkness and huge shade,
> Now saw the light and made it terrible.
> It was Hyperion:—a granite peak
> His bright feet touch'd, and there he staid to view
> The misery his brilliance had betray'd
> To the most hateful seeing of itself.
> Golden his hair, of short Numidian curl,
> Regal his shape majestic, a vast shade
> In midst of his own brightness, like the bulk
> Of Memnon's image at the set of sun
> To one who travels from the dusking East:
> Sighs, too, as mournful as that Memnon's harp,
> He utter'd, while his hands, contemplative,
> He press'd together, and in silence stood.
> Despondence seized again the fallen gods
> At sight of the dejected King of Day,
> And many hid their faces from the light."

Here is certainly a great artistical subject. The gloomy grandeur of that rocky recess, its giant occupants, Hyperion on the peak, with his encircling and emitted radiance illuminating the erect Enceladus, Saturn's grey hairs, and every salient point in the scene—surely all the accessories of a noble picture are here presented.

Turning from the grand to the beautiful, how many fine pictures may we not find in the gallery of the same poet! Look at this slight passing sketch of a lover and his mistress:—

> "And as he to the court-yard pass'd along,
> Each third step did he pause, and listen'd oft
> If he could hear his lady's matin-song,
> Or the light whisper of her footstep soft;
> And as he thus over his passion hung,
> He heard a laugh fall musical aloft;
> When, looking up, he saw her features bright
> Smile through an in-door lattice all delight."

Again, if any artist is fond of personifications—though that style has become somewhat unfashionable, and pre-existing works do certainly occupy the field in some measure—what a delicious series of sketches might be made from the following four representations of Autumn, in so many different yet all equally appropriate positions!—

> "Who hath not seen thee oft amid thy store?
> Sometimes whoever seeks abroad may find
> Thee sitting careless on a granary floor,
> Thy hair soft-lifted by the winnowing wind;
> Or on a half-reap'd furrow sound asleep,
> Drowsed with the fume of poppies, while thy hook
> Spares the next swath and all its twined flowers;
> And sometimes like a gleaner thou dost keep
> Steady thy laden head across a brook;
> Or by a cider-press, with patient look,
> Thou watchest the last oozings, hours by hours."

If any artist be partial to forest scenes, the opening of "Endymion" contains an exquisite picture of a Sacrifice to Pan, on the woody slopes of Latmos. The sacrificers and their altar must be passed over, but the open lawn, where the ceremony took place, is so vividly painted, that, even in an isolated form, the lines will be appreciated. The poet speaks of "many paths"

> "all leading pleasantly
> To a wide lawn, whence one could only see
> Stems thronging all around between the swell
> Of tuft and slanting branches; who could tell
> The freshness of the space of heaven above,
> Edged round with dark tree-tops!—through which a dove
> Would often beat its wings, and often, too,
> A little cloud would move across the blue."

This would make a variegated little painting by itself, were the green lawn, the dark branchy fringe, the blue sky, the dove, and the little cloud, all given as tastefully on the canvass as here in words; but from the poet might be obtained, as has been hinted, many other rich accessories, in the shape of "troops of little children garlanded," and damsels and shepherds, with the charioted Endymion, their pastoral prince, all aiding in the sacrifice to Pan.

In the second book of "Endymion," there is a description of Adonis sleeping, which contains materials for an exquisite painting, but is too long to transcribe. The description of the witch Circe, with her victims around her, transformed all to brutes, is also a fine sketch of another kind, though an imitation of old Homer—

> "An echo of him in the north-wind sung."

But, indeed, were we to point out all the passages of Keats which might yield hints to painters, we might quote one-half of his poems. He cannot mention sun or moon, sea or sky, without noticing some feature of a picturesque kind; for he had viewed them all with the eye of a painter. For example, observe the passage where, addressing the moon, he says—

> "The sleeping kine,
> Couch'd in thy brightness, dream of fields divine:
> Innumerable mountains rise, and rise,
> Ambitious for the hallowing of thine eyes;
> And yet thy benediction passeth not
> One obscure hiding-place, one little spot
> Where pleasure may be sent; the nested wren
> Has thy fair face within its tranquil ken,
> And from beneath a sheltering ivy-leaf
> Takes glimpses of thee; thou art a relief
> To the poor patient oyster, where it sleeps
> Within its pearly house. The mighty deeps,
> The monstrous sea is thine—the myriad sea!
> Oh, Moon! far-spooming Ocean bows to thee,
> And Tellus feels her forehead's cumbrous load."

General as the description here is, it might nevertheless give hints to the artist engaged on a moonlight scene.

It is not every poet, nor even every great poet, who attends so closely to the picturesque in nature, as to yield materials like these to the painter. Wordsworth, bard of nature as he is, examines her not so much to paint her beauties for the mere sake of their loveliness, as to extract from them some moral, bearing on humanity. Sir Walter Scott possessed a most inventive fancy, but it was bent and biassed in a peculiar direction by his antique and chivalrous predilections. He is full of pictures of that description; and, indeed, in his case the painters have made liberal use of the opportunities placed in their way. To this subject we may take occasion to return.

THE TWO WAYS OF LIVING.

A STORY OF HUMBLE LIFE.

"Well," said pretty Helen Thomson to her sister Jane, "I'd scorn to marry a man because he'd got a bit of money."

"So would I," answered Jane, in a quiet voice.

"Why, what are you going to marry David Cairns for, but for his money?" asked Helen.

"I'm going to marry him because I like him, and because I expect he'll make me a good husband," replied Jane.

"But would you marry him if he had no money?" inquired Helen.

"No, I would not," responded Jane. "I've seen enough of people marrying to live in worse poverty than they were in before."

"I knew you wouldn't," answered Helen, triumphantly; "and that's what I call marrying a man for his money."

"I might as well say, Helen, that you are going to marry Richard Mills for his legs; for I'm sure you wouldn't marry him if he had none," said Jane.

"Oh, that's quite a different thing," replied Helen, laughing. "Nobody would marry a man without legs. He couldn't earn his living if he had no legs."

"I don't know that," returned Jane; "he might get a very good living by begging perhaps. His want of legs might be a fortune to him in that way."

"But who'd marry a beggar?" said Helen.

"Not I, certainly," replied Jane, "if I can help it; and all I seek in marrying a man who has a little something to begin the world with, is to put as good a chance as I can betwixt me and beggary."

"Many that began with nothing have done just as well as those that are so over-cautious," said Helen.

"They may sometimes, where they have great luck," replied Jane.

"Luck!" said Helen; "why, look at the Davisons; what particular luck have they had? and yet how well they are doing; and I'm sure they had nothing to begin with."

"Why, they have had the luck never to be ill, for one thing," answered Jane; "and he has had the luck never to be out of work, for another. But suppose either of these circumstances had happened, and they may happen yet, how would they have got on?"

"Oh, if one's to begin by supposing all sorts of misfortunes," exclaimed Helen, "nobody would ever be married at all. For my part, I think there's nothing so foolish as always looking at the dark side of things."

"I quite agree with you," said Jane; "I am far from wishing you to look always at the dark side of things. I only wish you to look on *both* sides; for life will show us its dark side, Helen, whether we look for it or not."

"Well, it's time enough to think of trouble when trouble comes," replied Helen; "sufficient for the day is the evil thereof."

Here Jane gave up the argument, for although her mind was not convinced, the authority of the quotation was too much for her; and a few weeks saw her the wife of David Cairns, and Helen of Richard Mills. Excepting the simple circumstance that one had something to begin the world with, and the other nothing, the present situation and future prospects of the two young couples were much on an equality. David Cairns was a carpenter, Richard Mills was a mason; they were both good workmen, and both decent well-disposed young men; and amongst the neighbours, old Thomson was considered to have married his daughters very well. The weddings took place on the same day, the girls were dressed alike, neatly and respectably, as were their husbands; Giles Thomson strained a point to give them a good dinner after the ceremony; some of their neighbours were invited to tea; in the evening they took a walk in the fields, and at night each bridegroom conducted his bride to a tidy cottage, duly provided with such utensils and articles of necessary furniture as are indispensable to the comfort of a poor man's dwelling. Helen had not taken such serious views of life as Jane had, but she was a cheerful, active, industrious girl, and had every intention of doing her duty and making a good wife. Her cottage was as neatly kept as Jane's; Richard Mills had his meals as regularly and as well provided as David Cairns, and she took a pride in letting her sister see that, although they had not the comfortable bit of money in the savings'-bank, they were in want of nothing.

"See what a nice new cloak I've got," said Helen to Jane one Sunday, as they met on their way to church; "it's a present from Richard; he gave a pound for it."

"It's a very nice one, indeed," replied Jane.

"Why don't you get one?" asked Helen. "Wright has plenty more, and they're quite a bargain at the money."

"I don't think it is dear, indeed," answered Jane; "but my old one will do very well for this winter. Perhaps next year I may afford myself a new one."

"Pooh!" said Helen; "next year! That's always the way. I really think the more money people have, the more stingy they grow. I'm sure if Richard can afford to give me a cloak, David can afford to give you one."

"Oh, David would give me one if I wished it, I know," answered Jane; "but I don't. I had rather make this last a little longer, and save the money."

"Why, haven't you got ever so much money already in the savings'-bank?" said Helen. "Surely you might spare twenty shillings for a cloak?"

"But I had rather have the twenty shillings than the cloak, I tell you, Helen. Every one to his taste, you know. But I suppose Richard has been doing very well lately with such a rise of wages, and having constant work?"

"Yes," said Helen, "that's the way I got the cloak, and several other things I wanted. It's as well to get what one wants when times are good. By and by wages may fall, and then we could not have afforded them."

"It is right to get anything you *absolutely* want, certainly," answered Jane; "but I wouldn't buy things I could do without, merely because I had the means. I would rather try to lay by a little."

"Oh, lay by!" cried Helen. "What's the use of laying by the little we could spare?"

"But everything must have a beginning, Helen. When David began to lay by, it was with half-a-crown. Suppose he had spent it instead, because the sum was so small, he might have found the same excuse for spending the next, and never have begun at all. People in our situation must not wait for large sums, if they mean to save. You know the old proverb, *Every little makes a mickle!*"

"But, gracious, Jane," said Helen, "if, when wages are high, one is to lay by every farthing one can spare, there would be no difference between good times and bad times. They would be all bad times, and one would never have any enjoyment at all!"

"Oh, you are mistaken, Helen," returned Jane; "it would be much nearer the truth to say that they would be all good times. And, besides, if you have nothing to spare when wages are high, how will you do when they are low?"

"Why, we must do as other people do—as well as we can," answered Helen. "Besides, Jane, Richard likes to see me respectable; one doesn't like to look worse than one's neighbours."

"But what is respectable, Helen?" asked Jane. "If you mean clean and tidy, I agree with you; but I think an old cloak well kept, and worn from motives of economy, is more respectable than a new one bought with money that ought not to have been spent. And since everybody's circumstances differ in some respect or other, why should we be guided by our neighbours? Besides, suppose our neighbours are imprudent, is that any reason why we should be imprudent too?"

When people are worsted in an argument, and begin to feel that they are wrong, they very commonly take refuge in a little bit of ill temper, by way of putting an end to the discourse, and getting out of the dilemma; and thus did Helen, saying impatiently—"Well, my goodness! what's the use of making such a fuss about the cloak; what's done can't be undone. Wright wont return my twenty shillings and take back the cloak, if I go on my knees to him; so do let's hear no more about it!" But Helen knew very well in her heart that it was not the individual cloak that Jane was "making such a fuss about," but the general principle of economy and saving that she wished to enforce; and although she scarcely acknowledged it even to herself, she was perfectly aware that her sister was right.

"Jane thinks it very extravagant of us to have bought this cloak," said she to her husband. "She says I ought to have worn my old one, and laid by the money." Richard was not more conceited or self-opiniated than men in general; but few people relish advice and interference with respect to their private conduct or domestic affairs, unless it is very delicately administered; so he answered that Jane should mind her own business.

"We don't find fault with her old cloak, and she need not find fault with your new one," said he. "If I had borrowed the money of her to pay for the cloak, she might have had a right to say something; but as I earned it by my own labour, I think I had a right to spend it as I pleased."

Whether Richard was right or wrong in this view of the case, we need not stop to inquire, but shall proceed with our story. Things went on tolerably well for some time, and to all appearance one sister was as well off as the other; for Jane, by good management and industry, and taking care to make everything go as far as it would, contrived that the little weekly sum that was laid by should never be missed. David always had his meals in comfort and sufficiency, and always found his cottage clean, and his wife and little girl (for each sister had become a mother) neat and tidy. And what more had Richard? Nothing that it would be easy to name. The money that was saved in one household without appearing to entail any perceptible privation, was spent in the other without producing any perceptible enjoyment; and this shows what may be done by good management and strict economy—economy without niggardliness, we mean; for if Jane had made her husband's home uncomfortable through her desire to save, she would have lost more than she gained. It is true the sum laid by was small—it could not be otherwise; but if, at the end of a month, there was a sum of ten shillings to carry to the bank—accumulated at the rate of half-a-crown a-week—what a wide difference there was between having it, without having suffered any sensible privation to obtain it, and having spent it without having anything to show for it, or being able to recall any particular pleasure or advantage its outlay had procured!

It seemed a piece of great good luck, that just as winter was coming on, and work not likely to be so plenty, Richard got a job about thirty miles from home; a gentleman named Halford, who was about to be married, was in haste to get some alterations made about his house, and an extra number of hands being required, Richard applied and obtained employment; but before Helen had well done rejoicing at their good fortune, news came that Richard had had a fall, and had broken his leg. The gentleman, however, who had employed him, acted very generously; he took him into his house, provided him with medical attendance, and desired that his wife should be sent for to remain with him till he was well enough to be moved. Helen went, and tended him carefully, until he was in a fit condition to be laid in a waggon and carried home, and then both she and Richard felt that it would not be right to encroach longer on the charity of their host.

There was every reason to hope that, with due care and rest, Richard would recover, and his damaged limb be as useful, if not quite as ornamental, to him as before the accident; but as Helen sat, with her child on her lap, watching his pale face, whilst the waggon crept slowly along the road, care sat upon her brow, and ever and anon a sigh bore evidence to the uneasy thoughts that weighed heavily upon her heart. Where was their daily bread to come from now? And as her eye fell upon the cloak, now worn and past its beauty, which had furnished the occasion of Jane's first lecture, a pang of remorse shot through her heart. "Ay," thought she, "had I begun to save then, we might by this time have had money enough to maintain us till Richard is able to work again, without being obliged to anybody." *Obliged to anybody!* and who could she look to be obliged to but the parish or her sister? "Never! no, never!" murmured Helen, as her heart swelled, and her cheek flushed, and the tears started to her eyes; "I'll eat my fingers before anybody shall know that we are in want!"

It is very easy to say such things: we shall see how Helen acted upon this very self-applauding expectation.

"What's the matter, Jane?" said David Cairns to his wife one evening. "What are you looking so grave about?"

"I was thinking of my sister and her husband," replied Jane. "Richard seems to get on but very slowly."

"Oh, but he'll do very well. I saw the doctor this evening as I came from work, and he says everything's going on quite right; there's no occasion to be uneasy."

"It is not about his leg, exactly, that I am uneasy," responded Jane; "I daresay it will get well in time, as the doctor says; but it's because I can't make out how they are living."

"Living!" replied David; "why, didn't Helen say that Mr Halford had given them money enough to keep them till Richard could work again?"

"She said he had behaved very generously to them," answered Jane; "and when I asked her what they were to do if Richard was long out of work, she told me I need not be uneasy, they should do very well; but I am uneasy though, for I can read Helen's countenance, and however she tries to carry it off, I can see she is very unhappy."

"Pooh!" said David; "that's all fancy. Why should she say they are well off if they are not?"

"From pride," answered Jane. "Helen's very proud, and I know she would rather suffer anything than own she was in want, especially to me."

David did not comprehend this so clearly as his wife did; but one thing he did comprehend, which was, that if Helen and her husband got into difficulties, there was no one to help them out of them but himself; and as he had no desire to be called upon to make such a sacrifice, he was by no means inclined to yield belief to Jane's suspicions, or to encourage them in her. Not that David was an unusually selfish or unfeeling man, but he had earned his money hardly; he had the prospect of a little family to provide for; he looked to the possible accidents of illness or want of work that might happen to himself, and he set a proportionate value on the little store that was his anchor of hope in the event of storms or reverses. So, whenever Jane made an attempt to introduce the subject, David threw cold water on it, recommending her not to pry into her sister's affairs, or persist in believing people in distress who declared they were not so; and as Helen's lips remained closed on the subject of their finances, Jane was obliged to keep her uneasiness and her suspicions to herself. All she could do was frequently to carry some little delicacy or mess of nourishing food to Richard, which, she said, she was sure would do him good, and which, she might have added, he seemed very much in want of; for Richard gained strength but slowly; which was the more unfortunate, as spring was coming on, and there was good prospect of plenty of work.

A man needs all his strength and activity to work as a mason; he has heavy weights to carry and long ladders to climb; and as long as stout hale workmen were to be had, Richard did not find it so easy a matter to get a job as he used to do. However, he got what he could, and worked his best; which was, indeed, very necessary, for Helen expected to be confined in June. Jane took care that she should want for nothing during her illness, and Helen silently, and, perhaps, rather sullenly, accepted her attentions—for Helen was an altered woman. She had been a thoughtless girl and a thoughtless young wife, but there was now an air of recklessness and sullen defiance about her, that occasioned Jane the deepest distress. Richard, on the contrary, seemed depressed, ill, and discouraged, but he made no complaints, and was as impenetrable to Jane as Helen was. This time, Helen gave birth to a little boy, and in the following autumn, Jane made her husband a similar present. Helen made little effort to return the attention she had received. She called once to see the child, and inquire how her sister was; but, she said, "she had enough to do at home to look after her own two brats, to have time for gadding." Jane said nothing, but she turned and looked in her face when she used the word *gadding*, and Helen blushed. "Besides," said she, with an affectation of gaiety, "I can be of no use to you, such rich people as you are," and she cast her eyes round on all Jane's little comforts—"you want for nothing that poor people like us can send you."

"No, I am thankful, I want for nothing," replied Jane; "but that is no reason I should not wish to see my sister; but, Helen, there's many a true word spoken in jest, and now the ice is broken, I can't help saying that I am afraid you and Richard are really poor; at least that you are not so well off as you pretend to be."

"Pooh!" said Helen; "you think nobody well off that has not got money in the savings'-bank; but if people have enough to eat every day in the year, what does it signify?"

"Not much, perhaps, if they always have enough," answered Jane; "though there was a time, Helen, when you looked to something more than having enough to eat," and she glanced at Helen's worn and faded cotton gown and scanty shawl. "But have you enough to eat, sister, every day in the year? Carry it off as you will, I can't help fearing that you have not, nor Richard either."

"Does Richard complain?" asked Helen, almost fiercely interrupting her sister.

"Oh, no," answered Jane, "never by words; but his looks complain, and so do yours. Those pale cheeks and hollow eyes, Helen"——

"Just because I'm nursing," interrupted Helen, peevishly. "Little Dick's such a hungry child that he drags me to death—and so, by the by, I must run, for I daresay he's squalling long before this, and little Jane wont know how to pacify him. He came into the world hungry, and I believe he has been hungry ever since," and with a forced laugh away ran Helen.

"I'm afraid he has," thought Jane, with a sigh, as she looked after her sister. "Poor little Dick!—by and by, when he is weaned, I can often get him here and give him a meal, as I do little Jane, without Helen's knowing anything about it."

And so she did; but Helen did know about it, though she affected ignorance; and, in her heart, she was glad, and even obliged too, although she would not have owned it. When her children went to their beds with full stomachs, Richard and she lay down in theirs better able to endure the cravings of their own empty ones.

The ensuing winter was very damp and close. There

was scarcely any frost, and the poor rejoiced, for they needed less fuel; but when the spring came, a fever broke out, and being very rife in the quarter where the Cairns family lived, David caught it, and was laid up for several weeks. Had they had nothing to fall back upon, this would have embarrassed them sadly; but they had a comfortable sum in the savings'-bank, and ten pounds of this, discreetly used, carried them through David's illness, and by enabling Jane to purchase him nourishing wholesome food afterwards, soon sent him back to his work a hale and cheerful man, leaving them both more determined to be careful for the future than ever, after thus experiencing the benefits of frugality and forethought.

It may be supposed that during David's illness Jane had no time for visiting her sister, and as her sister seldom visited her, their intercourse became less and less. But as soon as David was recovered, and they were out of their troubles, she seized her first moment of leisure to go and see how Helen and her children were getting on. When she arrived at the door, and lifted the latch, she found it was locked, but she heard the voices of both the children crying within.

"Where's your mammy, Janey?" said she to the little girl through the door.

"Mammy's out," replied the child.

"Has she been long gone?" inquired Jane.

"I don't know," said the child, sobbing; whilst Dicky roared loud enough to crack his windpipe. Not liking to leave them in that state, Jane tried to pacify them by talking to them through the door, and resolved to wait, if she could, till Helen returned; but Helen stayed so long that she found it impossible; so, leaving the bread and jam she had brought for the children with the next neighbour, she bent her way homewards.

"Where can Helen be away so long at this time of day?" thought Jane, as she turned from the door. "Ah! there was a time when she would not have left her children there to cry alone, poor little things." But she had not gone far before, in turning the corner of a street, she almost ran against her sister and her husband, whose loud voices, before they saw her, proclaimed that they were at angry words. Helen's cheek was flushed, her dress was slatternly, and not over clean, whilst Richard looked thin, wan, and dejected. They both started on perceiving it was Jane, and were evidently both confused; but Helen looked defiance to the conclusions her sister might draw from what she saw and heard, whilst Richard looked really humbled and abashed.

"I have been to your house," said Jane, "but I could not get in, and I left the poor children crying for you."

"We have been to receive some money," answered Helen—and as she spoke she chinked a few shillings in her hand with an assumed air of negligence—"and we were detained longer than we expected."

"I'll go back with you," said Jane, "for I am anxious to see the children. I haven't seen them these six weeks. I suppose Dicky's grown a fine boy."

"Middling," said Helen; "I don't think he thrives much; he's not half as forward as Janey was at his age."

"No wonder," murmured Richard in an under tone; but Helen gave him a look that stopped his mouth. He said nothing more, and Helen said nothing either, except in answer to Jane's inquiries; and she walked on with an air that did not seem to betoken a very hearty welcome to her sister. However, Jane was determined to see the children; and when Helen unlocked the door, uninvited she followed her in; but as she crossed the threshold, and caught a view of the rooms on either side, for both were open, she started with dismay at the picture of desolation that met her view. The parlour, which had once been prized, was perfectly bare; not an article of furniture remained in it; and the other room did not present a much more promising aspect. The bed was gone; but that Jane hoped had been replaced up stairs; and nearly everything else was gone too; in short, it was too evident that every article that could by any possibility be dispensed with had been removed. Whither? Alas! Jane guessed too well; they had been sold or pledged to furnish the means of subsistence. Richard silently drew forward a little three-legged stool—for chair there was none—and offered it to Jane, who, knowing Helen's proud spirit, did not dare to give utterance to the grief she felt, but taking little Dick in her arms, she hid her tearful eyes in the poor baby's bosom, whilst Helen tried to carry off her confusion by affecting to scold little Jane, whose naturally pretty face was scarcely recognisable for dirt and tears, because, during her mother's absence, she had dragged her silk cloak—*the* silk cloak, now little better than a faded rag—from the peg it hung upon, and putting it over her own shoulders, had been trailing it over the wet and dirty floor. What an air of discomfort there was over everything inanimate the room contained, and what traces of dissatisfaction and anxiety pervaded the features of those assembled there! What a home! How unlike the picture that the two sisters had imaged to themselves as the home of their husbands! Helen saw this, and felt it no less than Jane, as many reminiscences of air-built castles and cheerful anticipations crowded on her mind; but they presented themselves accompanied by remorse and self-reproach; and instead of allowing them to soften the growing spirit of hardness and recklessness that was stealing over her once frank and ingenuous temper, she dashed them ferociously from her mind, and laying to her heart that ill comfort—*ill comfort*, we mean, where our misfortunes are of our own seeking—"there are plenty others as badly off as we, and it is no use grieving over what can't be helped," she sunk her pride and her self-respect to the level of her fortunes, and made no further struggle to retrieve either.

In her prosperous days, Helen had found plenty of time to keep her house and furniture in order, to mend and make her husband's clothes, and to look well after her children too; but now, although the furniture was gone, and the house was bare, there seemed to have been no time to attend to the wants of husband or children either. Her pride in them and in herself was gone; Richard's decent wardrobe diminished by degrees, seldom arrested on its road to ruin by needle or thread; the children would scarcely have had clothes to cover them but for the kind care of their aunt; and, as it was, their unwashed faces and ragged heads, as they lay wallowing in the dirt before the door, instead of being sent to school, betokened no maternal tending, and showed too plainly the commencement of the first chapter in the records of their progress to destruction.

But had Richard no work? Yes, he had some, though not such good jobs or high wages as when he was a stout, hale, decent-looking man, and a steady workman. Still, there was enough earned to keep things together better than they were kept; but, alas! the vice, the cruel vice, the offspring and the cause of destitution, was twining its insidious snares around them, and precipitating their downward course. The craving, unsatisfied stomachs, the gnawing self-reproach, the despoiled cottage, the ill-clothed bodies, the comfortless present and the hopeless future, were working their usual effects, and conducting these victims of improvidence to their last stage of degradation and ruin—the gin shop and the public-house. This road to perdition, once entered upon, we need not say how fast it was travelled; down, down they went. A stone may rest secure for ever on the summit of a hill, but let some mischievous hand once urge it over the edge of the declivity, and how rapid is its descent!

At length, one morning the whole family disappeared, and Helen left word for her sister that Richard was going to look elsewhere for work. They left some small debts, which, as they were owing to very poor people, Jane and her husband paid, the cottage being found divested of every article that could be converted into money.

Jane shed many tears over her sister's departure, and the lamentable causes that had led to it. The poor children, too. What was to become of them? The fate of the unhappy family was as deplorable as these fears anticipated. Surrounded by a thousand temptations in London, to which they proceeded, and untrained to resist them, Dick went through various grades of vice, and was finally charged with an offence, and committed to jail. The father sunk and died, partly from distress of mind, and partly from the intemperate habits in which he had indulged. Helen was now desolate, with her daughter Jane, who, though guiltless of any error, shared the disgrace of the family, and could procure no means of earning a livelihood. Helpless, indeed, is poverty without character!

What was to be done? At last, Helen resolved that she would travel back to Fernfield with Jane, begging their way along the road, and if her sister would take charge of the girl, which she did not doubt, she would then return to London by herself, in order to earn a subsistence as she best could. So they started. Fortunately, the season was favourable, and the weather fine; and although they had often empty stomachs, and sometimes not wherewith to pay their lodging, yet the wholesome air, and the bright sky, and the green fields, contrasted so pleasantly with the dark alleys and wretched streets which they had long frequented, that their heavy hearts were cheered by the change; and many a time Helen had to hasten Jane, who was lingering behind, entranced with delight at recognising again the wild flowers she had gathered in her childhood.

Helen had determined not to see her sister, nor even to enter the town; she proposed getting somebody to guide Jane to the house, and then, without announcing her intention, to set off immediately on her return to London.

With this intention she lingered about the outskirts of the town till dusk, and then they drew nearer, and she looked about for somebody to whom she could intrust the girl. Jane, however, said that she wanted no guide. "I remember the house and the street as well as if I'd left it but yesterday," said she. "See, mother, there are the Fairley Meadows, and that's the way to the old mill, and that's the lane that leads to church; but there's a pretty house—I don't remember that house."

"No," answered Helen; "that house is new; it wasn't here in our time. But if you are sure you know your way, you shall go to your aunt's alone; that will be better than asking one to guide you."

"But, mother," said Jane, "suppose aunt and uncle shouldn't live here now; it's a long while ago; perhaps they've moved."

Helen thought this unlikely; but as she intended to depart as soon as her daughter left her, it was important to ascertain this point, lest the poor girl should find herself a friendless stranger in the place; so she inquired of a lad who was passing, with a spade on his shoulder, if David Cairns, the carpenter, and his wife, still lived there. The boy said he did not know them.

"They lived in Well Street," said Helen, "at number five."

"They don't live there now, then," said he, "for that's where mother lives, and I never heard her speak of them." In short, he knew nobody of the name of Cairns, except farmer Cairns, that he worked for; he lived in the new house hard by.

Hereupon a labourer came past, and was applied to for information. "If it's Mr Cairns you want," said he, looking hard at the two women, "you haven't far to go. That's his house, and he's one of the overseers of the poor, if that's what you're looking for."

"But the person I mean was a carpenter," said Helen.

"Well, it's the same," answered the man. "David Cairns, that married Jane Thomson. He was a carpenter once, but he's a farmer now, and an overseer; and that's his house;" and therewith the man passed on.

"Is Mrs Cairns alive?" asked Helen, with a trembling voice.

"Ay, to be sure she is," answered the lad she had first addressed. "Alive and life-like, and so's young master and missus."

Helen said no more, but seating herself on a stone, she gave way to her reflections—to her reflections? ay, and to her tears. Here was a bitter contrast—"Young master and missus!" She looked at her poor girl that stood beside her, and she thought of her boy in a jail, and of Richard, her husband, the love of her youth, dead; dead of poverty, neglect, bad air, bad habits, and starvation dead, a pauper, and buried by the parish! It was too grievous to be borne; she started to her feet. "Go, Jane," said she; "go to that house and ask for your aunt; tell her who you are, and tell her that your mother—your thoughtless, proud, wicked mother; for I was proud once, Jane, very proud, and I wouldn't listen to the friend that would have saved me—tell her that I have brought your brother to a jail, and that I have led you to the brink of destruction, and ask her to save you; go on your knees and ask it; I know she will; and tell her"——

"But, mother," said Jane, almost alarmed at her vehemence, "don't you come to aunt too?"

"By and by—to-morrow," sobbed Helen. "Not to-night; bid her not seek to see me to-night; good-by, Jane—good-by—be a good girl, and mind your aunt; and remember—no, no, don't remember—forget your wretched mother!"

"But to-morrow you'll be sure to come, mother?"

"To-morrow — yes, to-morrow — good-by till then," and throwing her arms wildly about her child, she gave her a long, last kiss, and then, directing Jane towards the house, she turned away herself, and hastened along the road to London. The next day she was expected at her sister's house, and when she came not, was eagerly inquired for; but after she parted with her daughter, no one had seen her; and what became of her it is needless to inquire. Jane was saved, and passed a life of innocence and peace with her good aunt. She often said, in after life, that she thought the memory of her infant home, and of the wild flowers she used to gather in the Fairley Meadows, had preserved her from absolute corruption. She lived in the midst of vice and dirt; nothing met her eyes but what was sordid and wretched; but she knew there were beautiful objects in the world; she never saw a flower-pot in a window, that she did not remember the home of her childhood, and feel a vague desire that she might some day behold it again.

"We have many blessings to be thankful for," said David Cairns one evening to his wife, as they sat cogitating on past events, "and not the least is being able to afford an asylum to our unfortunate niece, who has had a warning to be careful which she will not easily forget. Oh! but if young people could reflect for a moment on the misery they are likely to incur, not only for themselves, but their children, by rushing headlong into marriage without almost a shilling they could call their own. As for Richard and your sister, what else could they expect than what actually took place? They married with next to nothing. Richard might have saved money whilst he was single, or waited to marry till he had; but when he took his wife home, I know that their furniture was not all paid for; and then, when they had good wages and good health, they lived up to whatever he earned. Did they suppose the course of the world was to be altered for them, and that they were to be exempt from the ups and downs that every workman meets with? The minister teaches us that we must not live as if there were no future beyond this world; but it would be a good thing if he would sometimes remind us that there is a future *in* this world too; and that if we don't make a provision for it, we have little chance of being happy, and almost as little of being virtuous; for destitution is a sad corrupter, and I believe both Richard and Helen meant well, and might have done well too, if they could only have remembered that the sun does not shine every day in the year, and that as rain follows fair weather, so does evil fortune succeed to good."

ENGLISH AND FOREIGN INNS.

A CORRESPONDENT of the *Spectator* newspaper makes a serious complaint respecting the charges usually made at inns in England.

"On Monday last (he says) my niece and myself travelled to Portsmouth to embark the next day in a west of England steamer. We arrived about six in the evening, and put up at the inn where the coach stopped. We intimated our wish to take something in the shape of dinner, which we could have directly we were told a joint was then ready; and it was shortly put before us, with a pair of soles. Both of us being invalids, we made our dinner principally off the fish, and scarcely touched the joint; tea followed; and breakfast on the ensuing morning; the latter, with the addition of a not faultless egg (and of course put aside), and a modicum of some rusty bacon. We left the inn soon after nine, having been under the roof some fifteen hours, two-thirds of which were spent in our bed-rooms, and consequently we could not have given much trouble. Our inn bill amounted to L.1, 11s.—the items are as follow:—

Dinners,	L.0 10 0
Teas,	0 3 6
Candles, beds, &c.,	0 7 6
Breakfast and eggs,	0 5 0
Waiter,	0 1 6
Chambermaid,	0 1 6
Boots,	0 1 0
Porter,	0 1 0
	L.1 11 0

Now for the contrast. I select one of my bills last autumn, when my niece and myself visited Dieppe and Boulogne; the bills of the Belgian innkeepers are rather less:—

	s.	*d.*
Dinners, 3 francs each,	5	0
Coffee, ½ franc each,	0	10
Beds, 2 francs each,	3	4
Breakfast (including shrimps and eggs), 1½ francs each,	2	6
Servants (including waiter and chambermaid), 1 franc each day,	0	10
Boots and porter [optional]	0	5
	12	11

But I think I hear some of your readers exclaim, look at the quality of the articles supplied? Truly this ought to be done. I will put aside the questionable egg, and admit that the soles and beef were faultless. So much for my English landlord. Now for the French or Belgian innkeeper's bill of fare for dinner:—

Course 1st, Excellent soup.
Course 2d, Two or three different kinds of fish.
Course 3d, Beef, mutton, or veal; fowl or game.
Course 4th, Puddings, tarts, and different sweets, preserved fruits, &c.
Finale, an excellent dessert, worth all the money.

It is, of course, not possible for a continental innkeeper to furnish such a dinner as I have described for such a trifling sum to one or two customers. Truth, therefore, compels me to avow that my niece and myself, to enjoy the good cheer, were compelled to sit down at the same table with some twelve or fifteen ladies and gentlemen, all our equals, if not superiors in life—many of them foreigners, but the majority were English. You will pity our sad fate at not being enabled to dine in solitary dignity; yet, strange to say, we tolerated the society of each other so exceedingly well, that even the ladies lingered with us until it was time to dress for the soirée, or "danse"—the admission to which is one franc less to a family, and less still if you subscribe for a week."

All will agree with the writer of the foregoing observations, that the charges usually made at hotels in this country are monstrous, and quite unsuitable to the improved and cheap modes of locomotion by railways and steam-boats. From our own recollections, we should say that the expense incurred at a good continental inn is little more than what would require to be disbursed for servants at a hotel in England. On one occasion, not long ago, for the simple accommodation of tea, a night's lodging, and breakfast, in a hotel near Charing-Cross, we were charged, for two persons, L.1, 10s. 6d.—the actual value of the articles consumed being perhaps half-a-crown; out of the guinea and a half, the servants had 7s. 6d. We find it everywhere customary to charge from 3s. to 4s. for dinner, no matter although the meal consists of only a morsel of steak, or any similarly unexpensive trifle. There is, in short, no kind of moderation in the ordinary routine of inn charges in England; the whole seems to be little better than a system of plunder; and like all other invasions on property, it doubtless reacts upon itself, and prevents thousands from travelling who would otherwise do so. That innkeepers, with the heavy burdens of rents and taxes which they must sustain, could lower their charges to what are customary on the continent, is not to be expected. But, short of this, they might greatly reduce their exactions, and much to their own advantage. If they do not, they may rest assured that new kinds of accommodation will spring up to meet the exigencies of the times. We should recommend, for example, that in all large seats of population, where there are railway termini, inns should be attempted on the continental plan—a house with from 150 to 200 bedrooms, each neatly but unexpensively furnished; a large saloon, in which all the meals are spread, at one or separate tables, and the charges to be arranged on the modern and now well understood principle of *small profits on an extensive and nimble trade*. Capital, seeking for an outlet, might fall on less advantageous investments than an establishment of this nature.

PAPER-MONEY BORROWING.

THERE is too much truth in the following observations on the English bank paper borrowing; we copy from the *Britannia* newspaper:—

"There is one circumstance which has always preceded a season of distress, namely, a great issue of the paper circulation. Immediately before the panic of 1825, the Bank of England had lowered the rate of its discounts, and every other bank in the country probably followed its example. The country was thus flooded with imaginary wealth, and in six months after it was overwhelmed with almost universal bankruptcy. The facility of borrowing always creates rashness of speculation, and speculation founded on paper always ends in bankruptcy. Men borrow at will, and depend on chance for the power to pay. They use lightly what has lightly come; and the most trivial touch breaks the bubble.

This accounts for all the panics; but our more gradual distresses come from the same source. By an anomaly of the most singular kind, the law of England, while it transports a man for coining a sixpence in metal, allows him to coin millions in paper; nay, a man without a sixpence may forge millions of pounds, and possess himself of all that millions can give, provided that he can get his paper into circulation. But who will take it? Thousands and tens of thousands. The process is the simplest thing in the world, and has been practised hundreds of times. A bank is opened in a country town; an equipage, a handsome house, a carriage, all easily supplied on London credit, give the new firm an air of opulence. The surrounding dealers, in their difficulties, are supplied with paper, and they thus become its circulators. The neighbouring manufacturers are assisted in their casual pressures; and they, too, thus become its circulators. An estate in the vicinity is to be sold, it is purchased by the firm, and paid for in its paper. All this adds to its credit with the people. The farmer, the butcher, and the baker, all find themselves paid better as the banker distributes his paper more widely. Thus Adam Smith's definition of prosperity, "high prices, and those advancing," is realised in the country. Every one is growing rich. The gold mine has been discovered in the banker's till; and it flows all day without any check from his conscience.

The process now extends. A piece of waste land lies outside the town. A speculator takes it, covers it with a manufactory, mortgages the building to the bank, and pays its price to the architect in paper. A hundred or a thousand weavers are gathered; the peasantry are drained from the next villages; and cotton cloth is fabricated with the greatest possible rapidity. To insure a sale, the manufacturer must sell it at the lowest possible price; and to meet his expenses at that price, he must produce the largest possible quantity. The wheel of fortune goes round, and the danger of imminent ruin is forgotten in the noise of the whirl.

The transaction is now spread to every corner of the globe where men can give a commission for cotton. On a sudden a letter arrives to say, that a merchant in Australia has failed, or a storekeeper in Massachusetts has run away, or a shop of finery in Calcutta has been burned to the ground. The manufacturer is sensitive all round the terrestrial sphere; he has *tentacula* like the lobster in perpetual motion and perpetual sensibility. With the failure of his returns he is ruined. His mortgagees seize his manufactory; his workmen are flung loose on the world; and mischief and misery close the scene. But the discovery is soon made that the banker, too, is worth nothing. The creditors seize house, equipage, and land; the peasantry "run for gold;" and all is beggary and despair.

Yet what is all this but the exemplification of the common maxim, that "out of nothing nothing can come."

ADVENTURE AT CHAUD FONTAINE.

How annoying to be travelling in a country and ignorant of its language; how amusing to witness two beings, in other respects well-informed, well-educated, making forced grimaces to understand each other, without being able to guess at their mutual wants and wishes! During a flying visit to Belgium, Mr T—— and his lovely wife stopped a couple of days at Chaud Fontaine, near Liege, so pleasantly situated in the valley of the Vesdre, and resembling in several of its most agreeable features our Matlock, though upon a smaller scale. They took up their quarters at the Hotel des Bains. On retiring for the night, the gentleman either fancying he was not at sleeping pitch, or else not feeling himself all right, resolved to line his night-cap with a stiff glass of grog, and rang the bell for that purpose; up came the attic nymph. "Que veut, Monsieur?" "Oh, ah; why, bring me a glass of brandy and water." "Qu'est ce, que c'est, Monsieur? Je ne parle pas Anglais." "Why, Frank," said his wife, laughing, "where is the use of talking English to the girl? she doesn't understand a word of it; she's staring at you in amazement." "Well," quoth the husband, "I believe you; but what the deuce am I to do? What a bore, not to be able to make one's self understood; I'm determined to learn French as soon as I return home. Come, Bessy, my dear, you speak it better than I do; pray tell her what I want, and bid her look sharp." "So I will, but cannot for the life of me call to mind what is the word for brandy; let me see. Oh, Mamsell, portez one glass d'eau" (pointing to a glass, and the water on the dressing-table). "Oui, oui, Madame, une verre d'eau." "Yes, oui; et un petty poor de chose dans it." "Une verre d'eau, et quelque chose dedans!" exclaimed the puzzled abigail, apparently at her wit's end, when all at once a light seemed to break in upon her—"Ah, que je suis bete! je comprends a cette heure, c'est une vielleuse qu'on veut: je vais la chercher a l'instant," and out of the chamber she darted. "Now, Frank, what do you think of that?" said Mrs. T——, quite delighted with her profound knowledge of the French; don't you think I speak the language exceedingly well!" "Indeed you do, my love; I am astonished when and where you picked it all up." "Oh, don't be surprised at that; I have a natural talent for languages; and if I were to stay here a month, I should parley as well as the natives. But here comes the girl with your grog; don't let her come in; take it from her at the door." Accordingly the husband did as he was bid, took the glass, dismissed the maid with an approving nod, turned to his better half, who was just considering how two people were to sleep in such a narrow bed—"Here is my love to you Bessy." "Thank you, Frank; but pray leave a drop at the bottom." But oh, horrible! instead of a stiff glass of grog, it was a night light, for so the girl had understood the order. Poor Frank had nearly swallowed the whole, when he was stopped by the floating wick, and a most violent feeling of disgust. How shall I describe his loathing and his rage, or his wife's screams of laughter, which she could not repress, in spite of every effort, at her husband's ridiculous blunder? The poor fellow is now reconciled to the nasty joke, which, he says, was the fruit of his wife having a natural talent for learning languages.—*Times*.

THE SUBSCRIPTION FOR BURNS'S SISTER.

September 28, 1842.

THE appeal made to the public in behalf of this interesting person was mentioned in the Journal a few months ago. We have now the pleasure of stating that the sum collected for her is of such amount as to secure her comfort for life. The sums sent in have been as follows:—

LONDON.

Her Majesty, the Queen,		£50	0 0
Collected by the Hon. C. Augustus Murray, Buckingham Palace,		14	0 0
P. F. Tytler, Esq.,		1	0 0
A. Hastie, Esq., M. P.,		1	1 0
Collected by Mr Hastie—			
W. Jardine, Esq., M. P.,	£1 1 0		
J. Jardine, Esq.,	1 1 0		
J. Smith, Esq., Deanston,	1 1 0		
A. Steaker, Esq.,	1 1 0		
W. J. Stephenson, Esq.,	1 1 0		
J. Arnold, Esq.,	1 1 0		
Dr A. Stewart,	1 1 0		
R. Eglinton, Esq.,	1 1 0		
J. M'Clure, Esq.,	1 1 0		
O. W. Halket, Esq.,	1 1 0		
A Friend,	1 1 0		
Additional,	2 0 0		
		13	11 0
Thomas Carlyle, Esq., Chelsea,		1	0 0
Collected by Mr Carlyle—			
Mr Macready, for himself,	5 5 0		
—— his children,	4 15 6		
Mr Renyon,	2 0 0		
Mrs Gaskill,	1 0 0		
Mrs Reid,	1 0 0		
		14	0 6
T. Monkton Milnes, Esq., M. P.,		1	0 0
Collected by Mr Milnes—			
The Duchess of Sutherland,	5 0 0		
Lord Francis Egerton,	5 0 0		
Mr Aldam, M. P.,	1 0 0		
Mr Pusey, M. P.,	1 0 0		
Sir Thomas Acland, M. P.,	2 0 0		
Hon. Sidney Herbert,	1 0 0		
Mr Dickinson, M. P.,	1 0 0		
Hon. Dawson Damer, M. P.,	1 0 0		
		17	0 0
George Thomson, Esq., Kensington (formerly of Edinburgh),		3	3 0
Collected by Mr Thomson—			
Sir Charles Forbes, of Edinglassie, Bart.,	10 0 0		
George Arbuthnot, Esq. of Elderslie,	5 0 0		
Dr James Fisher, Upper Bedford Place,	1 0 0		
Miss Eccles, London,	0 5 0		
Lady Holland,	1 1 0		
Colonel Fox,	1 1 0		
Miss Fox,	1 1 0		
Marquis of Tavistock,	1 1 0		
Sir Robert Adair, Bart., G. C. B.,	1 1 0		
David Dundas, Esq.,	1 1 0		
John Allen, Esq.,	1 1 0		
		23	12 0
John Wilson, Esq., 41, Regent Square,		3	0 0
Collected by Mr Wilson,		12	0 0
B. W. Procter, Esq.,		10	10 0
Thomas Tegg, Esq.,		10	0 0
James Grant, Esq., Morning Advertiser Office,		1	1 0
John Platt, Esq., 3, St Andrew's Place, Regent's Park,		1	1 0
J. G. B.,		5	0 0
Rev. W. Bishop, Upton, near Reading, Berks,		2	0 0

LIVERPOOL.

Collected by John Welsh, Esq., 20, Maryland Street,	L.40 1 6		
Collected by John Taylor, Esq., 23, Upper Bedford Street,	27 15 0		
	67 16 6		
Deduct expenses,	18 6		
		66	18 0
Subscription at Sheffield, per John Fowler, Esq.,		4	0 0
C. B. Portmore, Esq., Solicitor, Derby,		5	0 0

EDINBURGH.

Hon. Lord Cunninghame,		L.1	0 0
Sir Charles S. Monteath, Bart.,		1	0 0
J. W. Mackenzie, Esq., W.S.,		1	1 0
W. Patrick, Esq., 32 Albany Street,		1	0 0
Messrs Chambers, 339, High Street,		4	0 0
(Small subscriptions),		7	6

GLASGOW.

Collected by James Macfarlane, Esq.,		L.3	17 0
(Some further sums are expected from Glasgow.)			

AYRSHIRE.

Claud Alexander, Esq., Ballochmyle,		L.2	0 0
Mrs Alexander, Ballochmyle,		2	0 0
Collected by Mrs Alexander—			
Lady Jane Hamilton,	L.1 0 0		
Mr Hamilton,	1 0 0		
Sir D. H. Blair, Bart.,	1 0 0		
Mrs Ritchie,	1 0 0		
Sir J. M. Brisbane, Bart.,	1 0 0		
Dr H. Blair,	1 0 0		
Sir William Miller, Bart.,	1 0 0		
Mrs Somerville,	1 0 0		
Mrs Allason Cunninghame,	1 0 0		
Hon. Mrs Cathcart,	1 0 0		
Smaller subscriptions,	6 0 6		
		16	0 6
William Gibson, Esq., Greenfield, Ayr,		1	0 0
Collected by Mr Gibson,	8 9 0		
Deduct expenses,	3 0 8		
		5	8 4

HALIFAX, NOVA SCOTIA.

Remitted by a committee, composed of the following gentlemen:—John M'Lean, George Esson, William Mackay, Alexander Bain, Donald Murray, Alexander M'Leod, John Gibson, John M'Dougall, Esquires,		35	0 0

Being, in all, rather more than *three hundred and thirty pounds*.

We propose to add not one word of comment to the above list: positively and negatively, it will speak for itself. We cannot refrain, however, from transferring to this place a passage of the letter to Mrs Begg, which accompanied the contribution of our noble little band of warm-hearted countrymen settled at Halifax, N.S.:—"It cannot be otherwise than gratifying to you and your friends to learn, that the veneration felt for the memory of your departed brother has excited so general and warm a sympathy among Scotsmen, for the misfortunes with which you have been visited. These, under the decrees of a wise and benevolent Providence, fall often upon the good and the virtuous, and are sent for purposes which, as they cannot be comprehended, ought to be submitted to with patience and resignation. We have reason to believe that these have fallen upon you quite undeservedly, and it therefore gives us pleasure to lend our aid in alleviating them so far as the goods of fortune are concerned. Had your lamented brother lived longer to reap the fruits of his well-earned fame, his countrymen in this place would have been proud to repay the honours he has conferred upon them by some substantial mark of their favour. Such a return to him is now impossible; but they are glad to have the present opportunity of testifying their gratitude to his memory, and trusting that you may long live to enjoy contributions so frankly and voluntarily given, and the consciousness of being an object of public respect and sympathy.—We are," &c.

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 562. SATURDAY, NOVEMBER 5, 1842. PRICE 1½d

MERITS.

In Erasmus's Apothegms of the Ancients is the following anecdote:—"A Lacedemonian, seeing Diogenes the Cynic naked, in a vehement cold morning, grasping a brazen statue round, asked him, 'If he was not cold?' Upon denying he was, 'Then,' said the Spartan, 'where is the great matter in it?'" The Lacedemonian was right. If Diogenes did not feel the cold, he suffered nothing from his exposure, and he therefore could not fairly be considered as exercising that fortitude and disregard of earthly ills which it was a peculiarity of his sect to pretend to. The probability is, that Diogenes, although there might not be perfect sincerity in his answer to the Lacedemonian, had either inherited from nature, or acquired from long residence in his well-known doorless mansion, a certain robustness or physical hardiness which made him less sensible to cold than the generality of men. Modern physiologists find this explanation for several other notable cases of endurance. The North American Indian, for example, who shows such contempt for the tortures inflicted on him by his enemies at the stake, is now understood to be mainly indebted for his apparent power of endurance to a nervous system originally grosser than that of the Pale Faces, and since made still more dull by his barbarous course of life. When we wonder at the calmness of one of these sufferers, as Mrs Hunter does in her beautiful poem, "The Death Song of an Indian Chief," we attribute to him an European constitution; we think how we ourselves should feel under such trying circumstances; and knowing that we should squall most piteously, we imagine Alknomook to be a hero because he bears all without allowing a groan or a whimper to escape him. But all this is a mistake. Alknomook probably does not feel one-tenth of what we should do, and—"Where, then, is the great matter in it?" It is precisely an analogous explanation which is given of the power of the Australian savages to bear heavy blows with a club upon the back of the head—to which, it seems, they submit by way of a trial of strength, and thus sustain, without injury, what would dash any Englishman's head to pieces. The Australian has simply a thicker and harder skull than the Englishman. When we consider these things, we are apt to challenge the philosophy of such moralisings as this of Byron—

> ——— "mute
> The camel bears the heaviest load,
> And the wolf dies in silence—not bestow'd
> In vain should such example be; if they,
> Things of ignoble and of savage mood,
> Endure and shrink not, we of nobler clay
> May temper it to bear."

Granted that the patient sufferings of animals are affecting to look upon, and may well suggest ideas of resignation and fortitude; but if, in point of fact, the creatures here specified lack the mechanism or media of suffering, or possess a nervous system greatly less sensible to suffering than ours, their endurance must, on a rigid investigation, appear only a natural fact, and not a moral example. A poet would, of course, not inquire too curiously, but there is something to be done in the world besides poetising.

It is no very new remark, that merit is often claimed and often attributed where it is as little due as in the above instances. Men are every day seen, Diogenes-like, enduring, with an appearance of heroic fortitude, hardships and self-mortifications to which they are insensible. Possibly not a few saintly reputations have been built upon no better foundation than to voluntary exposures of this kind. There are skins less alive to the lash than others, and we can easily conceive of some pachydermatous St Francis, who could lay it well on with very little inconvenience to himself, while whole monasteries were looking on with admiration. Some stomachs, moreover, require much less food than others; and it is not impossible that some canonisations have been mainly owing to what Liebig might call an inferior oxygenability of constitution. There are instances of human beings, under some derangement of the system, living for weeks without food. How easy it would be for any such person to make himself out a paragon of the fasting virtue! Honest people, who have thick skins, or small powers of inhaling oxygen, make no fuss about the matter; but marvellers and cunning dogs look as big about it as possible, and leave odorous memories of many centuries' duration. We thoroughly believe that a great proportion of the cases of extraordinary negative virtue on record are explainable on this principle. The school of Diogenes, who affected a superiority to all the elegancies and amenities of life, were probably for the most part men who had no natural relish of or feeling for such things. Barbarians of the same kind are found in all civilised communities: there must have been such men in Greece also: there it was the fashion to make any peculiar notions the foundation of "a school." Hence, the haters of neat clothes and carpeted rooms, who, amongst us, are only regarded as detestable oddities, were exalted at Athens into the character of philosophers. There are also, in all countries, men of dogged imperturbable natures, who never cry out for any hurt or misfortune of their own, and are generally as remarkable for a want of feeling respecting the distresses and mishaps of their neighbours. Here, these men are generally shunned as disagreeable, or laughed at as odd: in Greece, they became the Stoical School, teaching that the perfection of virtue is to disregard all the evils of life! It is easy to trace a feature of natural character through various successive social appearances, modified only by the external pressure of the time. The Stoics reappear in the Anchorites of the fifth and sixth centuries. The tub of Diogenes becomes converted, in the middle ages, into an hermitage. Amongst us, many a worthy successor of that philosopher is known as the growling old gentleman, who lives by himself in the three pair of stairs back, and never allows a female to enter his door.

In these negative merits, there is often a double deception. Not only is there an indifference to the particular indulgence, for exemption from which the praise is given, but it is amply compensated by indulgences of a different kind, probably less liable to notice or to condemnation. It is well, of course, to be superior to any indulgence of a nocuous character, whether it be so absolutely, or in the way of excess, or too frequent repetition; let it be fully understood that all honour is due to every successful contest with such inclinations. But the merit of freedom from any particular error is rendered, to say the least of it, equivocal, if a great latitude be taken elsewhere, so as to leave, upon the whole, not less indulgence of one kind and another. I received my first impressions on this subject a good many years ago, in the course of acquaintance with a young person of my own age, who at first seemed superior to every foible whatever, and passed with me, of course, as a paragon of self-denial; until one evening, meeting him at supper, I found him eating and drinking so enormously, and that without becoming in the least affected by it, even to the limited extent of an increased cheerfulness, that it was easy to see that aliment was a moral infirmity which in him had swallowed up or precluded all others. Thus, also, some who are remarkably abstemious in respect of meat, are remarkably indulgent in respect of liquor; while others, who take little liquor, make up for it amply by additional dishes and extra helpings. Of the adherents of the tee-total cause itself, it is no scandal—it is only supposing the weakness of human nature—to say that some compensate for the banished crystal by the more frequent crockery. On this point we are tempted to introduce a very brief anecdote, which can do no harm to that good cause:—A distinguished advocate of the abstinence principle, who snuffed very largely, called one day upon a member of his own profession, with whom he was well acquainted, and who lived in a different town from himself, to press upon him the duty of his joining the society. He met a rather obdurate listener, but nevertheless persevered in his arguments for fully a quarter of an hour. At length, his friend said, "Why, now, it is very odd that, while you are preaching to me about the propriety of altogether abandoning liquor, you are every half minute taking a large pinch of snuff. Is there not as much of a bad indulgence in the one thing as the other?" The preacher was struck silent by the remark, the subject of which had never before occurred to his mind. But it is to be related, to his credit so far, that when he next called, about six months after, he had given up the use of snuff, thus proving his sincere anxiety to banish reprehensible indulgences in his own case. On this point, it may be not impertinently asked, if the gentleman "who never takes supper," and looks on while others do, with an air of affected superiority, really is entitled to take any credit to himself on this score, if he alone of all the company has dined late, or dined well. And to pass from a small thing to a great, it may be questioned if the well-off and comfortable are always quite right in their blame of the poor for certain indulgences notoriously attributed to them. Let us hear once again what Maggie Mucklebacket said on this subject to the Laird of Monkbarns, on his expressing a hope that the distilleries would never work again:—"Ay, ay—it's easy for your honour and the like o' you gentle folks to say sae, that hae stouth and routh, and fire and fending, and meat and claith, and sit dry and canny by the fireside; but an ye wanted fire, and meat, and dry claise, and were deeing o' cauld, and had a sair heart into the bargain, which is warst ava, wi' just tippence in your pouch, wadna ye be glad to buy a dram wi't, to be eilding and claise, and a supper, and heart's ease into the bargain, till the morn's morning?" 'Twere to be wished that the specified comforts were to be obtained otherwise than in this representative way, and Maggie's compeers should not be too ready to make use of this flattering apology, which certainly does not apply in that large proportion of instances where the dram has been the *cause* of that want of the fire, clothing, meat, and heart's ease, which it is also employed to supply. But there is not a little force in the views of the poly-petticoated philosopher, as far as the right of the comfortable to arrogate to themselves superior virtue is concerned, and considering simply the comfortable against the uncomfortable. A human being, in average conditions, requires a certain amount of comfort of some kind to make life pass tolerably. He may take it in various ways, but he must have it, or life becomes insupportable. Now, certainly, he who has all the comforts usually experienced in the houses of the middle and upper classes in this country, must be considered as independent of drams. Were he to take *these* besides, he would be a remarkable monster indeed. There is not the most distant shade of merit, circumstanced as he is, in abstaining from the vicious indulgences to which the comfortless are tempted. *Here*, however, lies the merit

of the more comfortable classes, and would that it could be impressed deeply on the hearts and minds of the poor!—their merit is in endeavouring to attain to, and sustain themselves in, the circumstances which tend to make man superior to low indulgences. In as far as any of the comfortable portion of the community can say, "I have wrought for this house, this good clothing, this fire, and this ease and peace of mind," he is clearly meritorious. The poorest can in some degree, by a right direction of their energies, and a prudential course of conduct, secure themselves in like manner from that comfortlessness which, when it does exist, forms the only shadow of a palliation which the case put by Maggie Mucklebacket admits of. Assuredly, where any have brought on the comfortlessness by their own imprudence, or by indulgences for which there was originally no apology of any kind, the beautifully humane sentence of Scott would only be a description of the punishment imposed by providence for the error, instead of an apology for the present indulgence.

There is also such a thing as merit attributed for things done by accident, or without the design which they ultimately seemed to have. Everybody has read in "Joe Miller" of the English sailor, who, falling from the top-mast upon deck, without hurting himself, instantly got up, and springing to the side of the vessel, called out to the crew of a Dutch vessel near by, one of whom had performed some wonderful feats in leaping, "Can any of you lubbers do anything like that?" This is the type of many cases which occur in life. Some one says a clever thing by chance; it is applauded, and he quietly pockets the praise, as if he had meant to say the thing. Some one is favoured by fortune in performing some feat, or transacting some piece of business very successfully; his friends praise him for his skill, his address, or his courage, and he coolly puts up with the imputation. Some years ago, this idea was made the basis of a series of papers in a popular magazine, in which a young man, who was an absolute coward, is represented as advancing rapidly in the army through the mere favour of a succession of events in which he *appeared* to have conducted himself with boldness and spirit. First he is carried by an unruly horse into the midst of the enemy at the head of a charge which is successful, and, coming off unhurt, is held as having shown a wonderful example of bravery—then, attacked in travelling by a robber, he, in a frenzy of terror, seizes the man's wrist convulsively, and calls to the coachman to drive on; the assailant is thus dragged on, a helpless prisoner, to quarters—and so forth. Such circumstances may well be presumed to occur much more frequently than the world is aware of, for concealment is essential to them. There is another class of merit-takers worthy of special notice, namely, those who are always prophesying how ill things will turn out, merely for the pleasure of damping the hopes or dashing the joy of their neighbours. When things turn out well, these forebodings are of course forgotten; when the case is otherwise, the seer is enabled to take some praise to himself. "I told you how it would be—I always said so"—&c. I wish some statist would give us a return of the number of persons of this kind who annually *disappear and are never more heard of.*

Need I say how true merit is to be distinguished from all these false kinds? by actual good designs and good doings, by genuine self-denying and self-devotion for good ends, and all under the prompting of a principle which does not limit its views to this nether sphere.

MORMONISM.

The sect of the Mormonites, or Latter-Day Saints, has of late years become familiar by these names in Great Britain. They derive their first and standing appellation from a work called the Book of Mormon, assumed by them to be the fruit of inspiration and revelation, and taken as the text-book and Bible of the sect. The Book of Mormon, published two or three times in North America, and once in Britain in 1841, had the following origin:—

Some twenty and odd years since, a young man named Joseph Smith, the founder, apostle, and prophet of the Mormonites, followed the profession of a *money-digger* in the United States. It is a common belief in some of the maritime districts of that republic, that large sums of money and masses of bullion were there buried in the earth by the buccaneers, as well as, more recently, by persons concerned in the Revolution. The pretence of discovering these treasures by incantations was an artifice to which needy and cunning men frequently resorted, and Joseph Smith, according to the best testimony, distinguished himself peculiarly in this line. While he was engaged in these and similar pursuits, he received, as his own story runs, several revelations from heaven, relative to the religious sects of the day. On the first occasion when he was thus favoured, he had gone into a grove, and there besought divine aid to show him which, of all the denominations of the Christian church then existing, he ought to reverence and follow as the true one. A bright light, he said, appeared above his head; he was received up into the midst of it; and he there saw two angelic personages, who told him that all his sins were forgiven, that the whole world was in error on religious points, and that the truth should be made known to him in due time. A second revelation of a similar description informed Smith that the American Indians were a remnant of the children of Israel, and that prophets and inspired men had once existed among them, by whom divine records had been deposited in a secure place, to save them from the hands of the wicked. A third communication, made on the morning of September 22, 1823, informed Smith that these relics were to be found in a cavern, on a large hill to the east of the mail-road from Palmyra, Wayne county, state of New York. Here, accordingly, Joseph made search, and, as he says, found a stone-chest containing plates like gold, about seven by eight inches in width and length, and not quite so thick as common tin. On these plates was graven the book or bible of Mormon, so called from the name given to the party supposed to have written and concealed it. Smith was not allowed to take away these golden plates until he had learned the Egyptian language, in which tongue, or a modern dialect of it, the graven book was composed. At length, in September 1827, Smith was deemed qualified to receive the golden plates, and he transcribed an English version of the characters, which was published in the year 1830. The work made a considerable impression on the poorer classes of the United States, and a sect was formed soon afterwards, calling themselves "The Church of Jesus Christ of Latter-Day Saints." From their text-book, they were more familiarly called the "Mormonites."

The Book of Mormon, which is nearly of the same extent as the Old Testament, contains, properly speaking, two distinct stories or histories. The history of the Nephites, a portion of the tribe of Joseph, supposed to have emigrated from Jerusalem under a prophet named Nephi, and to have been miraculously led to America, occupies the first part of the work. The Nephites founded, says the story, the Indian race. Many years after their settlement, they are also stated to have discovered the records of the Jaredites, an extinct nation which came to America about the time of the building of Babel. The revelations of various prophets to these Jaredites and Nephites, and direct divine communications respecting "my servant Joseph Smith," the apostle of the present day, compose the staple matter of the Book of Mormon.

From beginning to end, this work is filled with evidences of forgery and imposture. The peculiar style of holy writ is borrowed throughout, and, as regards words and names, many separate languages are drawn upon, proving the assumed writer of early ages to have all the information of our day before him. The difficulty arising from the red colour of the Indian skin, so different from that of the Jews, is overcome by the arbitrary and easy medium of a miracle. Their colour is said to have been changed as a punishment for their sins. Things are spoken of, which, it is well known, were not invented till late times. For example, it is said by the prophet Nephi, in allusion to a mutiny that took place on his voyage to America, "And it came to pass, after they had loosed me, behold, I took the *compass*, and it did work whither I desired it." Besides antedating the discovery of the needle's polarity by several centuries, the writer here evidently misunderstands the use of the compass altogether. A Mormonite elder, being pressed on the subject of this blunder, pointed to the account of St Paul's voyage, which has this sentence in the English version: "We *fetched a compass*, and came to Rhegium." The misapprehension of this sentence, the first words of which mean merely, "We made a circuit," had obviously led to the blunder of the composer of the Book of Mormon. According to the Athenæum: "The history of the pretended Israelites is continued in the books of Enos, Jarom, Zeniff, &c., and through them all, we find one signal proof not merely of imposture, but of the ignorance of the impostor, repeated with singular pertinacity. Every successive prophet predicts to the Nephites the future coming of Christ; the writer has fallen into the vulgar error of mistaking an epithet for a name; the word 'Christ,' as all educated persons know, is not a name, but a Greek title of office, signifying 'The anointed,' being in fact a translation of the Hebrew word *Messiah*; it is true that in modern times, and by a corruption which is now become inveterate, the term is used by western Christians as if it were a proper name, or at least an untranslatable designation; but this is a modern error, and it has been avoided by most of the oriental churches. Now, the use of a Greek term, in an age when the Greek language was unformed, and by a people with whom it was impossible for Greeks to have intercourse, and, moreover, whose native language was of such peculiar construction as not to be susceptible of foreign admixture, is a mark of forgery so obvious and decisive, that it ought long since to have exposed the delusion. Unhappily, however, we are forced to conclude, from the pamphlets before us, that the American Methodists, who first undertook to expose the Mormonites, were scarcely less ignorant than themselves.

A second Nephi takes up the history at a period contemporary with the events recorded in the New Testament. It avers that our Lord exhibited himself to the Nephites after his resurrection, and the words attributed to him bear still more conclusive evidence of the ignorance of the impostors:—

'Behold I am Jesus Christ, the Son of God. I created the heavens and the earth, and all things that in them are.' And again, 'I am the light and the life of the world. I am Alpha and Omega, the beginning and the end.'

In addition to the former blunder respecting the name 'Christ,' we have the name 'Jesus' in its Greek form, and not, as the Hebrews would have called it, 'Joshua;' but we have, furthermore, the names of the first and last letters of the Greek alphabet given as a metaphorical description of continued existence to a nation that had never heard of the Greek language. It is quite clear that the writer mistook Alpha and Omega for some sacred and mystic sounds, to which particular sanctity was attached—a blunder by no means confined to the Mormonites—and wrote them down without perceiving that they were an evidence of forgery, so palpable as to be manifest to schoolboys."

The same authority which we have now quoted gives a hint of the probable origin of this whole imposture, for, as we shall show, Joseph Smith is a man scarcely capable of inventing or writing even the ravings of the Book of Mormon. A clergyman named Solomon Spaulding, had left his ministry, and entered into business in Cherry Vale, New York, where he failed, in the year 1809. The sepulchral mounds of North America were then exciting some interest, and it struck Spaulding that he might relieve himself from his distresses by composing a novel, connecting these mounds with the lost ten tribes of Israel, supposed by some to have peopled America. Intending to name his work "The Manuscript Found," he wrote it in the old style of the Hebrew compositions. In 1812, the work was taken to a printer named Lamdin, residing in Pittsburgh, Pennsylvania, but the author died ere any arrangement could be made for its publication. Lamdin also died in 1826. He had previously lent the manuscript to a person named Sidney Rigdon, and this person it seems to have been who, in connexion with his friend Joseph Smith, formed the idea of palming it on the world as a *new revelation*. The manuscript was well suited to their purposes, and of course they would make such changes as appeared requisite. That this was the true source of the Book of Mormon, is borne out by the testimony of the wife, brother, partner, and several friends of Spaulding, who had heard him read portions of the manuscript, and who recognised many of the names and incidents in the Book of Mormon to be the same with those occurring in Spaulding's novel. The difficulty of supposing paper of any kind to have been so long preserved, appears to have suggested the additional and characteristic device of the "plates of gold" to the money-digger, Mr Joseph Smith. Sidney Rigdon is now the "prophet's" secretary. He, by the way, and a few other persons, have alone been honoured with a sight of the said plates.

It might be deemed superfluous to say so much on this subject, were it not that the Mormon delusion has spread widely in North America, and even in Great Britain. Joseph Smith and his colleagues settled in 1831 on the Missouri, whence they were soon after expelled on account of their lawless conduct. They then went to Illinois, and founded a town or city, called Nauvoo, near the Mississippi, said now to contain 1700 able-bodied men, exclusive of women and children. To this place too many emigrants are directing their course even from Great Britain. What sort of people they will find in the persons of the prophet and his associates, appears very clearly from a little work by Mr Caswall, who visited the city of the Mormons in the present year (1842). The following is his picture of Joseph Smith:—

"I met Joseph Smith at a short distance from his dwelling, and was introduced to him. I had the honour of an interview with him who is a prophet, a seer, a merchant, a 'revelator,' a president, an elder, an editor, and the general of the 'Nauvoo legion.' He is a coarse plebeian person in aspect, and his countenance exhibits a curious mixture of the knave and the clown. His hands are large and fat, and on one of his fingers he wears a massive gold ring, upon which I saw an inscription. His dress was of coarse country manufacture, and his white hat was enveloped by a piece of black crape as a sign of mourning for his deceased brother, Don Carlos Smith, the late editor of the 'Times and Seasons.' His age is about thirty-five. I had not an opportunity of observing his eyes, as he appears deficient in that open straightforward look which characterises an honest man. He led the way to his house, accompanied by a host of elders, bishops, preachers, and common Mormons. On entering the house, chairs were provided for the prophet and myself, while the curious and gaping crowd remained standing. I handed a book to the prophet, and begged him to explain its contents. He asked me if I had any idea of its meaning. I replied, that I believed it to be a Greek Psalter, but that I should like to hear his opinion. 'No,' he said; 'it ain't Greek at all, except, perhaps, a few words. What ain't Greek is Egyptian, and what ain't Egyptian is Greek. This book is very valuable. It is a dictionary of Egyptian hieroglyphics.' Pointing to the capital letters at the commencement of each verse, he said, 'Them figures is Egyptian hieroglyphics, and them which follows is the interpretation of the hieroglyphics, written in the reformed Egyptian. Them characters is like the letters that was engraved on the golden plates.' Upon this the Mormons around began to congratulate me on the information I was receiving. 'There,' they said, 'we told you so—we told you that our prophet would give you satisfaction. None but our prophet can explain these mysteries.'" The error of taking a Greek Psalter for a specimen of Egyptian hieroglyphics, sufficiently proves the slender pretensions of Mr Joseph Smith to be a mystery-expounder.

In another part of the book, Mr Caswall relates a few personal anecdotes of this worthy, mentioned to him by credible witnesses; but they refer to such scenes of drunkenness and profanity, that we should not feel justified in transcribing them. Enough, we think, has been said to expose the character of a dangerous impostor, and to prevent individuals amongst our working population from expending their little all on the faith of such a man's promises. We have before us a letter from an unfortunate cotton-spinner of Lancashire, which shows how necessary such a caution is. The Mormon preachers in England had described Nauvoo to him as a land overflowing with milk and honey, and a place where the divine Being had commanded a temple to be built, that might be a refuge to all mankind. Joseph Smith, at least, had certainly commanded this, as the following very *unequivocal* passages from his writings will show:—"Verily, verily, I say unto you, let all my saints come from afar, and send ye swift messengers, yea, chosen messengers, and say unto them, 'Come ye with all your gold, and your silver, and your precious stones, and with all your antiquities; and all who have knowledge of antiquities that will come may come; and bring the box tree, and the fir-tree, and the pine-tree, together with all the precious trees of the earth; and with iron, and with copper, and with brass, and with zinc, and with all your precious things of the earth, and build a house to my name, for the Most High to dwell therein: for there is not a place found upon earth, that he may come and restore again that which was lost unto you, or which he hath taken away, even the fullness of the priesthood.'"

By such blasphemous and deceitful stuff as this, the poor cotton-spinner, like too many others, was induced to go to Nauvoo, where, like other victims of delusion, he was wretchedly used.

It is needless to carry our notice of this matter further. Every shadow of evidence yet obtained tends to prove Mormonism to be a gross imposture, and one unworthy of notice, save on account of the dangers which have here been described and exposed.

AN OMNIBUS ADVENTURE.

One day an elderly gentleman, named Cartwright, stepped into an omnibus at the west end of the town, in order to pay a visit to the Bank to receive his dividends. In the Strand, the vehicle stopped, and took up a lady and a little girl, who, having seated themselves exactly opposite to Mr Cartwright, afforded him full leisure and opportunity to survey them. The first thing he remarked of the lady was, that she was both young and pretty, and the next, that she bore in her countenance evident traces of sorrow and anxiety. The little girl was very pretty too, and, whatever her mother's cause of grief might be, was yet too young to share it, for she did not look more than four years old. Interested by their appearance, Mr Cartwright made one or two attempts to address the lady; but although she answered him politely, she seemed too much absorbed in her own reflections to be disposed for conversation. Some courtesies offered to the child met with a more willing reception. Before they reached the Bank, however, he lost sight of them; they descended and turned into a street that led off at right angles, whilst the heavy omnibus rumbled on to its destination.

Receiving one's dividends is a very pleasant occupation, especially to a comfortable Leicestershire farmer, who adds something to his principal every year, which was the case with Mr Cartwright, who was an extensive breeder of sheep in that county. He was a very good-natured kind-hearted man at all times; but in consequence of the soothing effect of his errand, when, having transacted his business, he buttoned up his pockets and stepped into the omnibus to return, he felt in a more than usually complacent mood, and very well disposed to chat with his companions. Accordingly, he entered into an amicable dispute regarding the badness of the times with a passenger who sat opposite, and whose errand into the city had probably been of a less agreeable kind, seeing that he professed his belief that a period of universal ruin was approaching. Mr. Cartwright took the cheerful side of the question; averring, that in all ages it had been the fashion to abuse the present and laud the past, but for his part he did not doubt that the times were as good as any that had preceded them, if not better.

Whilst our happily-disposed friend was engaged in this argument, the omnibus suddenly stopped at exactly the same spot where the lady and the little girl had descended from it, and when the door opened, he perceived that it was to take them up again. The lady made him a slight acknowledgment of recognition, the little girl smiled in his face, but on looking at the countenance of the former, he could not help concluding that her expedition had not terminated so agreeably as his own. There were traces of recently-shed tears, and the expression of grief he had first remarked seemed now almost deepened into despair. At this sight, Mr Cartwright left off praising the times, and set himself to think what could be the matter with his fair fellow-traveller. He wondered much if her trouble arose from want of money. She was genteelly dressed, and so was the child; but how often the outside is maintained at the expense of the inside, and with how many is personal appearance the last thing sacrificed! How frequently good clothes, the only remaining relics of better days, are accompanied by an empty pocket; and the decayed gentleman or gentlewoman, whose air and attire in the street would have repelled the suspicion of poverty, retires to a fireless hearth, and lies down with a supperless stomach!

"Perhaps," thought Mr Cartwright, "she has been into the city to ask the assistance of some rich relation, who has refused to aid her;" and the good man ardently wished he could discover if that was the case. "Who knows but one of these five-pound notes I have in my pocket might be of the most eminent service to her, and how well I could spare it!" But how was such a delicate mystery to be discovered? Had Mr Cartwright been alone with her, he would have made a bold effort to penetrate the cause of her affliction; but there were several other passengers in the vehicle, and it was therefore impossible to venture the slightest observation on her distress. All he could do was to renew his civilities to the child, whilst the unhappy mother sat with her head as much as possible averted from the company, every now and then lifting her handkerchief to her eyes to wipe away the starting tears as they began to steal over her cheek. "Poor thing!" sighed Mr Cartwright, as they descended from the omnibus exactly at the spot where they had first joined it, and he looked out to observe which way they went. They turned down a narrow street, which led towards the river, and as Mr Cartwright caught a glimpse of the water at its extremity, it rather augmented the pain he felt at losing sight of the interesting stranger without having been able to make any effort towards alleviating her distress. He remembered how often those dark waters had proved the last refuge of the destitute—the resting-place of the wretched who could find no other; and when he sat down to his comfortable dinner at his hotel, his thoughts involuntarily reverted to the young mother and her child, and he felt, if poverty were really the evil under which she was suffering, how happy he would have been to have seen them seated at his table, and partaking of the abundant repast provided for himself.

It was not only because he was really a benevolent and kind-hearted man that Mr Cartwright felt thus, but also because he stood more alone in the world than he liked. He had been married, but his wife had died childless; and he had neither brother nor sister, nor any relation alive, except his mother, a worthy old woman, who resided with him, but whom he reasonably expected to see fall before himself. Being rich, he did a great deal of good amongst the poor in his neighbourhood, and in his will he had made a benevolent disposal of his property; but he nevertheless often regretted that he had nobody to make happy with it, to whom he could be attached, and who could, in return, be attached to him; and thus, when distress presented itself before him in so interesting a form as that of the lady and her child, he could not help earnestly desiring to make further acquaintance with it. "Still, however," as he said, "there are many evils in the world besides poverty, and many for which I can do nothing; so I had better think no more about it." But he could not help thinking more about it; and for the few following days that he remained in town, when his business was over for the morning, he invariably found himself lounging along the Strand, and taking a turn, by the way, down the street that led to the river, in the vague hope of meeting the objects of his interest and curiosity. However, his wishes were not realised; he left London without seeing any more of them, and gradually the impression they had made faded from his mind.

Six months after this adventure, Mr Cartwright went to London again, and on precisely the same errand. He had before gone to receive his July dividends, now he went to receive his January dividends. He put up at the same hotel, and stepped into the same omnibus, at the same hour, for the purpose of being transported to the bank; but what was his surprise when the omnibus was hailed at the very same spot in the Strand, and the same lady and child got into it! "They are poor," said he to himself, at the first glance, for the difference of their attire betrayed their secret. Their dresses were not only shabby, but insufficient for the season; and the hollow cheeks of the mother, and the faded roses of the child, told a tale of suffering and want that could not be questioned. "Providence seems to throw them in my way," thought Mr Cartwright; "and this time it shall not be in vain." But the lady, apparently weighed down by her afflictions, never raised her eyes, and did not see him, or, if she did, did not recognise him; whilst his attempts to make friends with the child were less successful than on the former occasion. The young spirit was nipped by penury; and cold and want had already clouded the smooth brow, and dimmed the lustre of the laughing eyes. "I must not lose sight of them," thought Mr Cartwright, as they approached the place where they had before left the omnibus; so when the vehicle stopped to put them down, he descended also. They took the same road they had done on the former occasion, and he followed them, desiring to address them, but not knowing how to set about it; till after a little while they entered a door which appeared to lead into a counting-house, which point being ascertained, and a probable means of tracing them thus secured, Mr Cartwright hastened on to the bank, in order that he might transact his business and return in the omnibus as before, in the hope that they might do the same. They did so; and when they left the carriage in the Strand, he left it too, and once more followed them till they entered the door of a shabby-looking house, and disappeared without his having found resolution or opportunity to address them. After walking up and down the street a little while, considering what he should do, he advanced to the same door and knocked. "There is a lady and a little girl living here," said he to a dirty-looking woman, who answered his summons.

"Them as I let in just now?" said she.

"Yes, exactly," replied Mr Cartwright. "What is their name?"

"Sinclair," responded the woman.

"How long have they lived here?"

"Almost two years; but they're going away next week."

"Has the lady a husband?" inquired Mr Cartwright.

"I believe so, but I never saw him. I heard that he had turned out ill, and had left her."

"Do you know what her situation is? She does not appear to be in very good circumstances."

"Not she. That's the reason she's going away—she can't afford to pay for her lodging, and I can't afford to stand out of my money."

"Has she any friends?" asked Mr Cartwright.

"A few people used to call on her when first she came to live here," answered the woman; "but they have all dropped off, and you're the first person that has inquired for her for many a day. Do you know her?"

"I believe I do; and I'll thank you to let her know that a gentleman of the name of Cartwright wishes to speak to her. Perhaps she may not recollect me, but tell her I'll explain to her who I am, if she'll do me the honour to admit me."

After a short absence, the woman returned, and desired him to follow her; and having led him up two pair of stairs, ushered him into the presence of Mrs Sinclair. Everything in the room bespoke poverty, and the dresses which the mother and child had worn half an hour before had already been changed for something more homely and faded, clearly betokening that those which had struck him as being so shabby and insufficient, were, nevertheless, the best their reduced circumstances had left them.

"I must begin, madam," said Mr Cartwright, when the woman had closed the door, "by apologising for an intrusion which nothing could excuse but the motive that occasions it." To this exordium the lady bowed, and a faint blush suffused her cheek; whilst the little girl, who evidently recognised her fellow-traveller, crept to his side and laid her hand upon his knee, whereupon he lifted her up and asked her if she remembered him.

"Yes," said she. "You were in the omnibus."

"But did you ever see me before to-day?" inquired he.

"No," said the child.

"Ah! it is too long for you to remember; and probably even you, madam, may not recollect that six months ago we met under exactly the same circumstances as those of this morning."

"I fancied I had seen you before, sir," said Mrs Sinclair, "but I had quite forgotten where."

"Well, madam," continued Mr Cartwright, "that was not the case with me; I remembered the circumstance very well, and was extremely glad of the accident that gave me an opportunity of discovering your residence, which I often regretted I had neglected to do the first time we met."

"Do you know me, sir?" inquired Mrs Sinclair, surprised at this appearance of interest from a stranger.

"No, madam," replied Mr Cartwright. "I never saw you, to my knowledge, till we met in the omnibus last July. But as we may beat about the bush all day, and lose a great deal of time if I do not explain clearly the motive of my visit, I shall beg leave to come directly to the point, first apologising for the liberty I am going to take, and requesting a patient hearing."

Mrs Sinclair having bowed her acquiescence, Mr Cartwright hemmed two or three times to clear away the embarrassment he felt on entering upon so delicate a subject as the lady's distresses. He then proceeded to narrate how much he had been interested by the appearance of herself and of her child, and moved by the evident affliction under which she was labouring. "Whether it be true, madam," said he, "that we are occasionally drawn towards others by particular sympathies, I know not, but certain it is, that I was more than commonly affected by your unhappiness, and more than commonly anxious to contribute towards its relief, if it were in my power. But having no means of ascertaining your name, or anything respecting your situation, I was obliged to leave town without accomplishing my wishes; but the singular coincidence which has again brought us together, leads me to hope that I am destined on this occasion to be more fortunate."

As such instances of disinterested benevolence are not common, though we believe they are not quite so rare as the world supposes, Mrs Sinclair raised her eyes to the face of her visitor, as if she were seeking the key to his generosity. The open, honest, manly

countenance of the country gentleman was one that could well stand the test of scrutiny. "I mean nothing but what I say," continued he. "I am a plain man, and make straight to the object of my discourse. There are many afflictions for which human aid can do little, but there are others which it can alleviate, and one of these is, not being altogether well off—in short, *poverty*. If I am not wrong in supposing that pecuniary embarrassments form some part of your distress, pray, confide in me, and give me an opportunity of doing what will confer on myself the greatest satisfaction."

The tears started into Mrs Sinclair's eyes; she blushed, and turned pale, and hesitated. "However painful it may be, sir," she said, "it would be folly to attempt to deny that I am poor; everything you see around me attests the meagreness of my resources; and although I have other and great troubles, yet I will own that the most pressing at this moment *is* poverty. But what reason have I, sir, to hope that a stranger will afford me the assistance that my own connexions deny me? Why should I intrude my distresses on you? What claim have I on your benevolence?"

"Every claim, madam," replied Mr Cartwright; "at least so my feelings tell me; and of this I am certain, that your declining my assistance would give me more pain than, I think, you would be willing to inflict on a person who desires to serve you;" and in order to invite her confidence, he next proceeded to inform her who he was, and how he was situated; and, in return, she told him that she had married a young man who was a clerk in a public office, but that he had forfeited his situation through misconduct; that for sometime she had lost sight of him altogether, and that, with him, her means of subsistence had ceased, except what she had been able to earn by needlework, and a very small half yearly allowance which was paid her by a relation in the city. "It was on my way to receive that money," she said, "that I had the good fortune to meet you in the omnibus."

"And you do not know where your husband is?" said Mr Cartwright.

"No," replied she, "I do not; and I fear he has too much reason to keep out of sight. On the day I first met you, last July, I heard very afflicting intelligence with respect to him, when I went into the city;" a communication which recalled to Mr Cartwright the remarkable augmentation of grief he had observed in her countenance when she stepped into the omnibus the second time.

As space cannot be afforded here to detail the progress of the intimacy and confidence that grew up between Mr Cartwright and Mrs Sinclair, we must content ourselves with saying, that, having satisfied himself that she was well-worthy of the interest he was disposed to feel in her fortunes, he not only relieved her immediate distresses, but invited her and her child to accompany him into Leicestershire on a visit, intending to keep them there as long as it should be found agreeable to both parties. His mother, therefore, having been duly prepared for the arrival of these new inmates, the three started from London by the mail, and without accident reached Uphill, the comfortable residence of Mr Cartwright, where they met with a glad reception from his aged relative. The contrast between the luxury and abundance to which they were now introduced, and the privations their indigence had long imposed on them, were sensibly felt by the strangers, as they seated themselves at the well-served dinner table on the day of their arrival; whilst the benevolent host and hostess were intensely gratified by so favourable an opportunity of exercising their hospitality. Thus, in friendly discourse over the cheerful fire, and with much enjoyment to all parties, the first evening passed rapidly away, and at an early hour, being somewhat fatigued with their journey, the travellers retired to their beds.

It was not known to Mrs Sinclair; but the room to which she was conducted was the one that, before his journey to London, had been occupied by the master of the house. As it had a particularly warm and pleasant aspect, he had directed in his letter that it should be appropriated to the visitors, and another prepared for himself; and this was accordingly done. After returning thanks to providence for having raised them up such a friend in the hour of need, and having invoked blessings on their benefactor's house, the mother and her child stretched themselves to sleep in the good man's bed.

It was a sound sleep they fell into; the journey, the change of air, the well-appointed couch, and the peace of mind resulting from the change in their fortunes, naturally disposed them to rest, and Mrs Sinclair's anxious thoughts had reposed in deep slumber for some hours, when she was suddenly aroused by a sound as of something falling in the room, and, on opening her eyes, she beheld two men, one of whom was standing with his back towards her at an old bureau, the lid of which he had just let fall, whilst the other, who had a knife in his hand, was in the act of turning away from the bed, over which, a moment before, he had been bending. "Come along," said the latter, in a low hurried voice to his companion; "the old man's not here—we must look further—there's a woman and a child in the bed—come along, lest they should wake;" and he drew his companion away.

"Are you sure they're asleep?" asked the other.

"Quite sure," answered the first. "Quick!—come along." And they stole out of the room, softly closing the door behind them.

Mrs Sinclair looked at her child, who fortunately still slept soundly; then she slipped out of bed, and, gently opening the door, listened to discover which way the men were gone. She knew nothing of the house, neither where the servants slept, nor where her host or hostess slept, for she had seen nothing but the rooms below, and her own bed-chamber; but presently a slight creaking of a stair satisfied her that there were footsteps ascending to the floor above; so she crept after them. The thieves entered a room to the right; she approached the door, hesitating what to do, uncertain whether any one slept there, and afraid of uselessly sacrificing her own life if she discovered herself too soon; but in a moment more the voice of Mr Cartwright saying, "Who's there?" satisfied her there was no time to lose, and she pushed open the door. At the sound of this unexpected disturbance, both the men turned suddenly towards her, whilst Mr Cartwright jumped out of bed, and seized the one nearest to him by the arms. The other, on seeing this attack made upon his companion, lifted up his knife with the intention of plunging it into the breast of the man they came to murder, when Mrs Sinclair darted forwards, and seizing the robber by the arm, exclaimed, "Oh, James! for mercy's sake spare the friend and benefactor of your child!"

"Charlotte!" ejaculated the man, confounded at so unexpected a meeting; "what has brought you here?"

"We were starving, James," replied Mrs Sinclair, "I and your child, and the charity of this good man has saved us. Oh, spare him for our sakes, as well as for your own!"

"Come along, Bob!" said the man, whom the reader will by this time have discovered to be the unfortunate woman's husband; "this affair won't do;" and pushing his companion before him, he moved towards the door. There he stopped, and turning round to Mr Cartwright, who stood an amazed spectator of this scene, he said, "Sir, she has saved your life! Take care of her and the child."

"I will," said Mr Cartwright, with an earnest expression, and the robbers descended the stairs, and in a moment more left the house as they had entered it, with their hands unstained by blood, and without the booty they had been induced to come in search of, from knowing the object of Mr Cartwright's journey to London.

Mrs Sinclair never saw her unhappy husband again. Some time afterwards she learned from her relation in the city, that he had been convicted of a burglary, and was transported for life; but as his real name did not transpire, she was spared the infamy that would have recoiled upon herself and her child from the disclosure of his crimes. We need scarcely add that Mr Cartwright fulfilled his promise to the uttermost. Mrs Sinclair ended her days in peace and contentment at Uphill, which, at the death of Mr Cartwright, became the property of her daughter, who has been many years herself a happy wife and mother, having married a young clergyman of elegant accomplishments and exemplary piety.

SOME RECENT EXPERIMENTS IN MESMERISM.

THE Phrenological Journal for October presents, without any opinion of its own, some accounts of recent experiments in mesmerism, which seem capable of interesting a wider circle of readers. It appears that, towards the end of last year, mesmerists in England and America made the discovery, or believed themselves to have made the discovery, that, while a patient is in the sleep-walking state, or magnetic trance, it is possible for the practitioner to operate upon the various organs of the brain as these are distinguished in the system of Dr Gall—thus producing special mental manifestations according to the special organ which may be operated upon. We shall here endeavour to give a condensed view of the doings of these gentlemen, merely as something which may gratify immediate curiosity.

It was on the 7th of October that the first excitation of a cerebral organ in a magnetic patient was considered to have taken place. J. W. Gardiner, Esq., then having a female patient in the sleep-walking state, played a few notes on a small musical instrument, which caused her to wave her head from side to side in the time of the music. He then sounded the instrument without attention to harmony, when the patient was observed to shudder and appear distressed. Interrogated as to the cause of this, she said she was in pain; and, asked where the pain was, she placed a finger of each hand on the organ of Tune on one side of the head. C. B. Mansfield, Esq., practising at Cambridge, in December, upon a gentleman unusually susceptible of the magnetic influence, found that he could operate in like manner upon a special organ. The patient was taking his dinner, and indulging in a strain of comicality, to the great amusement of those around him, when Mr Mansfield touched the organ of the Ludicrous, with the intention of arresting his flow of humour; instantly his conversation became grave. Other organs are stated to have been acted upon in like manner. Another mesmerist, the friend of these gentlemen, had a patient, a young lady, who had been confined for eighteen months to bed. While she was in the magnetic trance, he applied his finger successively to various organs, and willed that they should be excited; in the majority of cases, the result immediately followed. "Thus," he says, "the finger applied to Imitation produced the most splendid mimicry it is possible to conceive. The words and gestures of friends were copied in the most exact manner. Anecdotes which had been forgotten by all the members of the family were repeated in a way that brought the circumstances instantaneously to their recollection, notwithstanding many years had elapsed." The excitation was banished in each case by a wave of the hand over the organ. "The organs," he adds, "remained active even after the patient had resumed her natural state. This was so marked, that the attendants have frequently requested me not to demagnetise the organ of Benevolence, because, when this was allowed to continue active, she was so much more kind and affectionate."

In December, similar experiments were for the first time made in America by Dr Buchanan of Louisville. Since then, they have been tried by others in different parts of the United States, particularly in New York and Philadelphia. The Journal gives an extract from a letter dated from the last mentioned city in May of this year, relating an experiment to which the writer was witness, and in which all the parties were of such character as yielded assurance of the most perfect good faith on their parts. A Mr N. being thrown into the somnambulistic state, the experimenter put his finger in succession on parts of the head of the former, corresponding with some of the phrenological organs. The same results as those above detailed followed. "It was not a little amusing," says the writer of the letter, "to see the lofty air of Self-Esteem and expression of contempt for others quickly succeeded by the deferential manner and language of Vanity, the endearing expressions and gestures of Love of Children, the animation of Adhesiveness, the rude boisterousness and preparation for fight of Combativeness, the mimic drawing of the bowie knife and reckless disregard of life of Destructiveness. In like manner were developed, and with great vivacity of expression and manner, the manifestations of the faculties of Tune, Colour, Order, Weight, Form, and Locality. Mr N., who is very fond of music, imitated various sounds as of the horn, and the movements of rapid and emphatic fingering of, and as if sweeping over, the piano-forte; and at last, so great was his delight, that he exhibited it by sundry odd gestures, one might say contortions, with accompanying vocal sounds. * * But most extraordinary was the simultaneous manifestation of two faculties of very different natures, such as Covetousness and Conscientiousness, or Combativeness and Conscientiousness. Under the impulse of Combativeness, he was raised on the ground, had, in idea, a dagger drawn, and threw himself into a most menacing attitude; when, on Conscientiousness being touched, his whole manner underwent a change; he drew his before extended and uplifted hand quickly to his breast, thrust away then rapidly his supposed weapon, and buttoned up quickly his coat. The gradual unfolding of the feeling of Acquisitiveness, from the moment when he first saw something in view—bags with strings twisted round them, and his knowledge then of their contents, with a desire of possession, up to an appeal to his companion, whom he supposed to be present, whether they could not without danger appropriate the money to their own use, was a natural and fine piece of acting, if we were to regard it in that light. So, also, was his quickly dropping the money, and his expressions of misgiving at the act when Conscientiousness was touched. * * Mr N. said that he remembered much that had transpired in his magnetic state. His manners and deportment are reserved, and he is quite diffident and averse to exhibition, and to practical jokes or rough mirth of any kind." The writer adds, that experiments have been performed upon thirteen persons at Philadelphia, and he instances the case of a young lady who was quite unacquainted with the presumed locality of the cerebral organs.

In the course of the spring and summer of the present year, various gentlemen in England have pursued this line of investigation. Mr Brookes of Birmingham has made several private exhibitions in London, the patient being a young female servant of his own, who is said to have been cured of epileptic fits and insanity by what is called a course of mesmerism. The Journal contains a letter of a correspondent giving an account of a series of exhibitions of this girl, to which he was witness. "She appeared," he says, "to be about twenty years of age, of a nervous and rather unhealthy appearance, and extremely modest and timid demeanour." Mr Brookes was morally certain that she knew nothing whatever of the system of Gall. It was the practice of this experimenter only to hold his fingers within about an inch of the head, instead of touching it. It was arranged, says the letter-writer, that the organs to be mesmerised should not be mentioned in hearing of the patient, but that he should write them on slips of paper, and hand these to Mr Brookes. It was also agreed that no leading questions should be put to the girl, but only these two, "How do you feel?" and "What are you thinking of?" At the exhibition now to be detailed, one other gentleman was present. The girl was, in about ten minutes, thrown into mesmeric sleep, or coma, from which she was brought by pattings and shakings into the state in which a con-

versation can be carried on, when there could be no doubt of her condition being peculiar, as the pupils of her eyes were expanded so as to occupy the whole space of the iris—a state in which, it may be remarked, there can be no vision.

"Wishing to witness the effect on the small convolutions of the knowing organs, I wrote down 'Form,' showed it to the other stranger, and handed it to Mr Brookes. He incidentally stated—as an answer to one objection, namely, that the mesmeriser's *willing* a particular manifestation, may, from what is known of mesmerism, produce it by mesmeric sympathy—that manifestations sometimes came out which he did not will, in consequence of a neighbouring organ being excited. This happened in the present mesmerisation of Form, for Size was put into activity. I placed myself so as to see, *with the strictest watchfulness*, all that Mr Brookes did, and to hear all that he said to his patient, or she answered to him. She sat, and he stood without in any way touching her. Mr Brookes's fingers were, for about a minute, held half an inch from Form, being very silently brought near. To the question, 'What are you thinking about?' she answered, 'I am in the Park; I see many people and pretty things. I see such a handsome face; but everything is big (Size excited). I am big myself; my hand is so large.' Here I wrote 'Weight,' feeling a peculiar interest to observe, from the manifestation, whether that much-disputed organ was rightly located and named. Mr Brookes's fingers shifted silently onwards over it, and almost instantly the patient of herself repeated, 'I am so big; and oh! so heavy.' She now showed considerable agitation and alarm, and seized hold of Mr B., saying, 'Oh, my weight will break the floor! I shall fall; I am falling!' The next organ, Colour, having been influenced without Mr B.'s intention, nosegays, or, as she called them, posies, appeared to her 'beautiful flowers, but so large and so heavy—oh, they will fall upon and crush me; they are so big and so heavy, they will hurt me; they are flying over me; a cat or a dog is flying over me, and will fall and hurt me!' Mr B. diminished the mesmeric influence by a rapid movement of his hand over the organs, as if brushing flies from the face; and Form, Size, Weight, and Colour, with Individuality, which seemed to have been mesmerised when Form and Size were approached, all at last acting together, became tranquil, and ceased to manifest themselves. As the patient had hitherto been in perfectly good humour, I wrote 'Destructiveness' for the next experiment. Mr B.'s fingers were for a minute or two held to the organ. A cross expression came over the patient's countenance. To the usual question, she answered, with considerable temper, 'Don't bother me; I could stamp my foot; I feel very angry,' showing at the same time the quick movements of anger, clenching the hands, &c. As a contrast, Benevolence was influenced, when the countenance relaxed into good humour and gentleness, and all the natural language of irritation was gone. 'How do you feel?' 'Very well; very happy; I would wish all to be happy.' Another contrast was suddenly tried in Self-Esteem; the change was striking. The expression assumed was proud and repulsive. To the question, 'What are you thinking of?' the answer was, 'Why do you speak to me? You insult me.' When asked how, she answered, 'Speaking to me insults me.' 'Explain yourself.' 'I won't explain; that would be making myself less than you. I am above you; I will not condescend to explain; it is not worth my while.' Naturally, the girl is remarkably humble and respectful to her master. Veneration was suddenly mesmerised, as if another note of the instrument had been struck—and she became silent, and no longer haughty in her expression and attitude. 'What are you thinking of?' was repeatedly asked before she answered, her manner being that of some absorbing meditation. At last she replied, 'I am thinking of another world.' 'Well,' said Mr B., 'no one is proud or conceited there.' 'No! God views us all alike. We should bow to him, but we don't.' Mr B., 'What made you fancy that you were above me? I suppose you think yourself as good as the queen?' Answer, 'The queen and the beggar are the same in the sight of God.' * * Tune was mesmerised as she was talking. For a considerable time no result followed; but at last the patient began to sing; we recognised one of Watt's hymns, with a hymn tune. The voice was musical and sweet, but subdued, as of one singing in sleep. She continued to sing much longer than we wished, and was with difficulty stopped. Alimentiveness was next called forth, and soon every feeling and thought was gone but this one. Mr Brookes afterwards told me that voracity had been a feature of the girl's insanity, and that, when excited, the organ always acted morbidly, and continued to act long after she waked. It did so on this occasion. It first showed itself by an angry inquiry—for its neighbour, Destructiveness, was roused by sympathy—'Why she did not get her dinner?' Mr B., 'Dinner! why, you have just had your breakfast.' 'I am very hungry—I have two stomachs.' Mr B., 'Will you have some potatoes?' 'Yes, yes! (earnestly) I could eat a whole peck, and more when that is done.' I suggested *beans and bacon*, which, without my knowledge, is, it seems, a very favourite food with Sarah. Instantly her demand for beans and bacon was vehement; other things were suggested, but nothing but beans and bacon was listened to." [On a subsequent occasion, when Alimentiveness was excited, the girl spontaneously called for beans and bacon, and, when awakened, so urgent did she continue to be for this dish, that Mr Brookes was obliged to procure it for her. "He resolved never to awaken beans and bacon again."] "This, the most troublesome organ yet tried, was for the time quieted by much waving over and blowing upon it. Imitation being then written down—Mr B., 'What are you thinking of?' Answer, 'My mother. If I were at home, she would give me beans and bacon—that tow would, mother' (imitating the provincial language of her mother). She then spoke like 'Tommy Addison' of her village, and next like the minister, when he preached. As she laughed when she did all this, we concluded that Wit or Laughter had been influenced at the same time with Imitation. Sarah was then awakened, looked bewildered, and then abashed; and said, when asked, that she had no recollection of anything that had passed during her mesmeric state."

Here, for the present, we leave this curious subject. To many, we are sensible, it must appear foolishness; but why to such persons should it not appear equally absurd to suppose that a small bit of opium will produce gorgeous dreams, or a supper of pork griskins the night-mare? The brain is undoubtedly the organ of the mind, and a most wonderful instrument it is. Its action appears to be connected with that subtle agent which takes the various names of galvanism, magnetism, &c., but is proved to be fundamentally one thing. Why, therefore, may it not be supposed liable to be operated upon in the way described? It is easy to meet such subjects with scepticism and scoffing; but a genuine lover of natural investigation, and one who is at the same time candid and honest, would be more likely to see in them traces of some important though unascertained natural laws, and disposed, for that reason, to give them the benefit of a careful inquiry.

GEIKIE'S ETCHINGS.

THE etchings of the late unfortunate Mr Geikie are at length issued in a complete form, along with the illustrative letter-press, and a biographical introduction by Sir Thomas Dick Lauder, Bart.* Geikie was a true child of genius, and to what height his industry would have carried him, if blessed with hearing and speaking, may be inferred from his wonderful efforts under the melancholy deprivation of these faculties. Geikie—we write more particularly for the information of southern readers—was a native of Edinburgh, his father being a respectable perfumer in that city, and he was born in Charles's Street (1795), in the midst of the suburban scene in which Sir Walter Scott spent the earliest years of his life. When nearly two years of age, a nervous fever destroyed his organs of hearing, and consequently he was doomed to the calamity of being ever afterwards deaf and dumb. Thrown thus very much on his own powers of amusement, a natural taste for drawing was eagerly practised. While yet a child, as his biographer informs us, his turn for this delightful recreation was manifested in "attempts to cut out in paper representations of the objects which came within his observation. He began also from his earliest youth to sketch figures with chalk on floors and walls, and from these attempts he gradually advanced to the employment of pencils and paper. Having once acquired the use of these implements, he made frequent sallies from the city into the outskirts, where, with the fullest enjoyment, he would fill his sketch-book with picturesque subjects of every description, animate as well as inanimate. Often has our informant accompanied him whilst on such rambles, and frequently has he stood beside the young artist, where, perched upon a wall, or some other elevated place out of reach of danger from wheeled vehicles, he would busy himself with his pencil in catching, with all that truth and accuracy so uniformly displayed by his sketches, those traits of feature and of character, with the union and combination of which his genius afterwards so luxuriantly recreated itself throughout his whole life. Observing that his bias was thus so unequivocally manifested, his father was desirous to give it every encouragement; and, accordingly, when Geikie was about the age of fourteen, he was sent to study under Mr Patrick Gibson, and in May of the year 1812, he was admitted into the drawing academy established by the Honourable the Commissioners of the Board of Trustees for the encouragement of Scottish Manufactures, a school which has been the nursery for so many artists who have done honour to Scotland, and through whose works the taste displayed in the industrial arts has been so much improved."

Being in time initiated in the mysteries of the pallet, Geikie became a painter by profession; but a radical deficiency as to colouring, and likewise as to taste, or more properly a want of any great perception of the truly elegant in art, and for which his physical disabilities sufficiently account, limited the scope of his pencil, and, following the bent of his broad humour, he addressed himself to the etching of pieces such as have now appeared. In thus following a line of art not unlike that pursued so successfully by Cruikshank, he was continually on the watch for characteristic subjects for his pencil. His main field was Edinburgh, and its environs; and there he was indefatigable in picking up all kinds of oddities. His execution was surprisingly rapid; "and, indeed," says his biographer, "so great was the facility and rapidity with which he used his crayon, that it was by no means an uncommon thing for him to catch the contour of odd figures, or of remarkable features, together with all the raciness of character which they exhibited, whilst he was walking by the side of the originals in the streets.

An anecdote regarding one individual, who makes a very conspicuous appearance among the characters to be found in his etchings, is worth relating, as an example of the difficulties he encountered, and the risks to which he was sometimes exposed in his attempts to gratify the ardent desire he had to collect the portraits of such people whom he saw in the street, whose figures, features, or general appearance, were of a description calculated to strike his humorous fancy. The man to whom we now allude, was a porter in the Grassmarket, somewhat pot-bellied, and with that projection and hang of the nether lip, and elevation of nose, that gives to the human countenance a certain air of vulgar importance. In this subject it seemed to say, 'though I'm a porter, I'm no fool.' Geikie had made various attempts to get sufficiently near this man to sketch his figure and physiognomy. Day after day he haunted his intended victim, without obtaining the least chance of him. At length, however, he thought he had caught a favourable opportunity. But he had hardly taken out his sketch-book from his pocket, and sharpened his pencil, when the porter perceiving him, and suspecting his intention, immediately moved away, and plunged into the crowded market. Like a young Highland sportsman, who wishes to get a shot at an old fox, who may have dodged into cover, Geikie, with his pencil and paper in hand, prowled about, now worming his way through the crowd after his prey, and now stealing around the outskirts of it, watching for a glimpse of him. The porter all this time was on his guard, and took especial care to keep behind some knot of farmers or corn-dealers, so as to defy the attempts of his young persecutor, until at last when the market began to thin, and his hopes of defeating the foul intention against him ebbed away with the lessening crowd, he lost all patience, and abused and threatened his tormentor with great fury both of words and of action. The first were of course lost upon the poor deaf lad, although there was no mistaking the meaning shake of the porter's mutton fist. But as this only threw his subject into a more tempting attitude, the artist's fervour for his art rendered him utterly regardless of consequences, and he proceeded to the exercise of his pencil with the utmost enthusiasm. This so enraged the porter, that, roaring like an infuriated bull, he rushed at him to give him immediate chastisement, and before Geikie had time to apply the point of the pencil to the paper, he was obliged to fly to save his bones from being beaten to mummy. Though well built for carrying weight, the porter was of a mould that rendered him anything but fit for racing; and as Geikie had by much the heels of him, he stopped every now and then as he fled, like a Parthian, up the Grassmarket, to have a shot behind him with his pencil at his pursuer, who was puffing, and blowing, and labouring after him. But this only the more excited the fury of the porter, and made him strain every nerve to catch him, so that not only could Geikie make no use of the drawing implements which he carried in his hand, but the porpus in pursuit of him so pressed upon him, that he in his turn was compelled to look out for some place into which he could escape for temporary shelter. Fortunately an open stair, common to the doors of all the various inhabitants who occupied its respective flats, most opportunely presented itself. Into this he rushed, and the porter conceiving that he had retreated into some of the dwellings it contained, halted in the street opposite to it, and putting his arms behind him, under the tails of his coat, he stood panting and heaving till he recovered his breath, with a full resolution of waiting till his enemy should venture forth from that which he believed might be merely a temporary place of concealment in the house of some acquaintance. Now was the time for Geikie, and he was not the man to lose it. Fortunately there was a window in the first flat of the common stair, through which he had a most perfect view of his subject, though its dirt-begrimmed panes of glass completely concealed his own figure from view. With a few touches of his powerful crayon, he very quickly made the man his own property. This was all very well, but how was he to escape from the porter, who still continued to stand doggedly, like a sentry on his post, surveying all the windows of the huge tenement long after Geikie would have most willingly seen him relieved from it. There was no alternative for the poor artist but to remain a prisoner in the common stair until the porter should give up his watch, and this he did not do for some hours, until his patience being at last exhausted, or some job occurring to his mind that called him away, he slowly and unwillingly retired, grumbling as he we went, cursing the object of his wrath, and vowing vengeance, and then, Geikie stealing forth from his hiding-place, hurried homewards as fast as he could run, and without once looking over his shoulder."

The career of this ingenious and amiable being was soon to be brought to a close. Failing to make known

* Edinburgh: J. Stewart. 1842.

an ailment which affected him till it was too late, he sunk under the disease, and died August 1, 1837, at the age of forty-one.

The series of this unfortunate artist's productions has extended to fifteen numbers, each containing several etchings along with characteristically written illustrations from the pens of various of our northern luminaries; and a more interesting work could not well be pointed out to the lovers of humour and patrons of artistic merit.

AN ENGLISHMAN'S TOUR AMONG SCOTCH FARMERS.

THE method of conducting agricultural operations in the Lothians, or counties of Haddington, Edinburgh, and Linlithgow, is allowed, we believe, to be the best in Scotland, and has long served as a model for the farmers of other districts. Whether the Lothian husbandry is superior to that of Norfolk and a few other highly improved quarters of England, we are unable to say, but it is gratifying to know that English agriculturists are beginning to visit the shores of the Frith of Forth, in order to acquaint themselves practically with the mode of farming there so successfully pursued. The latest account we have seen of an English farmer's tour of inspection, is one written by Mr Robert Hyde Greg, an intelligent agriculturist of Hertfordshire, and communicated by him in a letter to the editor of the Manchester Guardian. Both that Scotsmen may know what a stranger thinks of their proceedings, and that Englishmen may have an idea of how our farmers conduct their affairs, we beg to make the following extract from Mr Greg's letter:—

"It would be uninteresting to the general reader, were I even competent to do it, which I am not, to enter minutely into details; those capable of understanding them should visit the country; and whether they do so on a tour of profit or amusement, they will be most amply repaid.

The general conviction which remains upon my mind is this, that with a system equal to that of the Lothians, established throughout England, landlords might receive double rents, farmers be rich and prosperous, and the country be rendered for two generations independent of foreign supplies, notwithstanding an abolition of all protective duties. I am confident the agricultural produce of England, Wales, and the west of Scotland, might be doubled, and that of Lancashire and Cheshire be tripled, and this without any material addition to the agricultural population.

The Lothian farms consist each of from 200 to 500 Scotch acres, the Scotch acre being one-fourth larger than the English statute acre; and I shall limit my remarks to the current acre of the Lothians, not knowing whether it is, or is not, the common measure of Scotland. Some few farms are rather smaller, chiefly those a few miles from Edinburgh, upon which it is not necessary to keep stock for the purpose of manure, and some few are larger, where stock are fattened for market; but a farm of 300 to 500 acres is, by common consent, the utmost which one farmer is thought capable of managing himself, just as a concern of 500 looms is considered, in this country, enough for the personal superintendence of one man.

The farm-buildings are small, compact, and situated near the centre of the farm, and have always a steam-engine of six to eight horse-power for thrashing and other purposes. The corn is put up in stacks in a stack-yard, near the thrashing-machine; the stacks being of such a size as that one may furnish a day's work for the thrashing-machine. At the entrance of the farm-yard is the dwelling of the greeve, or bailiff; for every farmer keeps a bailiff, who superintends everything on the farm, and is cognisant of everything that goes in or out of the farm-buildings.

A fact which struck me much was, that the greeve received only *one shilling a-week* more than the ploughman. The explanation given me is equally remarkable, that every man on the farm has knowledge enough for the situation of greeve, but that every man has not the qualifications which fit him for the management of other men, or perhaps is not sufficiently trustworthy for so responsible a situation. That the requisite knowledge for conducting a farm of 500 acres may be had for 12s. a-week (the wages of a ploughman), and that 1s. extra will command the extra qualifications for a bailiff, speak eloquently what education has done for the peasantry of this part of Scotland. I found the greeves universally clever, acute, and sensible, and their minds open to what was passing in the world beyond the limits of their own farm or immediate neighbourhood.

The farmer's dwelling-house is generally a little in front of the farm-buildings, a neat, comfortable house, with kitchen and flower-garden attached.

The farmers themselves are men of much superior education, manners, and style of living to the possibly equally wealthy ones of the farming counties of England—even Lincolnshire and Norfolk—where the farms are of about equal extent with those of the Lothians. As a class, they would compare more with master manufacturers of Lancashire—so keen and pushing. Few of them are without a handsome phaeton for the use of the female members of their family; they are all of most hospitable habits; and I was informed that, excepting for a month at seed time, and the same at harvest, they have company at home or dine out at least three times a-week. One feature throughout the Lothian farms may be remarked —*a great uniformity in the quality of the crops.* Not as elsewhere, here a good farmer and there a bad one; here a failing crop, there a middling one; and here, again, a finer one; but nearly all the same, showing that farming is there reduced to a science, leaving nothing uncertain but the seasons, and which, affecting all nearly alike, do not materially affect the uniformity I speak of.

The present season has been remarkably favourable in the Lothians, as a whole, though somewhat too dry. The wheat would average about five quarters to the acre; and in the seventy or eighty acres on the same farm, it would sometimes be difficult to point out a square yard which carried more or fewer ears than the rest of the field. The farms are divided into fields of from twenty to fifty acres each; the hedges are clipt low and thin, and the ditches covered in, so as to occupy as little space as possible. There are no trees in the hedge-rows, and few furrows in the land, all being laid down flat; and thus, between one thing and another, the entire area of the farm is made productive, and the expense of fences and gates is reduced to a minimum.

Another thing worth noting is, that permanent grass, either as meadow or pasture, is unknown, or nearly so; the only hay, or pasture, is derived from artificial grass, sown in the regular rotation of crop, and which remains two years down, and is then ploughed up and followed by oats. The crops of artificial grass were extremely heavy. I counted in one field of sixteen acres no less than 234 sheep, from 150 to 200 of which had been on the land since the 1st of April. On another farm, a field of the same size had on it 20 cows; and in both, the feed, chiefly white clover, was abundant, and of the finest quality.

The rent of the Lothian farms is from L.3, 10s. to L.7 per acre; and these high rents the farmers not only pay, *but thrive upon;* indeed, a more thriving set of men I never met with. They are enabled to pay these rents, and thrive, partly *by the heavy crops arising from skilful cultivation*, and partly by *economy of management* in every department. Actual wages, however, are as high as in England, namely, 10s. to 11s. a-week for a common labourer, 12s. for a ploughman, and 9d. a-day for women—ten hours to the day. As to the great amount of produce, it must be remembered that *all the land is under the plough.* Five quarters of wheat are reckoned a good average, but some fields turn out *six* to the acre. Ten or eleven quarters of oats, eight to ten tons of potatoes, and twenty-six to thirty tons of turnips, are reckoned good fair crops. Economy of management is shown in many ways:—

1. In the position and quality of farm-buildings, in having no land lying idle or unproductive, and in the use of machines and horses, instead of manual labour, wherever circumstances admit of it.

2. By confining attention to as few points as possible. Thus, instead of buying stock to feed off the grass during the two years the land is seeded down, it is let off to stock-feeders or butchers, at generally about L.6 the acre per annum, and the farmer's attention and capital is thereby saved from distraction and division. They contract, in like manner, to supply turnips, or both stalls and turnips, &c., for the winter, at so much the ton for turnips, or at so much the head to the stock-feeder; and so the stock-feeder, in his turn, becomes limited to his own peculiar branch of business. The dairyman, in the same way, hires the fields in grass by the year, or for the summer, and contracts for his turnips during winter; thus attending to nothing but his cows, which, by-the-by, he scrupulously milks *three times a-day* for at least half the year. In a similar spirit, also, instead of getting up his potatoes himself, and *with a fork*, as is done with us, the Lothian farmer sells his crop of potatoes at L.14 to L.20 per acre, according to the crop and state of markets, *to a dealer.* The farmer then *turns up the potatoes with the plough;* the dealer appears with a hundred women and children, and sacks and scales; and the whole crop is transferred from the field to the market, or shipped for London, in one-tenth the time, and at one-tenth the expense, which would be required in England.

3. Economy in the use and keep of horses.—Such an abuse as *three horses to a plough*, except to the subsoil plough, is unknown. The universal complement for 100 acres I found to be two pair of horses, two ploughmen, and one labourer; the number of women and children varying with the particular crop, perhaps six or eight during the season.

In this small allowance of horses, it must be remembered that the whole 100 acres are arable, there being no permanent pasture. The winter-keep of the horses is a mixture of half-chopped straw, or chopped anything, and *half-steamed* turnips or potatoes; and this feed is found not only much cheaper than hay and oats, but the horses are kept in better condition, and enjoy better health. No horses could look in finer condition than they did, without exception.

All the Lothian farms are held on nineteen years' leases, and the rents wholly, or partly, corn rents, rising and falling with the yearly fluctuations of the price of corn. The tendency of the corn rent I conceive to be to throw fluctuations in the value of a farm—that arising from an alteration of corn-laws, for example—upon the landlord, instead of the tenant.

Without a long lease, the farmers would not lay out their capital in the free manner they now do; and with a long lease, they feel independent of their landlords, more as if they were the actual proprietors, and altogether hold themselves higher, and with good reason, than the most wealthy of our English farmers. In consequence of this independence, and part ownership, as it were, of their farms, men of much superior rank, education, and capital, engage in the business of farming, than is the case in England, or, indeed, *than ever will be the case in England*, under existing circumstances.

The foundation of all improvements in the Scotch farming is the system of *thorough draining;* and so essential is this considered, that most of the land is deemed unworthy of being farmed at all until it has undergone this operation. Thorough draining is a series of drains, of tiles or broken stones, made at regular distances, from fifteen to thirty feet or more apart, according to the nature of the soil, over the whole field. This may be called the new system of draining, as opposed to the old one of cutting a few deep drains where springs actually show themselves, and which mode of draining is now, I believe, entirely abandoned by the best farmers. For minute directions on this and other branches of the subject, I refer to the book of Professor Low on Scotch husbandry, which is considered the best authority. I will merely remark, that it is advisable, in every case, to lay the drains in the old furrows, not across them; and the drains themselves should be from sixteen to eighteen inches deep. When made with stones, the top of the drain may be brought nearer the surface than is safe with tiles, and also when the land is for permanent grass, than when intended for arable; but I believe the tops, even of stone drains on grass lands, should be at least twelve inches below the surface of the ground, and that tile drains, in arable land, should not approach the surface nearer than eighteen or twenty inches.

The sums spending at present in Scotland upon thorough draining are immense. It will be seen, in the following notes of the farms I visited, that one farmer had laid out L.1800 in thorough draining alone, during the two first years of his lease. I will now put down a few extracts from my notes of the farms I visited, and shall call them by different numbers, that the actual farms may not be recognised:—

No. 1. Meadow land in small holdings—where the common sewers of the town discharge—one or two miles from Edinburgh, the grass constantly cut and taken into town for cows and horses; rent L.15 per acre.

No. 2. At two miles from town, with ample supply of town manure; potatoes and turnips carried daily into Edinburgh for sale; rent L.7 per acre.

No 3. Farm 340 acres; old lease of ten years lately expired; old rent L.1700, or L.5 per acre. The farmer took off L.18,000 to L.20,000, and has just bought a handsome estate in the neighbourhood, which he is improving. This farm is re-let, on a new lease for ten years, at a rent of L.2000, or L.6 per acre.

No 4. 250 acres, at three miles from Edinburgh; rent L.1000 to L.1200. Thrashing machine, with dressers and finishers, on most approved principle, made by Carlow, of Lenny Port, Corstorphine, Edinburgh; cost L.85, exclusive of geering; steam-engine, six horses' power, complete, for L.120, of Edinburgh manufacture. Last year, the crop of wheat on this farm reached six quarters to the acre, and the whole was sold at 80s. per quarter. Contracts with blacksmith at L.3 per annum, for each pair of horses, including shoeing, geer, plough and cart repairs, but no renewal. Laid by last year L.700, besides living.

Nos. 5 and 6. In one hand, or at least under one management. Last year and this together, has spent L.1800 in draining alone; this done with broken stones, which seem generally preferred; is not only cheaper, but more durable than tiles. When tiles are used, always put *flats* or *pans* for them to rest on. Draining here varies from 18 to 60 feet between drains.

For seeding down 1 bushel of rye grass, 8 lb. red clover, 4 lb. white, 4 lb. yellow, or trefoil—all per acre. If intended to lie down three years, or indeed two, reverses the quantities of red and white clover. Lets his grass, and contracts for sale of his turnips with a dairyman.

No. 7. 500 acres; rent L.1750; seven miles from Edinburgh. Too far from town to benefit, like the other farms, and a stiffer quality of land; grows less potatoes and turnips, but very fine beans, and obliged to keep stock. General stock for fatting, three year old, Angus breed; but some cross of the Caithness cow and short-horn bull, quite fat at two years old. Best manure, half rape, half dung; only good when used with dung; buys whole cargoes of rape. The gentleman who farms this, and his two brothers, pay together L.4500 rent.

[Nos. 8 and 9 may be passed over as of less importance.]

No. 10. A farm, or, we should call it, an estate, of 600 acres, lately purchased for L.70,000, without a single attraction of any kind but to a farmer. The proprietor has just laid out about L.5000 pounds in a new steading, or farm buildings, compact and complete, containing stalls for twenty-five horses, eight horse steam-engine, and every possible convenience for carrying on so large a concern. It contains numerous pens for stock-feeders, the farm to supply them with turnips for winter and grass for summer; but it is not intended, I was given to understand, to meddle with stock themselves, without necessity, following out the plan of attending only to one branch of business.

The general course of cropping in the Lothians seems to be, wheat, after summer fallow, or not; turnips, or potatoes; barley; seeds, down for one, two, or three years, as circumstances vary; oats. When further from town manure, and land stiffer, a crop of beans and pease is taken. In the East Lothians we saw comparatively few potatoes, whilst in the West Lothians it appears to be the grand crop.

The best approximation I could come to, as to the division of the gross proceeds of a farm, gives—rent 33, expenses 47, and profit and interest 20 per cent.; total, 100 per cent.

I have thus endeavoured to give, in a somewhat unconnected way, the result of my observations on the Lothian farming, where high rents, high profits, and a well-paid and contented peasantry, are all seen combined in a pleasing union. There is as wide a difference between the system existing there, and in these parts of England, as between that pursued in the small detached spinning-mills of thirty years ago, and what is now practised in the first-rate factories.

It is an interesting question, but one I am not going to enter upon, how this improved system of cultivation can be introduced into England, particularly into our own and the neighbouring counties? Where are the landlords ready to grant a nineteen years' lease? Where the farmers of sufficient intelligence and capital to manage successfully 500 acres, and willing and able to lay out L.1000 to L.1800 in draining alone, during the two first years of their lease? Where the ploughmen educated enough to convert into bailiffs, on such farms, for an extra shilling a-week?

I am inclined to think the superior and more practical education of the Scotch has been at the bottom of the

improved state of things. Education has given the knowledge which has enabled them to apply their capital with success, and to extract from the landowner the long lease which enables them to invest their capital with safety, as well as success."

THE RECLUSE IN THE COUNTRY.

[A paper under the above title appeared in a deceased provincial periodical about twenty years ago. Lighting upon it by chance, we have been so much pleased with its placid old-gentlemanly tone and quaint pleasant semi-pastoral style, as to deem it worthy of being disinterred from its original situation. It is here presented in an abridged form.]

It has been my favoured fortune to spend the greater part of my life in the country. I succeeded in my youth, by the death of my uncle, to a small but beautiful estate, upon which, throughout life, I have with little intermission continued to reside. It is situated in the west of Scotland, in one of those intermediate ranges of country, possessing few of the uniform and less inviting features of an agricultural district, but delightfully diversified by those picturesque undulations of hill and plain, which mark the near approach to the more grand and majestic scenes of the Highlands. In its general features, it partakes much of a pastoral air; and when I wander, in a calm summer evening, amidst that singularly rich and varied scenery which it displays, either carelessly tracing the picturesque windings of one of its clear and swift streams, or reclined upon some wooded bank, beneath a dark and grateful shade, while I look out upon the windings of the water, which, far in the distance, streaks the richly-wooded valley with its silver gleam, while the sun is seen in splendour, slowly sinking behind the majestic mountains of the west—I say I feel disposed to doubt if any of your pastoral writers, in all their fablings of Tempe and Arcadia, have ever conceived a scene more rich and delightful to the eye, or more soothing and grateful to the heart.

The family mansion in which I reside is one of very old erection, to which, as the wants or caprice of its successive owners have led them, a variety of additions have been made. Its site is delightfully romantic and beautiful, upon the summit of a somewhat steep and rugged eminence; and I confess, when I see my old fabric with its numerous and variously-disposed turrets—its broad and massive winding-stair in front—its tall and irregular chimneys, which shoot aloft into the air—its venerable windows, looking out in every variety of size and antiquity of shape, while several majestic trees, vigorous and luxuriant in their age, tower above the whole, with their far out-spreading and over-arching branches, I often think my old mansion a more picturesquely beautiful object, and that it harmonises more fittingly and impressively with the scene, than many of our more elegant and fairly-proportioned fabrics.

Like all true lovers of the country, I delight in gardening. My garden is spread out upon the irregular and sloping bank in front of my house. It looks towards the south, and the entrance towards it is by an old arched gateway, overgrown with briar and honeysuckle, which salute you as you enter with the rich diffusion of their sweets. I have been anxious that my garden should, at the same time, partake somewhat of the nature of an orchard. My fruit-trees are not disposed in corresponding rows and succession, but fancifully thrown into groups, and occasionally mingled with some rich and graceful forest trees. At the foot of the bank runs a rapid and clear rivulet, which still flows copiously, even amid the heats of summer. Its margin is thickly wooded, and here and there I have introduced an apple or plum-tree, or several tall flowering shrubs, whose blossoms give additional beauty and animation to the more sober livery of the other forest-trees. When fatigued with my garden labours, I often retire from the noon-tide heat to the dark and grateful shade of this grove. There I hear the murmurs of the stream, hid by the luxuriant foliage around me, or through some remote opening seen stealing softly and swiftly along, like the report of a noble action, which its doer seeks not to reveal. Here, while the progress and varying appearance of every plant and tree interest me in a way which you cannot perhaps easily conceive, I derive health and recreation from those occupations which the changing seasons and nearly every month in the year present; and when the time advances for gathering in the produce of my orchard, while I shake my trees, and am pelted by a shower of my own Ledingtons or Pippins, and see my adventurous little boy perched high upon a branch, and stretching his hand to some apple desirable in his eye, and my daughters gathering the fruit as it drops, while my servants convey it in sacks and baskets to the garner, I feel some of those emotions of delicious and tranquil satisfaction which Rousseau, the most eloquent of moderns, has described in such glowing colours as experiencing himself when engaged in a similar occupation.

But the amusement in which, of all others, I take most delight, is that of angling, and especially that of fly-fishing, in which, you must know, I regard myself nearly as dexterous as old Isaac Walton, or his sporting friends, R. Roe, or "honest" Nat, who angled till he was ninety-five. The river is distant several miles, and can only be reached by threading the fields, and traversing a long range of wild heath. Having selected a day which promised to suit the sport, I set off, accompanied by my little boy, with the first dawn of the morning, while the dew lies heavy upon the grass, and the clouds yet hang in one dark unseparated mass in the heavens. By the time we have reached the extremity of the heath, the fleecy vapours are seen slowly rolling up the sides of the mountains; we hear the rushing of the stream, as we descend the rugged pass which leads to it; while the sun is seen slowly breaking through the clouds of the east, going forth in that march which animates and gladdens all nature. Having, as quickly as my impatience will allow me, fitted my rod, chosen a pair of flies—perhaps the "green-tail" or "yellow-watchit"—to suit the aspect of the day, and slipped on my wading-shoes, I give my line one or two careless throws, to free it from its folds, and make it fall sweetly and softly in the stream; and having folded back the sleeve of my coat from my wrist, I then put my best skill and dexterity into play. Were I here, sir, to describe to you the keen abiding pleasure I feel while thus engaged in this most peaceful and delightful of all sports, your readers, I fear, would either not understand me, or regard my expressions as hyperbolical. I am then seen, my basket swung beneath my left arm, slowly wading and descending the stream, and feeling, whilst the water beats against my limbs, a delicious and refreshing coolness. I am seen often crossing to opposite sides of the river, that I may more dexterously throw my line into the wished-for places; not, perhaps, into the stronger and more rapid parts of the stream, but into the dark whirls and eddies, occasioned by some projecting bank or stone, or into that side of a pool which is overspread by a deeper shade. I have often, in such a solitude, yielding to my excursive and wandering thoughts, delighted to figure to myself, in the olden time, the accomplished Sir Henry Wotton, the elegant Cotton, and the venerable Walton, the darling friend of those great and pious men whom he so impressively perpetuates, finding in this peaceful sport a healthful and refreshing relaxation from their laborious studies, or more harassing pursuits.

When I have amused myself sufficiently—by which time, like all very keen anglers, the sun is generally declining in the west—I unscrew my rod, and deposit my hooks and lines in my pocket-book till another day. I then draw off my wading shoes, slip on a pair of soft warm lamb-wool stockings, and having thrown my basket (filled with fine trouts, from which the tails of some of the largest may be seen protruding) across my shoulders, my son and I proceed slowly homewards. As we approach the termination of our journey, we are generally met by my wife and daughters, who have become impatient for our return, by whom I am always relieved of my rod and basket; while my wife, insisting I look tired, makes me take hold of her arm; and as we proceed homewards, my young traveller having shaken off his fatigue, is recounting with much animation and satisfaction to his sisters the wonders he has seen.

But there is another recreation more refined and elegant than either of these I have already detailed, and which, by its magic influence, has contributed to smooth and compose the troubles and anxieties of a long life. I allude to music, of which I am a passionate admirer, and in the practice of which, in my younger days, I used to be esteemed somewhat of an eminent proficient. This I have zealously and fondly encouraged among my children, as of all the arts perhaps the purest and most enchanting; as that which, while it vividly awakens, most richly and adequately satisfies the excursive longings of imagination, and which binds most closely and intimately in its willing bands the domestic circle. I speak here of music in its highest and truest acceptation; such as those who have best appreciated its astonishing capacities, and whose noblest and most felicitous exertions have increased the delightful range of its sway, have raised it to.

My eldest daughter plays the piano-forte with a clear and distinct articulation, and a rapidity of execution and steadiness of time which, with little study, carry her through, with considerable power, the most excellent productions of the most valuable of the ancient and modern composers. My second girl, after much friendly altercation and zealous persuasion, I must allow, with my wife, I have myself taught the violin, from which she now draws, I can assure you, a very rich and mellow tone, and displays a very graceful and flowing bow-hand.

Your female readers may perhaps smile here at the vulgarity of my taste. I can, however, assure such delicately sensitive readers, that this instrument was frequent in the fair hands of the ladies in my younger years; and I still recollect the animation and fascinating movements of elegance and grace which they displayed in the use of it, forming a singular contrast to that stiff unvarying formality of manner which is unfortunately inseparable from the seated position of our piano-forte performers. I may, however, ingenuously confess, that, in teaching my daughter the violin, I was perhaps unconsciously influenced by the recollection of having heard, in my earlier youth, a beautiful black-eyed girl, full of unconstrained and artless vivacity, play upon this instrument some airs and movements of Vivaldi, with an expression I have never forgotten; while her dark hair waved in rich and clustering ringlets on her bosom, and the motion of her white and delicately-formed arm displayed the most perfect beauty and gracefulness. When I look on my daughter, and listen to her while she plays, the memory of this delightful vision of my youth often tenderly and forcibly impresses me. The instrument upon which I perform is the violoncello; and, like an old Maestro di Capella, while I play the fundamental bass, I have a scientific and delightful pleasure in watching the march and progress of the changing harmony, the gradual development, and final rich embellishment of the subject, and that delicious concinnity and graceful proportion of parts, which is happily and wonderfully preserved amidst all the delicate intricacies of invention and skilfully adjusted contrivance.

In this way we are enabled to play, in concert, many of the best productions of Abel, Wagenseil, Bocherini; and among those more modern, Woelfe, Clementi, Haydn, and Mozart, and a whole host of others. When I meet among my collection of music some piece which strikes me as peculiarly excellent, but composed for other instruments, I often beguile the tedium of a winter day by remodelling its parts, to suit the more limited musical forces of our family circle. Or, while I stroll in my garden, or mend my tackle, or proceed slowly to the trouting-stream, I devise little airs and mottivos, which, under a fictitious name, often become favourites in some of the neighbouring families.

My literary pursuits are now more limited than they once were; and with respect to these, my taste, I fear, will appear to some of your readers nearly as antiquated as in music. As I do not read to become either an antiquary, a linguist, or a politician, and being free from the calls of peculiar and exclusive study, which a learned profession demands, my literary avocations, you may presume, are neither very deep nor very various. At an early period in life, I was, however, much devoted to an extensive range of literary study and pursuit, and my ardour and avidity carried me through the most esteemed productions in the European languages. Since then, however, this insatiate passion for excursive reading has gradually grown weaker within me; and, except the heroic romances of the Italians, the "Oberon" or "Idris" of Wieland, or some of his numerous novels, or the "Idylls" of Gesner, I now seldom, in reading, depart from the field of our own language. For I am now old enough to be convinced of the folly of exploring, with a never-tiring curiosity, the literary territory of other countries, for what, to him who can diligently seek, may be found in equal richness, beauty, and power, among the highly-gifted authors of our own land. I am fond, enthusiastically fond, of poetry; not indeed of that ostentatiously splendid and elevated kind which seeks to command admiration, but rather of that which affects and wins upon me irresistibly by its unobtrusive and touching simplicity; of that of which our early dramatists exhibit such impressive examples, and of which I find a mine which never satiates, in the smaller pieces of Greene, of Withers, and innumerable detached passages of Old Daniel and Michael Drayton. Of that poetry which more exclusively describes the fair and diversified scenes of nature, I have ever been a constant and devoted lover. I do not so much mean that which is solely descriptive, in which the author is the sole prolocutor, as that which assumes dramatic form, and in which nature, lovely and inviting in herself, acquires a more interesting locality, and additional beauty and animation from those personages who move and act amidst her varied and contrasted scenes.

In reading such pieces, I feel at once impressively that there is indeed a poetry which has its seat deeper in our nature, and touches, with a more irresistible hand, the chords of our affections, than much which in these times has sprung up amongst us. My daughters sometimes on this point gently attempt to shake my scepticism, by citing some passages from our living poets; but as they have never yet heard the empty and dogmatical lispings of any of your famed blue-stockings, I easily bring them back to a proper feeling of nature and poetry, by repeating some passage from Drayton or Spenser, striking, yet natural, and impressively simple in its conception; rich and copious, and significant in that stream of living language which pictures forth with vividness and power those scenes they so much love, and of which they so truly feel the awakening influence.

By such a course of delightful study, I guard (as it seems to me) against that coldness and aridity of mind so apt to steal upon age; and, aided by the nature of my amusements, communicate to my fancy somewhat of the buoyancy, and richness, and elasticity of youth. These great productions, in the delightfully vigorous tone they impart to the mind, may be likened to those rich and fragrant essences which communicate, without exhaustion, to whatever approaches them, a balmy and delicious odour; or to the soft and refreshing dews which ascend from a full and gentle river, and which, amidst the parching heats of summer, diffuse beauty and luxuriant bloom along its banks. But I now hasten to draw this long, and, I fear, tedious communication, to a close. You may perceive that I feel too impressively the grandeur of nature to be forgetful of that humble and devout homage which is due from all to its Great Author. I have carefully inculcated on my children sound and just religious principles, and have endeavoured to inspire them with an ardent piety, constant and abiding in the heart, humble, yet which, in its humility, does not seek to lower or trample upon the glorious capacities of our nature.

During the summer months, I am almost constantly in the open air, when the weather permits, to which I chiefly ascribe the equable and vigorous health I have throughout life enjoyed. I am seldom at a loss

for objects to occupy my attention; and as I am willing to find satisfaction in very humble occupations, I may be seen at one time, perhaps, leading my horse or my daughters' ponies to the pasture, or to drink at the stream; at another, sauntering carelessly along with a Dutch hoe in my hand, and perhaps rooting from my gravel-walks a thistle or bindweed, or giving to the bordering turf a sharper and a neater edge. At other times, I may be seen thrusting a bush into a broken fence, or angling for small trout to be used as pike baits on the morrow; or, it may be, that my bees have cast, and the whole household are assembled beneath some lofty elm or ash upon which they have settled; then I may be seen swelling the rude clanging chorus which is to lure them from their height. In short, if my occupations are innocent, I by no means allow myself to be staggered by their seeming vulgarity or insignificance; the pure and sparkling water which springs from an obscure fountain is still grateful and delicious to my taste.

Thus does my life steal softly away, like a stream whose smooth waters glide imperceptibly by; and the sports and avocations which delighted my youth still cheer and solace my age. Most of my friends have long since departed, some of them after tempestuous and disastrous struggles; yet the going down of my sun is glowing, yet peaceful and tranquil, and I perceive the shadows slowly deepening without emotion or disquiet. I shall yield up life amidst those dear and tender accompaniments for which thousands, in the abiding passion of their nature, have fondly languished and sighed in vain. I shall drop this mortal career where first I took it up—amidst those delicious scenes which knew my early infancy; I shall die in the very arms, so to speak, which nurtured me; and my last gentle struggles shall be hushed and composed by those who have spread a hallowed and serene joy around my sequestered life, and who—shall I speak the last fond wish of humanity?—shall long associate me with the wildly-beautiful scenes among which I now wander, and drop a tender and pious tear to my memory.

ABOUT PICTURES AND PAINTERS.

THE "Art-Union," a London monthly journal of the fine arts, to which we have not referred for some time, continues to be managed with the same activity as at the outset, and every number offers a pleasing variety of notices on subjects of taste. The paper, as may be supposed, is a zealous advocate for the encouragement of the home trade in picture-painting, in preference to importing indiscriminate supplies from continental countries. In the number for October, the editor presents us with the following statistics of the import system:—

"In the 'Art-Union' for July 1839, we published a statement of the number of pictures imported into Great Britain during the years from 1833 to 1838, both inclusive. They were received from Italy, Holland, Belgium, and Germany, and averaged about 8000 annually in number. We have now procured an account of the number of pictures imported into the United Kingdom, and the amount of duty paid thereon, during the four years ending 5th January 1842. It is as follows:—

	Number.	Duty.
Year ended 5th January 1839, ..	9,620 ..	L.3844
.. .. 1840, ..	11,641 ..	3299
.. .. 1841, ..	11,920 ..	3628
.. .. 1842, ..	13,108 ..	3681

It will thus be seen that the increase has been enormous: only think of 13,108 'veritable' Titians, Berghems, Rembrandts, &c. &c., being put into circulation throughout Great Britain within the past year, eight of which are probably of value, but 13,100 of which are, no doubt, miserable and trashy copies. It is really wonderful how and where these things are disposed of; and it is not a little humiliating to find the evil anything but diminishing. To these 13,108 'old masters' (for very few of them profess to be modern), we must add the number of *genuine* pictures manufactured in this country and sold to foolish buyers. We have heard a variety of illustrative anecdotes of the modes in which such works are produced; and some 'artists' have been named to us who ought to be ashamed of lending themselves to such base and scandalous impositions. This evil, under the existing law, has no remedy; but really the makers of forgeries should be known and exposed—the profession should cast them out utterly. To copy old pictures, knowing they are to be passed off as genuine, is bad, very bad; but to make copies of modern works for a like purpose, is infinitely worse. Yet every day this is done, and there is no sort of punishment either for the forger or the vender."

Nothing, as the editor appears to imagine, is so well calculated to encourage native painters, as the support of associations to purchase pictures by lot, but he, at the same time, is not blind to the practices now common among a certain class of painters, of charging sums for their works far beyond their fair value. This is a growing evil. On a late occasion, as we are told, L.3700 was subscribed to buy pictures at an exhibition in Dublin; and, says the editor, "Mr Blacker (the secretary) could easily point out pictures valued at L.50, for which no person in his senses would give L.5; and he knows, also, that in many cases the sums *asked* were not the sums *given*. Mr Blacker asserts that the exhibition was the best that has been opened in Dublin: our only answer need be, 'bad is the best.' The Art-Union (of Dublin) did—we say it without the fear of contradiction—purchase many wretched productions, because they were compelled to expend a large proportion of their funds in the gallery, and had previously bought all the pictures that were good."

If the evil of extravagant prices be growing, so is the cure. The import of pictures from the continent in the way of trade is likely ere long to affect the home market; but a more effectual check will be found in the gradual demission of members, who are already beginning to tire of venturing money on articles in very many instances double or triple the price they would bring at open sale, if they sold at all for anything, and thus improperly fostering a class of mediocre painters, whom the public can never have the means to support. Another way in which things will be brought to their level, is the growing encouragement of foreign associations, for which there are now regular agencies in this country. We consider this to be a pleasing trait of international union—a step in universal civilisation. The editor of the paper before us has some judicious remarks on this topic:—

"The project for drawing closer the connexion between the lovers of art in this country and in Germany, progresses more favourably than our most sanguine hopes could have anticipated. Already, a very large number of subscribers have entered their names on the lists of the societies of Dusseldorf, Berlin, and Dresden: those lists are rapidly augmenting. The experiment has been completely successful, and the result cannot be otherwise than satisfactory and serviceable to the artists and amateurs of the arts in Great Britain. First, it will increase the intimacy between the kingdoms, that must be pregnant with good to all; next, it will familiarise us with those higher qualities of art in which the Germans are universally admitted to excel, and which are perhaps best exhibited by their engravings; and next, it will inevitably lead to an acquaintance with the 'style' of the German school, by introducing collections of its best productions into England. The time is auspicious for the attempt; the British artist has been at length called upon by the nation to aim at loftier objects than those with which he has been hitherto generally content; our beneficial intercourse with Germany is becoming daily more frequent and useful; and we have learned to know and appreciate the vast sources of enjoyment and information they possess, with the most ready means of rendering them available. We have examined the prints that have been already issued by the several societies, and those that are in progress for the members of 1842. They are all of them of rare excellence and value; each is fully worth the amount of the subscription, setting aside the chances of prizes; there is not one that is not calculated to improve the taste and elevate the mind, for the selections have been made exclusively from pictures not only painted by the best artists, but painted with the grand and lofty purpose of conveying a high moral lesson by the arts. As we have said, great good must follow the introduction among us of the works of the master-minds of Germany; and sure we are, there are thousands in this country who only require a knowledge of the advantage within their reach to avail themselves of it."

"UNDER TRUSTEES."

TUNE.—*The Jolly Young Waterman.*

O HAVE you ne'er heard of a worthy Scotch gentleman,
Laird of that ilk, and the chief of his name,
Who not many years since, attaining majority,
Heir to some thousands of acres became?
He lived so well, and he spent so merrily,
The people all came to his house so readily,
And he made all things in it so much as you please,
And he made all things in it so much as you please,
That this gentleman soon was put under trustees.

O never till then had our worthy Scotch gentleman
Lived for a day as his taste did incline,
There never were wanting some plaguy good fellows
To rattle his pheasants and tipple his wine.
He kept a pack, which the county delighted in,
He gave charming balls, and the ladies invited in;
O he never knew what was a moment of ease,
O he never knew what was a moment of ease,
Till snug he had placed himself under trustees.

Being now in plain truth a Distressed Agriculturist,
No one expects him to play the great man;
He is sure of whatever he needs in this world,
For creditors wish him to live while he can.
Rents may fall, but that doesn't trouble him;
Banks may break, but that cannot hobble him;
At the cares of this sad life he coolly may sneeze,
At the cares of this sad life he coolly may sneeze,
Who only will put himself under trustees!

Subscriptions come round for election-committees,
New churches, infirmaries, soup for the poor,
Our worthy Scotch gentleman gives his best wishes,
But of course the collectors ne'er darken his door.
He never is called to look a paper in,
To get up a cup to huntsman or whipper-in;
O who would be *fashing* with matters like these,
O who would be *fashing* with matters like these,
A gentleman known to be under trustees?

When any good neighbour, hard up for the wherewithal,
Looks for some friend who is likely to lend,
Our worthy Scotch gentleman never need care at all—
He's not the man who the matter can mend.
In short, all others have something crossing them,
On beds of trouble are always tossing them;
But only the Income-Tax truly can tease,
But only the Income-Tax truly can tease,
A gentleman snugly put under trustees.

July 1842. R. C.

CLEANSING THE SKIN.

In order to enjoy good health, it is as necessary to cleanse the skin of every part of the body as the hands and face. If you once begin to make a rule to wash the whole body at least once a-week, either by bathing or otherwise, in cold water, the vigour and hilarity of feeling you will experience will amply repay you for the labour. Try it a few weeks—it will cost next to nothing.—*Newspaper paragraph.*

QUICK POSTAGE!

THE ridiculous manner in which the postage of letters is conducted is daily becoming more manifest. Take the following:—On a late occasion, we arrived at a seaport on the west coast of Scotland at 5 o'clock in the evening, and, desirous of letting friends in Edinburgh know of our arrival, we asked when the post would leave the town in that direction. "Not till to-morrow forenoon," was the answer. "When would a letter reach Edinburgh?" we asked. "Your letter would reach Glasgow in about two hours after posting; it would lie in the post-office there till half-past 9 at night; it would arrive in Edinburgh at 2 or 3 in the morning; and it would be delivered at 8 in the morning." "Is there any other means of forwarding a letter?" I inquired. "Oh, yes, there are plenty railway trains; you can send it by one of them." I followed the hint; made up a small parcel with an old newspaper, and thus despatched my letter on its travels. The packet reached Edinburgh next day at 2 o'clock afternoon, or 18 hours earlier than it would have been delivered if it had been intrusted to the post. Cases of this kind are universal. From being the quickest, the post has become in very many instances the slowest organ of transmission. But this intolerable grievance cannot last. The post-office authorities must either make an effort to increase the number of transmissions between large seats of population favoured by railways, or the monopoly of the post be abandoned to private enterprise.

We again express a hope that the newspaper press will agitate this important question.

A PLEASANT STORY.

SCOTLAND furnishes many instances of persons, by care and attention, rising from comparative obscurity to stations of high rank and consideration. The following interesting narrative details one of these instances of successful merit, and is calculated to promote good conduct in all:—

When Mr Grigor Grant first entered the excise, he was stationed in Grantown of Strathspey. He, being then unmarried, took private lodgings for himself, and engaged a young boy, named John Grant, in order to attend him in the capacity of servant. Mr Grant got very fond of young John, and used him more like a child of his own than a servant. Mr Grant being derived from a respectable family, got a liberal education; and being of an affable and kind disposition, he began to teach his favourite the first branches of education. The boy having a quick capacity to learn, soon became a tolerably good scholar. He one day informed his benefactor that he never expected to get such a kind and indulgent master; but having arrived near the years of maturity (being at the time seventeen years of age), said that he was anxious to go to Edinburgh, and that if he got a situation there, good and well, but if not, that he intended to enter his majesty's service. At parting, Mr Grant acted towards the lad in a liberal manner. Upon his arrival in Edinburgh, he implemented what he intended, as he enlisted in an English regiment. A short time thereafter, the German war commenced, when the said regiment was ordered to the seat of war. John Grant being an active young soldier, and well disciplined, was the first of his regiment, while the British were engaged in the taking of a garrison, to mount one of the scaling-ladders. In consequence of his being so valiant and active, his colonel appointed him sergeant; and having conducted himself so well in the discharge of his duty, his good conduct afterwards procured for him promotion to the rank of ensign. Mr Grant, about sixteen years thereafter, had occasion to go to Aberdeen, where there happened to be an English regiment stationed at the time; and as the duties of his situation at Strathspey, &c., had not led him to see a military band, he was anxious to see a regiment at drill, and he therefore attended for that purpose, along with a good many other spectators. When the regiment formed line, the colonel took his post, and looking at the great number of spectators, he stepped forward with his sword in his hand, and tipping Mr Grant on the shoulder, and beckoning him aside from the crowd, asked if he was not Mr Grant, officer of excise? He replied that he was the very person. The colonel then asked him if he knew who he was? Mr Grant said that he did not. The colonel then said he was happy to inform him that he was John Grant, his old servant, but now colonel of the regiment before them; and that if he had not been kind to him when in his service, he would not have made so free with him. After mutual interchanges of affection and esteem, the colonel invited Mr Grant to dine at mess in the evening with him and the other officers of the regiment. "Roast Beef" shortly afterwards having beat, a good many of the officers entered the mess-room and took their seats; but Mr Grant waited the arrival of the colonel, who took hold of him by the arm and led him into the mess-room, the whole of the officers standing at the time, when the colonel took the chair, placing his old preceptor on his right hand. Mr Grant used to state that it was one of the happiest days he ever enjoyed. But all rank and honour are uncertain; Colonel Grant and his regiment were ordered soon after to foreign service, when, alas! in a short time thereafter he was killed fighting for his king and country, to the great sorrow of his early benefactor, and the loss of his highly honoured country.—*Elgin Courant.*

LONDON: Published, with permission of the proprietors, by W. S. ORR, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

Complete sets of the Journal are always to be had from the publishers or their agents; also, any odd numbers to complete sets. Persons requiring their volumes bound along with title-pages and contents, have only to give them into the hands of any bookseller, with orders to that effect.

NUMBER 563. SATURDAY, NOVEMBER 12, 1842. PRICE 1½d

BOOK-STALLS.

BOOK-STALLS were the cheap literature of a former age. Their business was with a humble kind of new publications, and the worn-out of the old. Ben Jonson—who was probably a haunter of them, since it is told of him that, when a working bricklayer, he used to be seen with a trowel in one hand and a book in the other—says, in his Underwoods—

> "It is a rhyming age, and verses swarme
> At every *stall*."

Ballads and other poems, in single sheets, or half-sheets, together with a great variety of homely prose productions of similar form, were then hung up at stalls to attract the attention of passers by; and many compositions thus introduced to the world have been gathered by our literary antiquaries, our Percies, Evanses, and Ritsons, and transfused into grave-looking volumes for the admiration of learned and polite readers. Time out of mind, these humble marts of literature have been the resort of the curious youth, the struggling scholar, and the pains-taking book-collector. Lackington, who, from a poor shoemaker, rose to be a wealthy bookseller, tells in his whimsical memoirs of the following adventure:—While residing in a suburb of London, he had been sent by his wife with a few shillings which formed their all, to buy a leg of mutton for the next day's dinner. On his way to the butcher's shop, some book, presenting very attractive food for the mind, caught his attention at a book-stall, and so won his admiration, that, before he could reason on the contrary charms of the mutton, he had made a purchase of it. Reaching home, he encountered his wife's disappointment with the assurance that, if he had bought the mutton it must soon have vanished, while here was a book which would for many a day cheer their winter evenings. Charles Lamb tells a somewhat similar story of his purchase of a folio Beaumont and Fletcher at a book-stall. He had marked it longingly, but was delayed by want of funds. While these were gathering, he almost daily passed the place to see if the book was still there, fearful lest it should be gone. At length, late one Saturday night, having mustered the sum wanted—thirteen shillings—off he set to the shop, never dreaming that it had any chance of being shut. Finding the shutters closed, and the man gone to bed, he was not to be baulked of his prey, but presently commenced a rattling at the door sufficient to have wakened the seven sleepers. The bookseller came in the greatest alarm half-dressed, and grumblingly took thirteen white shillings in exchange for the twin dramatists, whom Charles immediately carried home in the highest rapture.

Stall-readers—a class of porers who don't buy—are as old as the days of Milton, who alludes to them, and probably much older. To poor lovers of learning, young and old, the book-stall was—to use a just phrase of the Quarterly Review—as a table spread in the wilderness. He who pens these lines never can forget his delighted surprise, on coming, during his book-devouring boyhood, to live in a large city, when he found that there were tablefuls of volumes laid out in the streets, which he—a boy—without one coin in his pocket—might go and peruse whenever and for as long as he chose. Nor is he anxious to conceal that, when pursuing classical studies with rather an imperfect store of materials, he has several times in a day gone to one of these really public libraries to consult an English-Latin dictionary necessary for some voluntary tasks in the way of Latin versifying. It is recorded of Miss Benger, authoress of the "Life of Mary Queen of Scots," and many other meritorious productions, that in early life, when resident in Wiltshire, being very poor, and at the same time athirst for reading, she used to peruse the open pages of books in the windows of a book-shop, which she visited daily in the hope of finding another page turned over. Probably not a few of those who shine in the world of letters could tell a similar tale. And, doubtless, even in these days of cheap literature, there are many thoughtful self-educating youths who are more or less indebted every day of their lives to the bits of broken intellectual meat, which they snatch with a fearful joy, and with what they think a sufficient respect for the eighth commandment, at the tables of the old bookseller. When we think of this, a beautiful remark of a recent writer is recalled to us—"The love of knowledge," he says, "is in itself the attainment of knowledge. Poverty or toil discourages it in vain. It supplies the scarcity of time by the concentration of attention, and replaces comfort by self-denial."

An early habit of frequenting book-stalls is never quite overcome, even after one has long become a purchaser in higher fields of literature. Leigh Hunt pleasantly confesses to this weakness, if such it be—"We still find ourselves halting," says he, "at the humblest book-stall, as we used to do when fresh from school. In vain have we got cold feet at it, shivering, wind-beaten sides, and black-fingered gloves. The dusty old siren still delays us, charming with immortal beauty inside her homely attire, and singing songs of old poets. We still find ourselves diving into the sixpenny or threepenny box in spite of eternal disappointment, and running over whole windows of books, which we saw but three days before, for the twentieth time, and of which we could repeat by heart a good third of the titles. Nothing disconcerts us but absolute dirt, or an ill-tempered looking woman. What delights us is to see a plentiful sprinkle of old poetry, little Elzevir classics, Ariostos full of loving comment, and a woman getting gradually better and better dressed, her afternoon ribbons matching with her pleasant face, and a chubby urchin in her arms."

We have ourselves precisely the same habits. Nothing delights us more than to overhaul the fourpenny box, reading a chapter gratuitously in this book and a chapter in that, and anon slyly glancing over the shoulders of the poor scholars at our elbow to see what class of books most interest them. Occasionally, when we have opened some very attractive old book, we have stood reading for hours at the stall, lost in a brown study and worldly forgetfulness, and should probably have read on to the end of the last chapter, had not the vender of published wisdom offered, in a satirically polite way, to bring us out a chair. "Take a chair, sir; you must be tired." We protest, however, that we never study thus gratuitously except through sheer thoughtlessness about buying—a perfect inadvertence to the business of trade and profit. On some pressing occasions, to be sure, we have gone instinctively to the book-stall to settle, perhaps, a question in geography, orthography, or etymology, or to endeavour to recover the lost line of a song by a free consultation with the books so conveniently reposing there. We often have to lament that these repositories are hardly ever furnished with the Court Guide and Street Directory, two very handy books of reference.

It affords us much pleasure to watch from day to day the growth and development of the little old book-stall, till it has gradually attained the dimensions and honourable title of a book-*shop*—a very warehouse, stored so full of books that no Dominie Sampson can behold their numbers without exclaiming, "Prodigious!" When the book-stall has reached this large growth, the threepenny box, the old tea-boards, and the knife-boards, which did duty as book-shelves, all vanish mysteriously, and Jack Shepherd and Dick Turpin are no longer seen hanging by cords over the doorway. The tarnished and broken bindings have been repaired, there is less paste and fewer labels visible, and the printed catalogues are given gratis to every book-ish-looking person that approaches within two yards of the counter, which is now no longer a plain window-shutter covered with green baize, but a spruce genuine *bona fide* counter of solid deal, ingeniously painted so as to resemble the finest mahogany. The catalogues soon prove more attractive than the blotted manuscript list of books which Dick, the four shillings a-week assistant, used to write out in the less flourishing days of the book-stall. We have known some few unpretending book-stalls to sport catalogues, but these rarely exceeded two or three pages, and (by way of launching for once an unnecessary remark) in no instance ever attained a size equal to that published last year by Mr H. G. Bohn, which consisted of two thousand one hundred pages, was five inches thick, and contained the titles of above three hundred thousand volumes. It has been said, that a bookseller is nothing without his catalogue. It is his individual being; it is that which distinguishes him from others of his fraternity; it is therein that his taste and learning are displayed; it is therein that he writes down "his fancies chaste and noble;" it is his literary confession of faith, and he will be honoured accordingly. The publication of his catalogue is a great event in his life; he then plays the Mæcenas, the patron not indeed of living, but of dead men; he opens to us a new world of pleasant thoughts, and introduces to us choice spirits of departed ages, who have been "to dumb forgetfulness a prey"—and he knows it—he feels that he does so. Young aspirants after knowledge are apt to envy the bookseller, and not unfrequently are heard to declare that, if they were he, they would read from morning till night. They never reflect that the books are not the bookseller's library, but simply the wares of his trade, and which he seldom cares about further than as to what sums of money they will fetch in the market. Like pastry-cooks, booksellers rarely taste their own goods. We have known it happen, that the poor lads engaged to mind the bookseller's stall would, when tired with too much watching, and soured by slackness of trade, take up a book to pass away the monotonous hour, but the boy's master would inveigh against this as a treasonable dereliction of duty, and give him distinctly to understand, that he was never to read beyond the title-page; and that, if ever caught writing sonnets instead of labels, woe betide him and his four shillings a-week.

The grand recommendation of the book-stall is the cheapness of the goods. It must, indeed, be a very dashing book-stall that dares to require more than half-a-guinea for any book, however valuable. Hence, by little and little, threepence to-day and threepence to-morrow, a poor scholar may pick up at these places some excellent old books; so that by the end of the year he shall see with pleasure a nice comfortable library in one corner of his room, the whole the result of a judicious and praiseworthy mode of expending the little sum he could spare out of his small means. Even when he has read all his little library through, and may be unable to add more to its contents, he may console himself with the words of John Kenyon—

> "Oh! sweet 'twill be, or hope would so believe,
> When close round life its fading tints of eve,
> To turn again our earlier volumes o'er,
> And love them then, because we've loved before

And inly bless the waning hour that brings
A will to lean once more on simple things.
If this be weakness, welcome life's decline;
If this be second childhood, be it mine."

It is to be remarked, however, that when a desirable book is lighted upon at a book-stall, its purchase ought never to be delayed, not even for a single minute. Mutton and beef may be bought any day while sheep and oxen continue; but the old book may be scarce, and hundreds of professed book-collectors are continually prowling about, ready to pounce upon and bear off every rare old book they can find, whether in the fourpenny box or on the half-crown shelf. They will almost seize it out of your hand, and it is in vain that you offer them a shilling more for the coveted article —your offer only makes them hug the prize all the closer. If you would secure the book that takes your fancy, you must imitate the example of Tristram Shandy's father, when he saw at the book-stall the rare work by Bruscambille, entitled, *Pensées Facecieuses et les Bon Mots*. "'There are not three Bruscambilles in Christendom,' said the stall-man, 'except what are chained up in the libraries of the curious.' My father *flung down the money as quick as lightning*, took Bruscambille into his bosom, hied home from Piccadilly to Coleman Street with it as he would have hied home with a treasure, and never once took his hand off Bruscambille all the way."

Oldbuck, it must be confessed, took a different plan. "These little Elzevirs," said he to Lovel, "are the memoranda and trophies of many a walk by night and morning through the Cowgate, the Canongate, the Bow, St Mary's Wynd—wherever, in fine, there were to be found brokers and trokers, those miscellaneous dealers in things rare and curious. How often have I stood haggling upon a halfpenny, lest, by a too ready acquiescence in the dealer's first price, he should be led to suspect the value I set upon the article!—how have I trembled, lest some passing stranger should chop in between me and the prize, and regarded each poor student of divinity that stopped to turn over the books at the stall, as a rival amateur, or prowling bookseller in disguise!" This caution, we humbly opine, was needless, and must be set down to the penurious character of the laird of Monkbarns. We much more admire the practice of his hero of book-collectors, "thrice happy Snuffy Davy," who, he says, "had the scent of a sleuth-hound, and the *snap of a bull-dog*." The remainder of the antiquary's speech is, however, what every book-hunter must sympathise in—"And then, Mr Lovel, the sly satisfaction with which one pays the consideration and pockets the article, affecting a cold indifference, while the hand is trembling with pleasure! Then to dazzle the eyes of our wealthier and emulous rivals by showing them such a treasure as this—(displaying a little black-smoked book about the size of a primer)—to enjoy their surprise and envy, shrouding, meanwhile, under a veil of mysterious consciousness, our own superior knowledge and dexterity—these, my young friend, these are the white moments of life that repay the toils, the pains, and sedulous attention, which our profession, above all others, so peculiarly demands!"

The good fortune of Snuffy Davy, who secured at a book-stall for twopence a copy of Caxton's Boke of Chess, for which royalty itself ultimately gave a hundred and seventy pounds, is perhaps a remarkable case; but it is of a class of incidents by no means rare. A person conversant with the rarity and pecuniary value of books, may often make lucky purchases at the book-stalls. When the library of Mr Bindley, chairman of the Board of Stamps, was brought to the hammer, several rare books, which he had picked up at the stalls for a few shillings, were sold for more than the same number of pounds. Thus, Herbert's "Dick and Robin, with songs and other old tracts (1641)," which cost him only two shillings, was bought by Mr Heber for ten pounds; a volume, containing Patrick Hannay's "Nightingale, and other poems, with portraits of the author, and of Anne of Denmark, by Crispin de Pass (1622)," bought by Mr Bindley for six shillings, was sold for thirty-five pounds fourteen shillings. Five of Robert Greene's productions, which altogether cost Mr Bindley only seven shillings and ninepence, were sold for forty-one pounds fourteen shillings. A friend informs us that he has frequently made excellent bargains at the book-stalls, and after reading them through, resold them at a good profit to first-rate booksellers and collectors. One of the most remarkable of these purchases was a copy, in its perfectly original state, stitched and unbound, of George Chapman's rare comedy, entitled "Monsieur d'Olive," and published in London in 1606. When read through and done with, it was disposed of to an eminent bookseller in Piccadilly for sixty times the sum it had cost its last possessor; and, from the remarkable state it was in, there can be little doubt that it would have obtained two hundred times its stall price of threepence had it been sent to a first-class book auction. At the sale of the library of Isaac Reed, the Shakspearian commentator, a copy of this comedy sold for thirty-six shillings; and Mr Thorpe has known it sell for sixty shillings.

Though the very old books are the *game* most followed by the professed stall-hunter, anxious to rescue rarities from perdition, the second-hand modern books are the chief attraction of the multitude who tarry about the stall. For ourselves, we declare with Prior—

"Some folks in ancient books delight,
Though most prefer what moderns write;
But we should be extremely loath
Not to be found expert in both."

While many works are peculiar to this or that book-stall, it is noticeable that some hundred similar works are common to all book-stalls. A vast number of odd volumes are also sure to be met with at these places; and we have known more than one person who has obtained his living by going about the town in search of odd volumes to complete imperfect sets of valuable works. Volumes that have strayed away from their brethren always sell very cheap; and he who wants a good and long-lasting treat of nice quiet reading, at the lowest terms, cannot do better than purchase, for the *nonce*, a bulky odd volume of some old-fashioned periodical, such as the Gentleman's Magazine, the European Magazine, the Macaroni Magazine, or of the one which was quaintly entitled the Magazine of Magazines. One of these, of fifty years old or thereabout, carries us pleasantly back to the youthful days of our fathers, and gives us a glimpse of the world as they saw it. In the life of William Hutton, we read that the first books he ever purchased were three volumes of the Gentleman's Magazine.

Deeply as we feel interested in the instruction of the people, by means of new publications written according to the intellectual wants, the moral tone, and social feeling of the day, we cannot but wish well to the old book-stalls that so effectually adapt themselves to the pockets of the people. The celebrated Boerhaave used to take off his hat whenever he approached an elder-tree, in reverence to its medicinal virtues; we feel inclined to imitate him whenever we approach an old book-stall, sanctified by the presence of the glorious works of Milton, Shakspeare, Bunyan, Burton, Newton, Franklin, and of many other men whose minds are left among us, though their bodies are dead and gone

SKETCHES IN NATURAL HISTORY.

ANIMALS CHARACTERISTIC OF THE DIFFERENT QUARTERS OF THE GLOBE.

When we think of the multitude of living creatures scattered over the earth, we are apt, in the first instance, to come to the conclusion, that they are distributed promiscuously and at random, or, at most, that they are influenced only by the degree of temperature, and the natural productions depending on that temperature, as being more or less fitted to afford a supply of suitable food. But further reflection immediately shows us that such an opinion is altogether untenable. We perceive animals, and groups of animals, confined to particular localities, from which they never wander, although numerous other places might, to all appearance, afford them precisely the same physical conditions under which they exist. Examples of this nature so constantly force themselves on our attention, that we soon find it impossible to escape the conviction, that the geographical distribution of animals must have been regulated by certain laws, and made to depend on certain conditions, of which, in most cases, it is impossible for us to form any adequate conception.

The most influential agent effecting this distribution, and the one whose operation we can best understand, is that already alluded to, namely, temperature. Where this attains its maximum, animals occur in the greatest profusion, and of the largest size; and from thence, through the sub-tropical, temperate, and colder zones, they undergo a progressive degradation, both in regard to numbers and dimensions, till they approach the regions in the vicinity of the poles, where life ceases to exist. A certain degree of heat, and the conditions of various kinds which accompany it, are necessary to the well-being of certain animals, and these animals, as might be expected, only occur where these are to be found. We thus, in a general way, find the proximate cause of animals of a particular organisation and constitution being distributed in different latitudes, never exchanging their relative position, nor in any remarkable degree becoming intermingled with each other. But no such explanation will, in general, apply to their distribution along a given zone of longitude. In different parts of such a zone, and in circumstances to all appearance similar, we find groups of different animals having the limits of their range eastward and westward, as distinctly defined as it is to the north and south. We can readily perceive why this should be the case, when particular localities, from their special nature, character of the surface, productions, &c., are only adapted to the maintenance of animals of a particular kind; in such instances, in order to exist at all, or at least with comfort, animals must be local. The subterranean lakes of Carniola, for example, present a very peculiar locality, and it is not surprising that their remarkable inhabitant, the Proteus, should be confined to them. The vegetation of saline marshes is fitted for the support only of particular tribes; such is likewise the case with certain volcanic countries; and it is easy to imagine many other circumstances which necessarily prescribe definite limits to numerous kinds of animals. But others are found to be very local where no such causes can be supposed to operate; while not a few, on the other hand, are so widely extended, that they may almost be said to make the circuit of the globe. The occurrence of high mountain ranges, of seas, lakes, and rivers, of sandy deserts, marshes, &c., has necessarily great influence on the distribution of animals; but even when due allowance has been made for the modifying agency of all these great physical features of the globe, much will still remain for which we shall in vain endeavour to find an explanation.

It is not to be expected that we shall ever be able to solve the question which has sometimes exercised the ingenuity of naturalists, whether animals were originally dispersed over the earth from a single point, or from numerous and widely-distant centres of creation; the last supposition seems best to accord with actual appearances. But without any reference to the causes of their distribution, or the modes in which it has been effected, it is a matter of great interest to observe the facts as they are now presented to us, to notice what localities are occupied by particular species, and what diversities in this respect prevail in different countries. An extensive and accurate record of facts of this nature would afford materials wherewith to construct a zoological map of the earth's surface. Every extensive tract is found to be characterised by the prevalence of particular animal forms; and these, considered collectively, constitute its zoological aspect or character. It is not, of course, to be expected that zoological regions should in general correspond to the artificial divisions into which the earth's surface has been partitioned; but it at times happens that the physical features which have determined the one determine also the other, and thus they occasionally become coincident, or nearly so. But however this may be, taking the great divisions of the globe as they are at present established, we shall find that each possesses numerous animals peculiar to itself; in other words, that it has a zoological character distinct from all the rest. This we shall now endeavour to point out as briefly as possible, taking the great divisions in question in the following order: Africa, Asia, Europe, North and South America; to which may be added what has been called (by a kind of Hibernicism) the *fifth quarter* of the globe, New Holland. The great islands of the Indian Archipelago and Madagascar are likewise of sufficient importance, in the light we are now to consider them, to require respectively a brief notice.

Of all the great divisions of the globe, Africa is among the best characterised by its animal productions. This we might in some measure expect beforehand, from the peculiar nature of the country in many other respects. Owing to its great width, and the almost unbroken regularity of its sea-coast, the influence of the surrounding ocean is comparatively little felt. It is pervaded by very few large rivers, and almost, as a necessary consequence, there is an equal paucity of inland lakes; while the mountain ranges are comparatively few, and seldom of sufficient elevation to disturb the prevailing character of the climate. From this there result a degree of dryness in the atmosphere, and a boundless extent of waste and torrid sand, of which we find no similar examples elsewhere. In many parts of this continent it can never be said to rain, and the only refreshment which the thirsty earth receives is from the dews of heaven. This excessive dryness constitutes the most marked peculiarity of the climate of Africa, and it necessarily exercises a notable influence on its natural productions, whether vegetable or animal. But in a continent of such vast extent, great diversity of climate, surface, and vegetation, cannot fail to occur; and while, on the one hand, we find far extending tracts, incapable of affording sustenance from their parched and burning surface to other forms of animal life than scorpions, lizards, serpents, and other cold-blooded reptiles, almost capable, as has been fabled of their associate the salamander, of enduring the heat of a fire; there occur, on the other, luxuriant oases, so grateful to the eye, as contrasted with the surrounding sterility, that it is scarcely to be wondered at that the ancients regarded them as the site of the garden of the Hesperides—extensive forests, umbrageous and well-watered valleys, affording fit haunts for the elephant, buffalo, and rhinoceros.

By far the most remarkable of African animals, and in some respects the most remarkable in existence, are the giraffe, hippopotamus, and ostrich. The two former are altogether peculiar to this continent, and the last may almost be said to be so, the only other place where it occurs being the adjoining deserts of Arabia. Although arranged in our zoological systems near the deer and antelopes, the giraffe has but little affinity to either, standing out conspicuously and alone as one of the most extraordinary animals in existence. Although gradually retiring before the advance of colonization, there is reason to believe that it is by no means rare in the interior, troops of thirty or forty being occasionally met with by the adventurous sportsmen who approach its haunts. Some recent naturalists are disposed to believe in the existence of two species, one in the north, the other in the more southern regions of Africa; but there seems little to countenance this notion. The huge and unwieldy hippopotamus, which has no counterpart in any other quarter of the globe, frequents the rivers of the central and southern parts of the continent. The ostrich is pretty generally distributed over Africa, whence, no doubt, straggling individuals have found their way into Arabia.

Although elephants, rhinoceroses, buffaloes, and crocodiles, are common to Africa with other quarters of the globe, it must be understood that the African animals are specifically distinct from all others; that is, they differ from those of other countries, nearly in the same degree as the horse does from the ass; they

are, therefore, perfectly distinctive of this continent as *species*. The elephant is much less docile than that of Asia, being scarcely ever subjugated so as to become a beast of draught or burden, and it is readily known by its inferior size, and the enormous dimensions of its ears, which are so large, that, when separated from the animal, they are sometimes used by the natives as a kind of sledge. The disposition of the largest African buffalo (for there are several kinds) is fierce and savage, compared with that of the domesticated species of Asia and southern Europe. Three species of rhinoceros are ascertained to inhabit Africa, and we are informed by Dr Smith, to whom the recent discovery of the third (the Ketloa rhinoceros) is owing, that the natives believe in the existence of five sorts of these animals, which they accordingly distinguish by separate names. Africa is therefore the metropolis, or most abundant and characteristic locality, of these massive and formidable quadrupeds. Only one crocodile, properly so called, occurs in the Old World, and that is the famous reptile of the African rivers, at whose approach

> Old Nilus sighs through all his cane-crown'd shores,
> And swarthy Memphis trembles and adores.

It can scarcely yet be said to be entirely divested of the reverence in which it was formerly held; for the modern Egyptians frequently suspend a stuffed crocodile over their doors as a kind of guardian genius.

It is impossible to contemplate the peculiar features of African zoology, without being speedily struck with the remarkable preponderance of the antelope tribe, and the numerous kinds of equine or solid-hoofed animals approaching to the asinine type of form. Upwards of seventy antelopes are now known, and the larger proportion of these inhabit Africa. We can here mention only two or three of the more remarkable. One of the best known belongs to the section containing the gazelles; it is the spring-bok of the Cape colonists. When the springs and rivulets of its native plains are dried up, this small and elegant species sometimes descends upon the cultivated lands in innumerable herds—twenty or thirty thousand occasionally appearing within view at once—and devastates the crops, again retiring with the first fall of rain. The bubalus of the ancients is about the size of a stag, and more heavily formed than the others. Similar to it is the *harte-beeste* of the colonists, which has somewhat of the appearance of a small cow, inhabits the more sterile districts, and is capable of being domesticated. The klip-springer, or rock-springer, has brittle hair of a greenish-yellow colour, and the hoofs do not incline forward, but are placed perpendicularly on a line with the leg. The algazel, a large species of the northern regions, is often sculptured on the monuments of Egypt and Nubia, and is thought to be the oryx of the ancients. The impoof, which is the elk of the colonists, attains the size of the largest horse, with strong straight horns, surrounded by a spiral ridge. Three species of gnu-antelopes are found in southern Africa, the largest and best known of which is a very remarkable animal, having a tail not unlike that of a horse, a beautifully flowing mane, a hanging dewlap, horns approximating and enlarged at the base, then curved downwards, and afterwards turned up at the points. Both sexes are provided with horns. One species of African antelope (*A. nigra*) is remarkable for its colour, which, in the male, is almost wholly black; and others for their diminutive size, the group named *Neotragus* containing several species of extremely delicate structure, some of them not a foot in height at the shoulder.

Horses and asses, including under the latter name all equine animals with a naked tail tufted at the tip, and long ears, are characteristic of Asia; only one other tribe of solid-hoofed animals is known, named the hippotigrine, or zebra group, and that is separated from all the others by being geographically confined to southern Africa, rarely extending beyond the equator. The most recent investigation of their characters determines the number of species to be five, and they are all more or less conspicuously marked with the transverse parallel bands, giving them that peculiar aspect which is attempted to be expressed by the term *hippotiger*, or tiger-horse. They are often found associated with the ostrich, whose company they are supposed to seek, owing to the keener vision of the bird giving earlier intimation of approaching danger; and this assemblage, with a few troops of slim and elegant antelopes, bounding over a plain which they scarcely seem to touch, and whose uniformity of level is but little interrupted by the stunted herbage and straggling tufts of succulent plants, placed there as if to concentrate the scanty humidity, combine to form a scene which is perfectly unique, and of which the geographical position can never be mistaken.

The African deserts would be quite impassable without the aid of the camel and dromedary, and these have been from time immemorial the most useful and laborious servants of the inhabitants, to whose comfort, nay in some cases, to whose very existence, they may be said to be indispensable. But although the occurrence of these animals forms a very striking and distinctive feature in the zoology of this continent, as compared with Europe and America, it is one which it shares in common with Asia. The same thing may be said of the larger and more remarkable feline animals—the lion, panther, leopard, and chetah, or hunting leopard, all of which are likewise Asiatic. But it seems to be here that the lion finds its more congenial and appropriate home. Disregarding the dense covering of the jungle—the proper abode of the more insidious tiger and panther—the king of beasts delights in an open country,* with occasional tufts of wood to afford him temporary shade or shelter as the occasion may require; a kind of locality in which this continent abounds. He here attains his most magnificent proportions, and occurs in greater plenty than elsewhere, exhibiting also several well marked varieties. Those who maintain that the African differs specifically from the Asiatic lion, would probably change their opinion on examining all the intermediate gradations to be seen in the living specimens now in this country. There can be little doubt that the simple Linnæan characteristic—"tail with a tuft at the extremity"—is still as applicable as ever, and designates a single species, the noblest and most powerful of his race.

Africa is the metropolitan station of the hyænas. All the three species known are African, and two of them, the spotted and woolly hyæna, are exclusively so. The more common striped hyæna extends into Syria, Persia, and other parts of the Asiatic continent. Of sanguinary disposition, disgusting habits, and not very amiable aspect, hyænas are commonly regarded with aversion; but it is perhaps not generally known that they are frequently tamed, in which condition they sometimes show strong attachment to those who use them kindly, and are actually employed in the capacity of watch-dogs both in Asia and Africa. Allied to the hyænas in structure, and strikingly resembling them in form, are the wild dog of the Cape (*Lycaon picta*), a tall gaunt figure, with large ears, and a tail like that of a wolf, which hunts in packs; and Laland's proteles, which inhabits caverns, whence it issues to attack sheep and lambs, having the singular propensity of eating off their tails; a preference no doubt owing to that appendage in the African sheep being furnished with a massive fatty protuberance.

Of the more strictly canine animals, Africa possesses several different kinds of jackal; but although the well known lion's provider, as it is called, occurs here, it is more characteristic of Asia. The interior also produces a race of foxes remarkable for the size of their ears; these form the genus *Megalotis*, and one of the species is the zerda or fennec of Bruce. The mangouste, so celebrated among the ancients by the name of *ichneumon*, has the form of a marten, and is larger than our domestic cat; like the latter, it is easily domesticated, and pursues mice, reptiles, &c. In its wild state, it chiefly hunts for the eggs of the crocodile, and thus destroys many of these animals, by an easier and incomparably safer process than entering the mouth of the gigantic reptile, as it was formerly fabled to do. The wild boar is unknown in Africa, but it is represented by the wart-hogs, which are like it in general form, but have a singularly large skull, and tusks, to use Cuvier's expression, of frightful magnitude; and these, with a large mammiform protuberance on each cheek, give them a very hideous aspect. One occurs in the north, another in the south of the continent. Many regions of Africa are infested in an extraordinary degree by ants, which in some places almost usurp the soil. They are kept in some measure in check by a peculiar animal called the ant-eater, or Cape orycterope, which inhabits burrows, and feeds on these insects. By the Dutch colonists, who occasionally use it for food, this animal is styled the *ground hog*. It is assisted in its useful operations by the pangolins, or scaly lizards, as they are commonly called, which, instead of hair, are covered with imbricated scales, the edges of which they present to an assailant, rolling the body into a ball like our hedgehog. Various kinds of very remarkable gnawing quadrupeds are found in the vicinity of the Cape of Good Hope, of which we can merely mention the otomyd, jerboa, jumping hare, and bathyergue.

A zoological feature of Africa, of too conspicuous a nature to pass unnoticed, even in the most cursory glance, is presented by the occurrence of various singular species of quadrumanous, or monkey-like animals, in particular the chimpanzee, which of all living creatures most nearly approximates to man.† It is peculiar to Africa, chiefly found in Guinea and Congo, lives in troops, and if the reports of travellers can be relied on, sometimes attains a size equal, if not superior, to that of a man. Baboons, properly so called, or dog-faced monkeys, are also confined to this continent, with a single exception, and that also is of African origin. The mandrill baboon (*Simia maimon* and *Marmon* of Linnæus) is a most hideous and extraordinary animal, nearly of the size of a man, of a most sensual and ferocious disposition, and held in great dread by the natives of Guinea, where it principally occurs. Its food and habits are quite in accordance with its revolting aspect, the former consisting chiefly of scorpions, which it obtains by traversing the ground on all fours, and lifting up the stones with its hands. Before swallowing the choice morsel, the creature extracts the sting with great dexterity. The smaller kinds of monkeys peculiar to Africa are very numerous, constituting entire generic groups, very rich in species.

* According to Mr Blyth, the feline species which affect the open country, as the lion and leopard, have the pupil of the eye contracting to a point; whereas in those which inhabit forests, as the tiger and domestic cat, the pupil closes in a vertical line, permitting thus, when least dilated, of a full range of vision in the direction in which these animals chiefly watch for prey.

† The resemblance of this race of animals to man is intimated in some of the names assigned to them wherever they are known. Ourang-outang is a Malay word, literally meaning *rational being*, or man, *of the woods*. The familiar name monkey is obviously a dimirutive of *man*. Some baboons are named *mandrills*.

BIOGRAPHIC SKETCHES.

SIR WALTER RALEIGH.

On many accounts the history of Sir Walter Raleigh is an interesting one to his countrymen. His name is indelibly associated with our national literature; he forms a prominent link in the early connecting annals of the old and new worlds; and his personal adventures in youth, manhood, and age, are invested with the strong charm arising from stirring adventure, and from sufferings endured with manful patience.

Walter Raleigh was a younger son of a family of Devonshire, of the inferior class of landed gentry. He was born in 1552, at Hayes, in the parish of East Badley, and after some domestic tutorage, was sent to Oriel College, Oxford, where his ready talents and aptitude for instruction appeared so remarkably, that Lord Bacon has deemed them worthy of notice. At the age of seventeen, however, he quitted his academical career for a more active one, joining a "gallant company" of one hundred gentlemen volunteers, who, with permission of Queen Elizabeth, went over to France to assist the oppressed Huguenots, or Protestants. There is every reason to believe that Raleigh here fought in person in the great battles of Jarnac and Moncontour, under Condé and Coligni; but we know not much of these his first warlike adventures, and his participation in the French civil war is chiefly noticeable as giving an indication of that liberal spirit and hatred of oppression which marked his later years. He spent about six years in France, and no doubt there added to his previously-acquired learning and knowledge those social and courtly accomplishments which charmed the discriminative eye of Elizabeth not long afterwards. Before he came in her way, however, he had seen further service both by sea and land. In 1578, he again enlisted himself under the banners of Protestantism, serving with the Dutch against Spain, under Sir John Norris. His step-brother, Sir Humphrey Gilbert, withdrew him from this adventure in the following year, and induced him to join in an expedition to the El Dorado of the age, the American hemisphere. It failed; and again Raleigh turned his thoughts to military success. At the close of 1579, the rebellion of several chieftains of Ireland had called for an increased levy of men for that country. The subject of our memoir had so far proved his abilities as to receive a company; and subsequent exertions procured him the governments, successively, of Munster and Cork. History ascribes to this period of his life many acts of daring courage, of chivalrous generosity, and of prudence far beyond his years.

When young Raleigh first presented himself fairly at the court of Elizabeth, that queen was surrounded by men whose personal merits and accomplishments rendered the avenue to royal favour difficult of access. The wise and faithful Burleigh, the haughty and intriguing Leicester, and the all-accomplished Sidney, then stood full in the eye of the queen, with many others whose talents and deserts ranked only second to theirs. But even among such men Raleigh was not long in making himself prominent. His dexterous use of a little accident is always related as the first step made by him in the graces of the queen. Elizabeth was passing on foot from the royal barge to the palace, and, reaching a spot where the ground was miry, hesitated for a moment to advance. Raleigh was in her train, a humble member of the group of youthful aspirants for future offices and honours. His quick eye caught the momentary hesitation of the sovereign, and with admirable presence of mind he stept forward to her aid. Loosening his richly-embroidered cloak from his shoulders, he cast it on the ground before her, with an air of profound respect, yet with grace and gallantry. Elizabeth was just the party to be charmed by such an act, especially when the doer was a young man of noble figure and mien, from whom admiration of the woman came not less naturally and agreeably than devotion to the queen. She immediately sent for Raleigh, and took him into her service.

Raleigh was first employed by Elizabeth to accompany the Duke of Anjou to the Netherlands, after she had resolved against a marriage with that prince. In 1583, we find Raleigh again actively engaged in prosecuting schemes for colonising North America. The first expedition failed, but he got a new and extensive patent in 1584, and the captains sent out by him discovered Virginia, which they so named in honour of the queen. Though unsuccessful in forming a colony, Raleigh's messengers effected important ends at various times. They brought home the potato, and it was first planted on an estate in Ireland, given to Raleigh for his services. They also brought home the tobacco plant, which he was the means of bringing into use. In addition to his Irish estate, the queen knighted Raleigh, and made him seneschal of Cornwall and Exeter, as well as warden of the Stanneries, and licenser of the wine-retailers of Britain. He was also chosen captain of the queen's guard, and knight of the shire for Devon. All these benefits and honours show the estimation into which he had risen. The queen admired, trusted, and consulted him.

In the year 1588, the great Spanish Armada advanced against Britain, and Raleigh was actively em-

ployed both by land and sea. On the memorable 27th of July, Sir Walter joined the squadron of England in a ship of his own, and was forward in conducting the victorious attack of that day. Elizabeth rewarded him with an augmentation of his patent on wines. Soon afterwards, the active knight joined in the attempt to re-seat the expelled king of Portugal on his throne. For his share in this enterprise, Raleigh once more gained the thanks of his sovereign. He paid a visit at this time to Ireland, and there saw Edmund Spenser, the great favourite of those muses whose smiles Raleigh himself had already courted with no mean success. By the banks of the romantic Mulla, these two men of genius met and united sympathies. Both have left records of their meeting, and of their high admiration for one another. Raleigh's sonnet on Spenser is among the finest in our language, and may be given here as a specimen of his poetical powers :—

"Methought I saw the grave where Laura lay,
Within that temple where the vestal flame
Was wont to burn, and passing by that way
To see this buried dust of living fame,
Whose tomb fair Love and fairer Virtue kept;
All suddenly I saw the Fairy Queen;
At whose approach the soul of Petrarch wept,
And from thenceforth those Graces were not seen;
For they this queen attended, in whose stead
Oblivion laid him down on Laura's hearse;
Hereat the hardest stones were seen to bleed,
And groans of buried ghosts the heavens did pierce;
Where Homer's spright did tremble all for grieve,
And curst th' access of that celestial thiefe."

Spenser, on the other hand, remembering Raleigh's passion for maritime adventure, calls him "The Shepherd of the Ocean," and, in memory of his powers of verse, gives him the title of "The Summer's Nightingale."

When Raleigh returned to England, he introduced Spenser to the queen, as the poet gratefully acknowledges. He also used his influence in other commendable ways; as, for example, in saving the life of Mr John Udall, a poor clergyman, who had incurred the sentence of capital punishment. His scheming and ambitious mind led him to exert himself constantly to further the interests of himself and friends. It is said that Elizabeth somewhat pettishly said to him once, "When, Sir Walter, will you cease to be a beggar?" "When your gracious majesty ceases to be a benefactor," answered he pointedly. The requests could not be very improper ones, in allusion to which Sir Walter dared to make such a reply to Queen Elizabeth.

A new naval enterprise was undertaken in 1592 by the Shepherd of the Ocean; namely, an adventure against Panama. Raleigh was admiral, and he hoped to seize the whole Spanish plate-fleet. By accident, the plate-fleet escaped, but nevertheless large ships were taken, one valued, with its freight, at L.500,000. These were not unworthy rewards; but Sir Walter, when he landed from his cruise, found an unexpected misfortune awaiting him. He had become attached to Elizabeth Throgmorton, one of the queen's maids of honour, and her majesty, having discovered the circumstance, cast him, in consequence, into the Tower. There Raleigh thought it necessary to act the part of a despairing lover; and by sundry poetical flatteries of the royal person, he was fortunate in gaining his liberty.

Reinstated in part in the graces of the queen, and again a member of the parliament, Raleigh turned his active mind ere long to a new attempt of colonisation. He had been told wonderful stories of the wealth of Guiana, and he fitted out an expedition for that region, taking the command in person. Excepting that he took possession of it in his sovereign's name, and facilitated the progress of geographical discovery by his account of the river Orinoco, Raleigh gained little by this enterprise, though his courage and conduct were never before more strikingly evinced. Again, in 1596, Raleigh was on the broad seas, being honoured with a command in the expedition against Cadiz under Essex, and a leader of the van in the splendid victory which the English there obtained. In 1597, he was rear-admiral under Essex, in the expedition for the seizure of the Spanish West-India fleet, and, eager for glory, made a successful attack on Fayal, in the absence of his superior. Though Raleigh justified himself fully, this affair widened the already existing breach betwixt him and Essex, who were rivals for royal favour, and also contended, on no unequal terms, for popular applause. Though of lesser rank, Raleigh's personal accomplishments were such as to give him an advantage even over the gallant Essex. At those tournaments of which the queen was so fond, the former had no equal, and, at will, could bear off the tilting prizes given by the sovereign. After his return from the expedition of 1597, till the fall of Essex and death of the queen, Raleigh, in addition to his share in these royal amusements, occupied himself with his duties in parliament, and became also the founder of the Mermaid Club, around the board of which congregated such men as Shakspeare, Jonson, Fletcher, Beaumont, and Carew. Sir Walter, indeed, was perhaps in every way the most generally admired and prominent man in England of that day.

When Elizabeth died in 1603, Sir Walter Raleigh had touched the summit of all his greatness, and his star began to decline. He was left the main competitor for power with Cecil; and that minister, a man of consummate address, gained the favour of James I., while, unluckily, a prejudice was instilled into the royal mind against Raleigh. In the very first year of the new reign, Sir Walter, after being stripped of several of his offices, was accused of a conspiracy to place Arabella Stewart on the throne. The very existence of such a plot was an entire fiction, invented for the purpose of ruining Raleigh. He was tried, and it was at his trial that a strange scene, often alluded to, passed between the accused and the Attorney-General, Sir Edward Coke, a man of splendid powers, but violent temper and strong prejudices. To all the unjustifiable taunts of this personage Raleigh bore himself most nobly. By a constrained jury, the accused was found guilty, and was confined in the Tower, for the time escaping the scaffold, to which he was condemned and ultimately destined. At first, indeed, he had no hopes of life, and, with the block before his eyes, wrote a most beautiful letter to his wife, from which we take a few sentences :—"You shall now receive, my dear wife, my last words, in these my last lines. My love I send you, that you may keep it when I am dead; and my counsel, that you may remember it when I am no more. I would not, by my will, present you with sorrows, dear Bess—let them go into the grave with me, and be buried in the dust. And, seeing it is not the will of God that ever I shall see you more in this life, bear it patiently, and with a heart like thyself.

First, I send you all the thanks which my heart can conceive, or my words can express, for your many travails and cares taken for me; which, though they have not taken effect as you wished, yet my debt to you is not the less. But pay it I never shall in this world. Secondly, I beseech you, for the love you bear me living, do not hide yourself many days after my death; but by your travail seek to help your miserable fortunes, and the right of your poor child. Thy mournings cannot avail me—I am but dust."

For twelve years Sir Walter Raleigh lay in prison, never certain for one hour that the next would not see him perish by a violent death. But he gave not way to despondent inactivity. He made this period the most famous of his stirring life, composing, during it, his great "History of the World," a work of wonderful learning, genius, and industry. Other essays upon useful subjects were composed by him; and the mean prince who kept him so unjustly in durance, and in such a species of durance as wasted the prisoner's health, did not scruple to profit the while by his toils and talents. Prince Henry, the promising and short-lived son of James, was the attached friend of Raleigh, and, in allusion to him, is reported to have exclaimed indignantly, "Sure, no prince but my father would keep such a bird in such a cage." James acted still more vilely towards Raleigh, in permitting the favourite, Somerset, to seize the prisoner's estate of Sherborne, upon the ground of a legal quibble. Lady Raleigh, who showed an unmatched constancy to her husband in his misfortunes, went on her knees to the king on this occasion, to petition for the preservation of her children's inheritance, but without avail.

At length, when all appeals for justice had passed for ten years unheeded, Raleigh obtained his release in 1615, by a bribe to the uncles of the new favourite, Buckingham. Other considerations, and those of a like paltry nature, had partly influenced King James. Sir Walter had renewed his schemes upon Guiana, and promised him the fifth part of the bullion to be imported thence. Upon this undertaking, the active Raleigh set his whole remaining fortunes, as on a die. All the means that he, his wife, and his friends could accumulate, were embarked in this great undertaking; and by the month of March 1617, a fleet of fourteen sail, well equipped, with Raleigh himself as commander, were ready to cross the Atlantic. But heavy impediments stood in the way of the indefatigable adventurer. Though Guiana was an English colony, the jealousy of Spain was roused by the news of this great enterprise. In council and in battle, they had again and again cowered under the master-genius of Raleigh; and Gondomar, the Spanish ambassador in England, made the most urgent remonstrances against the expedition, falsely representing it as a piratical scheme against the colonies of Spain. James had sanctioned it, and did not withdraw his sanction; but, with a degree of baseness almost unexampled, he placed in the hands of the Spaniards the most minute and private details of Raleigh's proposed proceedings, thereby enabling them to baffle them wholly.

Ignorant of these matters, the unfortunate knight set forth, and reached the Orinoco. His own health sunk under fatigue and the climate, but he sent a party to take possession of the spot where he believed a valuable mine to be. Alas! the party found all the passes occupied by watchful Spaniards, and after a severe engagement, in which many of the Spaniards were killed, the adventurers were forced to return. When Raleigh heard of the engagement, knowing what Spain would make of it, he declared himself a "ruined man." Other distresses followed thick upon the first; his son fell in battle, fighting bravely; and, with his force lamentably thinned, Sir Walter was forced to turn his course again to England. Respecting his son, he writes affectingly to his wife—"I was loath to write, because I know not how to comfort you; and God knows I never knew what sorrow meant till now. All that I can say to you is, that you must obey the will and providence of God, and remember that the queen's majesty bare the loss of Prince Henry with a magnanimous heart, and the Lady Harrington of her only son. Comfort your heart, dearest Bess. I shall sorrow for us both. And I shall sorrow the less, because I have not long to sorrow, because not long to live."

On his return to England, the contest with the Spaniards proved, as he had feared, fatal to him, or at least gave a plea for his death. He had never received a formal pardon, believing it to be implied in the new patent granted by the king for his voyage. He was therefore condemned to die, on the score of the former conviction. Manfully he stood forward to vindicate himself, but all in vain. On the 29th of October 1618, in the 66th year of his age, he died by the axe on the scaffold. His demeanour in his last moments was calm and noble. He felt the edge of the axe, and said to the sheriff, "This is a sharp medicine, but a sound cure for all diseases." To the people he declared his innocence in a short speech, and then, after a fervent prayer, exclaimed, "Now I am going to my God!"

Sir Walter Raleigh certainly possessed one of the greatest intellects of which our nation can boast. His capabilities were almost universal. He was eminent in all things. Scraps only of his poetry have been preserved, but they show his fancy to have been as brilliant as his judgment was sound. His "History of the World," and a collection of miscellaneous essays, form the bulk of his extant writings.

A TRAVELLING REMINISCENCE.

BY MISS PARDOE.

To the reflective and observant traveller, every variation of costume, feeling, and habit, in the different lands through which he passes, is a distinct study; and although many customs to which he has not been previously habituated may at the first glance appear to be both absurd and indefensible, it is more than probable that, on carefully examining the subject, he will discover equal discrepancies in his own former impressions. Nothing is more common than for a stranger, on his advent in a foreign city, to see a smile upon every lip, induced by some detail of his manner or costume, which to its inhabitants conveys singularity, and even ridicule; and it is by no means improbable that, should he remain long among them, he would see reason to adopt their opinion, and to discard prejudices upon which he had previously prided himself.

In almost every relation of life, we find it infinitely more easy to condemn certain things, than either to give a valid reason for our dissent, or to supply a remedy; and this is peculiarly the case as regards foreign countries. Allowances must be made for the conventionalisms of every distinct people and state of society, or existence among them becomes not only irksome, but absolutely painful; nor should the fact ever be forgotten, that what is refined courtesy in one nation may be rank incivility in another. Singular scenes frequently grow out of these local differences of feeling and action; some of them, doubtless, unpleasant enough at the moment, but still so irresistibly ludicrous, that even the sufferer cannot choose but laugh at his own disaster; and perhaps I shall not better illustrate my position, than by narrating a provokingly absurd incident which happened to myself during my residence at Constantinople in 1836.

We had embarked at Marseilles, in the November of the previous year, having taken our passage in a large Austrian merchant-brig, manned by Venetian sailors. Our voyage lasted forty-six days, during which weary period we only twice made land; first at Syra, and subsequently at Troy. On the first night after our embarkation, we were overtaken by a severe gale, which swept our decks of everything save the guns (of which we carried four), the long boat, which was firmly stowed amid-ships, the masts, and the main-sail. It caught us so suddenly, that the crew were totally unprepared, and every moveable object upon deck went overboard within ten minutes after it commenced. Italian sailors are proverbially both slovenly and procrastinating; and thus, satisfied with getting the passengers' luggage and property on board, every article was flung or stowed aside wherever it could be put most out of the way for the moment; while casks of water, and sides of beef, and even coops of poultry, were left almost unsecured, until daylight on the morrow should render their arrangement a matter of greater facility and convenience. Such being the case on deck, it will readily be believed that matters were not much better in the cabin. Such a scene of confusion I assuredly never witnessed; and although my own packages contributed not a little towards the misery, I felt all the horror of being obliged to clamber over boxes, hampers, and portmanteaux, in order to arrive at my little state-room. Had I known *how* the inconvenience was to have terminated, however, I should have been quite satisfied to put up with things as they were.

About midnight, a heavy sea struck the brig, which split the bulwarks seven feet from the stern, carried away the small boat, and forcing its way through the skylight, poured two feet of water into the cabin; the shock at the same time hurling from the locker to the floor all the multifarious objects which had been piled pyramidically to the roof. Had the adventure been less disagreeable, or the position less dangerous, it would have been impossible not to have felt amusement at the extraordinary and heterogeneous collection which was absorbed by, or floating on, the briny flood by which we were so suddenly overwhelmed.

Cases of millinery, hampers of wine and brandy, bottles of various sauces, anchovies, and pickles, the whole of which were broken as they came in contact with trunks and packing-cases; dried fish, which gradually became soaked; porter, eggs, and various other descriptions of sea-provisions—all combined to create a stench so nauseous, that it was with the greatest difficulty that we could support it.

Among the other floating luxuries was a case of millinery, which had been packed for me in Paris, and which was formed of basket-work. In this precious case were contained all my bonnets—articles of which I had already learned the inconvenience at sea, and which I had replaced by a cloth travelling-cap—the only description of head-covering that I possessed which was not carefully enclosed in the wicker-case. My female readers will at once appreciate the extent of my misfortune. I was about to land in the metropolis of a country where ladies substituted muslin for silk, buckram, and feathers, and where it was consequently far from likely that I should be able to supply myself with anything sufficiently *wise-like* to make a creditable appearance, instead of the spoilt articles in question. I had no alternative on our arrival but to land bonnetless; and the first use which I made of a Constantinopolitan acquaintance, who met me with offers of service, was to engage her to discover if, by some lucky chance, the unfortunate hiatus in my wardrobe could by any possibility be filled up. In 1836, the Frank quarter of Pera boasted but one milliner, an Italian, who supplied the ladies of the different embassies with finery, which she procured from Vienna. How these affairs may now be arranged, I cannot even guess; for recent travellers have, on their return from Turkey, occasionally put forth statements in which I cannot at all recognise the country and the people as *I* knew them. It will perhaps be sufficient for me to state, in order to prove the difficulty of indulging in matters of personal vanity, and the sensation created by European novelties consequent thereupon, that, during our stay in the capital, a French hair-dresser established himself, who exhibited in his window a couple of the wax busts, which are at home the usual ornaments of the shops of these traders; and which so excited the wonder and admiration of the natives, that the street in which he lived was rendered impassable by the dense crowd that collected to gaze upon them, until it was found necessary to disperse them by the aid of the police; and their fame having reached the Reis Effendi (minister of foreign affairs), he rode to the house of the astonished and frightened Frenchman, in order to convince himself whether they were indeed the miracles of art and beauty which he had been taught to believe; when he was so enchanted with the waxen wonders, that he offered a large sum of money for them, being anxious to present them to the Sultan his master as ornaments for his summer palace. This incident will, I think, go far to prove that my dilemma was no common one; and I was comparatively glad to learn, through my agent, that La Signora was daily awaiting a case from Vienna which was to contain three bonnets for the Austrian ambassadress; and that, on condition of my paying whatever price she might see fit to put upon it, the accommodating modiste would oblige me with one of the three. At that period I was not acquainted with the amiable Baroness S——, and consequently felt no compunction in depriving her of some portion of her excess, in order to supply my own necessity. I therefore acceded at once to the terms proposed; and in the middle of January, when the earth was covered with snow, I became the happy possessor of a bonnet of sky-blue satin, decorated with French flowers as parti-coloured as the rainbow, for which I had given in exchange sundry coins, whose value amounted to between five and six guineas English.

It will be readily imagined that this piece of unseasonable finery was the alpha and omega of my care; and it will not therefore be matter of surprise, that when, on the second occasion of its appearance, I went over to Constantinople from our residence at Pera, to visit the wife and daughter of the Pasha of Scodra, with whom I was to sojourn for a couple of days, I requested that the Greek lady who acted as my interpreter, would intreat of our hostess to give strict orders to the slave who took charge of our wardrobe to be extremely careful of my bonnet, as it was the only one that I possessed, and would be replaced with great difficulty. This was courteously acceded to my wishes, and a promise given by the attendant that all due attention should be paid to all that belonged to me. I accordingly troubled myself no farther on the subject; nor, amid the novelty of the scene, did I again waste a thought upon the subject, until we ultimately prepared to depart; when, in reply to my request for my walking-dress, the slave who had been my principal attendant during my visit knelt before me, holding out upon her spread palms a flat something covered over with a gold embroidered napkin. At first I did not apprehend the extent of my misfortune, and throwing aside the elegant drapery by which my less costly habiliments had been shrouded, I took possession of the shawl that lay beneath it; but my consternation may be imagined when, on withdrawing it from its resting-place, I discovered beneath its folds my unfortunate and ill-used bonnet, which, like its companion the shawl, had been duly folded and put under a press, where neither dust nor insect could intrude to injure it!

The predicament was most mortifying, and for some seconds I stood gazing in stupid horror at the wreck before me; but the absurdity of the thing was so monstrous, that in spite of the dilemma to which I was reduced, a sense of the ridiculous overpowered every other feeling, and I laughed as heartily as though I had not been myself the victim of the jest.

It was a case in which clearly no one was to blame. The simple-minded slave understood nothing about bonnets; and in fact neither she nor her mistress seemed to the last to comprehend that any injury had been done; or that the misused fabric of satin and flowers was one whit less graceful or less becoming, when I had pulled and squeezed it into the nearest approach to a head-dress of which it was still susceptible, than it was when I first presented myself in the harem. Every portion of their own costume might be folded, pressed, and packed at pleasure, and they were consequently not prepared to expect that mine was less accommodating. The destruction of any article of dress by a domestic, where its nature and capabilities were understood, would have been an affront to the guest who suffered; but in this case the error was one of ignorance; and this incident, simple as it was, may serve as an example and a proof that difficulties will arise, and annoyances occur, to every traveller, of which those who cause them are as virtually innocent as though they had not been actors in the little drama.

Let the travelling English bear this fact in mind; and both their temper and their digestion will be improved by the reflection. It is just possible that those among whom they sojourn may discover as many discrepancies in their own mood and manner as they have discovered on their side; while it will not be wholly profitless for them also to remember that they have *sought* the annoyances of which they complain; while the unconscious offenders are the victims of passive, or perhaps indignant, endurance of an evil which has been forced upon them.

JOKES ON THE COTTON FOLK.

Of all people in the world, the cotton folk of Lancashire have been made the subject of a novel! The idea will strike all other persons as most extraordinary: what! heroes and heroines, and all the other characters of fiction, from the cool villain to the crazed oddity, found amongst the unromantic brick chimneys in and around Manchester. In the people themselves, the idea will probably awake feelings much akin to those of the inhabitants of Cincinnati on receiving the earliest copies of Mrs Trollope's work on America. Even in the Exchange on a Tuesday, we should not wonder if one were to hear occasional remarks on this plaguy new novel filling up pauses in the discourse on yarns and twists. After all, the notion is not so absurd as may at first sight appear. Manufacturers and their work-people have feelings and passions as well as other human beings, and that very opposition to the romantic in which they live might be interpreted as an advantage, in as far as it was likely to afford scenes and events of a fresh and unhackneyed character. However this may be, a novel *has been* written on the cotton districts, the principal characters of which are manufacturers and the members of their families, and the scenes of which, with few exceptions, lie in the immediate neighbourhood of Manchester.*

There will probably be different opinions as to the general truth of the impression which is given by this work respecting the class whom it professes to delineate. It will be said to be over-drawn—to be true only in part, or of a section of the class, and so forth; and probably some of these objections may be sound, for how can any such delineations be universally true? But the characters and some of the descriptive scenes may be true, nevertheless, to certain originals, or sections of the class, which the writer has had opportunities of observing; and as such let them be taken. It is by no means certain that partial pictures of this kind are calculated for nothing but to offend the mass. The poignant remarks of Johnson on the Scotch are now acknowledged to have contributed much to the improvement of their domestic habits, and already the satire of Mrs Trollope and other European observers is beginning to effect some most desirable reforms on the other side of the Atlantic.

Mrs Stone describes the wealthy manufacturers of Manchester and its neighbourhood, as for the most part men sprung from a humble origin, and who have grown rich and luxurious, without greatly changing their original manners and style of thought and feeling. But not only is this true of individuals: the whole county was recently poor and thinly peopled; it has been suddenly enriched, and filled with a dense population through the efficacy of industry, while there was no corresponding growth of any of those elements which tend to refine and cultivate—a leisurely and scholarly class—nor any attraction for such elements coming in from without. If, then, wealth and splendour are to be found in this district, with little admixture of that intellectuality and taste which often grace much humbler scenes, it is little to be wondered at, however much one might wish it were otherwise. The most conspicuous result of wealth without refinement seems to be a disposition to competition in the shows of life—splendid furniture, equipages, and entertainments. The wife of a cotton-man rests content with what she has, and the style in which she has for some time lived, until, some luckless day, she finds that a neighbour has got some fine piece of plate which she wants, some better kind of carriage or horses, or had her drawing-room newly furnished in a superior style; and then she knows no peace till she has been made in all respects equal. Strange as it may seem, this new-sprung population is more split into grades and castes than any aristocratic community in the country. Men who sell calico in whole pieces, form a sect who will have no social intercourse with men who "cut the piece." To the struggle for eminence which consequently takes place, Mrs Stone ascribes "the out-Heroding-Herod in dress, in equipage, in entertainments, in luxury, in expense and extravagance of every kind, which so often makes the cotton-man, despite of fifty redeeming qualities, the butt and ridicule of those, from home, with whom he may chance to associate. 'He is a cotton-man,' seems to be a sufficient explanation for anything that may appear absurdly ostentatious or extravagant; and it is a common bye-word in the mouths of many who are themselves totally deficient both in the shrewdness to plan, and the unwearied energetic assiduity to realise, the undertakings which make the cotton manufacturer what he is." The ostentation is only relieved by a hearty hospitality which accompanies it. We shall here quote a characteristic scene from the novel:—"The drawing-room in which Mrs Langshawe received her visitors was as splendid as money could make it. The furniture and decorations were, however, all good—the best of their kind; but there was an *elaboration* in the style, and a profuseness in the ornaments, that savoured more of a heavy purse than a cultivated taste. The walls were hung with silk damask, finished off by massive gold cornices and mouldings, or draped round the magnificent mirrors, extending almost from the ceiling to the ground, which reflected the forms of a fair bevy of ladies, whose garments were not, certainly, their least noticeable appendage. The couches, the ottomans, the bosses, the buhl time-piece, the profusion of ornamental trifles that glittered around, the choice exotics in the recesses, the elegant china ornaments, and the magnificent cut-glass chandelier which sparkled like diamonds in ten thousand different hues, and gleaming in the mirrors, gave the idea of a fairy-land vista opening on every side—these, each in itself fit for the mansion of a nobleman, were yet clustered and crowded incongruously. They were, however, not merely collected, but, comparatively speaking, naturalised in the house of this low-born and uneducated cotton manufacturer.

The dining-room was equally expensive and luxurious, though somewhat more sombre in its adornments. But the dinner—ye gods!

The table was profusely decorated with plate, magnificent and modern; and literally groaned under the weight of all those eatables that 'man's gurmandise can feed.' The richest of soups and the most luxurious of fish were followed by a course of more substantial food; which in its turn gave way to a succession of such elaborate collections of eatables, as most surely were never congregated on any but a 'cotton-man's table.' And then, the manner of discussing it! Most earnestly did the good company do homage to the treat. There was no elegant trifling with plates and forks, no sentimental withdrawal from the vulgar and everyday habit of eating: the dinner was actually and elaborately devoured. Little was spoken during its progress, except on the merits of the various dishes and the intricacies of the culinary preparations. The good hostess entered with great animation into the mysteries of her *cuisine*, and exchanged sundry remarks with a well-dressed and rather saturnine-visaged gentleman on her left hand, on the propriety of this sauce having a grain more cayenne, or that ragout a thought less seasoning. Never had dinner more justice done to it. The company evidently met to eat; and eat they did.

There was, it may be supposed, none of that quietude of manner which in really highly-bred company places visitors, even of inferior rank, so completely at their ease, when their wants are supplied they know not how, and their feeling of strangeness is banished—how—they never think to inquire; still less was there that caricature of high breeding assumed by the 'doubtfully distinguished,' when a frigidity, that chills the very blood to an icicle, is substituted for aristocratic ease, a meagre table for a 'genteel' display, and a cold indifference to your wants as a proof of fashionable *nonchalance*. The courtesies of Mr and Mrs Langshawe's table were of a different order. Most actively, most unweariedly, did they exert themselves in specific attentions to each individual, at the somewhat crowded table. Dish after dish was recommended and pressed on each; voices rose to a somewhat lofty pitch in the earnestness of hospitable intreaty; and once a momentary sensation was caused by the sudden and by no means gentle descent of Mrs Langshawe's clenched fist on the table, as her most obvious and ready method of obtaining the attention of her busily-occupied partner to the wants of a lady near her. The sensation seemed but instantaneous; per-

* The title is—"William Langshawe, the Cotton Lord." By Mrs Stone, author of "The Art of Needlework." 2 vols. London: Bentley. 1842.

haps the circumstance was not of unusual occurrence. Never was hospitality more genuine; never was enjoyment more real."

As a matter of course, wealth and mercantile success form in such a district the grand bases for the estimation of human character. "Money covers a multitude of sins—of ignorance," says our novelist, who, while acknowledging that there are men of cultivated minds and refined manners in Manchester, adds, that such characteristics are the subject of something like a prejudice on 'Change, as if they were thought unfavourable to the success of their possessor in life. We have certainly heard intelligent inhabitants of Manchester speak of such a prejudice existing, though we cannot say to what extent it may be understood to exist. A mercantile man, we have been told, was expressing his fears one day of how the state of the market might permanently affect his affairs, and added, with the greatest seriousness, "well, if the worst come to the worst, I have at least the consolation of thinking, that I have always paid sufficient attention to business. No one can say that I have trifled away my time in *reading*, or any such foolish amusement." Mrs Stone introduces a few anecdotes, which she declares to be matter of fact, illustrative of the strange union between opulence and ignorance. We give one:—

"'Do you know,' said a gentleman, high in the *official* as well as in the private social circle of the town, to a bookseller, 'do you know a writer named Tom Moore?'

'Oh yes.'

'What has he written?'

'Oh, many things; 'Lalla Rookh,' 'Hebrew Melodies, and'——

'Oh, very well; when he writes anything in English, send it me.'

And another, seeing a book lettered 'Vicar of Wakefield.'

'The Vicar o' Wakefield—who's he? Oh (answering his own question), some writer on church rates, I suppose.'"

Our novelist draws, and we believe justly, a considerable distinction between the leading manufacturers of Manchester and those who dwell in the outlying districts of the county, and in some other rural portions of the Factory Province. These, being much less subject to improving influences of all kinds, are regarded, even in Manchester, as a class of semi-barbarians. Mrs Stone sketches one of them as a man of vast wealth and local authority, but not in the least degree more refined in language, manners, and style of living, than when he was a humble rustic weaver:—

"'I'm reeght glad to see thee, Mr Langshawe, that I am; you'll e'en tak me as ye find me; we've known each other these forty year, and the world's gone well wi' us both—thanks to luck and our own wit.'

So saying, Mr Balshawe ushered his unexpected visitor through the passages of a large and elegant house, and finally enthroned him in an armed chair in the kitchen—his own accustomed domicile when guests were absent.

'Now stir yoursel', Maggy—come; don't let the grass grow under your feet! If I'd done so, you'd ne'er hae had this fine house about ye. Come, mistress, stir yourself, will you? look sharp—be slippery!'

And Mrs Balshawe did stir herself. With the quiet celerity of one well accustomed to the work, she laid a cloth with other etceteras on the table, and turning up the sleeves of her gown, did rather more than superintend the progress of a steak which a servant was cooking. This operation achieved, she removed it to the table, placed chairs for her husband and his guest, and, as her wont was on ordinary occasions, prepared herself to wait upon them. This she did with great quietude and good humour; she looked meek and gentle, and it was quite evident that the leading principle, to which she had been for a lifetime habituated, was, that man was the nobler animal of the two; and if that was the case five-and-twenty years before, when her husband stepped from his little clay-paved loom-shop into the small apartment which was 'parlour and bedroom and all,' how much more must it be the case now, when he 'was monarch of all he surveyed' in his elegant and capacious mansion, or in the magnificent factory and thickly-populated hamlet which nearly adjoined it! So she continued her attendance without remark, the husband expecting it as a matter of course, and his friend not seeming to think the circumstance remarkable enough to elicit any notice, though varying from his own domestic economy.

'That'll do,' said Mr Balshawe, as his wife placed water, glasses, a flask of brandy, and pipes, on the table—that'll do. Now, make thysel' scarce; go to roost, and, I say, Mag, mind the parlour's ready in good time i' the mornin'; and stir your chalks, woman, and make those lazy husseys do it too. I mean to have some old cronies to dinner to-morrow; and mind, I'll have no slammacking and shirking o' work, but a right good dinner, well got. There—be off.'"

This, in the great cotton lord of a district, may be thought a wild fiction; but that there are such persons and such things we cannot doubt. Three or four years ago, we heard of a precisely similar incident. A wine merchant, travelling on business, chanced to be taken to the house of one of these provincial potentates, where he formed one of a company who were entertained in the most magnificent style. The kind-hearted host, learning the occupation of his accidental guest, requested him to call next day, when it was not impossible that he might give him an order. The wine merchant called accordingly, and to his great surprise, was conducted by his host down stairs, and introduced to a seat beside the kitchen fire. "Why, you see," said the master of the establishment, "my missis and I are plain folks, and though we sometimes give a dinner up stairs, we loikes best when we are by oursel's, just to do as we did langsyne, and so here we are." Of the above Mrs Balshawe we are told—"She gave a dance now and then, when her really beautiful mansion shone in all its splendour; and ostentatious carriages, attended by servants in glittering liveries, deposited their over-dressed burdens at her portal. Then was the good lady busy and bustling; then did rich and luxurious condiments pass round, and costly wines vanish like smoke; and then, after a few hours, the wearied ladies and their wine-soaked escorts departed; the entertaining rooms received the necessary purifications, the mistress heartily helping her maids in the accustomed task; the silken hangings were carefully folded and laid by; the luxurious ottomans were ensconced in their brown Holland covers; the glittering gewgaws were placed in a snug chest; and the smart albums were carefully enfolded in paper; and the meek mistress and her purse-proud lord resumed their accustomed posts in the kitchen."

Mr Langshawe was induced to stay to dine with a company which his friend Balshawe had invited, and this introduces us to a scene of coarse bacchanalianism which, we would hope, is characteristic of but a limited section of even the provincial cotton-men.

"The dinner was luxurious; the wines the finest and most costly that money could procure, and no inferior ones were introduced. Mr Langshawe was not afraid of a bottle or two of wine; but at a latish hour, feeling that he had had enough, he rose with the view of quietly effecting his retreat. His host caught a glimpse of his receding figure, and rushed after him, calling on his friends for assistance. This was speedily obtained; the culprit was brought back *vi et armis*, and pushed down into his chair. The servant was ordered to close the shutters and curtains against the intruding beams of daylight, fresh decanters were put on the table, and plentiful refreshments placed within reach; and the waiter, having done all this with the air of one not unaccustomed to the task, was told to 'make himself scarce.' The master of the feast locked the door, and put the key in his pocket; returning to the table, he filled a bumper, and requiring all to honour his toast, immediately gave out the elegant sentiment—[with which we should be ashamed to pollute these pages.]

Then commenced the peculiar luxuries of a manufacturing gentleman of the *out-districts*. Boxes of cigars had been placed upon the table; pipes and tobacco were in readiness for those who preferred the unsophisticated herb; and costly claret, drunk, not from a miserable wine-glass, but from goblets, kept clear the throats of these thorough-going sons of profligacy. The night passed gloriously; riotous songs and unequivocal jests sweetened the wine, or rather the tobacco; for flavour, of course, the wine had none, to men whose throats were as so many chimneys; and if their free libations to Bacchus did kindle 'a row' and a fight at this end of the table, or induced a sudden secession from chair to floor among some of the weaker-organed, the skirmish and the fall were alike unheeded. Of the combatants, it was but for the weaker 'to give in;' and for the man who couldn't drink all night, but must needs tumble from his chair, why, it was by universal acclaim decreed that he had better lie there. Nor did the gradually-increasing bustle beyond the still-locked door, which told that Mrs Balshawe and her assistants were up and busy in their preparation for another day's business, stop the coarse and vociferous hilarity. Coffee and ale, anchovies, deviled goose, and red herrings, were called in; palled palates were forced into sickly activity again, and the carousal was renewed for the day.

Towards morning, some of the younger profligates, the consequences of whose absence from 'the mill' or 'the warehouse' during the day began to glimmer upon their consciences with a potency above that of the wine, quietly stole away. The elders followed; by nine o' clock the house was empty, and Peter was called to carry to his bed—there, in all probability, to lie for a fortnight—the *hospitable* purveyor of this banquet, who for some hours had sat on his chair, to all appearance awake, but silent, helpless, motionless, save in an occasional heavy waving of the head, a disgusting picture of brutal excess."*

Social life is full of anomalies, and it is a remarkable one, that, in Manchester and its neighbourhood, where intellectual pleasures are, generally speaking, few and faint, music is cultivated to an extent unexampled in England. Vocal harmony is almost an universal accomplishment, and the concerts occasionally given by amateur performers are of surprising excellence. Nor are there wanting students of science, though these chiefly belong to the professional classes, or patrons of the fine arts, or even cultivators of polite literature. Mrs Stone causes one of her characters to describe, in himself (rather awkward management on her part), a manufacturer of cultivated mind. "I have," says Mr Ainsley, "a considerable fortune, acquired, as you know, in the trade of the times; but hand-in-hand with riches have I striven to gain those habitudes, tastes, and acquirements, which alone can make riches respectable. Night after night, for weary hours after a day of toil, have I laboured as intently at mental acquirements as during the daylight hours I have at the business of the counting-house. Whilst Mr Langshawe and others of my compeers closed the day by a social meeting at a tavern, or by a domestic debauch, I took a slender and simple meal, not for economy's sake, but to keep my head cool and my intellects clear for that object on which I had set my heart. Sir, it made my blood boil to hear the sneers and the ridicule cast on the 'cotton lords.' I did not see why trade was inconsistent with gentlemanly habits and refined manners, and I was determined to prove in my own person that it was not. I determined to be a *merchant-prince*—and I am. I do not forget that for many things I am indebted to a career more fortunate than I had any right to calculate on; but I also remember with unmingled satisfaction, how much is the result of my own unwearying exertions. Now, the few real gentry who inhabit our environs, and the few aristocratic travellers who visit the town, are not victimised at my dinner-table, or wearied in my drawing-room. But how little do any of them suppose that the man who can discourse of a Titian or Correggio—not indeed in the jargon of a connoisseur, but with taste and judgment—who can lead his own domestic orchestra correctly in a concerted piece, or stand without wincing if a French satirist or an Italian poet be glanced at—how little do they think that the man who does this could not, at twenty years old, write an English sentence grammatically, and has acquired his hard-earned accomplishments entirely in the intervals of a laborious business!"

It might be asked, are such attainments utterly inconsistent with the lives of manufacturers in general? Our novelist states "the opinion of many well qualified to judge," that they are so with "success in the Manchester trade." To this we are loath to subscribe; for if men have time for gay and luxurious entertainments, may it not be presumed that they could have time also to improve an originally defective education, if they chose? We more fear that the difficulty lies in the want of will, and the defect of means to awaken superior tastes. Where is the leaven which would be required to leaven so great a mass? Where are the influences, whether purely moral, or merely matter of earthly feeling, to counteract the tendency to deify Mammon? Even an ambition to be as the great of rank are, would do something to check the money spirit, and lead to greater refinement; but the objects which inspire such a feeling are much wanting in these regions of the mine, the workshop, and the railway. Nor is Manchester alone in this respect. It is more or less a feature to be deplored in all our great mercantile cities, that mental cultivation lags sadly behind the march of wealth, so that in the domestic circle of many a man realising thousands per annum, more homely manners and untutored minds are to be found than in the homes of the denizens of other cities, where, perhaps, not so many hundreds are gained. There is generally in all the enjoyments of life in such scenes a *materiality* which is not to be seen elsewhere. Even the usually present redeeming trait of hospitality seems to partake of this character, and often looks like an effort to make up by some substantial expenditure for the conscious want of something more delicate, and which would be more enjoyed. It may, indeed, be said to be, in the main, benevolence acting upon the presumption which universally prevails, that all things are to be estimated by money.

Perhaps the best hope of a corrective to all this is in the improved education which is in the course of being everywhere introduced. The first wealthy men of particular families are hopeless cases; but the second generation acquires better ideas, and more high bearing, and in time, that concentration of many of the best original and acquired gifts proper to human nature, an English gentleman, is produced. It must be remembered, that the rise of a wealthy class in the districts here more particularly under notice, is but an event of yesterday; who can tell what the to-morrow of their history will bring forth!

* If it be thought this picture is overdrawn, I can only reply, that it was sketched to me by a gentleman who was accidentally a guest at one of these degrading revelries.—*Author.*

THE "GREAT BRITAIN," STEAM VESSEL.

[From the *Times*.]

Some few particulars respecting this immense iron steamship, the largest vessel in the world, now building by the Great Western Steam-Ship Company at Bristol, and which will be ready for sea in the early part of the next year, cannot fail to be interesting at this period, when the questions of transatlantic steam-navigation and of our communications with India form prominent subjects of discussion. The Great Western steam-vessel commenced running between Bristol and New York in the spring of 1838, and has continued her voyages ever since, often, too, under the most adverse circumstances, with a speed and regularity unequalled. The Great Western Company, in order to maintain the high ground which they had attained, and taking advantage of the improvements made known by scientific research, resolved to build an iron steam-ship of such vast dimensions and power, as should as much surpass the Great Western as that vessel had itself surpassed everything previously afloat. Taking advantage of their experience of the peculiar excellencies or defects in the Great Western and other steam-ships then in existence, and with the power of adopting every improvement that skill or vigilance could suggest, the directors proceeded to build a vessel with which nothing

yet seen upon the waters of the world can be compared, and which is destined to prove experiments as novel and of as great public interest as the first opening of the transatlantic steam-navigation. As the huge ship proceeded on her stocks, various names were assigned to her, among which, in allusion to her immense size, that of "The Mammoth" became the favourite. After mature consideration, however, she was named "The Great Britain," a name appropriately emblematic of British skill and British greatness. She has been variously described at various periods, but now that she is all but completed, I have obtained the following description of her, which may be relied on as being accurate:—

The Great Britain is built entirely of iron, with the exception of the flooring of her decks, and the flooring and ornamental parts of her cabin. She is 324 feet in length aloft, or upwards of 100 feet longer than our largest line-of-battle ship. Her extreme breadth is 51 feet, and the depth of her hold 32 feet. She is registered 3200 tons, so that her bulk far exceeds that of any two steamers in the world. She has four decks, the lowest of which is of iron, and appropriated for the reception of the cargo. The upper deck, with the exception of a small break in the forecastle, is completely flush from stem to stern, without building or elevation of any kind, so that, besides the masts and funnel, there will be nothing above deck to offer resistance to a head wind. The two intermediate decks are appropriated exclusively to the use of passengers and the equipage of the ship, and consist of four grand saloons, forming, together, a length of dining room of 350 feet, two large ladies' cabins or family rooms, and 180 state rooms, each containing two spacious sleeping berths; so that, besides the portion appropriated to the crew, steward's department, &c., the immense number of 360 pessengers can be accommodated, each with a separate bed, without requiring a single sofa to be made up in any of the saloons. The principal saloon is 100 feet long by 32 feet wide, and 8 feet 3 inches high. Besides the vast space appropriated to the passengers, crew, &c., and that occupied by the engines, boilers, &c., she has sufficient room for the stowage of 1000 tons of coals, and 1200 tons of measurement goods. There are three boilers, capable of containing 200 tons of water, which will be heated by 24 fires; and she has four engines, each of 250 horse-power, making in all 1000 horse-power. Some idea may be formed of her vastness, when I state that 1400 tons of iron have been used in her construction. The most novel feature about the Great Britain is her mode of propulsion, which is by the newly improved screw-propeller, patented by Mr Smith of London (with improvements made upon it), and applied by that gentleman with complete success to the Archimedes. With a view to ascertaining the powers of the screw, as compared with paddles, the Archimedes was hired for some months by the Great Western Company, and a series of experiments made with screws of various size and form; and it being found that fully an equal velocity, with an equality of power, could be obtained as with paddles, conferring a great advantage under adverse circumstances, particularly in strong head-winds, the machinery at the same time being infinitely more simple, and at no time an incumbrance to the vessel, it was resolved not to use the paddles in the Great Britain, but to adopt the screw, with the improvements which had been made in the course of the various experiments with the Archimedes. The screw with which she will be fitted will be 16 feet in diameter, and placed under the stern, between the stern-post and the run of the ship, in which situation it will be quite out of the way of injury. It is calculated that this substitution of the screw-propeller for the paddles will relieve the Great Britain of 100 tons of top weight, and admit of the boilers and engines being adjusted in that part of the ship which is best suited to receive them, and where they best act as permanent ballast. The Great Britain will be fitted with six masts, on five of which a single fore and aft sail only will be carried, the mainmast alone being rigged with yards and topmast. These masts will be low, as compared with the size of the vessel, although the mainmast will be 95 feet long; and the quantity of canvass, though inconsiderable to what she would carry as a full-rugged ship, will still be as much as would cover three-quarters of an acre of ground. Her decorations are intended to be in the first style of nautical embellishment. It remains only to speak of the speed and qualifications which may be looked for in this large ship, and the services she may be expected to accomplish. It is difficult to ascertain the precise limits of the speed which she is calculated to perform at sea. Probably the expectations of the directors are greater on this point than they choose to confess, until an actual trial; but something considerably exceeding that of any sea-going steam-ship at present afloat may be looked for. The rate at which the oriental steam-vessels accomplish their voyages does not average more than eight miles an hour; the Atlantic steamers about nine; and the most rapid sea voyage yet accomplished has not exceeded an average of ten miles an hour. It is estimated that the Great Britain will accomplish from ten to sixteen miles an hour, according to the nature of the weather and the sea; and no doubt is entertained but that her average will be at least twelve to thirteen miles per hour; taking the lowest of these rates, there would be an amazing increase over the greatest triumphs of steam navigation hitherto heard of. Let us consider some of the advantages which might accrue to this country by the success of the Great Britain. Our overland mail is now received by us by the favour alone of jealous neighbours in Europe and of semi-barbarians in Africa. By these means alone is our overland correspondence, and our passengers to and from India, transmitted in about thirty-five days, at a great expense and inconvenience, in various transhipments and intermediate land carriage, subject to many annoyances and anxieties; our Indian correspondence liable to be intercepted, and all communication cut off, for at least a month, at any moment that either of these powers to which we have alluded might choose to do so. Who, then, can properly estimate the value of our being able to secure, in defiance of the world, the same expedition by our old and rightful track round the Cape of Good Hope? And by the Great Britain this may be done, for she would be able to deliver despatches and upwards of 1000 troops, if necessary, at any point between the banks of the Indus and the mouth of the Ganges, in from 35 to 40 days. Allowing her consumption of coal to be 55 tons per day, to secure an average of 12 miles an hour, she could, by dispensing with goods, carry 40 days' stock of coals without occupying the least portion of the space appropriated to the officers, crew, and passengers of the ship, or adding one iota to her regular lading and draught of water; in which time, by following out the calculation, she would have run a distance of 12,000 miles; besides, should the patent fuel be found to answer, she would be able to carry upwards of sixty days' stock. In the Indian seas, too, it must be remembered, there are advantages not to be found in the North Atlantic, in which nothing is more common than for a vessel to have head to wind during the whole outward passage to America, and consequently the steamer traversing it has often to battle with the elements the entire way. In the tropics, on the contrary, the presence of the trade-winds enables the commander to calculate with certainty on performing a very large portion of his voyage at the very maximum of speed. When it is considered that, after making a liberal allowance from these calculations, this steamer is so constructed as to sail with great rapidity, having a fair wind, there being no paddles to drag along, and no hindrance from the screw, there is no saying what length of voyage she might not accomplish with great expedition without a relay of fuel; and, it must be granted, the experiment is of vast importance in a national point of view.

"THE VOICE OF JACOB."

Such is the title of a somewhat remarkable periodical which has just fallen under our notice.* It purports to be the only published organ of the opinions and proceedings of the British Jews, and to have been commenced (in the form of small fortnightly sheets), rather more than twelve months ago, the date of the first number being "Rosh Hashanah, A.M. 5602," or, according to our reckoning, 16th September, 1841. Confined in its circulation to its own proper people, it can be little known to the public at large; we may therefore be permitted to say a few words respecting its character and contents.

"The Voice of Jacob" is apparently the first periodical attempted by the Jews in England, and its appearance may be said to mark a distinct era in the history of that highly interesting people. Oppressed, scoffed at, and plundered by our barbarous forefathers, the Jews have quietly pursued their unostentatious career, outlived the age of gross prejudice, and at length, in the year 1841, have established a press in defence of their rights and opinions, and as a record of their educational and religious proceedings. The periodical they have set up does not seem to be in the slightest degree political, but is conducted, as we should suppose, on the model of the "*Zeitung des Judenthums*," and the "*Zion*" of Germany, or the "*Archives des Israëlites*" of France, papers devoted to matters connected with the proceedings of Jewish institutions in continental Europe. To those who consider that whatever may be the future destiny reserved for the Hebrews, they will best be prepared for its enjoyment by mental cultivation, the appearance of this Jewish periodical in England, like all other tokens of advancement, will be received with anything but dissatisfaction; and it cannot be doubted that the very discussions it will originate must be attended with beneficial results.

Turning to the contents of the work, we perceive that notices of institutions, specially devoted to the instruction of Jews, are of frequent occurrence. The Jews, we are told, are now alive to the necessity of education in its most extended sense—they are resolved to be behind none in general intelligence. Among other seminaries, they have commenced

INFANT SCHOOLS.

One of these useful institutions was opened on the 14th September, 1841, in Houndsditch, London, with 120 children, who had undergone a preliminary training from Mr Wilderspin. The president of the institution, Francis Goldsmid, Esq., made an eloquent appeal to the audience assembled on the occasion, concluding in the following terms:—"There could not be a doubt as to the utility of such an institution. Some years ago, indeed, people believed that education was ineffectual before the age of five or six years. But they could at that age educate the feelings and the heart, and they could not begin too young to do so. There was not a feeling of the infant that could not be turned to good or evil. There was an education which taught the child when he quarrelled to kiss and be friends, and not to cherish enmity. Let them take, for example, the feeling of fear. Let them suppose that from the fear of darkness, as was perhaps natural when encouraged by threats of ghosts, a feeling of superstition would naturally be produced, which the after man would strive incessantly and vainly to get rid of. But if the groundlessness of such fears were explained, the infant would soon answer, as an infant did answer, who had been trained in the school at Edinburgh. The child was passing through a church at night, and was asked if it was not afraid. The child said, "Afraid of what? I go to the infant school." *

In a subsequent number, we are informed that the establishment of the infant school had begun to make the elder sisters, and in some instances the mothers of the children, ashamed of their comparative ignorance. The result was an evening school for pupils of advanced age, and 280 were already on the books.

JEWISH GENEROSITY.

The following anecdote, quoted from a Hamburgh paper, runs pleasingly counter to the popular idea concerning the cupidity of the Jews:—"Herr Solomon Heine, the rich Israelite banker of our town, who has so often distinguished himself by his patriotism and beneficence, has just afforded an additional proof of liberality, which deserves to be generally published. The Lutheran church of the parish in which M. Heine resides being in a very tottering condition, and the Lutheran parishioners not possessing, or not being able to contribute, the necessary funds to secure its thorough repair, it was resolved that a collection should be made throughout the parish, without religious distinction. The deputation intrusted with the task of making the collection presented themselves first at M. Heine's with the list, which was still a 'virgin page.' 'Gentlemen,' said the banker, 'I shall contribute to the repairs of your church with the utmost pleasure; but I can by no means accept the honour you offer me of inscribing my name at the head of the list. Go to Herr von Bauer, the richest of your own parishioners, and intreat him to head the subscription; whatever he gives, I shall give the same.' The deputation followed this counsel, and Herr von Bauer, perceiving that the requisite sum was 30,000 current marks (about L.2000), subscribed with splendid liberality for half that amount. The deputation having again presented themselves before Herr Heine, that gentleman immediately handed them an order upon his cashier for a like sum, thus completing at once the entire subscription, and exonerating the poorer parishioners from the necessity of a single farthing of outlay."

CIVILISATION IN THE EAST.

Of the advances making in the civilisation of the Jews in the East, we have a few stray notices that will be considered interesting. Take the following:—"A very interesting work, by Herr Joseph Schwarz, is about to be published at Jerusalem. It is to appear in three parts: the two first of which are written in Hebrew. The third part is in German, and contains a series of articles on the East, in its physical, political, and historical relations. The work is to be printed in the newly-established printing-office at Jerusalem."—21*st of Nisan*, 5602 (1*st April*, 1842.)

"We have before us a new edition of a ritual, printed only last year at Jerusalem. Seldom has any circumstance excited in us so many joyful sensations as that of the publication, at so recent a date, of a Hebrew book in Jerusalem. Printing has, at all times, been the forerunner of improvement; the swallow which indicates the mental spring. Where printing is, there is an encouragement for reading; there are new ideas excited, there is life, there is progress. However indifferent the Jew may be to the signs of life among his brethren in other quarters, such signs, manifested at Jerusalem, must always awaken his deepest interest."—15*th of Ab*, 5602 (22*d July*, 1842.)

Sir Moses Montefiore and other gentlemen, in their mission to the East on behalf of the oppressed Jews, were instrumental in establishing a school in Cairo for Hebrew children, which is said to be productive of much good. According to the report before us—"The children have been redeemed from a state of the most revolting degradation; considerable progress has been made in elementary instruction; the good will and zealous co-operation of all parties have been conciliated, and the spirit of toleration firmly established. One gratifying evidence of these latter results the committee had before them, in the wish expressed by many parents, not Jews, that their children might be permitted to share the benefits given in these schools. A day was devoted to the examination of the pupils in the Hebrew tongue, this latter examination being conducted by all the members of the Jewish committee, and attended by all the distinguished Jews in the country. It is impossible to read of a scene like this, in one of the great cities of Egypt, amongst a population who were the other day the butchers and victims of an ancient and execrable superstition, without a feeling of high gratification, a sense of deep thankfulness, to the wisdom and benevolence which, out of that humble and disgusting persecution, have thus contrived to extract a sure blessing and an abiding good."

With respect to the Jews of Damascus, the following occurs in a letter from an English traveller to Sir Moses Montefiore, 5th June, 1842:—"In the houses of the Jews of Damascus there is an appearance of well-doing, and in their persons and manners there is an air of good breeding and cleanliness which pleased

* Volume I. for 1841-2. Steill, Paternoster Row. London.

* We have heard it frequently alleged against the lower classes of Jews, that the taste for cleanliness is less perfect amongst them than amongst their neighbours. Whether such be true, we have no means of judging; but there can be no harm in our recommending very great care in this respect, so as to put all reproach on so paltry a matter completely out of the question. Their children should be sent to school scrupulously clean, with hair cropped, and as neat in apparel as circumstances will admit.

me much. I have heard from their own mouths the details of their horrible sufferings, but now, thank God, they enjoy much respect and consideration, and are happy. The three brothers Harrari, who are under British protection, have, at the instigation of our worthy and intelligent consul, Mr Wood, emancipated the slaves who were in their possession, and are doing their best to cause the other Jews of Damascus to do the same act. I think they will succeed." The editor warmly adds, in reference to the generous interference of Britain to rescue the unfortunate Damascene Jews from Mahommedan oppression—"The semblance of slavery is henceforth sought to be set aside in the whole Jewish community; but more than that—the principle is introduced, the example is promulgated in the Ottoman empire itself, where there *is* slavery indeed; and who shall say that this action and reaction of generous impulses shall not, in some future day, be found to have achieved a prouder triumph for British interests, the interests of humanity, than did the planting of her flag on the ruins of Acre? Inscrutable are the ways of providence; we can almost forgive Ratti Menton's quiet return to France, when we can thus regard the martyrdom of our brethren, associated as it has been with the emancipation of mind from the prejudices of fanaticism, and of person from the thrall of cupidity."

ANECDOTE OF AN OLD RABBI.

We close our extracts with the following characteristic anecdote of an old rabbi:—"Towards the middle of the last century, there lived at Prague, in Bohemia, the famous Rabbi Sarach Eidlitz, a man of deep intellect and profound conception, celebrated not only for his learning in the sacred Scriptures, the Talmud and its commentaries, but also known to have devoted a portion of his genius to mathematical pursuits, as his work (Art of Reckoning) has testified. According to the custom of the place, and the time in which he lived, he devoted himself exclusively to solitary study, or the gratuitous instruction of others; whilst his wife (from a small shop which she kept) earned the scanty means of an humble subsistence.

Eidlitz, although aware of the abundant resources which his deep learning might open to him, yet declined receiving any remuneration for his services, as not consistent with the dictum of the sage—'Whoso misuses the crown will be cut off.'

In the course of time, the circumstances of the learned man became still more reduced, so much so, that he was obliged to deprive himself of many of the comforts and frequently of some of the necessaries of life. Notwithstanding the privations he endured, he resolutely concealed his state of poverty, lest its being known might be considered as a tacit claim for relief. About this time, he one day received a visit from an old friend, Rabbi Israel Frankel, principal of the congregation of Prague, when, in the midst of confidential and familiar converse, Eidlitz disclosed to his friend his real position. Soon after, when they again met, Frankel, in the most delicate manner, offered Eidlitz a sum of money, which he most steadfastly refused to accept. Then, said Frankel, 'Thou knowest that God hath blessed me with wealth, but that, in consequence of my temporal position, I am prevented from acquiring the portion in the world to come due to the study of the law; if thou persist in refusing to accept this trifle, I shall say that it is envy that prompteth thee to refuse, lest I should, by my act, purchase such claim to a portion in the life to come.' These remarks had the desired effect, for they induced Eidlitz to accept the gift in consideration for the feelings of his friend. Time passed on; the friends saw each other frequently, and, as it might be imagined, the subject was never recurred to. After some years, Eidlitz was taken ill and died. Frankel, as a point of duty, went to the house of the deceased to take an inventory of his effects, a task, which in this case was thought to be a mere matter of form, as it was known that Eidlitz died in a state of poverty. In the study of his deceased friend, Frankel found a chest, in which were deposited manuscripts, and such other things as were esteemed of value by the late possessor. So sacred did Eidlitz hold the contents of this chest, that the key was never (during his lifetime) allowed out of his possession. Frankel, on searching this closet, discovered a packet, hard and round; upon its being drawn forth, it was found to be a sealed bag, containing a considerable amount of money; to this bag was attached a label, upon which were written these words, '*Deposited with me by my friend Rabbi Israel Frankel.*'"

FRENCH INVENTIONS.

The French are certainly the most inventive people on earth, but it seldom happens that they bring their schemes to successful maturity. Amongst the extraordinary things recently announced, was a substitute for gas, called liquid hydrogen, which was to cost only half as dear for an equal portion of light. A company was formed before the merits of the discovery could be tested, and now the shareholders find that the cost of their liquid is twice that of coal gas. The company, therefore, is all but dissolved. Another association, however, has been formed for the same object, and it is announced that the liquid, in this case, will be two-thirds cheaper than gas. This will probably end also in smoke, although it is probable that we shall see very little in the way of light. Two years ago a man announced that he had discovered the means of fixing the electric light, of any size, within the circumference of three feet, and gravely proposed to light Paris at night by about half a dozen artificial suns. Wild as the scheme was, he found a few moneyed persons to back him in some expensive experiments, and it is still pretended that he will succeed; so that Paris, with half a dozen large electrical machines, will no longer stand in need of candles, oil, lamps, or gas. This is almost as grand an affair as that of the Venetian, some years ago, who pretended that he had discovered the means of absorbing the sun's rays during the day, and bottling them up for use at night. There is another wild scheme on the *tapis*, for which attempts are making to get up a company. Charcoal having become excessively dear, it is proposed to collect all the vegetable refuse of the capital, and to carbonise the liqueous portion, so as to produce charcoal. The projectors calculate that this refuse is more than sufficient for the supply of the whole of the charcoal required for the capital, and the cost of which amounts to no less a sum than twelve millions of francs annually. That charcoal can be produced from refuse, such as potato-peel, cabbage-stalks, &c., there is no doubt; for M. Raspail, the eminent chemist, who has been employed by the projectors, has obtained some very good specimens; but the wiseacres have, in their estimates, overlooked one important fact. They propose to obtain their materials from the *chiffoniers*, who twice a-day go through the streets of Paris, raking, in all the heaps of refuse in the streets, for rags, old paper, and bones. They are to put into their baskets the refuse required by the company. This they can do, but it would require ten loads to each *chiffonier* for every one he has now to carry; and the expense of carriage would amount to much more than the worth of the article. The artificial charcoal will therefore also end in smoke.—*London paper.*

MOLLY AND RICHARD'S DIALOGUE.

In a part of Pembrokeshire, chiefly along the coasts, inhabited by the descendants of Flemish settlers, and sometimes called "Little England beyond Wales," a peculiar dialect is spoken, seemingly allied to the Lowland Scotch, and what prevails in the north-eastern English counties. As a specimen of this form of speech, we present the following dialogue, which has been written and forwarded to us by an ingenious correspondent, whose good sense shines through the rude versification of the piece:—

SCENE—*A Cottage.*

Richard Warlow standing watching the rain, which is falling in torrents; his wife Molly, with her children, are near the fire preparing supper.

MOLLY.

I tell thee what, Richard—'tis better for thee,
To be stayin at hame with the young uns an me,
Than be gwayin[1] about, a preachin an talkin,
Fur thou knawest as much as the dead in their coffin,
How to mayke thim things right that thou sayest be wrong,
Should'st thee claver[2] an talk all the livin day long;
D'ya think them great folks with their heads full av larnin,
Can't kip[3] them an us from all trouble an harmin?

RICHARD.

Thairsilves thay will kip, thares no doubt av it, Molly,
An leave us to starve: so they can be jolly,[4]
They'll say we're well fid on trelawny[5] an salt,
An if we complains, why, 'tis we be in fault;
They will give us the heft[6] of the burden to bear,
Whilst thair awn lathy[7] shoulders be free from a share.

MOLLY.

If some was more like 'um in some things, 't were better;
Let each pay his debts, an ware is the debtor?
D'ya nind[8] that new cottage so heighty[9] an cleane?
Not a neater or nicer once ivar was sin,
An now a 's[10] as unkid[11] as unkid can be;
There poor Peggy sits lone, like an owl on a tree,
For her children be stivlin[12] an starvin to death,
Whilst thair feythar be wasting his time an his breath.

RICHARD.

Thare's somethin like reasin in what ya do saay,
But then if ya'd heard Billy Williams to-daay,
As cute as a lawyer, a tould us the waay,
If we would but jouin[13] to mayke maisters to pay
A nation good price for the work that we do,
Thay'd look dern[14] for a bit, but main rathe[15] thay'd come to;
"For," says he, "can they live without 'sistance from you?
'Tis kift[16] they would be at the spaide or the pleugh—
An no bread can be gat, without using av these,
An if thay would live, thay must pay an they please;
Then we should have plenty av all that we wanted,
Our children be fid, an no fear of bein cranted."[17]

MOLLY.

Why, Richard, thou'rt leesing thy sinces, yindeed,
To be listnin to him, an the trash a can plead!
Did a ivar do anything good in his life,
For hisself, or his childarn, or poor sickly wife?
Who afore she knawed hin, was as hearty a crawtur
As ivar broke bread, an the lovinest daughter;
The people used stop to see Sall an her feythar
A gwayin to church so happy togather;
The auld man so shouk,[18] so tidy, an clean;
An a smarter than Sally whare could thare be sin?
'Twas a black day for both when Billy com'd back,
With his ramassin[19] stories, so glib with his clack,
That nawthin the naighbours could say, her 'ld persuade,
That a still was the same, and not changed a grinch[20] shade,
Since when a was called the curst[21] fidlar Bill,
When his poor widow'd mother his wild ways did kill;
But she knaw'd it too soon: why, from morning to night,
He is erqing[22] av her, she has nivar no quiat,
With his quarlin[23] at hame, bullyraggin[24] his neighbours:
And now a would turn honest men from thair labours!
If I could come at him, I'ld "call him to rags;"
T'othar day a was sayin, so "conk[25] in his brags,"
That he could do more with his fiddle an fife
Than ten parson an more with thair prayers all thair life;
An thou, that wast always so tindar to me,
As good an as quiat as man ivar could be,
To be 'ticed by a scrimigin,[26] white lizzard fellaw.[27]

RICHARD.

Blady,[28] Molly, thou'lt beat him in talkin quiat hollaw;
An but that I promised, I'ld sure to be thare,
I would seat myself down in this snug yasy chair:
Why, sure it is raining as hilding[29] as ivar!

MOLLY.

An thou can'st be trapsin three miles in such weathar,
An leave this snug fire! come, doff thy best jeckit,
An taste my good porridge, with someat to deck it,
That'ill sarve us for sowl[30] for many a day—
'Tis a prisan our Jinny had given in pay
For windin some yern that was snaffled[31] so bad,
That missis was sayin no one could be had
With pashance to clear it; but Jinny bein by,
She axed her to leave[32] her just have it to try:
She's a clivar young maid, an takes after thee,
Thou wast ivar a deal longer-headed than me;
She favors[33] thee, too, in the turn av the eye;
D'ye mind 'twas thy eyes I first fancied thee by?

RICHARD, *looking out—*

Well, Molly, I thinks twinna[34] scarvy[35] to-night,
I shall leave Billy Williams to fight his awn fight,
An if I had ta'en, as they calls it, the chair,
I'ld have bin "like a sow in a saddle up thare."
Yis, yis. I do say it is always much better
To think, an ya'll come to the rights of the matter.

MOLLY.

Ay, I knaw'd when ya'ld think "all by leasures"[36] a bit,
Ya'ld sartanly give the right nail the right hit;
Thare's many will bend like a lizzah[37] young bough,
An but few will, like thee, be true throu an throu;
Thay'll awhile keep to right, then be timpted to leave it,
An go crawling in mud like a young cutty-evat;[38]
But thou art the saame as thou ivar hast bin,
An I wouldna change thee to be mayde a true queen.

THE SPECTATOR ON SPECIFICS AND PATENT MEDICINES.

Patent or secret remedies are absurd; the government ought neither to countenance nor to tolerate them; it should not levy halfpence on quack pill-boxes as it does; but, rather than thus indirectly encourage empiricism, it ought, with a parental care for the good of the public and the aggrandisement of the poor, to re-impose a small sum upon salt. A capital pamphlet, by a "Member of the College of Physicians," published in the beginning of the eighteenth century, and entitled, "The Present Ill State of the Practice of Physic in this Nation truly represented, and some remedies thereof humbly proposed to the two Houses of Parliament," exposes the absurdity of specifics in very pithy and quaint language: but it is to be feared that human intellectual progression is slower than sanguine people would wish, for tons of specifics are yet sold in the nation. This old pamphleteer settled the question concerning specifics about a century and a half ago, when he said—"The bill-quacks give out that they can cure all diseases by one or two medicines, or have a certain remedy for some particular disease. That the first pretence is absurd and vain, every man of sense will acknowledge; and that the second is dangerous, I will demonstrate. Supposing they are masters of a good medicine for some one disease (which it is odds they are not), yet it is left to every man's judgment that makes use of it whether he have that disease; and how easy and frequent is it for men to mistake? But suppose he has that very disease for which the medicine is proper, yet how seldom is a disease alone, or how seldom accompanied with just the same symptoms? not to mention the age, the sex, the variety of causes, the late invasion or long standing of the distemper; all which circumstances it is impossible that one medicine should be suited to. I will instance one disease and one medicine that cures it specifically. The disease is an ague, which can hardly be mistaken, and the medicine the Jesuits' bark, which seems to be no edge-tool; and I may affirm, there is not any other disease that has so peculiar and certain a remedy. And yet all that have agues, one and another, take this medicine in the same manner; and I daresay it will kill as many as it cures. Perhaps, indeed, they shall not die presently, nor of the ague for which it is given, but of other diseases that it either introduces or increases. How many asthmatical persons has it suffocated? how many intermitting (as well as remitting) fevers has it made continual and even malignant? how many desperate cholics, some ending in palsies, have I known caused by it? with many other grievous distempers, and all for want of due preparation before, a right method in, and proper treatment after, the use of it. Of this scandalous sort of practices, therefore, I shall take no further notice, believe ing they can have no patron, no advocate, among wise men." As there are no specifics for one disease, or for all diseases, there would be no hardship in suppressing secret medicines, and in making it necessary that the ingredients of all nostrums should be made known upon demand. If a chemist discover a new mode of manufacturing a salt, or any other valuable commodity, let him by all means have the advantages which discoverers in any branch of art or manufactures are entitled to by patent—that is a totally different affair; but let us not only not have a government-office for labelling empirical nostrums, but let the law prevent the propagation of compounds as good for this or for that, or for all diseases, as one of the most flagrant kinds of the illicit practice of medicine.

NUMBER 564. SATURDAY, NOVEMBER 19, 1842. PRICE 1½d

A WORD ON OBEDIENCE TO THE LAW.

THE objects of the laws are limited to the enforcement or restraint of certain specified actions; but public opinion exercises a wider jurisdiction. It takes notice of every imaginable wrong that may arise, and is a kind of imperial court, open on all sides, and to which every one has access. But whether redress is sought from the law, or from general sympathy, it is essential, in the first place, that the applicant himself should not be an offender, that he should come into court with clean hands, and not have provoked, by his own misdoings, the injury of which he complains. It is also essential to justice that it be sought peaceably, not with tumult or outrage. The ancients used to say of Jove, that when, in disputes, he took his thunder, it was a sure sign that he was in the wrong; and it is not less certain that the suite of an individual is prejudiced by force and clamour. Amidst noise and violence, indeed, it is obvious there can be no equitable adjudication, no investigation of the merits; neither accusation nor defence can be duly heard. Hence, the first step on a trial in an English court, is the old proclamation of *Oyez!*—that is, "hear ye"—be silent, peaceable, and attentive. Peace and order are plainly so necessary to the settlement of controversies, that we invariably find the spectators on all sides, whatever may be their prepossessions, readily lend their aid to secure this indispensable preliminary to just decision.

The predominance of this feeling has been strikingly evinced during the late protracted struggle between the work-people and their employers. While the danger of violence was impending, there was no disposition in any party to discuss the merits of the dispute. Differences of opinion might exist as to the points at issue, but the necessity of postponing the discussion of these to the more urgent duty of maintaining the general peace, was obvious to all. Upon the utility of this at least there could be no hesitation, either among magistrates, public writers, or intelligent individuals. Whatever might be the pretension of the conflicting parties, neither must be permitted to commit a manifest outrage on its opponent. The general industry, order, and security must not be subverted or endangered at the arbitrary will of any separate interest or class, however great or multitudinous.

The law is supreme, and to that all must defer. Judges and juries have been instituted; courts of session, of assize, and circuits, have been fixed, to hear and determine all wrongs, and no one must be allowed to judge his own cause, or redress his own injury. The more civilisation advances, the more manifest the duty becomes of a universal submission to legal authority. Private wars, duels, assassinations, incendiarisms, malicious injuries to property, and retaliatory outrages of every kind, are the barbarisms of a past age, the remnants of an imperfect judicial system, or of a crude social organisation. Until lately, it was thought that certain minor offences might be safely left to individual discretion and correction; that, for example, stealing a pocket-handkerchief, robbing an orchard, or wantonly breaking a window, might be summarily and adequately punished by a box on the ear, or a flogging from the injured party; but experience evinced the inconvenience of this sort of wild justice, as well as of the stocks, the pillory, the ducking-stool, the pump, and the horse-pond, and the advantages that would ensue by bringing even juvenile delinquents before the regular tribunals. It tended to augment nominally the annual number of offenders, but its general expediency is founded on these obvious and apparently satisfactory considerations: First, that men immediately after, and while smarting under the excitement, of an injury, are in a very unfit state to apportion or inflict the punishment; and, secondly, that this kind of self-redress, from its natural tendency to unfairness or undue severity, fomented ill-blood and quarrels among neighbours, perhaps engendering feelings of revenge and retaliation. Whereas, by bringing the offence before an established court, the apple of discord is at once abstracted, and the punishment, whatever it may be, is acquiesced in as that of a temperate and unbiassed judge.

Our American neighbours, spite of their occasional deviations into Lynch law, are generally impressed with the supremacy of legal authority. A late tourist mentions an instance of ready obedience to its mandates, by one of a class not exemplary for peaceable demeanour. It was the arrest of a "navigator," or labourer on canals and railways, for debt. The constable approached, and laying hold of him, said, "I take him in the name of the state." The fellow-workmen of the unfortunate defaulter looked at him for some time, and then one of them said, drily—"I guess you must go with the constable." Subsequently, Mr Ferrall heard a disturbance in a tavern at New York, and wishing to see the process of capturing refractory citizens, went in. The constable, unsupported by any of his brethren, merely placed his hands on the shoulders of the combatants, when they separated, fell into the ranks, and walked off with this humble instrument of power like a flock of sheep. All this, it is well known, is not the result of any mean or recreant spirit in the people, nor of blind obedience to the terror imposed by arbitrary rule; but is more likely the offspring of deliberate reason, of a conviction that all are benefited by maintaining respect for the laws that protect and govern all, and that no single person or class can with propriety set up their own self-will or imagined interests, in defiance of those public ordinances which are the expressed will and embodied interests of the entire community.

Feeling deeply interested in the welfare of the operative orders, and having been always ready, to the best of our ability and judgment, to give publicity to suggestions likely to accelerate their elevation, it will be with reluctance that we arrive at any conclusions to their disadvantage, or give currency to any sentiments in this journal likely to place them under a disparaging aspect. Trying, however, the progress of the late commotions by those simple elements of justice and of common right that we have endeavoured to explain, we cannot conceal our impression, that serious errors have been committed from inadvertence, misguidance, or want of useful information. It would be out of place here to discuss the economical questions involved; but, even granting that the views on these questions entertained by the authors of the tumults are right, for which there is not the authority of a single writer of reputation, there still would remain a dreadful error with regard to proceedings. In all instances, the movements have been originated by parcels of the working classes only, the men of one place or factory, or a portion of them, often, we believe, by a very small number, though the discontent, it may be admitted, was probably more general. Now, these persons would have a perfect right to discontinue labour if they choose, and even to use all proper means to induce others to discontinue labour too; but they have no right to *force* others to discontinue their labour. Here it is that their great mistake lies, and it is one which no sophistry can extenuate. It may be true that, while others work, their object cannot be accomplished; but that forms no justification. By interfering with the right of others to work, and to work at what rate they choose, they strike at the root of one of the first rights of man. It is a violation of natural right which no state could tolerate and live. Against such a movement—against the attempt to substitute the dominion of force for the dominion of reason—the reign of terror for the reign of law—society must ever be arrayed, and if arrayed, all opposition to its decrees must ever be speedily and inevitably crushed.

For these unreasonable assumptions, we can only account by ascribing them to the cause already hinted at, namely, an inattention to, or, perhaps, in some an ignorance of, the principles and laws sanctioned and instituted for the common benefit. Of principles we may have already said enough, and next, probably, we shall render a useful service by giving a short and simple exposition of the laws made for the general peace and security. These laws we shall find, for the most part, wisely framed, not for the good of masters only, but of workmen: in short, of every body; securing liberty to all, tyranny to none; allowing every person as much freedom as is compatible with the exercise of the same freedom by his neighbour; and permitting no one, with impunity, to be injured by fear, restraint, or intimidation, in purse, person, or reputation.

The most important, and generally interesting, are the laws for individual security, especially those for protecting from *bodily harm*. Merely to threaten or menace with personal injury, through fear of which a man's business is interrupted, is an offence for which legal compensation may be obtained. To constitute an assault, it is not necessary there should be violence; barely to offer it is enough, if coupled with the ability and intention to inflict it. For example, to hold up the fist in a menacing manner, to strike with a cane or stick, though the assailant miss his aim, or throw a bottle, glass, or knife, with intent to injure, are all assaults.

If there be an actual striking or beating, it forms a more aggravated case, which the English law terms a *battery*. But this beating may be very slight, hardly any at all; barely touching the person of another in a rude and angry manner is battery. So watchful is the law against corporal injuries, that every man's person is held inviolate; and no one, without lawful excuse, has a right to meddle with it in the slightest degree.

Change of place, or right of locomotion, is an immunity not less vigilantly protected. To constitute a wrongful detention of the person, it is not necessary to lock a man up in a prison, or bolt the door on him in a room, warehouse, or private apartment; the forcibly detaining a person in the street, though it be only by the collar of his coat or button-hole, is enough to make a false imprisonment.

Personal injuries become aggravated in character if committed with atrocious intentions, or with dangerous weapons. Thus, maliciously to shoot at, or in any manner attempt to discharge any kind of loaded arms, or to stab, cut, or wound any person, with intent to maim, disfigure, or disable such person, or do some other grievous bodily harm, subjects the offender to transportation for life, or not less than fifteen years, or to imprisonment for three years. This law (I. Vict. c. 85, sec. 4), as now expressed, was intended to meet those exhibitions of ruffianly vengeance which, some years past, were unhappily frequent in the northern counties. The same punishment extends to the gross outrage of sending an explosive mixture in a letter by post, through which any person is burnt, maimed, or otherwise grievously injured.

Assaults reach the highest pitch of criminality when coupled with the intention to rob, to murder, or violate the person. Theft, which is privily carrying off, with a fraudulent intent, the property of another, without the owner's consent, does not amount to robbery, unless accompanied with violence. Actual violence to the person, however, or even the exciting of fear in the mind, is not always necessary to constitute a robbery. For if a man, with a sword or pistol, demand and obtain the money of another without touching his person, it is robbery; though there is no consciousness of fear in the party robbed, only an expectation that violence will be resorted to, if the robber be refused or resisted. It is, doubtless, robbery for a mob to enter a house, shop, or warehouse, demanding bread or provisions, provided they are surrendered to them from fear (if they be refused) of violence to the person, property, or habitation. The value of the article taken is immaterial; a penny, as much as a pound, forcibly extorted, makes a robbery.

Security of the person and of the public peace form the chief elements of the social state. The laws, therefore, for the maintenance of general tranquillity, will next claim a brief notice; and, as under the head of assaults, we shall commence with the lesser offences.

Merely to challenge to fight, either by word or letter, or be the bearer of such challenge, is an indictable offence, punishable with fine and imprisonment. If two or more persons actually fight in any public place (in a private place it is only an assault), then they are guilty of an affray. Affrays may be suppressed by private persons; but a constable may break open doors to suppress an affray, and apprehend the affrayers. We thus perceive that the grand object of the law is to compel all parties whatsoever to refrain from the self-redress of wrongs, *to keep the peace;* and that this peace will be as much broken by two persons beating each other, or attempting to injure each other, by mutual consent, as by one person attacking another without his consent. Hence, duelling, though done with the consent or challenge of both parties, is a breaking of the peace, and may be prevented by peace-officers; while the duellists, and all parties immediately concerned in fomenting and abetting the quarrel, are liable in severe punishment.

When breaches of the peace are of a more serious kind, they are denominated an *unlawful assembly, rout,* or *riot.* An unlawful assembly is, when three or more persons meet with a confederated purpose to do some act against the peace with force or violence, or to the manifest terror of the people.* It is not necessary they should execute, or advance towards the execution of the act for which they have met; it is sufficient, if they meet with the intent of violating the peace, or in a manner tending to cause alarm in beholders, to render the assembly unlawful.

If, after meeting, they move towards the execution of such act, whether they execute it or not, then the unlawful assembly becomes a *rout.* Or, according to Hawkins, if the act be executed, a *riot.*

Mere numbers only, if numerous enough to excite general terror, is sufficient to make an unlawful assembly; the legal climax being, that numbers constitute force, force terror, and terror illegality.

If an unlawful assembly amount to *twelve persons,* or more, then the offence is greatly aggravated; and the riot act prescribes a summary and sharp process for dispersing and apprehending the offenders. This process consists in any sheriff, justice, mayor, bailiff, or other head officer, coming among the rioters, or as near to them as he safely can, and with a loud voice enjoining silence, while he reads, or causes to be read, the following proclamation:—

"Our sovereign lady, the queen, chargeth and commandeth all persons, being assembled, immediately to disperse themselves, and peaceably to depart to their habitations, or to their lawful business, upon the pains contained in the act made in the first year of king George, for preventing tumults and riotous assemblies.—GOD SAVE THE QUEEN!"

Continuing together one hour after being so commanded to disperse, subjects the offenders to transportation for life, or fifteen years, or imprisonment for three years. Trying, by force, to hinder the reading of the proclamation, subjects to a like punishment; and persons, knowing of such hindrance, and not dispersing, are equally criminal. If a riotous assemblage actually begin to destroy any building, mine, or machinery, then the punishment is transportation for a term of not less than seven years.†

It has been recently asserted by high authority,‡ and the fact cannot be too extensively known, that it is not requisite for a person to be aiding or assisting in a riot or tumultuous meeting to make him an accomplice in its acts. Voluntarily lending the sanction of his presence to an unlawful mob makes him guilty of participating in all the crimes it may commit; and from which criminal participation he can only defend himself by proving that his presence was accidental, or an unavoidable entanglement in the crowd. Women are equally liable with men. A private person, without warrant or magisterial sanction, may endeavour to suppress a riot; he may disperse those assembled, and prevent others who are coming up from joining the rest. If the riot be general and dangerous, he may even arm himself against the evil doers, to preserve the peace.*

On these laws we shall offer no commentary. Our purpose has only been to make them known, so that no person, without being aware of the danger he incurs, may be innocently involved in their punishments. That such penal consequences may be avoided, it will be the object of another article to establish, first, by showing that discussion and publicity do, in the existing state of society, mostly effect the meliorations which mere physical force did formerly; and next, by proving, from some singular examples of the last fifty years, both the futility and hurtfulness of any class seeking the redress of grievances by violence.

* Burns' Justice of the Peace, vol. v., p. 18, 25th edit.

† Till a very recent alteration of the law, this crime was punishable with death. Although transportation is mercifully substituted in this and many other cases of punishment of crime, it should not be imagined that this mitigated infliction will fall lightly on the heads of offenders. There are some loose notions on the subject of transportation, doubtless arising from the past laxity of the infliction, that seem to require correction. Transportation is now to all intents and purposes *equivalent to going into slavery.* The felon condemned to be transported loses, for the time, his civil rights. Torn from his family, his home, and his country, he is placed at the disposal of the crown and its functionaries; can be put to any kind of labour, however repugnant to his feelings; dressed in the most degrading apparel; chained like a wild beast, if refractory; and, on the commission of any new and grave offence, while in this state of servitude, he is liable to a punishment so summary and severe as to make death almost preferable. It might almost be said that no man in his senses would voluntarily expose himself to the risk of so terrible an infliction as that of transportation, even for the limited period of seven years.

‡ Chief Justice Denman, York Assizes, Sept. 2, 1842.

* Chief-Justice Tindal, Bristol Commission, Jan. 2, 1832.

THE LANCASHIRE WAKES.

WAKES are merry-makings which occur annually in various parts of rural England, sometimes on Sunday, sometimes on one or several of the ordinary days of the week, and are much like fairs in Scotland, excepting that no business is transacted at them. Originally, they were religious festivals, appropriate in each case to the eve of the *day* of that saint to whom the parish church was dedicated; but they have long lost all trace of their pristine character, excepting their occurrence on the same day as in ancient times. The vulgar revels by which they are marked give occasion to the assembling of vast numbers of people from the country round—who may, on the morning of any particular wake, be seen pouring to its scene, on foot, and in all sorts of humble vehicles. In Lancashire, wakes flourish in full vigour, and the nature of the amusements may in part be judged of by the following bills of fare, copied from advertisements posted on the walls, and referring to places within a few miles of Manchester:—

"Failsworth and Newton Wakes.—The public are respectfully informed, that the above wakes will commence on Sunday the 21st of August 1842, and continue the three following days at the Thomas Chatterton's Bull's Head, Failsworth, where they will meet with a choice selection of wines, spirits, home-brewed ale, porter, &c. N.B.—Teetotallers will be supplied with the above with the strictest secrecy. On Sunday, the original Lancashire bell-ringers will be in attendance, and will ring a variety of English, Irish, and Scotch airs, changes, &c. On Monday, the sports will commence with a game at cricket, by boys under eighteen years of age, for a new Guernsey and a straw hat." And so on with sack races, matches at eating hasty-pudding, apple-diving, &c., during the other days, the whole to conclude with a ball.

The next bill, which we copy entire, is headed by an invitation to tippling in doggrel verse:—

> "My beer-butts are full of Sherry-strong beer,
> And my cellars are stored with very good cheer;
> My servants are nimble to wait on you all,
> With meat, drink, or music, whenever you call.

Bradford wakes will commence at the Steam-Engine Tavern, on Monday, October 18, 1841, when the morning will be ushered in with the joyous sport of a donkey race for a new bridle; the best of heats; and no ass will be allowed to enter the lists unless he be a strong, staunch, steady, sound, stout, safe, serviceable, smart, sprightly, spirited, sure-footed, spunky, well-skinned, well-shaped, and of superlative symmetry—to start at eleven o'clock. A quoiting match for a prime leg of mutton; best of twelve quoits, at nineteen yards' distance. A foot race for a new stuff hat; the best of either colliers, printers, rich men, poor men, ploughmen, or cads to run. In the interval, between the above sports, will be a race by ladies, for a new gown. A sack race for one pound of best tobacco. Bumble Puppy for a purse and sweepstakes; no person, except the bowler, to stand within half a yard of the table. Grinning through a horse collar for ale. Treacle-loaf eating for various rewards. Smoking matches, apple-dumpling eating, wheelbarrow races, and a succession of other gambols and sports of the old English school. To conclude each night with a select band of music; country-dancing, quadrilling, and drinking hot punch and ale. By order, *Done Sprightly,* mayor of Bradford."

At Greenside, in Droylsden, four miles east from Manchester, a custom prevails, which those who practise it affirm they brought from Ashton-under-Lyne some twenty-eight years since. During the wakes, two persons fantastically habited, the one as a male, the other as a female (both are men), appear in the village on horseback engaged in spinning. As they spin, they conduct a rustic dialogue in limping verse, and gather contributions from the spectators.

DIALOGUE RECITED AT GREENSIDE WAKES.

"'Tis Greenside Wakes, we're come to the town
To show you some sport of great renown;
And if my old wife will let me begin,
I'll show you how fast and how well I can spin.
Tread the wheel, tread the wheel, dan, don, dell O."

"Thou brags of thyself, but I don't think it's true,
For I will uphold thy faults are not a few;
For when thou hast done, and spun very hard,
Of this I'm well sure, thy work is ill mar'd.
Tread the wheel, tread the wheel, dan, don, dell O."

"Thou'rt a saucy old jade, and pray hold thy tongue,
Or I shall be thumping thee ere it be long;
And if that I do, I shall make thee to rue,
For I can have many a one as good as you.
Tread the wheel, tread the wheel, dan, don, dell O."

"What is it to me who you can have?
I shall not be long ere I am laid in my grave;
And when I am dead you may find if you can
One that'll spin as hard as I've done.
Tread the wheel, tread the wheel, dan, don, dell O."

"Come, come, my dear wife, here endeth my song,
I hope it has pleased this numerous throng;
But if it has missed, you need not to fear,
We'll do our endeavour to please them next year.
Tread the wheel, tread the wheel, dan, don, dell O."

The most picturesque observance at wakes is the rush-cart with its noisy retinue. The practice of gathering rushes, and conveying them in rustic pomp through the village, had a religious origin. In earlier times, the churches being as destitute of wood or stone floors as they were of pews, it was usual to strew them with rushes; and the providing of these, in the decline of the year, was regarded as a sacred duty. They were gathered by the inhabitants, and taken with much ceremony to the church, where they were kept and used. The occasion has passed away, but the custom remains. The publicans find the rush-bearing too profitable a thing to allow of its becoming extinct; and in this, as in most other popular amusements in Lancashire, they are the moving cause of the ceremony, and the love of beer seems the sole inducement of the actors. In order to spend an evening or two in the gratification of the lowest appetites, they degrade themselves into buffoons, and toil up and down the street or village till compelled to stop from mere exhaustion. We lately witnessed one of these exhibitions. A landlord had provided the cart and rushes, in return for which the party were all to make his house their quarters till the end of the festivities. Two men had been appointed by him as masters of the ceremonies, who hired a band of musicians, provided banners, &c., paying all and receiving all, and finally accounting to the landlord, whose servants they were. In the procession, these two men led the way, dressed in plain clothes, with the exception of their hats, which were decorated with blue ribbons; each carried a small mahogany box to receive contributions. Next came two men bearing a large banner, which, from its devices, appeared to belong to some club. Three men followed, each carrying an elegant ornamental frame-work made up of coloured paper, ribbons, and flowers. Then came the band, consisting of eighteen performers, dressed in a military garb. After the band were the morris-dancers, no less than twenty in number, who looked at a distance like so many moveable masses formed of ribbons, flowers, and coloured papers. During the time they spent in dancing, one grotesque-looking mortal remained almost motionless, who, in answer to our inquiries, informed us that, from time immemorial, he had borne the office of fool, that he did business on his own account, and should commence his performances when the others had finished theirs. If we may judge from the sound and appearance of his two ample pockets, his folly is better repaid than the wisdom of most of his fellows. His cap was of the true cut, and bore the usual bells. Round his waist was a crimson silk scarf, from which hung two large tassels of the same material. A broad blue ribbon passed over his breast, having a large medal suspended from it. One leg of his trousers was of a bright pink colour, the other yellow. The sleeves of his jacket were slashed scarlet and green. In his hand he bore the skeleton of an immense umbrella. The cart followed, newly painted for the occasion a bright scarlet, and drawn by four very fine horses, with blue nets over them, and white nets on their ears, glittering with their brass ornaments and bright ribbons. Two drivers, one on each side, dexterously handled and slashed their whips, which were bedecked with white bows. On the top of each horse's head was a tastily-framed ornament, about two feet high, jingling with brass bells. The rushes are piled in the cart in a very peculiar manner, and have a beautiful appearance. They are framed into something like a sugar-loaf, cut down the middle, and having its two flat sides turned outwards. On the top were seated three men holding banners. The side of the rushes in front of the cart is hung with white drapery, presenting, suspended, all manner of little valuables, collected and borrowed for the occasion, such as silver spoons, plated cups, brazen candlesticks, &c. The back part of the rushes was decorated with the letters V. R., beautifully formed of dahlias and African marigolds. The lofty and heavy mass of rushes was kept in its place by six men, three on each side, holding and supporting it with ropes. In some instances rival trains of rush-bearers come into conflict, and confusion and bruises are the consequence. The day is spent in parading wherever there is a hope of levying contributions on folly or good nature, and at night the drinking and revelry which continued through the day are consummated in intoxication.

The wake of the parish of Manchester was put down by a local order in 1579, and allowed quietly to pass into disuse; but in the neighbouring parish of Eccles, the observance has, under the influence of gentlemen in the vicinity, been converted into horse-racing and a fair, though the place retained, longer than most others, the peculiar attributes of the wakes of former days. The church of Eccles is dedicated to the Virgin Mary, at or near whose festival—namely, on the first Sunday in September, and the three following days—the wakes are celebrated.

Gyst-ale, or guising, was a custom which once prevailed in Eccles, consisting in processions and revelry at the end of the season for marling and manuring the land. Those who took part in those festivities were gaily and grotesquely dressed, and were accustomed to display all the finery and valuables they could command for the occasion. With their neighbours of Barton, the guisers of Eccles were wont to maintain a species of rustic emulation, which almost became a feud. On one occasion, it appears that the parade connected with the silly contest cost Barton £644, and Eccles £1881, which sums were gratuitously contributed by persons of substance in the neighbourhood.

In proceeding to Eccles to view what is still called the wakes, we passed by the old May-pole at Pendleton, which now wears a dreary and unpicturesque aspect, stripped, as it is, of all its honours, and rising, like a solitary, sad, and blighted monument of the past. Our course lay in a direction west from Manchester, for Eccles, the object of our visit, lies between that town and Liverpool, and is the first place which you pass on the railway which runs between these two cities. Taking the road to the left, some small distance from Pendleton Pole and Church, we passed through a turnpike, having caught an extensive view of a flat but eminently rich country, and entered on a well-made road, adorned on both sides by the grounds and mansions of some of the wealthiest manufacturers and gentry. On our left we saw Bride Hill, the seat of Sir Thomas Potter, the first mayor of Manchester, whose luxuriant and well-stocked fields show that their owner has not lost, in the press of business, the agricultural tastes which his early breeding led him to form, and which, indeed, the discerning observer can still discover traces of alike in his general manner and in his conversation. On our right lay Claremont, the elegant residence of Sir Benjamin Heywood, whose name is permanently linked with the history of Manchester, as one of its wisest, most steady, and most consistent benefactors. Passing other mansions, we came to a part of the road which would have been entirely devoid of interest, but for one or two cottages, that owe their attractions to the trees and flowers which grow in their front; caught a sight of the tower of Eccles church, and soon found ourselves at the end of our ride. The village is little more than a long double row of houses, and possesses few objects worthy of notice. "Eccles cakes," indeed, seem to be a favourite dainty. We had seen these tempting compounds of flour, treacle, lard, and currants, displayed in many places, and were now made conscious that we had reached the spot whence they took their origin and name. In the manufacture of the article, rivalry appeared to have gone beyond the bounds of propriety; for we read, emblazoned on the front of a shop on the left hand, "The old established Eccles cake-maker *removed from the opposite side;*" while a sign threw out its fierce defiance, standing over against the other, and affirming itself to be "The old established Eccles cake maker *never removed.*" Leaving the antagonists to settle for themselves their rival claims, and rejoicing to learn that there was business for both, we found the place encumbered with carriages of all descriptions, and crowded with persons of every age and many conditions in life. The public houses were full, and in these, according to the Lancashire custom, women sat mingled with the men, performing their full share in smoking and brawling, if not in drinking. Songs, in which the vulgarity of the sentiment was equalled by the harsh dissonance of the voices, were heard on every side. One of these ditties, squeaked by a limping ballad-monger, which I had the curiosity to purchase, was entitled "The Humours of Eccles Wakes," and ran as follows:—

In August last being holiday time,
And being myself a young lad in my prime,
To see Eccles wakes it was my intent,
So I dressed in my best and away I went.
Chorus twice.—With Ned and a few men,
And Robin the plough-man,
And Sally, and Alley, and Mall.

Each lad took his lass as we passed along,
And when we came there it was wonderful throng;
There were some crying "Eccles," some "Banbury Cakes,"
For the lasses and lads that attended the wakes.
Chorus.—So Ned treated Sally,
And Bob treated Alley,
And *I* bought a Banb'ry for Mall.

Yon fine dressy work-folk from Manchester town,
They strutted as if the whole wakes were their own;
Putters-out, warpers, yea cutters and all,
Dress'd like masters and dames, jeer'd both me and my Mall.
Chorus.—I ne'er saw their fellows,
They spread their umbrellas
Ere rain from the elements fall.

The Bellart ere long tied the bull to the stake,
The dogs were set at him some pastime to make;
He jostled about, gave a terrible roar,
Tossed the dogs in the air, and the folk tumbled o'er.
Chorus.—Such squeaking and squalling,
Such pulling and hauling,
I ne'er in my life saw before.

Mrs Race* in the dirt spoiled her mousseline gown,
Mrs Warpingwell had her new petticoat torn;
Their spouses, poor creatures, in quitting the mob,
Had their coats torn to spensers, robb'd Stitch of a job.
Chorus.—Rent aprons and shawls,
Which they got in their falls,
Made many poor wenches to sob.

But stop, my good folks, the fun ended not here,
For a Banbury merchant attending the rear,
Crying, "Buy now, or toss," which the bull chanced to spy,
Gave his basket a *toss*, for he chose not to *buy*.
Chorus.—I thought to the wakes
There were coming with cakes
Confectioners down from the sky.

Next followed the race for a leathern prize;
Tits enter'd the field amid bustle and noise;
"Now, Bobbin!" "Now, Short!" "Now, Ball!" was the cry,
But Bobbin beat Short, and Ball pass'd them both by.
Chorus.—Disputing who'd won,
Soon to fighting they run,
And the winner came off with black eyes.

When racing and fighting were all at an end,
To an alehouse each went with his sweetheart or friend;
Some went to Shaw's, others Phillips's chose,
But me and my Mall to the Hare and Hounds goes.
Chorus.—With music and cakes
For to keep up the wakes,
Among wenches and fine country beaux.

According to the song, there were, on the present occasion, not a few "dressy work-folk from Manchester," but the majority were from the neighbouring villages and hamlets, many of the girls with white frocks, blue stockings, and clogs; while the young men were, for the most part, in velveteen jackets and scarlet waistcoats, adorned with pearl buttons and other elegancies to match.

Horse-racing appeared to be a prime element in the amusements of the day; and on the course we found a somewhat superior order of persons on foot and horseback, engaged as onlookers or in betting on favourite horses. Gambling, indeed, may be said to be the grand business of the Eccles Wakes. The means for indulging in games of chance prevailed in every quarter. Those who had but a penny to lose might lose that penny, and those who had the command of hundreds were encountered by corresponding temptations. Booths for the monied gamblers were on a large scale, with every expedient for secrecy, and every precaution against detection. It is almost needless to add, that much money must have been lost and won, to the injury, in either case, of those who yielded to the temptation. The amusements in other parts of the wakes were such as require no description, and it is enough to know that they were all such as ministered to the gross tastes of an uneducated population. On quitting the scene, I could not help lamenting that the providing for popular amusements should lie almost exclusively with publicans, itinerant players, and generally with those who live on the vices and degrading pleasures of the people. Until harmless recreations be regularly provided for by the respectable classes, and a better example be set, the wakes, with all their vitiating tendencies, as a matter of course, will continue.

STORY OF A SOLDIER.

In travelling some years ago in the south of France, it chanced that I was one day compelled to leave the diligence in which I had just started to return from Montpellier towards Paris. My health had been for some time unsettled, and the journey was undertaken somewhat rashly, particularly as neither friend nor personal attendant was with me at the time. The consequence was a stoppage to my travel. I had borne up for a time at the cost of much suffering, but was forced, when about thirty miles on my way, to take advantage of my arrival at a small neat-looking village, and make a halt. The cabaret before which I landed was very clean and promising in its appearance, and I flattered myself that, if necessitated to stay a few days, all would be right and comfortable in such quarters. But I was disappointed in my expectation of getting these quarters. The only two beds in the house fit for an invalid were taken up by strangers.

"What is to be done, then, good hostess?" said I; "here I must remain, sleep where I may." "I know not what to do, sir," was the reply; "though it *is* possible that one of the strangers may give up his bed to you." "I should not like to be troublesome; but"—— The hostess interrupted me by calling to an elderly man who sat on a bench at the door in conversation with another person. "Jaques," cried she, "come hither. Here is a gentleman wishes to have a bed. We have no spare one; can Bertha put him up?" The individual to whom these words were addressed was a fine hale-looking man, about fifty or so. He had that uprightness of deportment which at once marks the veteran of war. "I doubt not but Bertha can give him quarters for a night or two, if he wishes it," said Jaques in a cheerful tone; and he looks ill, too; but Bertha will take care of him, I promise him, if he can get her to take him in charge." "Well, well; show the gentleman the way to your cottage," returned the hostess; "but Jaques, don't *promise* too much. You are not famous for keeping promises!" "*Ma foi*, nor are you!" retorted Jaques; and the pair showed their teeth at once in a peculiarly broad and hearty laugh. "You will find everything comfortable, sir, with Jaques and his dame," said the hostess, when she had brought her merriment to a close. And so I was handed over at once to my new friend, nothing reluctant, I must say; for I liked his countenance, and was even better pleased at the thought of lodging in a cottage than in a cabaret, however neat and cleanly.

I did find everything comfortable in the cottage of Jaques. His wife, a tidy, round-faced, pretty matron, well nigh ten years younger than himself to appearance, made me welcome with a degree of ready warmth which highly gratified me. She seemed just the very person for an invalid to quarter himself with; and so I found it to be. But enough of myself—to my story.

In passing occasionally between the cabaret and the cottage of Jaques during the few days of my residence there, I had an opportunity of hearing the hostess and Jaques repeat their significant banter, once or twice, regarding *promise-keeping*. It seemed to be a standing joke between them of a venerable age. This excited my curiosity; and I one day asked Monsieur Jaques if it meant anything particular which it was proper to tell me. "Oh, yes; proper enough to be told," said Jaques with a laugh; "but it is a long story, and I fear would weary your honour." "No fear of that," said I; "I am an untirable story-seeker." Thus encouraged, Jaques related to me his history.

"I was drawn for the conscription," said he, "in my nineteenth year. That was no very advanced age, sir; yet, before that time, I had contrived to imagine myself in love, and to make all sorts of weighty vows of fidelity to a pretty little cousin of my own, who had then just reached her fifteenth year. Well, I was drawn for the wars, as I said; and, though man enough to be a soldier, I was child enough to cry, with great earnestness and sincerity, when I came to part with my pretty cousin Marie. We had no help for it, however, so we promised to be faithful as never two were before, and we separated.

The emperor—(continued Jacques, touching his hat as if his living master had been before him to receive the salute)—the emperor was at that time fighting all the world, and beating all the world, and I followed him for many a long day, without ever seeing home, and without ever hearing a word from home that could be depended on. Through all Italy and Germany I followed the heels of my master, liking the occupation very well after I had once got accustomed to it. The thing that kept us comfortable, sir, was, that we never had any fears of being beaten while the emperor was with us. But though not beaten, one can be wounded; and so it was with me sometime before the emperor entered Berlin. I did not go into hospital, however, but preferred going about with my comrades, concealing my hurt, though I suffered much; but in Potsdam all this sort of work came to an end. I was quartered in the town; and when the emperor moved on and entered Berlin, I was unable to follow. My wound—it was in the arm, sir—became so bad that I could not move; but I had fallen into good hands.

The house in which I was lodged certainly promised little to appearance. It was the humble home of a poor woman, who, as the widow of a Prussian sergeant, received a small pension, upon which she and her daughter subsisted. The widow was aged and feeble; and when I was laid on a sick-bed in the house, poor Bertha had two couches to attend. But she was born to do kindnesses; she was the best of nurses. You have had a little experience of that, sir?" continued Jaques, interrupting his story to address me. I nodded assent, and he went on. "I had not precisely forgot Marie by this time, sir, though constant employment and absence had certainly done something to banish her from my thoughts. She might have been dead long since, too, for aught I knew. Hence it was, that there was little to stand out against the impression that Bertha's good looks and kind nursing were calculated to make upon me. However, I never told her that I loved her, though I believe she saw it. Nor did she ever tell me, in her pretty broken French, that she loved me; but I confess that I thought she did. But all this came to a crisis. I recovered the use of my arm, and was obliged to move on to Berlin. With tears in our eyes, Bertha and I parted by the side of her poor sick mother's couch; and with some convalescent companions who had been left at Potsdam with me, I mounted a baggage-waggon for Berlin.

We had yet some of our companions left at Potsdam in a bad state. That circumstance had an important effect as regarded me. Three or four days after I had reached Berlin, one of these invalids came up with us, and soon after sought me out. 'I have a token for you,' and he gave me a lock of hair, which I soon saw to be Bertha's. 'A girl came and gave me this for you,' continued my comrade, 'and bade me tell you that her mother was dead.' This information produced a strong effect upon me. Bertha was now alone in the world; she had no one to protect or care for her; her mother's pension would cease; what would become of her? These questions, which I asked at myself, threw me into a state of inexpressible agitation; and finally, to be brief, sir, I mounted my horse (for I had been early transferred from a foot to a dragoon regiment), and contrived to make my way back to Potsdam. I say contrived; for, had my purpose been known, I should have been prevented most assuredly. But I did make my way to Potsdam;

* Race—a term in fustian cutting.

and when I returned, it was with Bertha, my wife, as I had made her, behind me.

I had been too long away on this occasion for my absence to have passed unnoticed. In fact, I was immediately seized and thrown into confinement as an intending or actual deserter. What, then, did my poor Bertha do, sir? She had the courage to go to the Little Corporal himself; she found access to him; she threw herself at his feet, and told all that I had done—out of gratitude, she said, for her care of me. And *he* (continued Jaques, again touching his hat at the mention of his hero's name)—he, who had then on his hands the affairs of empires, he condescended to listen to her—to hear the whole story of his poor soldier. He sent her away without a positive answer; and though he spoke in a kindly way, poor Bertha was dreadfully frightened. But on that same evening the emperor's own surgeon came to examine my arm, and next day I received my discharge, with a pension.

In the hurry and excitement of my feelings throughout this entire business, I had entirely forgot poor Marie; but as I returned slowly towards my native village with Bertha, you may be sure that I thought of little else, and began to look on myself as something of a rascal. I daresay Bertha then feared that she had got a sulky bargain of me; for many a time and oft she questioned me about my low spirits. At length we got home—to this village, sir. I stopped at an inn; nobody knew me. There was a question on my tongue which I wished, but found it difficult, to utter. I did not wish that Marie might be dead, but I heartily prayed that she might be married. Alas! when I asked the question, of a villager, the answerer not only told me that 'she was still unmarried,' but, seeing me to be a soldier, added, that 'she was engaged to her cousin, a soldier who had been long at the wars.' As there existed a necessity, however, for coming to explanations, I left Bertha at the inn, and, covered by the shades, moved, with rather slow steps, towards the home where I expected to find my mother, my brother, and my sisters. I found them all safe and well, and with them none else but Marie. Everybody welcomed and embraced me, Marie among the rest. 'Ah!' thought I, as I returned her embrace, 'poor thing, she loves me yet, and little knows what a rascal I have been! But out it must come.' So I asked her, with a stammering voice, if she remembered our engagement. Marie answered 'Yes,' in a low tone, and covered her face with her hands. My brother Michael, too, said, rather tartly—'Oh, we remember that childish engagement.' I made no answer, but went on, in a very stuttering way, to tell how much I had been obliged by one, when far from home; and finally, I got out that I was—married! Marie had never taken her hands from her face while I spoke; and imagining that she was going to give way to an awful explosion of grief, I was about to close my confession with some penitent and consoling words, when suddenly the hands were removed, and a face more full of smiles than tears was disclosed to me. 'Oh! Jaques, tell me, are you really married?' 'Yes', said I, amazedly, thinking she must be going into hysterics. 'Oh! you dear Jaques! you dear Jaques!' cried she, while at the same time my brother Michael came up to me, and, with most extraordinary warmth, shook me again and again by the hand. 'We have been both alike,' exclaimed Marie; 'but we thought you dead.' It proved, indeed, to be the case that Marie, as she grew in years, had forgotten her childish attachment, and that my brother Michael and she loved each other with something of a real and serious love; but they would not marry till they heard some tidings about me. My arrival, a married man, solved the difficulty to their great delight. 'Go, bring Bertha to us,' cried Marie; 'I am dying to embrace her!' I was not long in bringing Bertha to her friends.

My brother Michael is landlord of the little inn over the way, sir, and you may guess who his wife is, and why we rally each other about *broken promises*. Now you have my story." Jaques was a happy man.

PRECAUTIONS IN THE "DUSTY TRADES."

THE following highly useful observations on the best means of preserving the health of operatives employed in what are termed the "dusty trades," occur in the late Report on the sanatory condition of the labouring population, and are well worthy of attention.

In some of the "dusty trades," the excessive amount of premature mortality is so great as to justify interference, defensively, as against the charges which, from the neglect of sanatory measures, fall neither upon the employer nor upon the consumer, who directly benefit by the produce of the industry, but upon rate-payers, to whom the manufactory itself may be a nuisance. In the instance of such trades, personal cleanliness is so far requisite as to justify an additional rate of insurance where it is neglected. Yet the regulations preventive of disease are by no means onerous, either in their cost or their interference with the processes. Some of the noxious manufactures, and especially those in lead, have been the subject of examination by the "Conseil de Salubrite" of Paris, and the preventive rules they prescribed were as follows:—1. The establishment of a good ventilation in the workshops or manufactories. 2. Exacting from the workpeople close attention to personal cleanliness, obliging them to wash the hands and face before dining and before leaving the workshop; forbidding them taking any of their meals in the workshop, and, by reasoning and information, directing their attention to the dangers by which they are surrounded. 3. Employing the practicable means for conducting the processes so as to raise the least dust possible. 4. Boarding off the mills and sieves, so as to prevent the escape of the smaller particles. 5. Requiring of the workmen engaged in the processes where there is lead dust, or any other injurious dust suspended in the air, that they cover the nose and mouth with a handkerchief slightly moistened. 6. Subjecting the workshop to occasional medical inspection, in order to prevent the intensity of any maladies that break out; and with that view to examine the workmen from time to time, to detect any symptoms of disease, and to oblige the workmen attacked to abstain from work until the medical officer declares that they may resume it without inconvenience. 7. Obliging workmen to wear frocks or blouses, which they should leave in the workshop when they quit work; and these blouses should, from time to time, be washed. 8. Sending away from the workshop every workman who gives himself up to debauchery or drunkenness. 9. Endeavouring to get the workmen (that is, workers in lead) to form the habit of drinking every day, on leaving the workshop, a little hydro-sulphureted water, to neutralise the effects of the lead that may have been taken into the stomach. All these regulations, with the medical attendance for the purpose of prevention, would be greatly below any charge of insurance to the individual workman for procuring medical attendance and remedies when thrown out of work by sickness. In some of the trades, scattered instances of attention to cleanliness and measures of prevention are found—for example, amongst the journeymen painters. In answer to a question put by Dr Mitchell to Mr Tomlins, the clerk to the Painters' Company, whether painters suffer so much as formerly from the disease to which they are peculiarly liable, the clerk says:—"Not so much as formerly. This has been ascertained by a charity administered at Painters' Hall to men labouring under sickness. Formerly, they would throw their clothes on their beds, and go to their meals without washing their hands. A large proportion of the journeymen now carry a working-dress to their job with them, and when they quit work at night, they exchange and put on clean clothes which are free from paint. This applies more particularly to the westward of Temple-bar. One master painter of my acquaintance, Mr Thornton of Doctors'-commons, keeps a pail of solution of potash in his shop, in which the men wash their hands, and which takes off every particle of paint; and it is worthy of remark, that only two men in twenty years have been afflicted with paralysis in his employ. This is taken from fifteen men constantly employed on an average for seven years."

DICKENS'S NOTES ON AMERICA.*

WHEN Mr Charles Dickens—the immortal Boz—announced his design of visiting the United States, it was universally anticipated that he would produce a work more graphically descriptive of the American people, their manners, and habits, than any writer, however able, who had perambulated the world beyond the Atlantic. Public expectation has had but a brief period to wait. Boz visited the states in the spring and summer of the present year, and while the leaves of autumn are rustling in the breeze, his book has appeared to the delight of all eyes. And what kind of a book is it? is the general inquiry. We fear that, as in other cases in which expectation is too tightly bent, there will be some disappointment. Boz says nothing of his own personal intercourse with society; simply describing the main features of his excursion, he reveals no secrets of private life, pampers no prejudices, emits no sarcasm, and, to use his own words, dedicates his production to those, who, while giving him a friendly welcome, "left his judgment free, and who, loving their country, can bear the truth when it is told good-humouredly and in a kind spirit." There is a straightforward manliness in these sentiments, which all must admire; and not more so than the manner in which the writer acts up to them. He esteems the Americans for many excellent qualities, but he also lays bare the odious features in some parts of their policy, and just the more poignantly from the perfect sense of justice and propriety with which he is evidently guided. It would be impossible, we think, for any man, unwarped by the grossest prepossessions, to take offence at one word he utters. Our pages are limited, and we have little hope of being able to do justice to the force or beauty of Mr Dickens's "notes," excursive as many of them are, but we shall do our best to offer a few random passages to those readers whom circumstances may have prevented from seeing the volumes themselves.

Mr Dickens chose an unpropitious season for his voyage, the month of January, when boisterous weather and all the agonies of sea-sickness might reasonably have been expected. As it chanced, the ocean was in a rather worse humour than usual, and the scene, accordingly, on board the Britannia steam-packet was, as we are told, a happy mixture of the horrible and the ludicrous. Dickens is quite at home in the description, however much he was abroad while on the turbulent bosom of the deep. Hear him:—

"It is the third morning. I am awakened out of my sleep by a dismal shriek from my wife, who demands to know whether there is any danger. I rouse myself, and look out of bed. The water-jug is plunging and leaping like a lively dolphin; all the smaller articles are afloat, except my shoes, which are stranded on a carpet-bag, high and dry, like a couple of coal-barges. Suddenly I see them spring into the air, and behold the looking-glass, which is nailed to the wall, sticking fast upon the ceiling. At the same time the door entirely disappears, and a new one is opened in the floor. Then I begin to comprehend that the state-room is standing on its head.

Before it is possible to make any arrangement at all compatible with this novel state of things, the ship rights. Before one can say, 'Thank Heaven!' she wrongs again. Before one can cry she *is* wrong, she seems to have started forward, and to be a creature actively running of its own accord, with broken knees and failing legs, through every variety of hole and pitfall, and stumbling constantly. Before one can so much as wonder, she takes a high leap into the air. Before she has well done that, she takes a deep dive into the water. Before she has gained the surface, she throws a summerset. The instant she is on her legs, she rushes backward. And so she goes on staggering, heaving, wrestling, leaping, diving, jumping, pitching, throbbing, rolling, and rocking: and going through all these movements, sometimes by turns, and sometimes all together, until one feels disposed to roar for mercy. A steward passes. 'Steward!' 'Sir!' 'What *is* the matter?—what *do* you call this?' 'Rather a heavy sea on, sir, and a head-wind.' A head-wind! Imagine a human face upon the vessel's prow, with fifteen thousand Sampsons in one bent upon driving her back, and hitting her exactly between the eyes whenever she attempts to advance an inch. Imagine the ship herself, with every pulse and artery of her huge body swollen and bursting under this maltreatment, sworn to go on or die. Imagine the wind howling, the sea roaring, the rain beating; all in furious array against her. Picture the sky both dark and wild, and the clouds, in fearful sympathy with the waves, making another ocean in the air. Add to all this the clattering on deck and down below; the tread of hurried feet, the loud hoarse shouts of seamen, the gurgling in and out of water through the scuppers, with, every now and then, the striking of a heavy sea upon the planks above, with the deep, dead, heavy sound of thunder heard within a vault—and there is the head-wind of that January morning."

While such was the state of matters out of doors, the occurrences within were equally heterogeneous; but they can only be glanced at, "such as the breaking of glass and crockery, the tumbling down of stewards, the gambols overhead of loose casks and truant dozens of porter, and the very remarkable and far from exhilarating sounds raised in their state-rooms [cribs little larger than coffins] by the seventy passengers who were too ill to get up to breakfast." To vary the delights of the voyage, one evening, about sunset, when above ten days out, a storm comes on in fearfully increasing fury, except during a lull of an hour a little before midnight:—"There was something in the unnatural repose of that hour, and in the after-gathering of the storm, so inconceivably awful and tremendous, that its bursting into full violence was almost a relief. The labouring of the ship in the troubled sea on this night I shall never forget. 'Will it ever be worse than this?' was a question I had often heard asked, when everything was sliding and bumping about, and when it certainly did seem difficult to comprehend the possibility of anything afloat being more disturbed, without toppling over and going down. But what the agitation of a steam-vessel is, on a bad winter's night in the wild Atlantic, it is impossible for the most vivid imagination to conceive. To say that she is flung down on her side in the waves, with her masts dipping into them, and that, springing up again, she rolls over on the other side, until a heavy sea strikes her with the noise of a hundred great guns, and hurls her back—that she stops, and staggers, and shivers, as though stunned; and then, with a violent throbbing at her heart, darts onward like a monster goaded into madness, to be beaten down, and battered, and crushed, and leaped on by the angry sea—that thunder, lightning, hail, and rain, and wind, are all in fierce contention for the mastery—that every plank has its groan, every nail its shriek, and every drop of water in the great ocean its howling voice—is nothing. To say that all is grand, and all appalling and horrible in the last degree, is nothing. Words cannot express it; thoughts cannot convey it. Only a dream can call it up again, in all its fury, rage, and passion."

Fortunately no serious damage is sustained, and the well-managed vessel at last glides smoothly into Halifax harbour, with colours gaily flying—"the sun shining as on a brilliant April day in England; the land stretched out on either side, streaked with light patches of snow; white wooden houses, people at their doors, telegraphs working, flags hoisted, wharfs appearing, ships, quays crowded with people, distant noises, shouts, men and boys running down steep places towards the pier, all more bright and gay and fresh to our unused eyes than words can paint them. We came to a wharf, paved with uplifted faces; got alongside, and were made fast, after some shouting and straining of cables; darted, a score of us, along the gangway, almost as soon as it was thrust out to meet us, and before it had reached the ship—and leaped upon the firm glad earth again!"

Proceeding shortly to Boston, Dickens finds much to admire in the handsome appearance and social arrangements of the capital of Massachusetts. The politeness of the custom-house authorities is the first novelty that attracts attention:—"In all the public establishments of America, the utmost courtesy prevails. Most of our departments are susceptible of

* American Notes for General Circulation. By Charles Dickens. 2 vols. London: Chapman and Hall. 1842.

considerable improvement in this respect; but the custom-house, above all others, would do well to take example from the United States, and render itself somewhat less odious and offensive to foreigners. The servile rapacity of the French officials is sufficiently contemptible; but there is a surly boorish incivility about our men, alike disgusting to all persons who fall into their hands, and discreditable to the nation that keeps such ill-conditioned curs snarling about its gates." All travellers arriving in England will concur in the justice of these remarks.

Mammon, as is well known, is the object of worship in America, as Title is in this country, and it afforded Mr Dickens no small pleasure to find how much the worst features of pure money-getting habits and associations may be softened by the quiet influence of literature and intellectual refinement. Acted upon by the "gentlemen of learning and varied attainments," of the university of Cambridge, at the distance of a few miles from Boston, the general tone of society is greatly relieved from that which would be incidental to a purely commercial population. Our traveller's "notes" on this condition of things testify to the goodness of his heart and soundness of his understanding. The American universities, he observes, whatever be their defects, "disseminate no prejudices, rear no bigots, dig up the buried ashes of no old superstitions, never interpose between the people and their improvement, exclude no man because of his religious opinions; above all, in their whole course of study and instruction, recognise a world, and a broad one too, lying beyond the college walls." With respect to the university above mentioned, it was pleasing to "note at every turn the humanising tastes and desires it has engendered, the affectionate friendships to which it has given rise, the amount of vanity and prejudice it has dispelled. The golden calf they worship at Boston is a pigmy compared with the giant effigies set up in other parts of that vast counting-house which lies beyond the Atlantic; and the almighty dollar sinks into something comparatively insignificant, amidst a whole Pantheon of better gods. Above all, I sincerely believe that the public institutions and charities of this capital of Massachusetts are as nearly perfect as the most considerate wisdom, benevolence, and humanity can make them. I never in my life was more affected by the contemplation of happiness, under circumstances of privation and bereavement, than in my visits to these establishments."

Mr Dickens admires the prevalent practice in America, of supporting institutions wholly or partially by the state, which thus does for the people that which private endowments accomplish in England; but on this point there may be some controversy, and we pass from it to his definitions of the cause of such splendid charitable institutions as England is alone able to boast of. The worrying of rich old relatives, he says, is at the bottom of it. "Some immensely rich old gentleman or lady, surrounded by needy relatives, makes, upon a low average, a will a-week. The old gentleman or lady, never very remarkable in the best of times for good temper, is full of aches and pains from head to foot; full of fancies and caprices; full of spleen, distrust, suspicion, and dislike. To cancel old wills, and invent new ones, is at last the sole business of such a testator's existence; and relations and friends (some of whom have been bred up distinctly to inherit a large share of the property, and have been from their cradles specially disqualified from devoting themselves to any useful pursuit on that account) are so often and so unexpectedly and summarily cut off, and re-instated, and cut off again, that the whole family, down to the remotest cousin, is kept in a perpetual fever. At length it becomes plain that the old lady or gentleman has not long to live; and the plainer this becomes, the more clearly the old lady or gentleman perceives that everybody is in a conspiracy against their poor old dying relative; wherefore the old lady or gentleman makes another last will—positively the last this time—conceals the same in a china tea-pot, and expires next day. Then it turns out, that the whole of the real and personal estate is divided between half-a-dozen charities; and that the dead and gone testator has in pure spite helped to do a great deal of good, at the cost of an immense amount of evil passion and misery."

This is in Boz's best style, but is more clever than profound. The worrying may do something towards the charitable bequest; a far deeper principle, however, operates, we verily believe, in ninety-nine cases in the hundred. We allude to the love of posthumous fame. To die worth half a million, and leave it all to erect an everlasting monument to the name of Higgins, is a glory cheaply purchased with a lifetime of toil, anxiety, and possibly the most dire privation.

Getting in due time to New York, the traveller finds the city as hot as an oven. "Warm weather! The sun strikes upon our heads at this open window, as though its rays were concentrated through a burning-glass; but the day is in its zenith, and the season an unusual one. Was there ever such a sunny street as this Broadway! The pavement stones are polished with the tread of feet until they shine again; the red bricks of the houses might be yet in the dry hot kilns; and the roofs of those omnibuses look as though, if water were poured on them, they would hiss and smoke, and smell like half-quenched fires. No stint of omnibuses here! Half a dozen have gone by within as many minutes. Plenty of hackney cabs and coaches too; gigs, phaetons, large-wheeled tilburies, and private carriages—rather of a clumsy make, and not very different from the public vehicles, but built for the heavy roads beyond the city pavement. Negro coachmen and white, in straw hats, black hats, white hats, glazed caps, fur caps; in coats of drab, black, brown, green, blue, nankeen, striped jean, and linen; and there, in that one instance (look while it passes, or it will be too late), in suits of livery. Some southern republican that, who puts his blacks in uniform, and swells with Sultan pomp and power. Yonder, where that phaeton with the well-clipped pair of greys has stopped—standing at their heads now—is a Yorkshire groom, who has not been very long in these parts, and looks sorrowfully round for a companion pair of top-boots, which he may traverse the city half a year without meeting. Heaven save the ladies, how they dress! We have seen more colours in these ten minutes than we should have seen elsewhere in as many days. What various parasols!—what rainbow silks and satins! what pinking of thin stockings, and pinching of thin shoes, and fluttering of ribbons and silk tassels, and display of rich cloaks with gaudy hoods and linings! The young gentlemen are fond, you see, of turning down their shirt-collars, and cultivating their whiskers, especially under the chin; but they cannot approach the ladies in their dress or bearing, being, to say the truth, humanity of quite another sort."

With descriptions of visits to asylums of various kinds, prisons, and other establishments in New York, Philadelphia, and Washington, the writer gets to the end of his first volume, and there we, for the present, leave him.

JOSEPHINE SZYRMA.

THE virtues of private life have seldom any record beyond that which is left in the respect and affection of friends and relatives. Many of the most estimable, and perhaps the most valuable, women, have acquired no wider fame. Content to fulfil their duties humbly, though ardently, their difficulties, their struggles, their devotedness, and their usefulness, have been known to few. Their unobtrusive virtues, however venerated in their own circle, have made no claim upon public attention, and thus the world has little acquaintance with their simple but instructive biography.

The subject of the present memoir was a native of Poland, and distinguished for her earnest and faithful devotion to the duties of life amidst severe trials and reverses of fortune. Her patient endurance and active fortitude never appear to have forsaken her; nor did her own privations ever render her indifferent to the calamities of others, or chill her benevolent exertions in the behalf of her fellow-sufferers. The political condition of Poland, struggling for independence and deliverance, involved all ranks and conditions in the troubles attendant upon foreign tyranny and internal discord. Many women, whose habits inclined them to the privacy of domestic life, were forced by the circumstances of the times into public scenes of action. It was Josephine's lot to be so placed, and her short history proves that a woman may be a patriot, yet in no way forfeit feminine character, or sacrifice the duties of a wife and mother.

Josephine's maiden name was Dziergowski: she was born in 1804, in the palatinate of Rowa, in Masovia. Her family was noble, but, like many others in Poland, had been impoverished by the invaders of their country, who, when unsuccessful, never failed to leave ruin and devastation behind them. Josephine was sent at seven years old to one of the first ladies' schools in Warsaw, where she pursued the usual studies (under an improved system of education) in science, history, and art; and, besides a complete knowledge of her native tongue, she acquired the German and French languages, speaking and writing them fluently and correctly. She gained the affections of her companions, and retained their regard in after years, when these early friendships were cemented by still stronger ties. Josephine's education commenced in 1812, when Napoleon's army marched to Russia, and the Poles anticipated the probable restoration of their ancient monarchy. One portion of Poland was, in 1815, erected into a kingdom, and obtained a constitution. Although these political arrangements fell far short of the nation's hopes, yet there was enough of promise in the events of the period to excite the imaginations of the young and ardent. Emotions, common to the nation, were shared by the young in their schools and seminaries, added strength to friendship, and inspired with enthusiasm and devotion both individual sentiment and public feeling.

Josephine left school in her sixteenth year, and became an inmate in the family of Prince Czartoryski's physician. She was six or seven years older than the doctor's two daughters, and stood rather in the relation of their sister than of their governess; they all studied together under the parent's direction. At Siemiaura, the principal seat of the family of Czartoryski, Josephine was frequently a guest: she may be said there to have made her entrance into the world. The court of the prince was the resort of natives and foreigners of birth and distinction: he was himself distinguished for his literary attainments, as well as for his patriotism, hospitality, and splendour. The estate was of great extent, comprising towns and villages. The princess was very attentive to the wants of her poor neighbours, and sought to place herself on easy and familiar terms with them. The eldest son, Prince Adam, since an exile, was president of the national government during the Polish insurrection in 1830. Josephine was conversant with the history of her country; and the intercourse she now enjoyed with persons whose character she had studied from its pages, and whose patriotic virtues she had learned to adore, made a strong impression upon her mind. The sight of the venerable prince, over whose grey head nearly a century had passed, surrounded by the noble, the learned, and the devoted, the example of the Princess Isabella and her daughters, the circle of Polish matrons, who on festive occasions assembled with their families at Siemiaura, produced a favourable effect upon Josephine, and assisted in forming her character and confirming her patriotism. She obtained an insight into the human heart, its affections and impulses; she acquired a strong sense of propriety of conduct, and a power of so regulating her demeanour, that, without any dereliction of principle, she could steer her course amidst conflicting parties and interests, yet neither give offence nor provoke displeasure.

On the death of the prince in 1823, his court—the last left to Poland—dispersed. Josephine retired with the family, amongst whom she had hitherto resided, to their estate in Podlachia. There she received an offer of marriage. At this conjuncture, the most important of a woman's life, Josephine was spared the sweets and pangs which usually attend upon the course of love. The person who asked her hand had not exchanged ten words with her before he made his proposals, and she accepted his offer, for the sole reason, that he possessed the esteem of all who knew him. M. Szyrma had just returned from a tour in Germany, France, and England. Literature was his profession: he had obtained academical honours in the university of Warsaw, and was then a candidate for the vacant chair of moral philosophy, which he succeeded in obtaining. His moral and patriotic qualities decided Josephine to accept him for her husband; respect for these rather than love influenced her choice. Josephine Szyrma had now completed her twenty-first year. She was of the middle size, well proportioned, and graceful. Her demeanour was dignified, and she was distinguished by the peculiar expression of benignity with which she bowed; her eyes beamed with intelligence and benignity; in her own country, such eyes were called "eyes of wisdom;" her features were characterised by modest decision, tinged with thoughtfulness.

A newly-married couple are always subjects for speculation. On their arrival at Warsaw, resemblances and differences between the bride and bridegroom were sought and found; their tempers, characters, ages, &c., were discussed; the conclusions drawn were in their favour; and it was decided they possessed a remarkable similarity in the most important points, and even that they resembled each other in person. The promotion of so young a man to the chair of moral philosophy had excited some envy amongst a few individuals; but the feeling was dissipated by a remark made by one of the professors, that the young philosopher, in choosing such a wife, had surpassed Socrates himself in wisdom. It was good-humouredly determined that, for the future, the philosophy of the other professors should be tested by their discernment in avoiding a Xantippe.

Madame Szyrma possessed the *tact* of appearing with singular propriety under all circumstances—dignified in the assemblies of the great, interesting to the learned, and pleasing to all: she was also known as the active housewife and the indulgent mistress. She trained her domestics to her service. The culinary art in Poland is far from simple; and some patience is needed in dressing the various dishes and delicacies of the table, as well as in giving instructions for their preparation. On one occasion, at the commencement of Josephine's duties as the mistress of a household, a refractory cook objected, that her mistress was too young to understand the management of a house better than she did: this reply reaching the ears of M. Szyrma, he discharged the servant as a necessary mark of respect to his young wife. The woman refused to quit the house; nor would she leave a mistress to whom she was really attached, until removed by the police. Madame Szyrma, however, blamed her husband for an exhibition of aristocratic feeling and manner, which, she said, he had brought with him from England, jestingly adding, "for this cause she could not love him." After training her domestics to useful and regular habits, she usually interested herself in seeing them well married, and never ceased to take an interest in their welfare and happiness. Their attachment to her was unfailing; and in one instance a servant voluntarily quitted her husband to accompany her former mistress when leaving her country as an exile. Madame Szyrma, however grateful, could not conceal from the woman that this proof of attachment was at variance with her duty.

The beginning of married life is full of importance. Madame Szyrma possessed the qualities most favourable to a happy commencement. She had seen enough of the world to give her a relish for the seclusion necessary to her husband's occupations, yet she could still adorn and enjoy society. Having had the opportunity to look upon the present as it is, and upon the past as history represents it, her judgment was of a practical kind, and her sentiments possessed a masculine strength, tempered by feminine delicacy. Accus-

tomed to serious reading and severe study, her mind was never occupied by trifles. The time that remained from household duties she employed in assisting her husband in his literary pursuits, acting as his amanuensis, or correcting the printed proofs of his works: her literary taste gave a high value to her opinion. She was always occupied, and was never plagued by ennui: those who knew her best never saw her *yawn*.

The nature of her husband's duties as a public functionary, however honourable, caused him considerable embarrassment. He was responsible to a foreign and despotic government, whose views were diametrically opposed to those which he was bound to adopt, as a conscientious teacher, for the promotion of science, and for the good of his country. The suspicions of the government were never at rest; secret agents attended to report upon his lectures. A register was kept of all passages supposed to contain treasonable or offensive sentiments, and this was forwarded to St Petersburg for inspection. Other popular professors were subjected to the same jealous vigilance. This watchfulness and distrust rendered the performance of his public functions highly painful and dangerous to M. Szyrma. His wife shared in his anxieties and difficulties, and her participation was their best alleviation. In such a case, if action were a virtue, caution was no less a duty; clamour and complaint would have been a betrayal; silent perseverance was the safest, indeed the only means of securing the advantages which truth and patriotism desired to attain. In such a juncture, the discretion of the wife was as necessary as the steadfast and guarded ability of the husband. When all civic virtue was condemned to silence in public, it could only spring up and ripen at the domestic hearth. In this political conjuncture, the women of Poland performed an important part. Madame Szyrma was amongst the most distinguished. At Warsaw, she came in contact with women who, like herself, were distinguished for their amiable dispositions, their refinement, and patriotism. They met weekly at each other's houses, when music, conversation, and reading, formed their principal amusements, and served as an agreeable relaxation to their husbands and relatives after their daily studies and business. These domestic meetings were varied by excursions and pic-nic parties into the beautiful environs of the Polish capital. The ladies had the entire direction of the arrangements; for a system of espionage prevailed so universally in Warsaw, that neither servants nor even members of the same family could be trusted. These social meetings were necessarily exclusive; none but persons of known character and patriotism were permitted to join them; they soon became celebrated, and a good deal of ill feeling existed amongst those who were excluded.

Madame Szyrma's parties were held every Monday. On that day, November 29, 1830, as some of the elders of the party were sitting down to their game of whist, and the ladies, seated around a table engaged in needlework, were listening to Las Casas' work on Napoleon's Russian campaign, news was coming from the theatre that the revolution had broken out. The shock occasioned by this sudden and unexpected intelligence may be imagined. All hurried away; some of the gentlemen accompanying the ladies home, while others flew to arms. The night passed. In the morning, not a Russian was to be seen in Warsaw; but they were banded near its walls, with the Grand Duke Constantine at their head, ready to attack the town at a moment's notice.

On the following day, at three o'clock, a deputation from M. Szyrma's pupils at the university waited upon him, to request him to organise them into a military body, and to take the command. Madame Szyrma, as a patriot, wept for joy at the honour thus conferred upon her husband; but when she considered the dangerous service the trust imposed upon him, and looked upon her infant children, she wept as a wife and mother. She had a presentiment that troubles and anxieties were henceforth to be her lot. Her husband accepted the proposal made to him. The activity and good conduct of the corps, which was composed of the sons of the first families in Poland, and distinguished by the title of the guard of honour, soon acquired influence and power throughout the country. Josephine knew that offices of trust were confided to her husband, that he was enabled to save life and property, to keep order, and that he could even extend protection to the families of the Russians. She had seen him preside at national festivals, respected by the citizens; his services publicly acknowledged by the diet; borne home in triumph upon the shoulders of his regiment—honours she could only welcome with her tears. What the reverse of the picture? When executing a mission intrusted to him by the government, her husband had been imprisoned for a month in a Prussian dungeon, whence he expected to be delivered up to Russia. Rescued from this danger, she had to endure suspense as to the issue of the battles fought near Warsaw, the agony of repeated farewells, every one of which might be the last; the joy of seeing him return in safety—these, and similar alternations of happiness and misery, hope and fear, could not be supported without injury to her health, and much mental endurance.

In countries like England, where there is no experience of war, where it is only known in the shape of temporary and partial popular tumult, women can scarcely conceive the noble feelings excited among their sex by a struggle for independence such as that which now animated the Poles. We do not mean to say that the women took up arms in defence of freedom, although there are instances of a few who joined the ranks; the young Countess Platen, for example, placed herself at the head of a small body of her own vassals. With some exceptions, the women still pursued their domestic duties, though these were changed by the state of the times. Their usual social meetings were now thrown open to all; knitting and embroidery were laid aside for the preparation of lint and bandages for the wounded, flags for lances, and other trappings of war. The customary morning calls were exchanged for visits to hospitals, attending on the wounded, the sick of cholera, and performing the last offices for the dying. This Christian charity was extended equally to the Russians. Many private houses were used as hospitals, where Russians and Poles were lodged together; but the latter became irritated that equal attention was bestowed on their enemies, and they were separated. To this charitable sisterhood Madame Szyrma belonged; she escaped infection and disease, but many of its members fell victims to their zeal and devotion.

It often happened that the women who thus assembled had husbands, brothers, and fathers in the field; and that, amidst their employments, they eagerly expected news from the armies, which were so near, that at times the thunder of the cannon was audible. On other occasions, when the scene of action was remote, they listened to appeals to the provinces, to accounts in the newspapers, to some new patriotic poem, song, or march. Children, as soon as they could speak, were taught by their mothers and nurses to repeat these patriotic hymns. On one occasion, M. Suchodolski, a celebrated patriot poet, one of Colonel Szyrma's guard, having come from the army to Warsaw, dined with his colonel. During dinner, Madame Szyrma's youngest daughter lisped forth, unasked, in her childish accents, a stanza of the poet's most popular hymn. M. Suchodolski was so touched by hearing his verses thus uttered, and by finding they had fixed themselves in the memory of so young a child, that he could not conceal his tears. Humble as the tribute was, it was the last he received; for he fell in the next encounter with the enemy. His friends remember him in the camp, surrounded in the evening by the soldiers listening, with enthusiasm, to his patriotic songs.

The events of a war, which had so much influence upon Madame Szyrma's fate, belong to history. Colonel Szyrma was marching to the relief of Warsaw, when the news reached him of a capitulation after two days' siege. He was distant two days' march from the city. The soldiers shed tears on learning the disastrous intelligence; retreated, and soon afterwards dispersed. Colonel Szyrma made his way alone through Hungary and Austria to Munich, waited there for letters from his wife, and proceeded through Paris to London. Alarmed by the license of the Russians, and the atrocities they committed on Warsaw, the kidnapping of Polish children for the purpose of sending them to Russia, Madame Szyrma retired under a feigned name to her father and brothers in the country, there to await until a passport could be procured. This would probably have never been obtained, as no egress from Poland was permitted, but for the intercession of one of the Russian generals, Count Kiasimiski, whose life her husband had saved during the revolution, when threatened by the incensed citizens of Warsaw. The passport was for England, and extended to one year only; but Madame Szyrma, on quitting Poland, determined never to return, except as her husband's companion. Her journey through Prussia was cheered by the sympathy which the cause of Poland had excited, and by her own situation as a wife and mother, leaving her paternal home to follow her husband, and share with him the hardships of exile. From Hamburgh she crossed to England, and, after a stormy passage, landed at the custom-house, 27th November 1833. Here she was welcomed by her husband, who had been three days awaiting her arrival. Of the feelings of the husband and wife at their first meeting, after a period of such mutual anxiety, nothing requires to be said.

Madame Szyrma's residence in London was not one of pleasure, or even of comfort; but she was more than content, for she was with her husband, and could educate her children. Colonel Szyrma acted as secretary to the Association of the Friends of Poland, so distinguished for its efforts in behalf of the Polish refugees, and its advocacy of the Polish cause. His wife was compelled to witness the misery and destitution of her countrymen. She did what she could to alleviate individual suffering, frequently denying herself little comforts, from the feeling that others enjoyed still less. Her acquaintance with several English families enabled her to obey the impulse of her generous nature. She succeeded in forming a society of Englishwomen for the relief of her countrymen, she herself undertaking the most difficult part; all who needed assistance first applied to her, and she had to determine between comparative claims when all could not be satisfied. The society supplied the refugees with clothing, the sick and infirm with medicine and better diet; it encouraged industry among them, by buying articles of their manufacture, and reselling them at a bazaar established for the purpose, the profits being given to the Poles. The superintendence of the whole of the business, keeping the accounts, and especially the difficult task of distribution, and satisfying the demands of necessity, fell upon Madame Szyrma. The fatigue exceeded her physical strength; yet for three years, indeed until her death, she patiently performed an office which she felt to be incumbent upon her as a sacred duty.

On the 2d of January 1837, having become visibly feeble, she attended for the last time a meeting of the Ladies' Society, called to audit her accounts for the preceding year. At its conclusion, she said to her husband with great satisfaction, "Now the business of last year is done and closed, how happy I am." She lingered until the 22d, neglecting none of her daily duties, domestic or official. It was her habit to enter in an account-book every article purchased, and daily to cast up the amount. On referring to that book, three years after her death, her husband found the sum total, dated Saturday, the 22d January, written in her own hand, evidently trembling under the effects of fever. On the morning of the 24th she expired. It seemed as if on that Saturday she omitted none of her most trifling duties, and that the occupations of that week completed a life of labour. On that day her husband received letters and intelligence respecting her friends and family in Poland: she listened to them with delight, as if they recalled to her mind all who were dear to her, while the scenes and events of her youth, and all loved and happy memories, seemed to pass in review before her. Her countenance reflected the sentiments of her mind, and even a glow of health appeared to return to her cheek, and to promise that she had passed the crisis of her disorder. "How healthful you look, dear Josephine," said her husband, exulting in renewed hope; "I never saw you so beautiful." But this beauty, alas! was already that of heaven. During the night she became speechless, and at seven in the morning she breathed her last. She died of consumption, accelerated by influenza.

Her husband and children sorrowed as those only can mourn who lose such a wife and mother. Her exiled countrymen deeply felt her loss, while her English friends manifested their sense of her virtues by many private and public tributes to her memory. She was buried at Kensal Green cemetery, according to the rights of the Catholic church: a monument, erected by Englishwomen, marks the spot where her remains repose.

Madame Szyrma was the mother of four children; two daughters only survive her. She educated them herself, and particularly delighted in instructing them in history. She was patient, mild, and persevering; never excited to anger, and never having recourse to punishment. In her manners and conversation she was eminently natural—making no display of sentiment, or of what she thought, felt, and did. All her actions proceeded from a strong sense of duty, never from the desire of distinction. Her natural and acquired gifts sufficed for every emergency of her life; they were solid and applicable to all occasions; and instead of failing in time of need, as the pretensions of vanity must necessarily do, her various talents were inexhaustible in their exercise, and universal in their application.

Madame Szyrma kept a private journal, in which she entered the principal events of her life, and some of her opinions and sentiments. The last words she wrote therein are characteristic of her firmness, her submission, and right-mindedness:—"Whatever hardships and injustice may have fallen to my share, in the purity of my thought and conscience, I have my reward."

MR AND MRS HALL'S ACCOUNT OF IMPROVEMENTS IN DONEGAL.

To all who take an interest in the progress of improvement in Ireland, the following particulars will be acceptable. Mr and Mrs Hall, in the course of a tour last year in Ulster, for the purpose of collecting materials for their very beautiful work, "Ireland, its Scenery, and Character,"* visited a district of the maritime county of Ulster, which, as they inform their readers, is now undergoing a very remarkable change in its social and physical condition.

Leaving the northern and western quarters of Donegal, so rich in all that can delight the antiquary, the naturalist, and lover of grand and picturesque scenery, they proceeded in a direction towards the town of Stranorlar and the border town of Strabane. "Our object in visiting Stranorlar," they go on to narrate, "was to examine certain improvements effected upon a wild tract of mountain land, by which, we had been informed, many hundred acres had been so reclaimed, as to furnish comfortable farms for several tenants. It was also our purpose to inspect the schools connected with the estate of which the now fertile meadows form a part. We were not disappointed. We drove over well-made roads, where a few years ago bridle-paths only existed, by the side of a broad and most rapid river—which unhappily is still suffered to run waste and idle; and after ascending some miles, reached the mountain top, where we had ample evidence of the vast good that may be achieved by skill, judgment, and perseverance. The district is called Glenfin, and the estate to which we more immediately refer, Cloghan.

It is about twenty years since Sir Charles Style inherited his estates. He found the part that was situated in Donegal in a deplorable condition. Illicit distillation was then at its height, and Glenfin was one

* Part xxiv. London: J. How, Fleet Street.

continued distillery, over-run with all the demoralisation and misery which accompanies the trade. He at once determined to leave his native country, England, and to establish himself upon his Irish property. It contained about 16,000 acres, of which about 2000 were arable, and the remaining 14,000 mountain waste. He gave new leases to his tenants, made war upon the distillers, and in a short time completely eradicated them. He built the house, and formed a domain on a portion of the wildest bog; had a bridge built across the river Finn, and several roads made through the property; and after fourteen or fifteen years' residence and active exertion, the state of his health compelled him to leave Ireland; but instead of abandoning his tenants to their own resources and misery, as absentee proprietors too frequently do, he selected a substitute, to whom he gave *unlimited* powers to act for him, with ample means for continuing his improvements. He divided the rents of the estate into two equal portions, leaving one half to bear the charges of management, charities, taxes, &c. This arrangement left to the agent, to be applied to the improvement of the property, about L.300 a-year, after deducting all the fixed charges.

Captain John Pitt Kennedy settled, as his agent in Glenfin, in the autumn of 1837. The leases given by Sir Charles Style were to expire in November 1838. During the continuance of these leases, the tenants had divided and sub-divided the small portions of arable land into Rundale, a state of things which paralyses all improvement. It consists not in merely sub-dividing the farm into a given number of small detached farms, but every quality of land is sub-divided, so that a holding of four or five acres was frequently to be found scattered into fifteen or twenty different lots at considerable distances from each other, and interlaced with the similar lots of other occupiers, precluding all possibility of enclosing the holdings. He found the tenants congregated in villages which, from the incessant and unavoidable trespass of the cattle on each other's lands, were the seats of incessant warfare; many of the villages and townlands being without any means of ingress or egress by road.

His first step was to take up the possession of all the farms, and to re-divide the estate into compact holdings, giving to the original tenants as nearly as possible an equivalent, in their new farms, for the arable land they previously held. Observing that when such a claim came below the quantity by which a family could support itself, instead of receiving a similar small lot of arable, the claimant was placed on a waste-land farm, of improvable land, and dimensions suited to his capability — averaging twenty statute acres; and he besides received some compensation from those amongst whom his former small arable lots may have been divided. The effect of this measure was at once to multiply by about five the average extent of every man's field of exertion, which previously had been so limited, as not to afford employment for one-third of their time; and that in a country where there was but little opportunity of obtaining day labour.

The number of new mountain farms thus tenanted has been 160. Their occupiers are to hold rent-free for the first three, four, five, six, or seven years, according to the quality of the land, and are afterwards to pay a small, and gradually increasing rent, commencing at one shilling per statute acre, till it reaches about ten shillings an acre on the average. The oldest settlements are now of four years' standing; their progress we witnessed. The agent is well satisfied when they improve at the rate of an acre per farm each year, and many have exceeded this rate, notwithstanding the three last unfavourable seasons. This year promises to make up all losses. The richest crops are now growing on these new mountain farms.

The first operation of both the old and new land farmers consisted in enclosing their holdings, and in building cottages in the centre of each. To the building Captain Kennedy contributes a stipulated rate of assistance on the part of the proprietor. We should premise, that previously to fixing the limits of farms on the new division of the lands, he laid out general lines of road through the estate, and then laid off the farms with reference to these communications, the construction of which has been gradually going on from the commencement, at the entire cost of the proprietor, and at the rate of about five miles yearly. The cost of these roads varies from about twenty to sixty pounds per statute mile, according to the nature of the districts through which they pass; the average cost is about twenty-five pounds per mile. The extent made, up to this moment, amounts to about twenty miles; and the employment they afford, as well as every other outlay for labour that admits of it, is strictly reserved for the summer idle season of the year, when the stores of the poorer class become exhausted, and they are most in want of assistance. It is not sufficient, under the peculiar circumstances of Ireland, merely to effect objects useful in themselves. In order to obtain the maximum result, they must be effected in the right way, and at the right time. This consideration involves an analysis of the habits of the poor. They are, we may say, exclusively agriculturists. They imagine that their duties, as such, are limited to the spring sowing and the harvesting of their crops. The judicious preparation of his land for receiving the ordinary operations of tillage, do not enter into the calculation of the small Irish farmer. And during the winter season, which ought to be passed in draining and deepening his soil, irrigating his land, collecting manure, &c., he lays himself up in absolute idleness. His Lilliputian farm thus produces but a Lilliputian crop, not equal to one-third of its natural capability. His provisions become exhausted about May. Unable to get day labour to support his family through the summer, which is likewise a season when he thinks his farm has no claim upon him, he borrows at usurious interest for their support, and for the following year brings an additional burden upon his shoulders, already too heavily laden for his strength. Having thus commenced his downfall, he adds on, debt over debt, by the same process, each successive year, until he is obliged to sell his interest in the land, and turn out a pauper. Those proprietors who would use their influence or their means to improve their tenants, should consider well those circumstances. They should reserve the whole of their expenditure on all general labours that will admit of it for the 'loan quarter,' as it is aptly termed, and thereby prevent the poor man getting into debt. All government and county works should be regulated upon the same principle. And again, the winter idle season, which, if properly looked to, may be termed the *remedial* period of the year, should likewise receive the attention it deserves, by taking every means to call forth the energies of the farmer, so that in each successive year he may bring an additional portion of his land into a more prolific state than it was previously. The method proposed by Captain Kennedy to avert the evils of the 'loan quarter,' is to reserve all possible expenditure in labour for that season. The plan he has found most effectual in bringing out the poor farmer to make the indispensable improvements required on his farm during the winter remedial season, is by the instrumentality of a loan fund; from which no one can receive a grant unless he shall have qualified by completing a given quantity of draining, trenching, or other requisite work on his farm—to have been previously laid out, and its completion certified for, by the agricultural teacher of the district. The loans, for this reason, are for the most part made in the winter. The application of a loan, when granted, is likewise looked to. It must be for some reproductive object—as lime, improved farm implements, the purchase of a cow, &c., but not for food or clothing.

No fines are levied in this fund. No rate of interest is taken beyond what the ordinary law allows. During five years that it has been in operation, the 'decrees' have not exceeded seven in number, and no loss has yet been sustained. When the defaulters exceed a certain proportion of the borrowers, the issues cease until the number is reduced within that limit, and the names of the defaulters are made public. The system is working well. The people are gradually supplying themselves, by the aid thus afforded, with carts, improved farm implements, additional live stock, lime, &c.; and they are gradually losing their dormouse qualities, and facing the winter's blast for the permanent improvement of their lands. During the last winter, about a hundred tenants were to be seen constructing on their farms thorough-drains, which they had never before thought of; but without which, from the nature of the soil and humidity of the climate, harvesting a crop was by no means a necessary consequence of sowing the seed. It is not unreasonable to anticipate, that a very advantageous change must follow a continued system, thus adding to the productive time of the farmer about five months in each year, which were hitherto, we may say, lost to him; yet the change does not stop here. The intensity of his exertion, whilst employed, is gradually increased by the system of classified remuneration given to labourers at the public works—the man who performs the most labour receiving a commensurate reward; and already the fruits of this classified remuneration have been most prolific. Add, also, the effect of the agricultural teacher periodically visiting each man's farm, and advising with him on all his projects, besides the repeated practical lessons he is receiving, as often as he passes the model farm in connexion with the agricultural school.

Thus we have at once three elements of improvement at work in every man throughout the estate; first, a vast increase of his *productive* time; secondly, a vast increase of his productive energies during that time; and, thirdly, a vast increase of his skill and judgment in directing those energies.

We have very frequently received gratification by visiting the comfortable villages and cottages where the inhabitants are auspiciously located, and under kind and judicious management; such are rapidly on the increase; and, year after year, we have been happy to observe the active progress of improvement. Yet we had been unprepared, amid the mountain fastnesses of Donegal, to see the number of prosperous and pleasant dwellings that are to be met with throughout Glenfin.

Looking down from one of the hills, over folding valleys and leaping torrents, it was impossible, knowing the nature of the country, and the nature of the people, not to feel deeply anxious to ascertain how such admirable roads, intersecting the bogs and traversing the high lands, had been so quickly constructed; and how, in the midst of bog, such well-built homes and productive gardens had metamorphosed the 'cottier' into the small farmer—respecting the laws, and respected by his superiors. The wild beauty of the scene was enhanced by the moral beauty of improvement — cottages perfected, and in progress, dotted the landscape; the cry of the wild plover was mingled with the wild song of industrious labour. In one dwelling, which we entered by chance, we found a woman habited in the dress of the district busily employed at her wheel, which, though she turned with her bare foot, was in a neat room, lighted by a window that *opened and shut*, decently furnished—more than decently furnished, for a 'jack-towel' actually hung on a roller behind the door, and the newly-made stairs leading to the loft were covered in the centre by a narrow strip of coarse carpeting. The young woman shook hands with us both—a ceremony never omitted by these mountain peasants, when a stranger or an acquaintance enters their house.

We passed more than once over those roads, formed across what was once considered an irreclaimable bog, to a height from which we could command an extensive view of Glenfin and its interesting vicinity. How delightful was the reflection, that but for what had been done for the civilisation of the country, and the improvement of the land, the people who now are, and in a few years will be a still more valuable tenantry, would have either increased the starving population, or been emigrants to a foreign country.

Now they are prosperous, industrious, and happy. Where the foxes of the earth made holes, their cottages are built; land, over which the screaming eagle flapped its wings, echoes with the hum of cheerful voices. Children, ignorant of all book-knowledge, and wandering, like Indians, over the hills and valleys, are gathered in the profitable union of a happy school, and taught the independence produced by steady and well-directed labour. Land reclaimed without an outlay, which frequently Irish landlords cannot afford; members of a population of almost paupers converted into cultivators, improving the value of the proprietors' land, and their own condition at the same time; while the agricultural school, established with such fair success, promises that a race of better farmers shall spring up to guide the earth in bringing forth its fruits in due season."

TEMPERANCE COFFEE-HOUSES.

THIS class of coffee-houses, as may be readily supposed, owe their existence to what is called the "temperance movement;" and, though not in every respect what they ought to be, have done much good. They are not now confined to large cities, but may be found in almost every town of any note, increasing the stock of simple pleasures, and aiding in the diffusion of general information amongst the people; for no coffee-house can be kept up for any length of time without newspapers, magazines, or reviews—which form, indeed, a leading feature in their economy. During the intervals of business, and at the close of the day, they are much frequented by commercial men, to whom they afford the means of agreeable relaxation.

But it is matter of some regret that such establishments do not, in general, possess those conveniences, and that amount, or at least appearance, of respectability, which belong, as if by prescription, to an English inn, the comforts of which have been sung by more than one of our poets. In this, as in many things else, appearance goes a great length, and should accordingly meet with due attention. A house, for instance, may be unimpeachable in every quality, but if situated within a close or alley, approached by a common stair, or possessed of any other mark of inferiority, it is not to be supposed that it will be patronised by those accustomed to the better class of hotels; and, least of all, if lady travellers be in the case. We remember once going considerably out of our way to seek accommodation at a "well advertised" temperance hotel in a provincial town in England, but the spectacle of a drab washing the lobby at mid-day, with other appearances of a mean order, led us to turn away at once without putting our foot within the threshold. This we give as a hint to persons proposing to establish temperance hotels. If they expect to take a high standing, they must look a little more to exterior appearances, as well as to all the usual internal qualities of a good inn.

Glasgow, we understand, is making an effort in these respects, though no house, as far as we are aware, comes yet up to what we point out as desirable—that is, a large temperance hotel to compete with the other leading establishments. As to those houses already in operation, however, there is nothing to find fault with, as far as they go; whether as coffee-houses or inns, they deserve to be spoken of with respect; and from the slight examination we were able to give, they seemed not only reasonable in their charges, but superior in accommodation to any we had previously seen. With Mr ——'s temperance hotel in Jamaica Street, we were particularly well-pleased. It is frequented by the higher class of travellers, and possesses, besides a convenient reading-room, twelve bed-rooms, neatly but not expensively furnished; the charge for a single night's lodging being 1s., with 2d. extra for the servant. Other charges were proportionably low. Mrs ——'s coffee-house, in Argyle Street, is also of a superior description, but the charges are somewhat higher. Mr ——'s temperance hotel, Melville Place, Trongate, was the first established in Glasgow on total abstinence principles. It is very tastefully fitted up, kept remarkably clean, and possesses bed-rooms elegantly furnished. The reading-room is well sup-

plied with the periodicals of the day, and, we understand, much resorted to by the citizens.

Regarding these establishments as well fitted to contribute to the comfort of the traveller, and at the same time to elevate the tone of social life, we wish them every possible success.

ELECTRICAL PROGRESSION.

"INTELLECT" makes but slow progress in its "march," compared with the onward movement of electricity. We speak not of its physical movement, for, time out of mind, a flash of lightning has run second only to thought; but of its advances into the social system, and its increasing usefulness in the arts of life. The daily multiplying appliances of this subtile mysterious principle forbid us to question its power to accomplish all things. Electric influence is extending its dominion in regions where, some years since, the most outstretched imagination would not have conceived the possibility of its entering. The engraver finds the utmost ingenuity of his art surpassed; the plater beholds the solvent gold and silver reappear, and, at the touch of this invisible agent, spread themselves over all the intricacies of the chiselled metal with matchless uniformity and precision; saucepans and kettles actually grow in the blue copper solution, to set at nought the brazier's art; the fabric-printer throws down his wooden blocks in despair on seeing the most involved patterns, traced in varieties of colours, impressed at once and in the twinkling of an eye by the touch of a wire; the antiquary starts on discerning his rarest relics reproduced so exactly, that no skill can distinguish the copy from the original; even the giant steam, with his lightning speed, is left far behind by the lightning itself, and groans the announcement, that steam has had its day. To those who have witnessed the inroads of the electric fluid into all the affairs of life, it comes within the range of imagination to conceive that even the functions of *government* may be, at no distant day, performed "with punctuality and despatch" by its all-pervading influence. The lightning-telegraph already threatens to destroy at one fell swoop the whole corps of representative sovereigns and deputy-governors. What need of ambassadors at foreign courts, when communications can be made directly and instantaneously between the sovereigns or ministers of distant nations? Of what use will be colonial governors, where intelligence of passing events is communicated, and all necessary instructions transmitted, across the Atlantic ere an ordinary courier can ride from Whitehall to Windsor? Great advances have been made in the perfecting of this important governmental apparatus since we last noticed its progress; and if it but proceed on the road of improvement during the next twelve months at as rapid a pace as during the past year, the picture now sketched by imagination will be painted in vivid colours on the canvass of accomplished facts.

In the course of experiments instituted by Messrs Wright and Bain for the improvement of their electrical telegraph, they discovered that the electric circuit of a galvanic battery is as effectually completed through a large body of water as through an insulated wire. They have applied this curious discovery so effectually, as to be now able to dispense with two of the wires heretofore thought necessary for the action of their printing-telegraph; and they are thus enabled to print all communications, either verbal or symbolical, at any distance, by the use of a single wire. We understand they are now in treaty with the government to construct a telegraph on this principle between the Admiralty and Portsmouth. One insulated wire would be laid down between the two points, to connect the galvanic battery of the outport with the printing apparatus of the Admiralty, and the return current would be sent through the earth in lieu of using a second wire to complete the circuit. Should the moisture in the ground not prove sufficient to conduct the electricity, the inventors propose to transmit the return current by water; making it pass down the Thames to the German Ocean, and thence along the Channel to Portsmouth; this roundabout voyage to be performed instantaneously. By thus simplifying, and consequently greatly reducing the cost of the electrical printing-telegraph, the inventors have gone far towards rendering it generally available; another step in advance will dispense with all metallic connexion whatever. The atmosphere and the ocean may then be all-sufficient media for the communication of thought, literally to realise the poet's vision—

"And waft a sigh from Indus to the Pole."—*Spectator.*

[To the above may very properly be added the following, likewise a newspaper paragraph of recent date:—"A German journal gives the following account of what it designates as one of those wonders in which electrical chemistry is so fertile: 'A pupil of Berzelius, who was occupying himself in Sweden with galvanic gilding, having used in his apparatus the skin of a sheep, on which there was some of the wool remaining, perceived that it became partially covered with the gold. Struck with the incident, he followed up the idea it suggested, and in time produced an entire golden fleece, preserving the wool in its original and natural state as to texture and flexibility. Living in a village, the young *savant* showed the wonderful production to his neighbours; but the fanatical and ignorant peasants, regarding him as a practiser of the black art, attacked his laboratory, broke all his utensils to pieces, and compelled him to fly with his fleece to Upsal, where he was received with kindness and consideration by the members of the university, who, by a subscription, not only supplied him with the means of subsistence, but established a new laboratory for him, and aided him in applying his new discovery to the manufacture of woollen cloth. We may therefore expect to have shortly cloths of gold, silver, and platina, which will entirely supersede our present gold lace and embroidery.'"]

THE WEE RAGGIT LASSIE.

[From a late number of the *Gaberlunzie's Wallet.*]

WEE, genty, timid, bashfu' wean,
Tott, totting through the street thy lane,
Like sunny keeks through cluds o' rain;
Thy face sae fair
Peeps sweetly through thy clustering train
O' raven hair.

Thy wee bit neck and bosom bare,
Though tussled by the cauld raw air,
Are pearly pure, and lily fair,
As snaw flakes fa'in;
An' thy wee cheeks glow like a pair
O' roses blawin'.

Thy form light as a fairy fay—
Thy facy sweet as flowery May—
Thine ee, like dawn o' infant day,
Waukin' the east,
Till light an' lustre sparkle gay
In every breast.

Tho' sma' thy mak, an' scrimp thy cleeding,
Tho' bleak thy hame, an' puir thy feeding,
Tho' scant thy lair, an' laigh thy breeding,
Still we can see
Sweet beauty a' the graces leading
Captive to thee.

Yet beauty's e'en a doubtfu' gift,
Wi' mickle show, but little thrift;
W' it the rich may mak a shift
To lead the fashion,
While humble beauty's cast adrift
On human passion.

O, man! why wilt thou seek thy bane,
An' barter happiness for pain:
Why cast on beauty's flower a stain
That gars it wither;
I trow the heart gets little gain
That breaks anither.

Alack! puir wean, thy fate I fear,
Thy morning sky's e'en cauld an' drear;
Dark poortith hovers in the rear,
Wi' boding scowl,
An' how can sic as thou win clear
O' faes sae foul.

Auld beldame Fortune, would I kenned her!
I wadna, wee thing, let thee wander
Wi' thy sma' limbs, sae slim an' slender,
Expos'd an' bare,
And thy wee feet, sae jimp an' tender,
A' dinlin' sair.

Hail, holy Nature, thou whase power
Hast gi'en her beauty for her dower,
O tend wi' care this tender flower
That springs frae thee,
And rear her safe in Virtue's bower,
Aneath thine ee!

THE FLOATING ISLAND IN DERWENT LAKE, NEAR KESWICK.

THIS most extraordinary phenomenon is situate not far from Lodore, at the south-east extremity of the lake, and a little more than 150 yards from the land, where the depth of the water does not exceed six feet in a mean state of the lake.

During the last forty years, it has appeared thirteen times. In the year 1808, from July 20 to the beginning of October in the same year; in 1813, from the 7th of September to the end of October following; in 1815, from August 5 to the end of the month; in 1819, from August 14 to the end of the same month; in 1824, from June 21 to the end of September; in 1825, it was above the water from the 9th to the 23d of September; and from the 11th July to the end of September in 1826. "The circumstance of its appearing in three successive years," says Mr Otley, "may be attributed to the extraordinary warmth of the season." It made its appearance again on the 10th of June, 1831, and remained uncovered until the 25th of September. In 1834 and 1835, it was visible for a few weeks in August and September. In 1837, it appeared in July and August. It appeared again on the 19th July, 1841, and remained till the end of August. And it made its appearance in the latter end of last or the beginning of the present month (September), but it is not yet quite so large as on some of the former occasions of its appearance.

We will not undertake to investigate the great number of hypotheses which have been advanced relative to the cause of this singular phenomenon, nor examine into any of the arguments which have been adduced, but will merely give the opinion of Mr Otley, who is well-versed in the geological and meteorological properties of the lake district, who is resident at Keswick, and who, for the last thirty years, has watched with much attention the operations of it. Mr Otley says—"That it generally rises after an interval of a few days, and after a continuance of fine weather. Its figure and dimensions are variable; it has sometimes contained about half an acre of ground, at other times only a few perches; but extending in a gradual slope under water, a much greater portion is raised from the bottom than reaches the surface of the lake. Several large rents or cracks may be seen in the earth above the place, which appear to have been occasioned by its stretching to reach the surface. It never rises far above the level of the lake, but having once attained the surface, it for a time fluctuates with the rise and fall of the water, after which it sinks gradually. When at rest in the bottom of the lake, it has the same appearance as the neighbouring parts, being covered with the same vegetation, consisting principally of *literella lacustris* and *lobelia dorimanno*, interspersed with *isoetes lacustris*, and other plants common in this and all the neighbouring lakes. After remaining some time above the water, its verdure is much improved. For a few inches in depth, it is composed of clayey or earthy matter, apparently deposited by the water, in which the growing plants have fixed their roots; the rest is a congeries of decayed vegetable matter, forming a stratum of loose peat earth, about six feet in thickness, which rises from a bed of very fine soft clay. A considerable quantity of air is contained in the body of the island, and may be dislodged by probing the earth with a pole. This air was found by Dr Dalton to consist of equal parts of carbureted hydrogen and azotic gases, with a little carbonic acid."

Mr Otley further adds—"That one material circumstance has, however, generally escaped observation; namely, that the air to which the rising of this island has been attributed is not collected in a body underneath it, but interspersed through the whole mass. And the most probable conclusion seems to be, that the air or gas is generated in the body of the island by decomposition of the vegetable matter of which it is formed; and this gas being produced most copiously, as well as being more rarefied in hot weather, the earth at length becomes so much extended therewith as to render the mass of less weight than an equal bulk of water. The water, then, insinuating itself between the substratum of clay and the peat earth forming the island, bears it to the surface, where it continues for a time, till, partly by the escape of the gas, partly by its absorption, and partly by its condensation consequent on a decrease of heat, the volume is reduced, and the earth gradually sinks to its former level, where it remains till a sufficient accumulation of gas again renders it buoyant. But as the vegetable matter of which the island is principally composed appears to have been amassed at a remote period, when the lake was of less depth than at present, receiving very little addition from the decay of plants recently grown upon the spot, it is reasonable to suppose that the process of furnishing the gas cannot from the same materials be continued *ad infinitum*; but that there must be a time when it shall have arrived at its maximum, after which the eruptions will become less extensive or less frequent."
—*Glasgow Herald.*

SIR RICHARD JEBB.

This physician was very rough and harsh in manner. He said to a patient, to whom he had been very rude—"*Sir, it is* MY *way.*" "Then," replied the patient, pointing to the door, "I beg you will make *that* YOUR *way.*" Sir Richard was not very nice in his mode of expression, and would frequently astonish a patient with a volley of oaths. Nothing used to make him swear more than the eternal question—"What may I eat?" "Pray, Sir Richard, may I eat a muffin?" "Yes, madam, the *best thing* you can take." "Oh dear, I am glad of that. But, Sir Richard, you told me the other day that it was the *worst* thing I could eat!" "What would be proper for me to eat to-day?" says another lady. "Boiled turnips." "Boiled turnips! you forget, Sir Richard, I told you I could not bear boiled turnips." "Then, madam, you must have a very vitiated appetite." Sir Richard being called to see a patient, who fancied himself very ill, told him ingenuously what he thought, and declined prescribing, thinking it unnecessary. "Now you are here," said the patient, "I shall be obliged to you, Sir Richard, if you will tell me how I must live, what I may eat, and what not." "My directions as to that point," replied Sir Richard, "will be few and simple. You must not eat the poker, shovel, or tongs, for they are hard of digestion; nor the bellows, because they are windy; but anything else you please!"—*Flowers of Anecdote.*

HYDROPHOBIA.

My predecessors, Messrs Blaine and Youatt, as well as myself, have been bitten by rabid dogs, and we are still alive; and we have operated on some hundreds of human beings who have been bitten by rabid animals, and in no case has there been loss of life. The preventive is as follows:—The person bitten should, as soon as possible, thoroughly wash and cleanse the bitten part; not suck the poison from the wound, as is too commonly done—for inoculation may take place by an abrasion on the lip. If the wound be superficial and ragged, let the edges be removed with a pair of scissors, and then apply freely to every part the nitrate of silver, commonly called lunar caustic, and which may be had in any druggist's shop. If the wound be a punctured one, as in some cases it is, from the tusk of the animal going deep into the flesh, the stick of caustic must be carefully pointed, that it may reach the bottom; if necessary, the wound should be enlarged, care being taken in the use of the knife, or the poison may be carried by it over the fresh surface. The nitrate of silver destroys the surface of the wound, and neutralises the poison, which comes away with the destroyed surface without the absorbents acting upon it; and if freely applied to the part affected, the patient may feel himself perfectly safe. I do not recommend the application of a poultice after the operation, but let the wound be exposed to the atmosphere, and should any inflammation ensue, it may be relieved by dressings of olive oil. Believing that some lives may be saved, I communicate this information through your valuable columns.—*Extract from a letter of Dr Ainslie, Middlesex Hospital, in the Standard.*

COMMERCIAL STRUGGLES.

In truth, it is wonderful to behold—and not the less wonderful because little known, and therefore a thing little esteemed—how fiercely and successfully men of high commercial fame battle with difficulties as they beset them. The politician, the soldier, the sailor, each has his loud acclaim for coolness and freedom of demeanour in time of danger; but few remark, and nobody condescends to tell, how the mind of a tradesman battles with and subdues mere fleshly fears when that which he holds dearest on earth, his credit and his name, are in jeopardy, and the terrors of "stoppage" compass him about. In truth, that is no mean intellect which, on a crowded exchange, in the face of rivals, of those great ones whom he has met as equals, and those men to whom a glance of recognition has been an acceptable favour, can cover with a face of cheerfulness a bosom of sorrows, and carry high the head when the last planks of the ship are about to part.—*The Cotton Lord.*

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 565. SATURDAY, NOVEMBER 26, 1842. PRICE 1½d.

TEMPER.

PERHAPS of all the lesser ills of life, and which make up a pretty large amount of misery, few are so truly vexatious and distressing as those which proceed from the infirmities of *temper*. Thrice blessed are ye who may dispute the assertion, for your inexperience must be a blissful ignorance; but they who know the hideous aspect of the "domestic demon" will admit its truth. Not that it is easy to define precisely where just indignation is merged in mere anger, or where this sinks to the still more ignoble feeling which we recognise as "ill temper;" though, if we do anatomise the vile thing, we shall be obliged to confess that it is the triumph of the worst feelings of our nature over all the higher attributes; triumphs perhaps occasional and rare at first, but, by their exercise, very likely to become frequent or perpetual, for a bad temper is one of the many demons which you must resist, if you would have them flee from you.

Newton Grey was an only child, the only son of a widow, and, perhaps, if ever excuses should be made for such ill-training, some might be offered for the bereaved mother, whose over-indulgence of the sole remnant of her flock strengthened those errors which might have been in childhood uprooted. His education was in a great measure a home one, and Mrs Grey's acquaintance were for the most part of that mole-like and unobservant class (of whom, if the world entirely consisted, we should surely go back in a little while to primitive barbarism) who never discovered anything particular about Master Newton, though perhaps they would have acknowledged, if asked the question, that he was rather a disagreeable boy than otherwise. A public, or even large school, would have been the making of him, for in either he would have found his level; but, as it was, the "disagreeable" boy grew rapidly into the handsome, intelligent (as far as books could make him so), *but* ill-tempered young man. It must not, however, be supposed that he went about the world like a porcupine with his quills erect—very far from it: he had caught the tone of good society—if not the feeling which that tone is intended to represent—and to the stranger there was even suavity in his manners. The creature was harmless while all went smoothly, but stroke him the wrong way, and you would be glad to draw your hand back. It was remarkable, that though rather popular in society than otherwise, he had not formed any of those warm enthusiastic friendships which are so natural with the young, and which, though possibly in their very elements "sweet, not lasting," may yet be considered as an earnest of those aspirations after the good and the true, which bespeak at least a belief in their existence. Had Newton Grey been questioned on the subject, he would probably have told how often he had already been deceived, or how changeable people were. The truth was, that as soon as acquaintance merged into intimacy, he invariably (to keep up the metaphor) showed his quills, and the fresh warm hearts of his associates as instinctively drew back from a closer contact.

Among his young acquaintances, however, was one who either had for him a more sincere regard than the others, or for some motive not at the time known or suspected, did show unusual forbearance under Newton's petty but annoying outbreaks of temper. It is certain that George Hamilton, though only a year or two his senior, had penetrated the character of Newton Grey, and discovered some of the good qualities which he really possessed, despite his besetting fault. But more did he do than show forbearance, for, in a moment of confidence, he ventured to remonstrate with him on the painful subject. He cast his thoughts into the mould of gentle, even affectionate words, but he learned that hour a lesson of worldly wisdom, which, though he was too truthful and noble always to act upon, he never forgot; the lesson, that with inferior minds, to tell them of their faults, is most unpardonably to offend.

"Perhaps, sir," said Newton Grey, after a slight pause in the conversation to which we have alluded, "perhaps, sir, you will favour me with some other instance of my violence, or, as I think you phrased it, 'display of anger disproportioned to the cause.'"

"My dear fellow, I believe occasional violence of temper, however unjustifiable, to be even a less fault than that which I am urging you to correct. There is a Turkish proverb to the effect, 'Why beat the Stamboul puppy because the dog at Bagdad bit you?' and I think it applies to you. For instance, was it dignified, or even gentlemanlike, because you were disappointed of the curious prints I know you had promised to take with you, to disappoint the party at the manor house last Wednesday—a party made up chiefly in honour of your coming of age—without even sending an apology, until after they had waited dinner for you as long as in courtesy to the other guests they could do?"

"It was so provoking, when the fellow had promised that they should be cleaned, and a portfolio made expressly for them by that morning; it put me in such a rage."

"Exactly so. And because the printseller broke his word, you forfeited yours, and had to answer for poor Mrs Percival's soup being cold, her turbot spoiled, and an uneven number of guests being at her table—a thing her precise husband very much dislikes; not to mention that young Bolton had ridden eighteen miles to meet you, and talk over your childish acquaintance, or that my merry cousin Rose had no one to take second in her favourite duets."

"I was in such a rage" ——

"And are now," returned George.

"Nonsense. I never was calmer," stammered the other between his set teeth.

"Well, well, the truth was, you did not know Rose would be there, or I daresay you would have gone. It would *then* have been your pleasure to do so; but having no particular inducement, except the selfish gratification of being envied as the possessor of those rare engravings—after all, a ten minutes' interlude in the five hours you would have spent there; when deprived of that, you cared nothing about annoying, more or less, half-a-dozen other persons. This is what I call *temper*."

"And so, I daresay, you explained it to Miss Hamilton," exclaimed Newton, dashing to the floor a pile of books which stood at his elbow, merely to relieve his feelings. "Fortunately *I* was not called upon for an explanation; but when your mother entered the room, it was very evident that she had been recently in tears; and though she delivered your message, I doubt not, quite correctly, the real state of the case was, I believe, suspected by all. I even heard Rose defend you"—(a pause, but no word from Newton Grey)—"though a young lady, who is now on a visit to Mrs Percival, joined in the conversation, taking the very opposite side of the argument, and so sensibly and eloquently did she express herself, that I fear, poor girl, she must have spoken from personal experience. I really do believe," continued young Hamilton, after a moment's hesitation, "that good sense is the most valuable quality a woman can possess." Perhaps he might have added, "or a man either."

At all events, the absence of "good sense" in Newton Grey was strongly evinced by the fact of his being indignant beyond expression at the "liberty" his friend had taken with him—a liberty which only a very true friend could have ventured upon. Of course he struggled as much as possible to conceal his wrath, for to have given full vent to his feelings, would have confirmed all George Hamilton had asserted; but the latter was never forgiven, and in a few months their intimacy dwindled to a mere bowing acquaintance.

Perhaps the reader may suspect that George Hamilton was more than commonly pleased with the young lady who had spoken so eloquently on the subject of temper; and it was so. The world said he had very much admired his cousin Rose, and that her engagement to Newton Grey had been a great disappointment to him; if so, he was by this time reconciled to his fate; but such sentiments might account for the strong interest he took in the disposition of him on whom her happiness rested. For Ellen Saville, however, his affections soon assumed a much warmer character, for they were based on the most solid foundation. Without any striking beauty to attract, without more than a very moderate competence to lure, and without one particle of art to ensnare, she was one of those persons who, in frivolous society, too often meet with positive neglect. But the conversation which had made so strong an impression on George Hamilton convinced him that, however unobtrusive her manners, she observed, reasoned, judged, and felt; and a very few interviews convinced him he had found the one whose companionship through life would never weary. It might be two months after that eventful dinner-party that young Hamilton paid a visit to his relatives, and entered the drawing-room where, at the moment, Rose was alone. His manner was unusually animated, and his face radiant with pleasure.

"Give me joy, Rose," he exclaimed; "I am the happiest man in the world."

"You have passed your examination, and are admitted, I suppose?" (George was studying for the law.)

"Oh, no; that's a trifle in store for next spring," rejoined he; and then, with a voice almost faltering with emotion, he continued—"I have proposed and am accepted."

"By whom?" asked Rose, wonderingly.

"By whom?—why, by the only woman I ever did, could, or can love, Ellen Saville—*my* Ellen now. Of course she will wish you to be bride's-maid; but, alas! you'll not be needed till next summer; and I am afraid you will be married first, and *she* will have to be 'second to her friend.'"

"*Afraid*, George, that I should be married first! Perhaps you had better ask Newton to postpone our marriage because you, too, are in love," said Rose with a laugh. "I see you are over head and ears; and, remember, I do not expect one word of sense from you for the next twelve months. That is giving you ten months' courtship and a double honeymoon before the recovery of your senses."

"Though I know you are half in jest, Rose, yet you do me injustice. Since you are to marry Newton Grey, I shall be happy, as speedily as you please, to congratulate you on your nuptials, though I am sorry to say he has almost cut me three times since I saw you. However, let it pass, and forgive me if I ever pained you by the truths I some time since endeavoured to impress upon your mind. I shall be but too rejoiced if experience proves that I was in error. Believe me, my dear girl, I had only your happiness in view when I pointed out his one infirmity, which, I doubt not, you will speedily remove."

The engagement to her cousin naturally promoted

an increased degree of intimacy between Rose and Ellen, but to the deep regret of the former, she perceived that the growing regard which she acknowledged for Ellen was a perpetual source of irritation to Newton Grey. It was this circumstance, too evident to escape observation, which first startled the light-hearted girl with the fear that there might be some truth in the reports she had heard of his ungoverned temper. Hitherto, her young life had passed in the sunshine of affection and prosperity, without a cloud to cast its shadow and dull the flow of her naturally joyous spirits. So bright and happy had her life been, that she seemed scarcely to have had time to think deeply or judge of life correctly. Returning fully the love that Newton really bore her, their engagement sanctioned and approved by both families, and in fortune his equal, it seemed that the "course of their true love" was to falsify the proverb, and "run smoothly." Now, however, poor Rose saw the cloud upon the horizon, and felt that it was growing darker and more threatening every hour of her existence. Many feelings contended in her mind. On the one hand, she felt that she already owed to Newton so much of the deference of a wife, as should induce her to yield to his wishes in the choice of her associates; but, on the other hand, she could not blind herself to the fact, that the husband would be very likely to prove an absolute tyrant, since the lover, without one plausible reason, exerted a degree of influence, which verged very nearly on authority, to withdraw her from the society of a relative with whom she had been on sisterly terms since infancy, and from a friend whose companionship was becoming every day more dear to her, and whose advice and friendship she knew to be most precious. Naturally of a truthful disposition, she shrunk from the thought of deceiving him, and yet had not the courage to meet those bursts of anger—not, it is true, precisely directed against herself—with which he usually received all mention of their names; and yet her heart told her that he had no right to demand from her that she should act with unkindness and ingratitude. The natural result of this indecision was, that she learned to temporise. Without promising to give up their society, or definitely intending to do so, she avoided all conversation likely to lead to the dangerous subject. But, alas! when one topic is in this manner shunned or interdicted, it involves so many petty concealments, that the sweet solace of confidence is perfectly destroyed.

Keenly did Rose Hamilton feel this truth; and so perceptibly were her spirits depressed by it, that as the day appointed for her marriage drew near, the friends most anxious for her welfare began to fear she had repented of her choice. Extreme hilarity might have seemed unsuitable for the occasion, but there is a quiet sort of trusting happiness which is very unlikely to be mistaken for regret. In part, however, they were mistaken, for she had loved with all the faith and fervour of a womanly heart, and she had the womanly weakness to cling to the object of her choice, notwithstanding she had learned to see his faults.

How trifling an event often guides us to the most important steps in our life, and how thankful we ought to be, when, distracted by indecision, an accident induces us to turn the scale—wisely! The wedding day was fixed—the wedding guests invited. It was a bright autumnal morning, and Rose had promised that she would take her last ride with Newton Grey as Rose Hamilton. She had named twelve o'clock as the hour she would be in readiness, but an early visit from Ellen Saville induced her to send a message to Newton, whose home was not half a mile distant, to beg he would call for her at two o'clock instead. Although it was not formally so named, she *felt* it was a farewell visit from her friend, whose "good sense" had acquitted poor Rose of all blame in one or two recent slights which had been passed upon her. Each was sorrowful, and each felt that there was a subject on which they had not yet spoken without reserve. Rose Hamilton had not *dared* to invite Ellen to be present at her marriage, and yet her heart prompted her to offer an apology for this seeming neglect. She began some set phrases; but nature was too powerful, and she burst into tears. Ellen was silent, though the briny drops sparkled in her own eyes, and the kiss she imprinted on Rose's cheek was very eloquent. They sat for a few minutes clasped hand in hand, but that gush of feeling had broken the ice of reserve, and they soon spoke freely. Rose's secret sorrow was revealed, if that could be called secret which her friend had long suspected.

Not one unkind or intemperate word escaped poor Rose's lips; not one word that could be construed into regret at her engagement, or hesitation at her approaching marriage; but she confessed how sensible she was of Newton's faults of temper, and of the forbearance that would be necessary on her part; she lamented, in touching language, the strange aversion he had taken to her cousin and Ellen, even while she spoke of her hope, that by and by she should be able to renew their former intimacy. This led naturally to the conjecture, how far the influence of "a wife" might control her wayward husband, and Rose confessed she had already learned the bitter lesson, that to avoid outbreaks of passion, she must conceal from him such passing events as she thought likely to annoy him. This was the greatest trial to her open candid nature; and to feel that the unlimited confidence for which she yearned must be for ever restrained, was a perpetual care to her. In short, she had discovered, that to Newton Grey belonged the one marked characteristic of ill-tempered people; namely, he never owned himself in the wrong, and would never listen to reason, when reason was opposed to his own view of the case.

Something of all this, though spoken in sorrow, not in anger, and interrupted more than once by tears, was Rose's confession to her friend; though, when Newton Grey, pale with passion, entered the room, how much or how little he had overheard, neither of them ever knew. The truth was, that he had left home to keep his appointment with Rose, before her messenger, who had probably loitered on his way, arrived, and had entered by the garden-gate, as he frequently did, unannounced. He had proceeded to the next drawing-room, where Rose usually sat, and which was only separated by folding doors from that in which she and her friend were conversing. It is probable that, with all his faults, he would not have condescended to play the eaves'-dropper longer than the few moments during which his quickly kindled indignation might irresistibly have detained him; indeed, the abrupt manner in which he broke in upon their conference, was a sufficient proof that he was no intentional listener.

"I fear, ladies, I am an intruder," he exclaimed, in a voice of suppressed rage, in which there was also a tone of irony; "but as I seem the subject of your discourse, I may have some right to the benefit of your remarks."

They were all standing, and Rose laid her hand imploringly on his arm. Though the contact was but momentary, she felt that he trembled with passion, and hissing forth, rather than uttering, the one word "annoyance," he raised his own arm hastily to throw back the proffered hand. Let it not be supposed for a moment that he intended to strike or hurt her; he would not *then*, in early life, have raised his hand against a woman, far less against the woman he really loved, even in his wildest anger: but Rose, almost fainting with apprehension already, and thrown back with some force by his arm, caught her foot in the fringe of a footstool, and fell with violence to the ground. Calmed in some measure by such an accident, he raised her almost with tenderness; but Ellen Saville afterwards remembered that Rose appeared to shrink, as if instinctively, from his touch. The noise of her fall quickly brought servants to the room; and as it was soon discovered that her ankle was injured, a surgeon was immediately sent for. It proved to be only a very violent sprain, which, however, confined her to the sofa for several weeks.

The one misfortune of Rose's life was, that from infancy she had been motherless, otherwise she might have required less severe schooling than that which had at last taught her the precarious tenure on which happiness in a union with Newton Grey was likely to rest. But the accident to her ankle delayed the marriage, and this necessary delay gave her time for reflection and decision. A shudder *had* passed through her frame when Newton Grey lifted her from the ground, for at that moment came the conviction, that *now* his temper was, and henceforth would be, to her, as well as the rest of the world, ungoverned; but she was a loving girl, and not without pain could she even listen to the judicious arguments of her father and friends, who, taking advantage of the impression on her mind which his violence had already made, wisely strengthened it, by pointing out the inevitable misery which would result from such a marriage, and imploring her, while there was yet time, to dissolve the engagement.

It was after one of these distressing conversations that Rose Hamilton, with more determination than had been expected from her, promised that, whatever the struggle might be, she would give up all thoughts of becoming his wife.

"But it must be done at once, dear father," she exclaimed; "and—and—do not leave me; Newton is coming in an hour, and your presence will give me courage. The distress of mind I have endured, and the pain I have suffered, have made me weak and nervous, and I dare not trust myself alone with him; but, indeed—indeed, dear father, I am happier now that I have decided." Yet she burst into tears as she spoke.

It was a trying interview which decided the fate of each, and one for which Newton Grey was totally unprepared. For a while his best friends believed that its consequences would prove to him a lesson for life; and so crushed was he for a time by Rose's decision, that there really did appear some prospect of amendment. But who can tell what an ill-tempered person may do? Instead of repenting of his misconduct, he shortly went abroad, and in three months he returned with—a wife!

Yes, a wife is easily obtained, provided people are not too particular. The heart of Newton Grey had been more truly wounded by the final rejection of Rose than the world was inclined to believe, for a bad-tempered man is not necessarily an unfeeling one. He had determined on a tour through part of France and Germany, solely with the hope that a change of scene would work beneficially on his mind, though certainly not with the idea of finding any one to supplant Rose in his affections. A marriage so hasty as that of Newton Grey must necessarily be the mere drawing in a lottery; for though he was engaged a little more than "a week," he had not known the lady two months when he made her his wife. It is possible that he took some pains to curb his temper in her presence, previously to their marriage; but, like a fiery steed too tightly held, it appeared afterwards, when the reins were loosened, beyond all control. Neither had he strong affection to act as a check, for to his own heart he confessed that he had married entirely from pique. Still, he *intended* to prove a good husband: but the proverb concerning good intentions is somewhat trite. The lady was one of those commonplace, characterless mortals, whose destiny entirely depends on the hands into which they fall. She had just so much ability and good principle as might, in a union with a man possessing good sense and decision, have been raised above the general standard; but she was lamentably deficient in the firmness and sterling qualities which could alone have influenced the infirmity, or counteracted the evil effects of her husband's temper. They returned to England, and only a few months were necessary to proclaim to the world that they were a miserable couple. When the world makes a discovery of this kind, it is a proof that matters have arrived at a sad pitch; for the bonds of propriety must be often strained and warped by private disagreement before they burst asunder, and reveal to a stranger's eye the source of disunion. Oh, the wretchedness of that home-made infelicity of which *temper* is the cause! A wretchedness more insidious in its approaches, and really more disastrous in its ravages, than those great calamities which (provided they are unstained, unbegotten by guilt) enlist virtuous sympathy, and have a dignity which supports. But temper is a secret and treacherous foe, which comes on you when least prepared, and by repeated petty stings, wears away happiness even as the perpetual dropping of water wears away a stone. And, what is the worst, it has a *corrupting* power; for experience shows that a really good temper, exposed to the constant irritation of a decidedly bad one, loses, in the course of time, its own amiability.

What, then, must have been the influence of Newton Grey's temper on the character of his weak, half-educated wife? She had been inclined to look up to her husband as a superior being; but there is something so truly undignified in bursts of anger about trifling matters, that neither man nor woman in whom they are discovered can be really respected. When esteem passed away, love—a love based only on the sandy foundation of externals—soon crumbled away also. Then, instead of mere outbreaks on his side, came downright quarrels, in which *her* temper, also, had full play. Reproaches, recriminations, deception followed, weaving an inextricable web of discord. Disgraced by frequent separations, and re-united ostensibly for the sake only of two children which had been born to them, years passed on. The heart of youth, to which belong such bright hopes and lofty aspirations, rotted away in the vile atmosphere of discord and discontent; and middle life, which should bring more solid satisfaction, did not even open to the husband and wife a vista of future happiness.

As the children of Newton Grey grew up, there is little wonder that they became a source of trouble to their parents rather than a blessing. Treated only with capricious fits of fondness, and reproved not in proportion to their deserts, but according to the prevailing mood of either parent, they never even understood the holy trustfulness of filial affection; yet, accustomed as they were to strife, they felt its horrors. Pitiable are the mortals to whom "home" has not a sweet sound, to whom it has not associations of calm and freedom; the son and daughter of Newton Grey were of that sad number. As they grew up, each year strengthened their ardent desire to be free from the galling yoke to which they had been subjected. Happily, they were as yet too young to be infected by their household demon of ill-temper, but their fresh hearts were almost crushed by it. Although Mr Grey's estates were entailed, so that his son must ultimately succeed to them, it was the anxious wish of that son to study for a profession, and distinguish himself in it; but the father would listen to no intreaties on the subject, and instead of at least speaking reasonably and kindly about it, the young man was only met by the insane ravings of passion. His home was more intolerable than ever: is there any wonder that he left it?

Poor Rose (she had been named after her father's

early love), bereft of her brother, was more wretched than ever; though people did say she knew his plans, and from time to time the progress of his fortunes. Poor girl, if her pale cheek and tearful eyes were any criterion, they could not have been very promising. But a new page was opening on her existence; the great era of a woman's life—love—was approaching. Before she was twenty, her heart had found its mate. It is true that he on whom she had fixed her affections was one to whom her parents would never have given her, for he was poor, and belonged also to a family they disliked. In the earlier stages of the intimacy, the attachment might easily have been checked, but they had neglected to win in childhood their daughter's confidence, and they did not meet with it now. And even when at last the fiat went forth that the lovers were to part, she might have obeyed, had the stern mandate been couched in terms of kindness, had she respected and loved her parents, had her home been happy. But tones of anger, and the upbraiding of passion, contrasted dangerously for their influence with the soft whisperings of affection. She, too, left the paternal roof, and as the wife of him her father disapproved, was an outcast from it. And now *the parent's hearth was lonely*. Such marriages, even when there are the fairest excuses for them, always bring their own punishment; and perhaps our readers will consider four years of privation and penury, which chased away the bloom of life, sufficient retribution for the fault of Rose Grey.

The scene is shifted, though still we are telling of lovers and a bridal. Brightly the sun is shining, and merrily the bells are ringing. The mansion where the wedding guests are assembled is not half so stately as that of Newton Grey, but what happy beings it contains! A daughter of George Hamilton weds one who is not only her heart's own choice, but the approved of her parents, the already beloved of her family. Look at her fair smooth brow and truthful eye; she knows discord and deceit only by name; can she carry into another family aught but blessings and peace? And trustingly does the bridegroom feel that he is blessed beyond the common lot of men. He cannot even regret the drops that fall from her dear eyes, nor are his own quite dry, while she lingers for another and another farewell kiss; and he listens to the father's emphatic blessing on the child "to whom he had never cause to say one harsh word." He could not wish, he would not ask, her to quit without emotion the *home* endeared to her by the holiest and happiest associations, the home which had fostered the rare flower he was taking away—a home where he fondly pictured her, but with a matron's dignity, as henceforth the most welcome guest.

But Ellen did not leave her parents alone. Two other fair daughters, and two noble-hearted sons, remained to gladden their hearth with their presence. On this joyful occasion, there was present, amongst other friends, a middle-aged lady, who appeared to be the trusted friend of all, and who left a costly jewel upon the bride's finger, as she tore herself from home. That lady was Rose Hamilton. To her friends it seemed unaccountable—and we do not pretend to clear up the mystery—that with her fair face, her true heart, and considerable fortune, she had never married; but so it was; and though she had lost something of the high spirits for which in early life she had been remarkable, she was considered one of the most estimable and agreeable people in the world.

It was to her that, a few minutes after the bride and bridegroom had departed, a letter was delivered, the perusal of which drew tears from her eyes, far different in their source from those which had just sprung from such joyful emotions. It was a hurried epistle from the daughter of Newton Grey to *her benefactress;* for Rose Hamilton had lately discovered Rose Grey in poverty and sickness, and had, by kindly sympathy and generous bounty, relieved her misery. It was a letter imploring Miss Hamilton's presence in the house of mourning, whither the writer had been summoned at her father's dying request. Without waiting to return home, but attired in the gala dress she had assumed in compliment to her dear cousin, Rose Hamilton departed immediately, using for her journey, which was only one of a few miles, one of the carriages that had conveyed the bridal party from church. What strange contrasts does life present! And surely scenes so opposite as those in which Rose Hamilton that day participated would have affected minds far less susceptible of receiving impressions than her gentle nature had ever been!

Yes, Newton Grey was dying; and before his once beloved Rose reached the house, his erring spirit had fled. In a fit of ignoble anger at some trivial domestic annoyance, he had ruptured a blood vessel, and though the best medical advice was immediately summoned, it proved unavailing. Speechless almost from the moment of his seizure, he yet lingered for a few hours, during which time, it would seem that his heart relented towards his offending daughter, for he, with some difficulty, expressed his desire that she should be sent for. None ever knew the particulars of that agonizing interview; but it is very probable that the discarded daughter told *who* had been her greatest and truest friend, and it was very natural that, in the grief and bewilderment of such a shock, she should seek the counsel and presence of Miss Hamilton. Mrs Grey, although long since something more than indifferent to her husband, seemed stunned by the blow which changed so materially her position; but her own temper had become so infected by his, and her mind so frittered away by frequent and degrading contentions, that she was utterly incapable of directing and advising, as was at once her right and duty. Still, her daughter had to bear with an irritability and petulance more like the conduct of an imbecile child than anything else, but which, however distressing and annoying, were, from their inconsistency and the weakness of her character, otherwise powerless. Of course the absent heir appeared, wiser perhaps for the world's rough usage; but if so, it had been a bitter schooling, and his wisdom dearly purchased.

And now let us pause for a moment. It had been the lot of Newton Grey to have a warm and steadfast friend, but in passion he had cast him off; he had been blessed with the love of a true-hearted and high-minded woman, but he lost his promised bride from the same cause; from pique he had married one in no respect likely to make him happy, and after leading for years a life of discord, he was deserted by his children at the very period their society would have most contributed to his comfort; and on his deathbed he could make no dearer reparation for their sufferings, than bestowing on them their just inheritance. Yea, premature death was but the last and crowning evil in a catalogue of miseries which proceeded from BAD TEMPER!

THE BOWER-BIRD OF AUSTRALIA.

IT has been often observed, that all the productions of Australia have a strange, and what may almost be called an eccentric, character. The plants, the animals, and the fishes, have all something peculiar about them, which distinguishes them from similar objects in the Old World; and it now appears that some of the birds, though not so remarkable in their forms, are at least quite as distinct in their habits. One in particular, called the Bower-Bird (*Ptilonorynchus Holosericeus*), appears to have pursuits of its own, and apparently to take trouble, and display taste, in the construction of a bower, destined only as a place of recreation. The following extracts from Mr Gould's splendid work, "The Birds of Australia,"* will give some idea of the habits of this singular animal:—

"Although this species has been long known to ornithologists, and is familiar to the colonists of New South Wales, its habits, which in many respects are most extraordinary, have hitherto escaped attention; or, if not entirely so, have never been brought before the scientific world. It is, therefore, a source of high gratification to myself to be the first to place them on record.

One point to which I more particularly allude—a point of no ordinary interest both to the naturalist and the general admirer of nature—is the formation of a bower-like structure by this bird, for the purpose of a playing-ground, or hall of assembly, a circumstance in its economy which adds another to the many anomalies connected with the Fauna of Australia.

The localities favourable to the habits of the Satin Bower-bird, are the luxuriant and thickly-foliaged brushes, stretching along the coast from Port Philip to Moreton Bay, the cedar brushes of the Liverpool range, and most of the gullies of the great mountain-chain separating the colony from the interior. So far as is at present known, it is restricted to New South Wales; certainly it is not found so far to the westward as South Australia; and I am not aware of its having been seen on the north coast; but its range in that direction can only be determined by future research.

It is a stationary species, but appears to range from one part of a district to another, either for the purpose of varying the nature, or of obtaining a more abundant supply, of food. Judging from the contents of the stomachs of the many specimens I dissected, it would seem that it is altogether granivorous and frugivorous; or, if not exclusively so, that insects form but a small portion of its diet. Independently of numerous berry-bearing plants and shrubs, the brushes it inhabits are studded with enormous fig-trees, some of them towering to the height of two hundred feet. Among the lofty branches of these giants of the forest, the Satin Bower-bird, and several species of pigeons, find in the small wild fig, with which the branches are loaded, an abundant supply of a favourite food. This species also commits considerable depredation on any ripening corn near the localities it frequents. It appears to have particular times in the day for feeding; and when thus engaged among the low shrub-like trees, I have approached within a few feet without creating alarm; but at other times I have found this bird extremely shy and watchful, especially the old males, which not unfrequently perch on the topmost branch or dead limb of the loftiest tree in the forest, whence they can survey all around, and watch the movements of the females and young in the brush below. In the autumn, they associate in small flocks, and may often be seen on the ground near the sides of rivers, particularly when the brush descends in a steep bank to the water's edge.

The extraordinary bower-like structure, alluded to above, first came under my notice at Sidney, to the museum of which place an example had been presented by Mr Charles Coxen, as the work of the Satin Bower-bird. I at once determined to leave no means untried for ascertaining every particular relating to this peculiar feature in the bird's economy; and, on visiting the cedar brushes of the Liverpool range, I discovered several of these bowers, or playing places. They are usually placed under the shelter of the branches of some overhanging tree in the most retired part of the forest, and differ considerably in size. The base consists of an extensive and rather convex platform of sticks, firmly interwoven, on the centre of which the bower itself is built; this, like the platform on which it is placed, and with which it is interwoven, is formed of sticks and twigs, but of a more slender and flexible description. The tips of the twigs being so arranged as to curve inwards, and nearly meet at the top; in the interior of the bower, the materials are so placed that the forks of the twigs are always presented outwards, by which arrangement not the slightest obstruction is offered to the passage of the birds. The interest of this curious bower is much enhanced by the manner in which it is decorated at and near the entrance with the most gaily-coloured articles that can be collected, such as the blue tail-feathers of the Rose-hill and Pennantian parrots, bleached bones, the shells of snails, &c.; some of the feathers are stuck in amongst the twigs; while others, with the bones and shells, are strewed about near the entrances. The propensity of these birds to pick up and fly off with any attractive object is so well known to the natives, that they always search the runs for any small missing article, as the bowl of a pipe, &c., that may have been accidentally dropped in the brush. I myself found at the entrance of one of them a small neatly-worked stone tomahawk, of an inch and a half in length, together with some slips of blue cotton rags, which the birds had doubtless picked up at a deserted encampment of the natives.

For what purpose these curious bowers are made, is not yet, perhaps, fully understood; they are certainly not used as a nest, but as a place of resort for many individuals of both sexes, which, when there assembled, run through and around the bower in a sportive and playful manner, and that so frequently, that it is seldom entirely deserted.

The proceedings of these birds have not been sufficiently watched to render it certain whether the runs are frequented throughout the whole year or not; but it is highly probable that they are merely resorted to as a rendezvous, or playing-ground, at the pairing time, and during the period of incubation. It was at this season, as I judged from the state of the plumage, and from the internal indications of those I dissected, that I visited these localities. The bowers, I found, had been recently renewed; it was, however, evident, from the appearance of a portion of the accumulated mass of sticks, &c., that the same spot had been used as a place of resort for many years. Mr Charles Coxen informed me, that, after having destroyed one of these bowers, and secreted himself, he had the satisfaction of seeing it partially re-constructed; the birds engaged in this task, he added, were females. With much care and trouble, I succeeded in bringing to England two fine specimens of these bowers, one of which I presented to the British Museum, and the other to the collection at Leyden, where they may be seen by all those who take an interest in the subject."

Another species, called the spotted bower-bird (*Chlamydera maculata*), appears to have nearly the same habits:—"In many of its actions, and in the greater part of its economy, much similarity exists between this species and the Satin Bower-bird, particularly in the curious habit of constructing an artificial bower, or playing-ground. I was so far fortunate as to discover several of these bowers during my journey to the interior, the finest of which I succeeded in bringing to England, and it is now in the British Museum. The situations of these runs, or bowers, are much varied; I found them both on the plains studded with myalls (*Acacia pendula*) and other small trees, and in the brushes clothing the lower hills. They are considerably longer and more avenue-like than those of the Satin Bower-bird, being in many instances three feet in length. They are outwardly built of twigs, and beautifully lined with tall grasses, so disposed, that their heads nearly meet; the decorations are very profuse, and consist of bivalve shells, crania of small mammalia, and other bones. Evident and beautiful indications of design are manifest throughout the whole of the bower and decorations formed by this species, particularly in the manner in which the stones are placed within the bower, apparently to keep the grasses with which it is lined fixed firmly in their places. These stones diverge from the mouth of the run on each side, so as to form little paths; while the immense collection of decorative materials, bones, shells, &c., are placed in a heap before the entrance of the avenue, this arrangement being the same at both ends. In some of the larger bowers, which had evidently been resorted to for many years, I have seen nearly half a bushel of bones, shells, &c., at each of the entrances. In some instances, small bowers, composed almost entirely of grasses, apparently the commencement of a new place of rendezvous, were observable. I frequently found these structures at a considerable distance from the rivers, from the borders of which they could alone have procured the shells and small round pebbly stones; their collection and transportation must therefore be a task of great labour and difficulty. As these birds feed almost entirely on seeds and fruits, the shells and bones cannot have been collected for any other purpose than ornament; besides, it is only those that have been bleached perfectly white in the sun, or such as have been roasted by the natives, and by this means whitened, that attract their attention. I fully ascertained that these runs, like those of the

* This splendid work is published in numbers, folio, each containing seventeen plates, beautifully coloured. The drawings were made from nature, mostly by Mrs Gould, and lithographed by her. The numbers are three guineas each, and are published by Mr Gould, Broad Street, Golden Square.

Satin Bower-bird, formed the rendezvous of many individuals; for, after secreting myself for a short space of time near one of them, I killed two males, which I had previously seen running through the avenue."

DICKENS'S NOTES ON AMERICA.

SECOND ARTICLE.

Mr Dickens's second volume is, on the whole, more lively, and contains a few more sketches of character than the first, besides presenting the author's general remarks on the Americans and their institutions. At the opening of the volume, we find him in a night-steamer on the Potomac, bound from Washington on an excursion towards the southern states. The scene on board the boat, a kind of Noah's ark, is described with the author's usual drollery.

The cabin—"to my horror and amazement, it is full of sleepers in every stage, shape, attitude, and variety of slumber: in the berths, on the chairs, on the floors, on the tables, and particularly round the stove, my detested enemy. As the chairs are all occupied, and there is nothing else to put my clothes on, I deposit them upon the ground: not without soiling my hands, for it is in the same condition as the carpets in the Capitol, and from the same cause. Having but partially undressed, I clamber on my shelf, and hold the curtain open for a few minutes, while I look round on all my fellow-travellers again. That done, I let it fall on them, and on the world: turn round: and go to sleep. I wake, of course, when we get under weigh, for there is a good deal of noise. The day is then just breaking. Everybody wakes at the same time. Some are self-possessed directly, and some are much perplexed to make out where they are, until they have rubbed their eyes, and leaning upon one elbow, looked about them. Some yawn, some groan, nearly all spit, and a few get up. I am among the risers: for it is easy to feel, without going into the fresh air, that the atmosphere of the cabin is vile in the last degree. I huddle on my clothes, go down into the fore-cabin, get shaved by the barber, and wash myself. The washing and dressing apparatus for the passengers, generally, consists of two jack-towels, three small wooden basins, a keg of water, and a ladle to serve it out with, six square inches of looking-glass, two ditto ditto of yellow soap, a comb and brush for the head, and nothing for the teeth. Everybody uses the comb and brush, except myself. Everybody stares to see me using my own; and two or three gentlemen are strongly disposed to banter me on my prejudices, but don't. When I have made my toilet, I go upon the hurricane-deck, and set in for two hours of hard walking up and down. The sun is rising brilliantly; we are passing Mount Vernon, where Washington lies buried; the river is wide and rapid; and its banks are beautiful. All the glory and splendour of the day are coming on, and growing brighter every minute."

Proceeding to Richmond, the author has there an opportunity of observing slavery in its naked deformity, with which he is heartily shocked, and then proceeds on his intended journey to the western territories on the Ohio and Mississippi. The most amusing part of the trip was that performed in a canal boat on the route to Pittsburg, and which Boz hits off in the same graphic and good-humoured way as the scene on the Potomac. One of the passengers was an oddity.

"There was a man on board this boat, with a light fresh-coloured face, and a pepper-and-salt suit of clothes, who was the most inquisitive fellow that can possibly be imagined. He never spoke otherwise than interrogatively. He was an embodied inquiry. Sitting down or standing up, still or moving, walking the deck or taking his meals, there he was, with a great note of interrogation in each eye, two in his cocked ears, two more in his turned-up nose and chin, at least half a dozen more about the corners of his mouth, and the largest one of all in his hair, which was brushed pertly off his forehead in a flaxen clump. Every button in his clothes said, 'Eh? What's that? Did you speak? Say that again, will you?' He was always wide awake, like the enchanted bride who drove her husband frantic; always restless; always thirsting for answers; perpetually seeking and never finding. There never was such a curious man. I wore a fur great-coat at that time, and before we were well clear of the wharf, he questioned me concerning it, and its price, and where I bought it, and when, and what fur it was, and what it weighed, and what it cost. Then he took notice of my watch, and asked what *that* cost, and whether it was a French watch, and where I got it, and how I got it, and whether I bought it or had it given me, and how it went, and where the keyhole was, and when I wound it, every night or every morning, and whether I ever forgot to wind it at all, and if I did, what then? Where had I been to last, and where was I going next, and where was I going after that, and had I seen the president, and what did he say, and what did I say, and what did he say when I had said that? Eh? Lor now! do tell! Finding that nothing would satisfy him, I evaded his questions after the first score or two, and in particular pleaded ignorance respecting the name of the fur whereof the coat was made. I am unable to say whether this was the reason, but that coat fascinated him ever afterwards; he usually kept close behind me as I walked, and moved as I moved, that he might look at it the better; and he frequently dived into narrow places after me at the risk of his life, that he might have the satisfaction of passing his hand up the back, and rubbing it the wrong way."

But the inquisitive gentleman, it seems, was not more odd than another character on board. The boat getting unduly crammed with passengers, all the original inmates grumbled except our tourist, who, being a foreigner, held his peace. Not so a gentleman from the forests of the Mississippi, who, walking to and fro on deck, and without addressing anybody whomsoever, soliloquised as follows:—"'This may suit *you*, this may, but it don't suit *me*. This may be all very well with Down Easters and men of Boston raising, but it won't suit my figure no how; and no two ways about *that*; and so I tell you. Now! I'm from the brown forests of the Mississippi, *I* am; and when the sun shines on me, it does shine—a little. It don't glimmer where *I* live; the sun don't. No. I'm a brown forester, I am. I an't a Johnny Cake. There are no smooth skins where I live. We're rough men there. Rather. If Down Easters and men of Boston raising like this, I'm glad of it, but I'm none of that raising nor of that breed. No. This company wants a little fixing, *it* does. I'm the wrong sort of man for 'em, *I* am. They won't like me, *they* won't. This is piling of it up, a little too moŭntaĭnoŭs, this is.' At the end of every one of these short sentences he turned upon his heel, and walked the other way; checking himself abruptly when he had finished another short sentence, and turning back again. It is impossible for me to say what terrific meaning was hidden in the words of this brown forester; but I know that the other passengers looked on in a sort of admiring horror, and that presently the boat was put back to the wharf, and as many of the Pioneers as could be coaxed or bullied into going away, were got rid of. When we started again, some of the boldest spirits on board made bold to say to the obvious occasion of this improvement in our prospects, 'Much obliged to you, sir;' whereunto the brown forester (waving his hand, and still walking up and down as before) replied, 'No you an't. You're none o' my raising. You may act for yourselves, *you* may. I have pinted out the way. Down Easters and Johnny Cakes can follow if they please. I an't a Johnny Cake, *I* an't. I am from the brown forests of the Mississippi, *I* am'—and so on, as before. He was unanimously voted one of the tables for his bed at night—there is a great contest for the tables—in consideration of his public services; and he had the warmest corner by the stove throughout the rest of the journey. But I never could find out that he did anything except sit there; nor did I hear him speak again, until, in the midst of the bustle and turmoil of getting the luggage ashore in the dark at Pittsburg, I stumbled over him as he sat smoking a cigar on the cabin steps, and heard him muttering to himself, with a short laugh of defiance, 'I an't a Johnny Cake, *I* an't. I'm from the brown forests of the Mississippi, *I* am.' I am inclined to argue from this, that he had never left off saying so; but I could not make affidavit of that part of the story, if required to do so by my queen and country."

From Pittsburg, Mr Dickens went down the Ohio to Cincinnati, which, like other tourists, he describes as a beautiful city; cheerful, thriving, and animated, and with society intelligent and courteous. Proceeding onward, he steams up the Mississippi as far as St Louis, to take a view of that noble but very muddy river, and have a peep at a prairie, neither of which are very satisfactory. Afterwards returning to Cincinnati, he stages it northward to Lake Erie. The Falls of Niagara, a main object in the journey, call forth exclamations of the deepest piety and enthusiasm. The front view of the torrent was stunning, and it was not till he reached Table Rock, and looked on the vast bright-green mass of water, that it came upon him in full majesty.

"Then, when I felt how near to my Creator I was standing, the first effect, and the enduring one—instant and lasting—of the tremendous spectacle, was peace. Peace of mind—tranquillity—calm recollections of the dead—great thoughts of eternal rest and happiness—nothing of gloom or terror. Niagara was at once stamped upon my heart, an image of beauty; to remain there, changeless and indelible, until its pulses cease to beat, for ever. Oh, how the strife and trouble of our daily life receded from my view, and lessened in the distance, during the ten memorable days we passed on that enchanted ground! What voices spoke from out the thundering water! what faces, faded from the earth, looked out upon me from its gleaming depths! what heavenly promise glistened in those angels' tears, the drops of many hues, that showered around, and twined themselves about the gorgeous arches which the changing rainbows made! I never stirred in all that time from the Canadian side, whither I had gone at first. I never crossed the river again; for I knew there were people on the other shore, and in such a place it is natural to shun strange company. To wander to and fro all day, and see the cataracts from all points of view; to stand upon the edge of the Great Horse-Shoe Fall, marking the hurried water gathering strength as it approached the verge, yet seeming, too, to pause before it shot into the gulf below; to gaze from the river's level up at the torrent as it came streaming down; to climb the neighbouring heights, and watch it through the trees, and see the wreathing water in the rapids hurrying on to take its fearful plunge; to linger in the shadow of the solemn rocks three miles below; watching the river as, stirred by no visible cause, it heaved, and eddied, and awoke the echoes, being troubled yet, far down beneath the surface, by its giant leap; to have Niagara before me, lighted by the sun and by the moon, red in the day's decline, and grey as evening slowly fell upon it; to look upon it every day, and wake up in the night, and hear its ceaseless voice: this was enough. I think in every quiet season now, still do those waters roll and leap, and roar and tumble, all day long; still are the rainbows spanning them, a hundred feet below. Still, when the sun is on them, do they shine and glow like molten gold. Still, when the day is gloomy, do they fall like snow, or seem to crumble away like the front of a great chalk cliff, or roll adown the rock like dense white smoke. But always does the mighty stream appear to die as it comes down, and always from its unfathomable grave arises that tremendous ghost of spray and mist which is never laid—which has haunted this place with the same dread solemnity since darkness brooded on the deep, and that first flood before the deluge—light—came rushing on creation at the word of God."

Travelling through Canada, he is pleased to find that noble country at length in the way of advancement. In a vessel from Quebec to Montreal, many English emigrants were on board, and "it was wonderful to see how clean the children had been kept, and how untiring in their love and self-denial all the poor parents were." The sentiments which such a spectacle of enterprise struggling with poverty excites, come warm from the heart. How much harder, he observes, is it for the poor to be virtuous than the rich. Bring the wealthy man here, "upon this crowded deck. Strip from his fair young wife her silken dress and jewels, unbind her braided hair, stamp early wrinkles on her brow, pinch her pale cheek with care and much privation, array her faded form in coarsely-patched attire, let there be nothing but his love to set her forth or deck her out, and you shall put it to the proof indeed. So change his station in the world, that he shall see in those young things who climb about his knee—not records of his wealth and name—but little wrestlers with him for his daily bread; so many poachers on his scanty meal; so many units to divide his every sum of comfort, and farther to reduce its small amount. In lieu of the endearments of childhood in its sweetest aspect, heap upon him all its pains and wants, its sicknesses and ills, its fretfulness, caprice, and querulous endurance; let its prattle be, not of engaging infant fancies, but of cold, and thirst, and hunger; and if his fatherly affection outlive all this, and he be patient, watchful, tender—careful of his children's lives, and mindful always of their joys and sorrows—then send him back to parliament, and pulpit, and to quarter sessions, and when he hears fine talk of the depravity of those who live from hand to mouth, and labour hard to do it, let him speak up, as one who knows, and tell those holders forth that they, by parallel with such a class, should be high angels in their daily lives, and lay but humble siege to heaven at last."

We must hasten to shut this pleasing book, and leave the reader to peruse it entire, having now, we hope, given him a sufficiently copious specimen of its contents. We close with a few of the author's concluding observations on the American character. After denouncing that hideous social feature, slavery, prevalent in some of the states, he sums up the qualities of the people as follows:—"They are, by nature, frank, brave, cordial, hospitable, and affectionate. Cultivation and refinement seem but to enhance their warmth of heart and ardent enthusiasm; and it is the possession of these latter qualities in a most remarkable degree, which renders an educated American one of the most endearing and most generous of friends. I never was so won upon as by this class; never yielded up my full confidence and esteem so readily and pleasurably as to them; never can make again, in half a year, so many friends for whom I seem to entertain the regard of half a life. These qualities are natural, I implicitly believe, to the whole people. That they are, however, sadly sapped and blighted in their growth among the mass, and that there are influences at work which endanger them still more, and give but little present promise of their healthy restoration, is a truth that ought to be told. It is an essential part of every national character to pique itself mightily upon its faults, and to deduce tokens of its virtue or its wisdom from their very exaggeration. One great blemish in the popular mind of America, and the prolific parent of an innumerable brood of evils, is universal distrust. Yet, the American citizen plumes himself upon this spirit, even when he is sufficiently dispassionate to perceive the ruin it works; and will often adduce it, in spite of his own reason, as an instance of the great sagacity and acuteness of the people, and their superior shrewdness and independence.

Another prominent feature is the love of 'smart' dealing, which gilds over many a swindle and gross breach of trust; many a defalcation, public and private; and enables many a knave to hold his head up with the best, who well deserves a halter, though it has not been without its retributive operation; for this smartness has done more in a few years to impair the public credit, and to cripple the public resources, than dull honesty, however rash, could have effected in a century. The merits of a broken speculation, or a bankruptcy, or of a successful scoundrel, are not gauged by its or his observance of the golden rule, 'Do as you would be done by,' but are considered with

reference to their smartness. I recollect, on both occasions of our passing that ill-fated Cairo on the Mississippi, remarking on the bad effects such gross deceits must have when they exploded, in generating a want of confidence abroad, and discouraging foreign investment; but I was given to understand that this was a very smart scheme by which a deal of money had been made; and that its smartest feature was, that they forgot these things abroad in a very short time, and speculated again as freely as ever."

It would be well, he observes, if the Americans loved the "real less and the ideal more;" but all general efforts at social improvement will utterly fail—education, temperance, churches, everything—while one grand foul abuse is suffered to go on unchecked: this is the "newspaper press," a monster of depravity, which leads and rules public opinion, and before which intellect and character must bow down and worship, ere they can expect public distinction. "While that press has its evil eye in every house, and its black hand in every appointment in the state, from a president to a postman; while, with ribald slander for its only stock in trade, it is the standard literature of an enormous class, who must find their reading in a newspaper, or they will not read at all; so long must its odium be upon the country's head, and so long must the evil it works be plainly visible in the republic."

If only half of all this be true, we thank heaven that we live in a land in which, whatever may be its faults, the sanctuary of private life remains inviolate, and where the press is properly kept as the servant of, not the domineering tyrant over, public opinion.

PENEY GLENDINNING.

A CHARACTER IN REAL LIFE.

PENEY GLENDINNING was one of a large family left in their mother's hands by the death of their father, a village artisan in the north of Scotland, while the whole of them were mere children. Having no other resource, the widow retired to the house of her father, who was what is called a *crofter*, that is, tenant of a few acres. It is astonishing what this class of persons sometimes do with their small means. Upon the limited territory rented by her father, did this poor woman rear her three sons and five daughters till they were able to go into the world and do for themselves, which some of them did under creditable circumstances, considering their rank in life. The eldest son received such an education that he might have commenced study for the church, if he had so inclined; but he preferred a business career. The second took to husbandry: the third became a skilled mechanic. Several of the daughters, being handsome and neat-handed, became nursery-governesses and ladies'-maids, as these offices are known in rural districts in Scotland. Peney had no turn for any of these occupations. Her disposition seemed always more to the use of the hands than that of the head. Besides, being the plainest of the family, she had always said herself that she was only fit for drudgery, and, consequently, that education would be thrown away upon her. She could read and write, however, and knew something of accounts; but beyond that she would not go. Her mother, who was a woman of singular clearness of head, as well as goodness of heart, and always encouraged her children to give their opinions, was amused by a trait of Peney—namely, that she always talked of the others as "the children," though she was herself nearly the youngest, and pressed for their being set out in life in utter disregard of her own interests. At last, her youngest sister having grown up, so as to be able to assist her mother, Peney, greatly to her parent's annoyance, went to be washer and dresser to a gentleman's family, there being, as she said, enow in the family besides to fill all the *genteel* places. Peney laboured in this humble vocation several years, equally happy and respected; and, though only eighteen, was considered so sedate and trustworthy, that her mistress, being about to leave home for a time, would have conferred on her the entire charge of her family and servants in her absence, with a handsome addition to her income. But Peney had other views: she had saved a little money, and had resolved on educating herself as a pastry-cook, with the view of either becoming a cook and housekeeper, or taking charge of a shop; and so she could only oblige her mistress by sleeping in the house, and taking charge of the expenditure, for which duty her salary was continued.

Meantime her mother, being now without a family of her own, had moved into the village of the parish, where there was a considerable school, with the view of taking charge of the children of others sent thither for education; in short, kept a boarding-house of a humble but most useful kind, namely, a boarding-house for schoolboys; and Peney sometimes visited her. This village had neither a baker nor a butcher, nor, till that period, much use for them; for the inhabitants had not indulged much in either butcher-meat or wheaten-bread. But this last article, in particular, began now to be much in request, both in the village and neighbourhood, and of this Peney became aware. She remarked, also, that even her own mother required considerable supplies, and received them with difficulty, and not always of the best quality. Peney's resolution, therefore, was taken. She had herself educated as a common bread-baker, as well as confectioner; and at the age of nineteen, with fourteen pounds in her pocket, she set out for the village of her native parish to commence business as a baker.

It was considered a strange speculation for a female; but Peney thought nothing of this. She had previously fixed her mind upon a shop. It was a house that had once been good, but for many years deserted in consequence of the failure of heirs, and of which she had obtained a perpetual lease from the proprietor of the village, almost in the nature of a gift. Peney made good the roof, walls, and windows, in the meantime, and in the one end of the lower part established a bakery, in the other a flour-store and grocery, in case for a time the bakery should not entirely occupy her. Even this first touch astonished her neighbours; for here she had obtained one of the best houses in the village to begin with, almost for a song. The bread she furnished being excellent, and of honest weight, the bakery not only very soon occupied her own time, but she required assistance; and in this also Peney showed her judgment. She employed no man, to be rebelling against her, idling, and perhaps injuring her character; she entered into an agreement with a humble maiden, anxious, like herself, to escape ordinary servitude, and Peney and "her man Jane" (as the neighbours chose to have it) were patterns of quiet and successful industry.

For twelve years this state of things continued, if, with an every-day increasing business, continuance is a proper expression. The expenses of conducting the business were the least possible; for, as Peney's money was paid the moment anything purchased by her was delivered, flour, butter, eggs, barley, whatever she required for her business, were poured in upon her as she needed them, of the best description, and on the lowest terms; and, on the other hand, her bread was so excellent, that it was called for from all quarters, and the money paid down, and Peney's only difficulty was in meeting the demand. Meanwhile, in her domestic arrangements, she had equally shown her good sense. She waited till she saw how her business was likely to prosper, before expending anything on the house that could be avoided; and when she at last repaired it, she did so, not merely as her own circumstances seemed to suggest, but in the best style suitable to the house; that if she herself had left it on the morrow, the money might not be thrown away. In short, Peney had shown, that, though homely in her person, she was strongly rational; and her mother, instead of now laughing with her or at her, as in former times, as her plainest lass and a predestined old maid, had long respected her as the most sensible of her generally sensible and well-doing family, and never spoke of her or met her without feelings of respect and gratitude.

We have shown that Peney had not only felt no need of male assistance in her business, but steadily rejected it. She had also rejected all overtures of a matrimonial kind. Many young farmers, seeing her continually happy and prospering, now thought her exceedingly comely; and as they stepped up to her parlour occasionally to receive their money, and saw the quiet and comfort reigning there, were not slack in complimenting her; but she never gave any encouragement to pursuing the subject. She had seen, in her own family, that matrimony was not always another name for happiness; she reflected that she had always managed for herself with great ease and pleasure, and she did not know how long this might continue were she joined to another, and so she steadily resisted the idea of making a change. She would gladly, however, have had the society of some of her brothers for her mother and herself; and a farm in the neighbourhood becoming vacant, which she thought might suit her second brother, who was at the time steward to a gentleman in an adjoining county, she, with his consent, offered for it in his name, and her offer was accepted.

He took possession, and being in the immediate neighbourhood, Peney began to feel as if the family might yet be reunited under her auspices. But the hopes of mortals are vain; and especially liable to disappointment are the hopes of good-natured old maids. The farm was only about seventy acres, and her brother, as manager for another, had been accustomed to rule over seven hundred acres. His master, too, a considerable proprietor, who had tried to act as manager of his own property, found the charge too troublesome, and he persuaded Peney's brother to return to his employment, under the inducement of relieving him from his farm; in short, selling all off, and paying all damages.

This was a sad blow to Peney. She had set her heart on the little farm, which would not only have been a home to her brother's family, but she was sure would have paid well, as, having been grievously mismanaged by the previous tenant, it had been leased at a really moderate rent. But there was no help for it: an inventory of everything had been made; and the beautiful ploughs and carts, and the pretty animals of every description, selected with such care, and for which, as belonging to her brother, Peney had contracted an affection (for the heart *will* love something), were about to be sold for very probably half their value, and Peney was miserable.

At last, one morning Peney rose in more than usual bustle, and having arranged her own business for the day, set out nobody knew whither. It was for the residence of her brother's master. She could not but respect him for so respecting her brother; but she deplored the blow he was striking against his family, for, of course, in Peney's idea, they must now become common servants. "Quite a mistake," said the other; "I have arranged about that also; they may do many things with my assistance which they could not do without it, and I only regret we had not thought of all this eighteen months ago; it would have saved me some hundred pounds direct, besides the risk of re-letting this unfortunate little place." Peney said, everything had been so well selected, and got on the best terms. "To be sure," it was answered, "but who ever heard of a displenishing without loss?" "And what is it supposed must be the loss?" asked Peney. The inventory was laid on the table; and, after mutual consideration, it was agreed that, between the loss on the stock, and a year's rent to the landlord for cancelling the lease, the damage could not be under L.300.

Peney's colour came and went repeatedly; and the gentleman felt for her, for he thought she was regretting this loss as of her causing. But she was thinking of other things also. She had become attached to the farm. She was sure it might be made to yield wheat, and it could give such a deal of offal for fowls and pigs! At last she said, "Would you give *me* L.200 to free you of the farm?" "With all my heart," answered the gentleman, "but that I should not like to injure you." "I have considered everything," she said, "and think I may run the risk." Without further reasoning, the bargain was struck. Peney received an order for her money, and gave a missive, freeing the gentleman of the lease; and after dining with the family, returned home, tenant of the farm of Cauld-Shouthers!

Pope has said, that after contracting to translate the "Iliad," he felt, when lying in bed, as if a rope were about his neck! and the feelings of Peney Glendinning were precisely similar when she thought of being saddled with a farm for twenty years, and at a rent of nearly two hundred pounds. She endeavoured to think, however, that the loss could not be complete; next, that it might not be very considerable; and lastly, that, with good management, there might even be a profit; although this last was a view of the subject she hardly dared to take. It was with a very doubtful mind that she first broke the subject to her brother. His first look was very discouraging, for it seemed to say, as plainly as possible, that she had ruined herself. His next emotion was to laugh at the oddity of the thing, and Peney joined him, but with a tear in her eye. He thus saw the necessity of settling down into graver consideration of the subject; and when he saw what Peney had really done, he could not but applaud her sagacity and talent. The order she had received from his master more than paid his own claims upon the farm (for she had already made some advances for him), and he admitted, that if she could manage the farm as successfully as she had managed her other business, she was richer by the transaction by at least L.400. She entered not only to a farm, stocked to her hand in the best manner, and at a reduced price, but to a growing crop at the expense of seed and labour.

When at length the time came for her taking possession, she saw many things even more doubtfully than at first; yet, as the die was cast, she determined to go boldly on. Her very first operations showed an original mind, as well as a firm spirit. What had been done on the farm had been done well, but as usual, a good deal in the rough. Head and end ridges, spots for turnings, and for dung-heaps, had been disregarded; and from time immemorial, the dykes* had been approached no nearer than horses might conveniently go. Peney considered all this as waste. She saw that in many cases these spots were, from long rest and other circumstances, the most valuable parts of the farm, and that putting them together they made many acres. Peney resolved that they should lie waste no longer; and wherever the plough would not go, she determined to employ the spade. Her hind† remonstrated, and said they should be laughed at; but Peney only thought of one thing, making the most of everything. She said every apron-breadth, nay, foot and inch, was paid for, and she saw no reason why it should not be made to pay. In the mean time, she kept an account of the expense of trenching, and had the produce valued; and as the new land produced by far the heaviest crops, the balance was greatly in her favour, and she had no more opposition upon this point. By cultivating these odds and ends, draining and filling up a pond or two, which had been open beyond memory, but without any visible object, and filling up and cropping several open drains, Peney, during the first and second years of her incumbency, added six or eight acres to the productive power of her holding, and these, it was admitted, the most valuable on the farm. Having once proved the benefit of such management, she carried her arms into every quarter. Every useless dyke was thrown down and ploughed over; whins and stones that had stood untouched since the creation, were now grubbed out and dislodged without mercy, and the ground on which they stood subjected to the plough. Plashy meadows were drained and wholly altered in their character, and, in short, rendered dry and fertile; and even a small wood, that, being planted in a swamp, had refused to grow, was now,

* Dykes, in Scotland, are dry stone enclosures; in Ireland, and perhaps elsewhere, they are ditches.

† Farm-labourer.

with permission of the proprietor, rooted out, and its place being drained, turned into a level and fertile field. Everybody stood aghast at the untutored vigour of Peney, till her farm being like a garden, the proprietor placed at her disposal, and on her own terms, every acre in her neighbourhood that became vacant; and the only female tenant in the district shamed all the males! So sensible was the proprietor of the value of such services to him and to his successors, and of the benefit of such an example, every way considered, that, having breakfasted with her one day, on his own invitation, he left under his plate an order on his banker for a hundred pounds.

Of course, instead of loss, Peney was now realising considerable profits. As she herself required the flour, wheat was now raised by her in great quantity where it had never been raised before. To keep her ground in heart, she required large quantities of manure, and to make as much of that as possible, on her own premises, she took to feeding all her grown cattle in the stall. This was quite a new mode of keeping cattle in this part of the country; but Peney knew what she was about. A natural sagacity, without the aid of science, told her that when cattle roam about in the fields, they not only waste much pasture, but all their manure disappears, and is as good as lost. By stall-feeding, therefore, she saved provender, and did not allow a particle of the valuable manuring material to go to waste. Some people, she observed, from sheer heedlessness, permitted the liquid refuse of their stables and cow-houses to escape in putrescent streams, and were thus, as it might be said, instrumental in picking their own pockets. But Peney was most rigorous in her arrangements in this department of affairs. All the liquid manures of her farm establishment were led by conduits into tanks, and were thence, at proper opportunities, carried away for the purpose of irrigating the fields in the neighbourhood. Peney calculated that she saved twenty pounds a-year by this very simple and rational kind of economy. One thing leads to another in good farming. An abundance of manure permitted Peney to raise fine crops of turnips and artificial grasses, with which she fed her cattle, and by growing which she was able to meliorate and clean her land; for, as everybody knows, land cannot be properly improved or kept clear of weeds without a regular system of green-cropping. The old method of restoration and cleaning was to give the land a rest, or let it be fallow, and keep ploughing it from time to time. Peney fed and pulverised her fields, but gave them no rest. No sooner was one crop off than another was on, the plentiful manure keeping the ground sufficiently in heart. The landlord gave no play days in his rent, and Peney gave none to his land.

Nor did Peney thrive by cultivation only. Six or eight of her handsomest queys were sent early one morning, nobody knew where; but they soon returned, and people said, Peney had missed her market for once. It was not so. They had been visiting an estate at some distance, on which the proprietor had introduced a very handsome breed of cattle (it is believed the Teesdale), and in due time Peney was possessed of some of the prettiest little calves that had ever been seen. From humanity, she always gave her calves their milk as their mothers gave it, and she did not break off upon this occasion. Of course her calves grew apace. Her nursery, as she called it, was besieged! As we believe it is a law of nature, that where there is plenty of food, females are chiefly produced, nature taking the hint, and sending the prolific animal only where there seems room, most of Peney's brood were young cows; and at the proper time she sold them, so far as she chose to sell, at L.3 or L.4 a-head more than the ordinary stock of the district would bring. Peney, therefore, prospered in every way. She had no outlet for sheep, and therefore had few, except occasionally a score or two to help in consuming the turnips, or to furnish wool for blankets; for Peney was one of those who adhered to the old idea, that anything that could be produced at home was saved to home, and so raised both wool and flax for her own purposes, and had them spun as save-alls of time. But having plenty of bran and potatoes, and even skim-milk, her pigs were innumerable; and she did not confine them to a miry den, as is the almost universal custom of pig-keepers, but gave them lodgings, clean, dry, and airy, and had pleasure in thinking them the happiest pigs in the kingdom, as they certainly were among the handsomest. Understanding that it made them fatten faster, to be washed and brushed, and her cows give more milk to be *curried*, she would cause her little fellow of all work to amuse himself in that duty every other day, and, for a few pence, had probably many pounds added to the value of her stock.

There was yet another peculiarity. People in Scotland cannot endure to do anything which will cause them to be talked of; and many, for this reason, or rather prejudice, have avoided, doing many things which it was much their wish and interest to do; and, on the other hand, continued doing many things they heartily disliked. Peney despised all this. She had found riding to market on horseback uncomfortable, and a waste of clothes; and if her servant, who necessarily accompanied her, walked, he was fatigued for the day, and if he rode, he fatigued and occupied another animal. She therefore encouraged a young man, who had a turn for neatness in carpentry, to build her a carriage that would carry them both. The price was to be *a pound*, she finding the materials; and in due time a very passable gig, placed upon flexible poles, was formed; and the pony attached to the bakery being fitted with a neat bridle and reins, and some other articles of ornament, for another pound, Peney was mounted. When she first made her appearance in the market, there was a great cheer; but Peney felt the comfort and economy of her measure, and disregarded it. Many came round to look at the phenomenon, and among the rest, the surveyor of taxes, and Peney paid more attention to him than to all the others, though she affected it not. For one thing, she called her servant to remove her pillion to the inn, in case of rain, and to allow the surveyor to inspect the carriage. He did so in all directions, but could see no spring, though, from Peney's motion, he could almost have sworn there was one, and so retired discomfited. The spring was in the cushion! and Peney not only rode at her ease, but what was a great addition to her pleasure, tax-free. She was the first in the district who dared to make themselves comfortable without caring about being talked of.

We must not omit to mention that Peney was not only an advocate for the principle of shelter, but her natural sagacity led her to adopt it. When removing the trees from the bog which we have commemorated, she felt unwilling to destroy such as she thought useful, and so had them carefully removed and planted in form of a belt, along the north and east sides of her farm, these being the most exposed. By care, they survived, and have thriven better in their new than they did in their original situation. Without at all deducting from the extent of the farm (for the ground being clean where they were planted, and fenced in by a wall, they afford a pasture superior to anything that ever grew on the spot before), they form a shelter so valuable, that when other people's cattle are crouching with their tails to the blast, and quite incapable of feeding, Peney's (for she still pastures the young) are luxuriating in a nook so comfortable that they are hardly sensible that the storm is abroad: they only hear it roaring in the trees, and keep whisking and feeding in the coldest day, as if under the influence of a mild and gracious one. In short, Peney's farm, though it lies high (as its name imports), will soon be so surrounded as to seem low. From being the cold shoulder of a hill, it will seem a rich and happy valley.

We need not pursue these details further. It is enough to say, that, from a humble girl, Peney Glendinning has raised herself to be a woman of substance and reputation. In a state of things that often defies the exertions of *men* of strong minds and undoubted energy, a female—and why not?—found the means of raising herself in two separate professions. Nobody's opinions or proceedings are now looked up to with more respect where she is known; and when the sons and daughters of men of substance fear to make the plunge into life, they are told to think of PENEY GLENDINNING.

POPULAR ENGLISH FESTIVALS.

ALL HALLOW EVEN.

ALL HALLOW EVEN, called in Scotland *Halloween*, and in the north of England *Nutcrack Night*, is the last evening of October, being the vigil of All Saints' Day (November 1), a festival of the Catholic church, in commemoration of those of its saints to whom, on account of their number, particular days could not be allotted in their individual honour. There is perhaps no night of the year which the popular imagination has stamped with a more peculiar character than this, or which is more widely and uniformly marked by certain ceremonies and customs. It is clearly a festival of ante-christian times, for there is nothing in the church observance of All Saints' Day to have originated such extraordinary notions as are connected with it, or such remarkable practices as those by which it is distinguished.

The leading idea respecting All Hallow Even, or Halloween, is, that it is the time, of all others, when supernatural influences prevail. It is the night set apart for a universal walking abroad and bustling about of spirits and all sorts of beings not of this world; the night of sure divination; a time when the ideal takes the upper hand of the real everywhere, and (to use the language of an early Scottish poet)

> "Al is bot ghaists and elritch fantassis."

This general character of the night escapes the notice of writers on our popular antiquities; but we know it to be that which rests in the rustic mind in Scotland, and, indeed, this is partly acknowledged by Burns in a note to his poem on Halloween, which, he says, "is thought to be a night when witches, devils, and other mischief-making beings, are all abroad on their baneful midnight errands; particularly those aërial people, the fairies, are said on that night to hold a grand anniversary." The very same notion conveyed by the Ayrshire bard is embodied in a poem of the sixteenth century, of which he probably never heard—*Montgomery's Flyting against Polwart*—

> In the hinder end of harvest, on All-Halloween,
> When our good neighbours does ride, if I read right,
> Some buckled on a binweed, and some on a bean,
> Aye trotting in troops from the twilight.

Many a merry cottage group, holding this evening, has been arrested by terror when a storm arose, believing that they heard the infernal troops rattling along upon the blast.

There is a remarkable uniformity in the fireside customs of the night all over the United Kingdom. Nuts and apples are everywhere in requisition, and consumed to a pretty considerable extent. Indeed the night takes its name in the north of England from the prevalence of the former fruit. Goldsmith tells of his Wakefield party, that they "religiously cracked nuts on All Hallow Eve." As to nuts, they were not only cracked and eaten, but made the means of vatication in love affairs. And here we shall quote poetical reporters from all the three kingdoms, by way of showing the universal prevalence of the custom. Hear Gay first for England:—

> Two hazel nuts I threw into the flame,
> And to each nut I gave a sweetheart's name:
> This with the loudest bounce me sore amazed,
> That in a flame of brightest colour blazed.
> As blazed the nut, so may thy passion grow,
> For 'twas thy nut that did so brightly glow.

Then Mr Graydon* for Ireland:—

> These glowing nuts are emblems true
> Of what in human life we view;
> The ill-matched couple fret and fume,
> And thus in strife themselves consume:
> Or from each other wildly start,
> And with a noise for ever part.
> But see the happy, happy pair,
> Of genuine love and truth sincere;
> With mutual fondness while they burn,
> Still to each other kindly turn;
> And as the vital sparks decay,
> Together gently sink away;
> Till, life's fierce ordeal being past,
> Their mingled ashes rest at last.

Lastly, Burns for Caledonia:—

> The auld-gudewife's weel-hoordit nits,
> Are round and round divided,
> And mony lads' and lasses' fates
> Are there that night decided:
> Some kindle couthie side by side,
> And burn thegither trimly;
> Some start awa wi' saucy pride,
> And jump out owre the chimly,
> Fu' high that night.
>
> Jean slips in twa wi' tenty ee,
> Wha 'twas she wadna tell;
> But this is Jock, and this is me,
> She says in to hersel':
> He bleezed owre her and she owre him,
> As they wad never mair part;
> Till, fuff! he started up the lum,
> And Jean had een a sair heart
> To see't that night.

Brand, in his Popular Antiquities, is more particular: "It is a custom in Ireland, when the young women would know if their lovers are faithful, to put three nuts upon the bars of the grate, naming the nuts after the lovers. If a nut cracks or jumps, the lover will prove unfaithful; if it begins to blaze or burn, he has a regard for the person making the trial. If the nuts named after the girl and her lover burn together, they will be married."

As to apples—there is an equally universal custom on this merry night, of hanging up a stick horizontally by a string from the ceiling, and putting a candle on the one end and an apple on the other. This being made to twirl rapidly, the merry-makers in succession leap up and snatch at the apple with their teeth (no use of the hands allowed), when the probability is, that the candle comes round before they are aware, and scorches them in the face, or anoints them with grease. The disappointments and misadventures occasion, of course, abundance of laughter. It is worthy of remark, that this amusement is precisely similar to that of the *quintain*, which prevailed extensively in the days of chivalry, consisting of a wooden figure mounted on a pivot, with a flat piece of wood crossing in the situation of the arms, at the one end of which a bag of sand was hung. The feat was to ride full tilt with a blunted spear at the other end of the cross piece, and escape the thwack with which the revolving sand-bag was sure to visit the shoulders of all but dexterous players. Apples are also set afloat in a tub of water, which, being placed on the floor, young people take their turn of attempting to catch one with their teeth—a task by no means easy, and which usually is not accomplished without a great deal of ducking and bedabbling. This peculiar ceremony we suspect to be less general, for it is not mentioned by Burns, nor is there any notice of it amongst the many particulars respecting All Hallow Eve collected in Ellis's edition of Brand's Antiquities.

In the rural districts of Scotland, the first ceremony of Halloween is the pulling of cabbage stalks in the garden. The young people go out hand in hand blindfolded, and each must pull the first stalk which he meets with. They then return to the fireside to inspect their prizes. According as the stalk is found big or little, straight or crooked, so is the future wife or husband of the party to be. The quantity of earth sticking to the root denotes the amount of fortune or dowry; and the taste of the pith, or *eastock*, indicates the temper. Finally, the stalks are placed one after another over the door, and the Christian names of the persons who chance thereafter to enter are held in the same succession to indicate those of the individuals whom the parties are to marry. The latter part of this rite is like one celebrated by Gay regarding peascods:—

> As peascods once I plucked, I chanced to see
> One that was closely filled with three times three;
> Which, when I cropped, I safely home conveyed,
> And o'er the door the spell in secret laid;

* Author of a volume of poems published in Dublin, 1801.

The latch moved up, when who should first come in,
But, in his proper person—Lubberkin!

Another ceremony much practised amongst rural folk is that of the Three Dishes. Two of these are respectively filled with pure and soiled water, and one is empty. They are ranged on a table, when the parties, blindfolded, advance in succession, and dip their fingers into one. If they dip into the pure water, they are to marry a maiden; if into the soiled water, a widow; if into the empty dish, they are not to marry at all. At the advance of each party, the situations of the dishes are duly changed. Burns tells us that—

Auld Uncle John wha wedlock's joys
Since Mar's year did desire,
Because he got the toom dish thrice,
He heaved them in the fire
In wrath that night.

These ceremonies everywhere enter into the merry-makings of this night, because there is no terror connected with them. Even amongst the middle classes in our larger cities, young people meet on Halloween to duck for apples, burn nuts, and dip into the Three Dishes. There are other rites of augury peculiar to the night, which are perhaps scarcely anywhere practised, on account of their dismal character, a supernatural vision being always expected from them. No poet could dream of a more wild supernaturality than that of eating an apple at a looking-glass, in the expectation of seeing the image of a future husband come and look over the shoulder. Not much less terrible is the exhibition of a wet shirt sleeve at a fire at midnight, expecting to see from bed the same image come in and turn it; or the winnowing of three *wechts* of nothing in a barn, in expectation of beholding that form pass through from one door to the other. A fourth rite of this kind was to go into the farm-yard, and there sow a handful of hemp-seed (a bad subject of jesting), and afterwards go through the form of harrowing it over, saying—

Hemp-seed, I saw thee,
Hemp-seed, I saw thee,
And he who is to be my true love,
Come after me and draw thee.

Then, according to Burns, "Look over your left shoulder, and you will see the appearance of the person invoked, in the attitude of pulling hemp." Gay alludes to this as a rite proper to St John's or Midsummer Eve:—

At eve last Midsummer no sleep I sought,
But to the field a bag of hemp-seed brought;
I scattered round the seed on every side,
And three times in a trembling accent cried,
This hemp-seed with my virgin hand I sow,
Who shall my true love be, the crop shall mow.

Burns represents an old wife by the fire as indignant at her grand-daughter for proposing to eat the apple at the glass, saying—

Ye little, skelpy, limmer face,
I daur ye try sic sportin,
As seek the foul thief ony place,
For him to spae your fortune!
Nae doubt but ye may get a sight!
Great cause ye hae to fear it;
For mony a ane has gotten a fright,
And lived and died deleerit,
On sic a night.

An example of the bad effects of such adventures occurred so lately as 1802, when a maid-servant of Mr Mathewson, type-founder in Edinburgh, having sown hemp-seed in her master's foundry, and having seen what she thought a supernatural figure, fell ill in consequence, and died on the second day of apoplexy, the clear effect of the fright.

The delicacy called sowens always composed the Halloween supper of a Scottish cottage or farm-house.

These may be considered as the modern and common ceremonies of the vigil of All Saints. There are, besides, a class of customs evidently of far earlier antiquity, but which had many years ago become confined to remote and primitive districts. For example, in North Wales, according to Pennant, "there is a custom upon All Saints' Eve of making a great fire called Coel Coeth, when every family, about an hour in the night, makes a great bonfire in the most conspicuous place near the house, and when the fire is almost extinguished, every one throws a white stone into the ashes, having first marked it; then, having said their prayers turning round the fire, they go to bed. In the morning, as soon as they are up, they come to search out the stones, and if any one of them is found wanting, they have a notion that the person who threw it in will die before he sees another All Saints' Eve." Another writer tells us—"The autumnal fire is still kindled in North Wales, being on the eve of the 1st day of November, and is attended by many ceremonies, such as running through the fire and smoke, each casting a stone into the fire, and all running off at the conclusion to escape from the black short-tailed sow; then supping, &c." Anciently, throughout England, the master of a family carried a bunch of straw, fired, about his corn, saying—

Fire and red low,
Light on my teenlow.

Teen is fire in our aboriginal language—thus, *Beltein*, the fire of Bel. Now, see how surprisingly similar are certain customs in Scotland. The people of Lower Perthshire, on the border of the Highlands, "set up bonfires in every village on All Saints' Eve. When the bonfire is consumed, the ashes are carefully collected into the form of a circle. There is a stone put in near the circumference, for every person of the several families interested in the bonfire; and whatever stone is moved out of its place, or injured before the next morning, the person represented by that stone is devoted, or *fey*, and is supposed not to live twelve months from that day."* Another, reported from the same district, says—"On the evening of the 31st of October, O.S., heath broom, and dressings of flax, are tied upon a pole; this faggot is then kindled. One takes it upon his shoulders, and, running, bears it round the village. A crowd attend. When the first faggot is burnt out, a second is bound to the pole, and kindled in the same manner as before. Numbers of these blazing faggots are often carried about together, and when the night happens to be dark, they form a splendid illumination." Weever, speaking of the monks of St Edmundsbury, says, "They had certain wax candles, which ever and only they used to light in wheat-seeding: these they likewise carried about their wheat grounds, believing, verily, that hereby neither darnel, tares, nor any other noisome weeds, would grow that year among their new corn." The coincidence of these customs in parts of the island so remote from each other can only be accounted for by supposing a common origin for the people themselves. The customs are obviously Pagan in character, and show that All Hallow Eve is only a Christian festival, by virtue of that policy of the early Christians which dictated the taking advantage, for their own system, of the inclination to keep holy a particular day, when they could not altogether displace the rites connected with it. The four great festivals of the Celtic heathen appear to have been the 1st of February, the 1st of May, the 1st of August, and the 1st of November; and all of these were distinguished by the kindling of fires. That celebrated on the 1st of November was converted by the Christians into All Saints' Day.

There are traces of a few other customs for this eve. Henry VIII. directed the abolition of "the vigil and *ringing of bells all night long* upon All-Hallow Day at night." Martin, in his description of the Western Islands, written at the end of the seventeenth century, tells us that the inhabitants of St Kilda, on the festival of All Saints, baked "a large cake in the form of a triangle, furrowed round, and which was to be all eaten that night." The same, or a custom nearly similar, seems to have prevailed in different parts of England. Martin, speaking of the isle of Lewis, says, "The inhabitants of this island had an ancient custom to sacrifice to a sea-god, called Shony, at Hallowtide, in the manner following: The inhabitants round the island came to the church of St Mulvay, having each man his provision along with him. Every family furnished a peck of malt, and this was brewed into ale. One of their number was picked out to wade into the sea up to the middle, and carrying a cup of ale in his hand, standing still in that posture, cried out with a loud voice, saying, 'Shony, I give you this cup of ale, hoping that you'll be so kind as send us plenty of sea-ware for enriching our ground the ensuing year;' and so threw the cup of ale into the sea. This was performed in the night-time. At his return to land, they all went to church, where there was a candle burning upon the altar: and then standing silent for a little time, one of them gave a signal, at which the candle was put out, and immediately all of them went to the fields, where they fell a drinking their ale, and spent the remainder of the night in dancing and singing." Brand states that there was, in his time, a custom in Warwickshire, of having seed-cake at All-hallows: this seed-cake is alluded to in the Five Hundred Points of Good Husbandry, the edition of 1580:

Wife, some time this week, if the weather hold clear,
An end of wheat-sowing we make for this year.
Remember you, therefore, though I do it not,
The *seed-cake*, the pasties, the furmety-pot.

In Brand's description of Orkney, the author, speaking of the superstitions of the inhabitants, says, "When the beasts, as oxen, sheep, horses, &c., are sick, they sprinkle them with a water made up by them, which they call *forespoken water*; wherewith likewise they sprinkle their boats, when they succeed and prosper not in their fishing; and especially on Halloween, they use to sain† or sign their boats, and put a cross of tar upon them, which my informer hath often seen." Probably all of these customs are now totally extinct, even in the least civilised portions of our country.

* Reported by the minister of Callender, in the Statistical Account of Scotland, 1791.

† Sanctify.

PRESENT STATE OF THINGS IN NEW ZEALAND.

A small newly published volume, entitled "Narrative of a Residence in Various Parts of New Zealand," must be taken with some small allowance for the fact, that the author, Mr Heaphy, is a surveyor in the employment of the New Zealand Company. It contains, however, some interesting intelligence respecting the progress and present condition of the colonies in that part of the world. He spent two years and a-half in the islands, during which, he assures us, he never experienced a day's illness, though often obliged to sleep in the open air. The climate, he says, only appears too humid to those who have been accustomed to the aridity of Australia; he considers New Zealand as possessing a climate not more rainy or tempestuous than that of England. "The effect," he says, "of the equability of the climate is most conspicuous in the rapid development of vegetable life, and its constant progress. I have seen on many of the trees and shrubs indigenous to the country, every stage of yearly vegetation appearing at one time; the leaf, bud, flower, fruit, and decayed leaf were each, seemingly, in their natural state, and without any appearance of defect. During the two winter months of June and July, nature seems in more repose than at other times; but even then there is no suspension of vegetable life."

The cereal grains are all growing well in New Zealand, and it is expected that the Australian colonies will soon be chiefly supplied with wheat from this younger settlement. All the ordinary English vegetables and fruits are now reared with success at Wellington; potatoes, upon cleared forest land, already yielding 14 tons per acre. "To prove the extraordinary productiveness of the soil even in places where it should be least expected, I need only mention the circumstance, that on the day of my departure from Wellington, I saw in the garden of a poor man on the beach, strawberries, with ripe fruit, growing in the sand, within ten paces of the sea. I may also mention having seen pumpkins, maize, and melons, growing in the sandy soil of the beach of Thorndon, ere that place was chosen as the site of Wellington. English flax, or linseed, is also to be seen growing in a similar soil near the mouth of the Hutt." Farming is proceeding with spirit. "The gentlemen from the neighbouring colonies, who have settled in Wellington, have shown an excellent example of spirit and energy to those more recently arrived from England. They know the difficulties which are to be combated in all new settlements, and are not daunted by the sight of a government prohibition, or a hilly district; by a colonial secretary, or a forest."

The systematic settlement of the country has already had a marked effect upon the natives, who, as is well known, have ever been eager to see a white population amongst them. "The native now begins to see his own defects, and seeks to remedy them; and is anxious to place himself on an equal footing with the white people, by availing himself of the benefit of their improvements. As an instance of this, I may mention the circumstance of the fast disappearance of the native huts about Wellington, in consequence of their inhabitants discovering the superior comfort of more roomy houses built in the English mode. All the superior chiefs about Port Nicholson have now tolerably well-built cottages.

Great numbers of the inferior chiefs and common people are now domesticated in the houses of the settlers, for whom they work as servants. They will clear land, build, fence, fish, shoot, and cook for them, and but seldom, when treated with confidence, do they show themselves unworthy of it. It is not unfrequently that the settlers, on any temporary absence from the town, leave their houses in the charge of a native; and at such times, I have never heard of any act of dishonesty having been committed by one.

The Port Nicholson natives have a great liking for European clothing, and their personal vanity in no slight degree promotes their industry. One merchant in Wellington has on his books the names of nearly 200 natives, to whom he has given credit for various articles of clothing and ornament; and amongst that number are none who do not immediately cancel the account against them when able to do so, nor does the vender find their custom unprofitable. The natives do not at all times display much refinement of taste in their method of arranging their dress, but they are excellent judges of its quality, and are seldom deceived by a showy appearance of the article they are bargaining for.

Many of them are in possession of considerable sums of money. The amount of specie in circulation amongst them was estimated by Mr Smith, the manager of the Wellington bank, at L.150,000. I have myself seen as much as forty pounds tied up in the corner of a chief's blanket. Any native who chooses to work for a settler in Port Nicholson can obtain half-a-crown a day for any length of time, and on considering their few wants, it will be apparent that this is a fair rate of wages.

That trust and reliance can be put in them with safety, is sufficiently shown by the fact of the mail between the settlements of New Plymouth, Petre, and Wellington, being carried by a native weekly; and the circumstance of E'Wari, one of the young chiefs of Port Nicholson, having, with a native boat's crew, gone off to the *Olympus* emigrant ship, in the straits, during a gale, and piloted her with safety into the harbour and anchorage, and for which he received five pounds, proves the ability and confidence which some of them possess.

The Port Nicholson natives are fully aware of, and appreciate, the power of the law. Their dissensions between themselves and with the English they continually refer to the decision of the magistrate; and they at all times follow his opinion or advice, even in cases out of his legal judication.

Very few of the natives in the company's settlements repent having sold their land. Some difficulties have occurred when the settlers have chosen, for their sections, native plantations; this, however, cannot be wondered at, as they had then no knowledge of the situation of their reserved land, and naturally felt jea-

lous and alarmed at being dispossessed of their potato grounds, which are of course their most important property. All are now aware of the sufficiency of the reserved land for their wants; and through the judicious selection of many of their clearings for such reserves, the recurrence of any inconveniences on this matter is prevented."

Mr Heaphy gives a description of the principal town, Wellington, as it was at a recent date, after less than three years existence. It is "chiefly built on what are called the Lambton Flats, which are two pieces of flat or gently sloping ground, extending from the hills at the back of the town to the beach. Each of these flats is about a mile square, and the two would have been sufficient in size for the site of the town, had it been laid out in half instead of whole acre sections. Had the town covered only 550 acres, nothing could have surpassed the excellence of the site; as for commercial purposes, the advantage of having a town nearly encircling a good harbour, and with so extended a water frontage as three miles, is of great importance, and but rarely to be obtained. The quantity of ground which Wellington actually covers, gives the built portion of it rather a straggling appearance. This, however, is its only fault.

At first, the town consisted of few but native-built houses, which, although roughly put together, and seldom perfectly weather-proof, in the mild New Zealand climate served well the wants of the settlers, until they found themselves in a sufficiently secure position to enable them safely to expend money in the erection of more substantial dwellings. The houses at present extend along three-fourths of the beach-frontage of the town; and all the land in the immediate vicinity of the water is consequently already of great value. The average rent of land on the beach is L.1 per lineal foot of admeasurement, and this is given freely as an adequate value. The price of the land removed from the beach is very variable, but any within half a mile of it may be let advantageously.

In all parts of the town are now interspersed many handsome and substantially-built houses. These are in general the storehouses of the wholesale merchant, many of whom have been at considerable expense in rendering their establishments efficient and commodious. Three piers, or jetties, have been built by private persons, and one by a company; by their extending out a considerable distance into deep water, they much facilitate the landing of cargo and general communication with the shipping. The wharf latest built has sufficiently deep water alongside to enable ships of 150 tons burden to discharge cargo upon it. When I left Port Nicholson, the *Kate* brigantine was landing a cargo of oil on to it. The proprietor of one of the other piers intends extending its length yearly, until large vessels may approach it.

The number of substantially-built wooden or brick houses in Wellington was, in November last, 195, and their cost I estimate at L.23,600. In making this estimate, I have carefully calculated the cost of each house, and the result is certainly not far, either way, from being correct. The number of native-built houses was about 250, and their value may be estimated at L.3000. The total number of houses may, therefore, be calculated at 445, or thereabouts, at the date of the last intelligence from the colony, and their total value at L.26,600. The population of the town was principally engaged in commercial pursuits.

It is a circumstance much to be deplored, that the indecisive yet threatening conduct of the government towards the settlers, in the early days of the colony, should have so damped their spirit and enterprise as to cause them to turn their attention and capital almost exclusively to mercantile affairs, rather than to the clearing and cultivation of land, which was then deemed a hazardous and insecure investment of capital. Fortunately, however, this idea has now changed for a more rational one, in consequence of the 'Title' question being settled, and the proprietors being in possession of their land. They now seem to perceive that it is from the soil alone that they can ever expect to obtain wealth; and that the system of intertrading must in the end prove ruinous."

When Mr Heaphy left Wellington in November 1841, fifteen individuals were engaged in clearing land in the Hutt Valley, the cost being about ten or twelve pounds per acre. In Wellington, at that time, "I calculate," he says, "there were about 3000 white people; in Kaiwarawara, 200; in Petoni and Aglionby, 250; and in Porirua, on the coast, and at Petre and Wanganui, 250; making a total population of 3700 English in the first settlement. The number which had arrived in the company's immigrant ships was 3386 for the Wellington settlement; and somewhat more than 300 had arrived from the adjacent Australian colonies, or in private vessels from England. The number who have left the colony is very trifling; and in Port Nicholson far more have been born than have died. To the present population of Port Nicholson must be added a number of passengers who were on their way to the colony at the date of the latest intelligence. Allowing 200 to have arrived at Wellington from New South Wales (and considering the bad state of affairs in that colony, it will not appear that the estimate is extravagant), the population will now be about 4600.

About Port Nicholson a great part of the native population ought to be included in the census, as they live in the families of the English, work for them, and are entirely domesticated. Out of about 500, which is their number around Port Nicholson, 200 might be reckoned amongst the civilised inhabitants of the place. Without, however, reckoning natives, we may calculate the number of settlers in the company's several townships to be as follows, namely—

Wellington town and district,	4600
Petre,	350
New Plymouth,	900
Nelson,	1600
Total,	7350"

HINTS TO OPERATIVES.

Among Mr Knight's useful series of publications, forming "Guides to Trades," we perceive that one has lately appeared under the title of "The Tailor," which, from the plain and concise manner in which it is written, and the kindly advices with which it abounds, cannot fail to be serviceable to the numerous body of artisans for whose benefit it has been composed. We are not aware whether our pages are ever honoured with a place on the "shop-board," but if they are, the following hints as to meals and personal conduct and character, from the treatise in question, will be perused, we hope, with some degree of advantage. It may be added, that the hints will apply to many besides tailors:—

"At supper time, the quantity of food taken should always be small, and it should consist of such articles as are most agreeable to the stomach rather than the palate. Many young men hurt themselves by taking at this meal large quantities of radishes, onions, water-cresses, or other raw vegetables; or it may be that they eat shrimps, crabs, oysters, periwinkles, or such like fish, that are equally indigestible. To these things they will sometimes add cheese, and their bread will be, as usual, new, or very nearly so. Upon this heterogeneous mass of solid food they will put perhaps two or three pints of porter, and probably some spirituous liquor; while, as if to make the mischief as complete as possible, they will smoke a considerable quantity of tobacco, and sit sometimes for several hours in company with a number of men who are similarly employed. It were a waste of words to describe at length how injurious all this must necessarily be to the health of a young man, perhaps just come from the country, where he has breathed a comparatively pure air, and has had many other means of preserving his health, such as he will not easily find, or even a substitute for them, in a large and crowded city. The sad consequences of this imprudence are soon perceptible, not only by the subject of it, but also to all around him; and it is well for him when he escapes with no worse consequences than a greatly and constantly disordered stomach; for distressing as this is, it is not the worst, by far, of the effects that may and often do ensue upon such egregious folly as that of which he has been guilty. But enough has been now said upon this subject to warn such as are disposed to take the warning.

As to exercise, there certainly are difficulties in the way of taking it regularly and at proper times, but these may to a great extent be obviated by a little prudent management. A good walk, both in the morning and the evening, may be secured by simply taking care to lodge at a considerable distance from the shop, which arrangement will make it necessary to rise in the morning earlier than otherwise it would be, and thus a second benefit will be obtained. There will also probably be the advantage of breathing a somewhat purer atmosphere than that of the crowded city, as a convenient lodging for a single man may be readily found on the skirts of the town, and it is thitherward that his attention should be directed when he seeks for one. If he will but make the experiment, he will find himself none the worse, but most likely much the better, both in health and in personal comfort, by having a walk of from two to three miles every day. In addition to this, he may often contrive to get a short walk before dinner, and this will prepare him to take that meal with far more advantage than if he sits in the tap-room of an ale-house, and gets to smoking or drinking, as is often done before dinner as well as afterwards. The best way to avoid all temptation to this practice is to refrain altogether from taking his meals at a beer-house, or in any other way making such a place his home.

The next thing that remains to be noticed is 'respectability of character;' and here it should be understood that a mechanic may be, if he pleases, as respectable as a nobleman in all that goes to make up true respectability. And it is very important that a young man should aim at preserving or attaining this, as hereby he will be sure in the long run to gain the respect of both his master and his fellow-workmen, and will also, on this account, be likely to secure constant employment, and that, too, perhaps, in preference to a superior workman who is of a disreputable character and appearance.

Masters in general have a decided predilection for decently-dressed and well-behaved workmen, and seldom fail to show their regard for such; while they will sometimes discharge a man that is dirty, ragged, and vulgar, solely on account of these faults.

But highly important as is this respectability, it will not be likely to be duly valued, unless care be taken to avoid the following evils—for they are really evils, and great ones, too, whatever may be thought or said to the contrary. And, first, let every young man be careful to have a bedroom entirely to his own use, as the first step to his ruin may consist in having a fellow-lodger, especially if he be a dissolute man; and such men as this are usually very forward in getting an inexperienced youth to lodge with them, since hereby they can often manage to indulge their passion for intemperance or for gambling at the expense of another person.

And then, let such a one beware of going to the beer-house in the evening after he leaves work, as he will thereby be in danger of being 'led on' by confirmed sots or by gamblers, until he will fall into their habits, perhaps almost imperceptibly to himself, and thus, without intending to do anything more than to drink a little beer in a social way, and to smoke what is called a 'friendly pipe,' he will gradually learn to spend, perhaps, several hours every evening in drinking, smoking, and playing cards, bagatelle, and such like games, to the joint injury of his health, his morals, and his pocket.

He should also take care to avoid seeking amusement in company with what are called 'good fellows,' either in the streets, or at fairs, races, theatres, 'free and easy' clubs, odd-fellows' lodges, and the like; as hereby he will doubtless get no good, and the probability is that he will get much harm, by learning habits of idleness and dissipation, for the days as well as the evenings and the nights will be often required for one or other of these amusements.

Moreover, let him be careful how he spends his Sundays, otherwise he will gradually be drawn into the very common, yet very injurious, habit of spending the first half of that day in a listless manner, being neither shaved, washed, nor dressed; and the remainder of it in either tippling at an ale-house, or revelling in a place yet more dangerous to his health and morals.

If he attends to these admonitions and counsels, he will ultimately find that, although he may not be able to command great wealth, or fame, or station, he will both acquire and enjoy what is far better than all these together, namely, good health, a peaceful and contented mind, a fair reputation, and in general as much money as will enable him to procure all the necessaries and many of the comforts of life. And should he at any subsequent time be enabled to become a master, he will be all the more likely to succeed well in that capacity, for having been an industrious, careful, and well-behaved journeyman. Such cases are by no means rare; and although all cannot be masters, much less wealthy masters, yet all may be worthy and intelligent men, and, being such, may reasonably look for a sufficient maintenance, and also for much real and lasting enjoyment."

DUTCH LAUNDRESSES.

The Dutch possessed the art of washing, bleaching, and doing up linens, long before it was understood in England. During the reigns of Charles I. and II., and as lately as that of Queen Anne, many English families used to send their household and family linen all the way to Holland to be washed and bleached. Frequent mention of this fashion is made in the comedies written about these periods. The Dutch used to pride themselves upon the beauty and costliness of their linen, and, we may add, their china, in which articles many families have been known to expend several thousand pounds. The labouring classes were wont, in those days of Dutch prosperity, to partake largely of this national pride; and few mechanics could be found who would sit down without having a damask napkin to hang before him. Perhaps it is not generally known that the names of some of our finer tissues are derived from places in or near Flanders. *Diaper* is a corruption of D'Ypres, and *Cambric* is from Cambray.

A NORWAY DEAL.

The "Travels of a Norway Deal," before it reaches its destination, would astonish many that unthinkingly tread upon it in a London floor. Felled, perhaps, in the primeval forests of central Norway, the trunk is dragged over the hardened snow in the following winter to the nearest stream, in readiness to be floated down as soon as returning spring unbinds the waters from their frozen sleep. Then down many a foaming cataract, across many a torpid lake, along many a tributary river, must it be conveyed into the Gotha or the Glommen, to be finally floated into the timber yards of Christiana, or Drammen, or Gothenborg. It is usual for the principal merchants of those towns to hire from the proprietors in the interior the privilege of cutting trees in the forests the best suited for their purpose, at the rate of about two shillings for each dozen, besides paying for the labour. They are marked and sent down in the manner described; and at different stations of their route there are persons appointed by the respective merchants to assist them over the different obstacles they have to encounter. These men may often be seen, when the rivers are in flood from the melting of the snows, with long hooked poles in their hands, directing the timber over the fosses, and along the tortuous channels. Their labour is severe, and they are usually paid one mark (or tenpence) a-day, without victuals; or half a mark if provided with food.—*Two Summers in Norway.*

THE LAW OF WAGERS.

Until within the last ten years, all wagers, except those made at cards, were enforced in the courts of law. Lord Holt tried an action on a wager whether a player at backgammon, "who stirred one of his men, but did not play it, was bound to play it." And at a later period, Sir James Mansfield tried an action on a wager of a rump and dozen, whether the defendant was older than the plaintiff. The plaintiff recovered, and on a motion for a new trial, the court of Common Pleas decided that the action was maintainable; for though Sir James Mansfield had some compunction, as he did not judicially know the meaning of "a rump and dozen," Mr Justice Heath relieved him by observing, "that they knew well, privately, that a rump and dozen meant a good dinner and wine." Upon which the learned judge declared, in the most distinct manner, that he could discover "no illegality." Lord Loughborough was the first to object to try an action on a wager "whether there were more ways than six of nicking seven on the dice." And Lord Ellenborough refused to try another arising out of a beat of two guineas on the weight of a cock. The legality of wagers, and the duty of the courts of law in England to give them effect, has been often recognised; for instance, in the action before Lord Mansfield, on a wager on the sex of the Chevalier d'Eon, which ultimately failed, not because it was a wager, but on a different ground—the illegality of contracts by which parties gratuitously created to themselves an interest in the exposure or annoyance of a third person.—*Newspaper paragraph.*

NUMBER 566. SATURDAY, DECEMBER 3, 1842. PRICE 1½d.

NATURAL DAGUERREOTYPING.

THE British journals have as yet taken no notice, that we are aware of, of some very curious discoveries respecting light lately made by Dr Möser of Königsberg. By accident, in a great measure, we have obtained some information on the subject, which we shall now lay before our readers, confident that it will be read with considerable interest even by those but slightly acquainted with science.

Dr Möser observes, that if a flat seal or piece of black horn, having figures engraved upon it, be placed below a smooth and polished silver plate, and allowed to remain there for ten minutes, the silver will become charged with a faint picture of the figures engraved upon the seal or piece of horn, which will be rendered visible by the plate being exposed to the vapour of water, or any other fluid, or even by being breathed upon, and will become permanent if the vapour of mercury is used. This surprising result will at once lead the mind to the photographic process, in which, by the action of a strong light, either original or reflected, the images of objects become impressed upon a surface of paper previously washed in a solution of nitrate of silver, or a metallic plate prepared with iodine. But a remarkable difference exists: the silver plate in Dr Möser's experiment is presented *in the dark*, and there receives the impression of the object, without, as we would suppose, the agency of light.* The experiment has even been made in a dark room at midnight with perfect success. It is also remarkable, that any polished surface will do as well as a silver plate—glass, for instance, or the smooth leather-cover of a book. It appears that, to produce the effect, the object must not be far distant from the smooth surface; the nearer it is, the better is the impression produced. When the vapour of mercury is used, a permanent image is produced, by an union of the mercury with the silver; when other vapours are used, the image quickly vanishes. But perhaps the most surprising thing of all is, that after the image has vanished, it can be *reproduced* by being again breathed upon or subjected to other vapour, and this *over and over again, as often as may be desired.*

An account of Dr Möser's discovery was given a few months ago in the Paris Academy of Sciences, and had the effect of calling from M. Breguet, the celebrated watchmaker of that city, a remark highly favourable to the presumption that it is true. M. Breguet stated that he had frequently observed, upon the polished inner surface of the gold cases of his flat watches, the name of his house plainly and legibly marked, the impression having been received from the engraved letters of the covering of the works, which did not touch the case.†

Möser infers from his observations that there is LATENT LIGHT—a bold idea, which, if it becomes an established truth in science, must immortalise his name. He conceives that light enters into and resides in bodies, or is, as it were, absorbed in them, and may yet, after remaining in them many years, be capable of exhibiting its action. He calls this *light proper to bodies*, and shows reasons for distinguishing it from both phosphorescence and the light of those rays of which the retina is not sensible. He says it is in all its effects the same as ordinary light. In two plates exposed to each other, that the one may catch an image from the other, nearness is necessary, because otherwise the rays would *diverge*, and produce a confused image.* How strange to think of a divergence of rays from a substance placed in what our senses would call absolute darkness; for example, between the works and case of a watch!†

These phenomena are not curious only for their reference to the novel idea of latent light, but as an addition to the wonders of that perhaps most wonderful of all modern inventions, the *photographic and Daguerreotype processes.* What we have hitherto seen of this process is the production of an image under the influence of a powerful light: the experiments of Möser give an image by the agency of a degree of light below the power of our senses to apprehend; and which we, therefore, for want of a better term, call latent light. This is a remarkable extension, indeed, of what we not long ago knew of the powers of light: we now know that it will act as a medium through which the image of one object may be impressed on another, the impression possessing durability in proportion to the conditions of the impressed surface; and, more than this, *capable of being reproduced after it has vanished, and that several times over.* Nor is even this all. The Daguerreotype process, till a very recent period, did, like Dr Möser's experiments, require what may be called a considerable time to produce its effects; that is to say, it required a few seconds at least, and only still objects could be taken with accuracy. But last year, by the application of electricity, M. Daguerre made his plates so sensitive, that *less than a second* became necessary to produce the image. Indeed, so small a space of time was required, that no mechanical arrangement could be contrived to submit the plate *instantaneously enough;* the consequence of which was, that one part was overdone before the rest was submitted, and it was found necessary to take means to dull or lessen the sensitiveness of the plates.‡ Possibly, the application of electricity would make a much less space of time necessary for even latent light to produce images. The Daguerreotype process is evidently only in its infancy. Within the last few months, Sir John Herschel has been experimenting with paper surfaces prepared in two different ways, by one of which he produces impressions which may be *brought up from faintness to distinctness by repeated washings*, while by the other he creates *positive* pictures, which fade in a few hours, *leaving the paper capable of receiving other impressions.* §

In a conversation on Dr Möser's experiments, which took place at the meeting of the British Association at Manchester, Sir John Herschel called particular attention to the reproduceability of the pictures, and confirmed the fact by drawing from his pocket one of his own pictures, which he said was then invisible, but might be made visible by being placed over the vapour of muriatic gas. After a time, he said the image would again vanish, but a reapplication of the gas would bring it again into sight. He explained that the paper had been washed in a certain vegetable solution, which made it susceptible of such pictures. He also adverted to the remarkable fact, that the muriatic gas is perfectly colourless. He then added, "*Might not the retina itself be affected in a somewhat similar manner?* The impressions made upon it were gone in a moment. Might not those impressions on the retina be produced by a sort of photographic apparatus? The number of questions arising on this topic," he said, "were likely to render it a most electrifying topic among philosophers." Sir David Brewster considered the remark of Sir John Herschel as "having an important bearing on the philosophy of the senses. The moment it was mentioned in the hearing of any one acquainted with the physiological action of the retina, he would see a crowd of facts referable to it. He should mention one fact which appeared to be explained by it. After being present at a few of the meetings of the Association, where there had been so many white faces, a mass of white faces had at length become impressed on his retina. Each face had three black spots on it, two for the eyes and one for the mouth. For two days, these objects flitted before his eyes. He could not distinguish the whitest face in the company from the darkest. Here was a picture continuing longer than usual, in consequence of the retina being longer impressed. In some cases, he had been enabled to tear off the mask, and fill up these blank faces with individual likenesses." These remarks of the British philosophers have since been found to coincide with views entertained by Dr Möser, and which he has expressed in a paper published at Berlin.

That the impressions on the retina are photographic processes, is, we should say, by no means unlikely. Many phenomena, long before the world, perfectly harmonise with such an idea. The sixth of a moment is, we believe, the space of time during which these impressions remain in an ordinary state of health; hence, we may remind unscientific readers, such phenomena as that of a lighted stick making a fiery arc when waved quickly to and fro. The eye, then, may be said to be, in its ordinary state, a plate or speculum prepared to receive, and retain for that definite portion of time, any image thrown upon it. Amongst relative phenomena, the mind very quickly lights upon a well-known one recorded by Dr Darwin: "I covered a paper about four inches square with yellow, and with a pen filled with a blue colour, wrote upon the middle of it the word BANKS in capitals; and sitting with my back to the sun, fixed my eyes for a minute exactly upon the centre of the letter N in the word. After shutting my eyes, and shading them somewhat with my hand, the word was distinctly seen in the spectrum in yellow colours on a blue ground; and then, on opening my eyes, on a yellowish wall at twenty feet distance, the magnified name of BANKS appeared on the wall written in golden characters." Dr Abercromby records a similar instance: "A friend of mine had been, one day, looking intensely at a small print of the Virgin and Child, and had sat bending over it for some time. On raising his head, he was startled by perceiving at the further end of the apartment a female figure of the size of life, with a child in her arms. The first feeling of

---

* In a letter written by him to Sir David Brewster—which we have seen—he states that he has found the following invariably to succeed. He places a small camera obscura, furnished with a lens of very small aperture[1] under the moon in any of her stages, and makes her image fall upon a plate of *iodised silver*, which has been previously exposed to certain vapours noted below.[2] The moon having passed over the plate, he subjects the plate to the vapour of mercury, and obtains a very clear representation of her path.—It may here be remarked, that there is no necessity for supposing Möser's experiments to be fallacious because an attempt to repeat them may fail. While it is proper, of course, to be guarded against both voluntary and involuntary deception, there can be no doubt that nice experiments of this nature often fail, or all but fail, at first, with others than the discoverers, and yet are found to be true phenomena after all. Such was the case with Mr Fox Talbot's experiments in photography, which some of the most ingenious practical men of science in the country vainly, for some time, attempted to imitate.

[1] Fifteen millimetres. [2] Chloridised iodine.

† Athenæum Report, September 10, 1842.

* Letter of Dr Möser, MS.

† The idea of latent light corresponds with an opinion of Newton, that light entered the surface of charcoal, and never was brought out again. There are other phenomena tending to the same conclusion, as that nitrous acid gas, in a glass tube, on being exposed to heat, changes from a transparent yellow to an opaque red. The blood of a patient under inflammation, everted from a cup with a green flower, presents vermilion images of the flower relieved upon the dark ground of the clot. And, to preclude all doubt as to the character of these images, we are assured by a medical friend that he has produced them by green colouring on the *outside of a glass cup.*

‡ Athenæum Report, July 17, 1841.

§ Letter of Sir John Herschel, Athenæum, August 20, 1842.

surprise having subsided, he instantly traced the source of the illusion, and remarked that the figure corresponded exactly with that which he had contemplated in the print, being what painters call a kit-cat figure, in which the lower parts of the body are not represented. The illusion continued distinct for about two minutes."* In Dr Darwin's case, there was, we believe, only the ordinary action of the eye in exhibiting the spectrum of the accidental colours: in such instances as that recorded by Dr Abercromby, and described by Sir David Brewster, there is probably some extraordinary phenomenon, by which the impression, a simple image, is rendered permanent; we can easily conceive it to be some phenomenon in organic pathology analogous to the washing of a plate with a solution.

But is it upon the retina, or the retina alone, that the impression lingers? "In regard to ocular spectra," says Dr Abercromby, "another fact of a very singular nature appears to have been first observed by Sir Isaac Newton; namely, that when he produced a spectrum of the sun by looking at it with the right eye, the left being covered, upon uncovering the left, and looking upon a white ground, *a spectrum of the sun was seen with it also.* He likewise acquired the power of recalling the spectra after they had ceased, when he went into the dark, and directed his mind intensely, '*as when a man looks earnestly to see a thing which is difficult to be seen.*' By repeating these experiments frequently, such an effect was produced upon his eyes, 'that for some months after,' he says, 'the spectrum of the sun began to return, as often as I began to meditate upon the phenomena, even though I lay in bed at midnight with my curtains drawn.'" Does not this seem to imply that, if an actual impression of any kind is made, it must be upon something beyond the retina, something commanding both the outlets where the retinæ are placed; upon that internal nervous substance, in short, which forms the medium or organism of mind itself?

There are certainly many psychological phenomena which seem to bear a curious analogy to these image-making properties of light. For instance, "the distinct recollection of a fact is generally in proportion to the intensity with which it has been contemplated."† Suppose *attention* to be a greater than usual development of electric action in the brain, how strangely akin seem the recent experiments of Daguerre! When attention is languid, or when one is in a state of reverie, something is said by a neighbour: you are not conscious of more than that some one has spoken; but in a few seconds, or perhaps minutes, by an effort, the words are recalled. May not this be simply an electric evolution upon some impressible medium within, before the photographic impression had faded, catching up its shrinking tints? Newton could recall the spectra by intensely looking for them, or meditating upon them: so, by an effort of the mind, do we recall to *memory* a fact which we once knew, but which has been forgotten. To write down anything we may wish to remember, or to learn it from print or writing, is acknowledged to be the most ready means of acquiring it by heart. A comedian, accustomed to study his parts deliberately, and who remembered them afterwards without effort, had on one occasion to study one very hurriedly. This part immediately after disappeared from his mind. "When questioned respecting the mental process which he employed the first time he performed this part, he said that he lost sight entirely of the audience, and seemed to have nothing before him but the pages of the book from which he had learnt it, and that if anything had occurred to interrupt this illusion, he should have stopped instantly."‡ And Sir James Mackintosh, who could repeat whole pages of a book on the Brownonian system which he had read thirty years before, always acknowledged that he was guided by a recollection of the actual appearance of the pages of the book itself. The signs of thought, we may suppose, are more easily remembered than the direct thought itself, because they are objects—things producing a clear photographic image, so to speak, on the brain. Men in a partially diseased or infirm condition lose the recollection of words, or of names, but remember things and persons. They know the friend they meet, but they cannot pronounce his name. Dr Abercromby tells of a gentleman who "could not be made to understand the name of an object, if it was spoken to him, but understood it perfectly when it was written. His mental faculties were so entire, that he was engaged in extensive agricultural concerns, and he managed them with perfect correctness by means of a remarkable contrivance. He kept before him, in the room where he transacted business, a list of the words which were most apt to occur in his intercourse with his workmen. When any of them wished to communicate with him upon any subject, he first heard what the workman had to say, but without understanding him further than simply to catch the words. He then turned to the words in the written list, and *whenever they met his eye, he understood them perfectly.*" Here, clearly, a certain mental power was wanting. But the power of receiving a direct impression from an object remained sound, and was used. What was this but having to repeat every time those messages between objects in the external world and the inner powers of mind, which usually become unnecessary in a mature intellect, from so much coming to be fixed and understood? It was like Herschel's photographic paper, or Möser's plates, where some common vapour was used. Old men generally remember recent events least perfectly. This may be simply owing to the images in early life having been impressed on what was in a more fit state to receive them, or having been better secured after they were impressed. A silver plate bearing a good photographic image, of three years' standing, fixed with the fumes of mercury, or nitrate of silver, may be, in comparison with a piece of Herschel's paper which bore an image yesterday, but none to-day, exactly what an old man's memory of remote events is to his recollection of recent occurrences.

There are instances of temporary loss of memory in consequence of external injuries to the nervous system, and we chance to be able to advert to a remarkable example heretofore unrecorded. A boy of uncommon talents, who has since attained high civil employment in India, was boarded, during his attendance at the university, in the house of a medical gentleman, who took charge of a few other youths of about the same age. Towards the conclusion of a session, during which he had studied very hard, and the night before he was to deliver a prize essay to a particular professor, the young man was allowed by his protector to have a small supper party, at which he was very merry. Next day, after giving in the essay, he took a game at ball with some companions, in the course of which he fell on his rump and experienced a slight concussion of the brain. Coming home, he was found to talk incoherently, and he had no recollection of either the supper party or the delivery of the prize essay. He was immediately put to bed and bled, when he gradually, as with an effort, came to a faint recollection of these incidents, but remembered nothing which took place *after the fall;* and the few hours which elapsed between that event and the bleeding continued ever after to be a complete blank in his memory.

There are remarkable instances of a revival of old and forgotten impressions in a state of disease, particularly with regard to languages. "A man, mentioned by Mr Abernethy, had been born in France, but had spent the greater part of his life in England, and for many years had entirely lost the habit of speaking French. But when under the care of Mr Abernethy, on account of the effects of an injury of the head, he always spoke French. A similar case occurred in St Thomas's Hospital, of a man who was in a state of stupor in consequence of an injury of the head. On his partial recovery, he spoke a language which nobody in the hospital understood, but which was soon ascertained to be Welsh. It was then discovered that he had been thirty years absent from Wales, and, before the accident, had entirely forgotten his native language. On his perfect recovery, he completely forgot his Welsh again, and recovered the English language. * * A case has been related to me of a boy, who, at the age of four, received a fracture of the skull, for which he underwent the operation of trepan. He was at the time in a state of perfect stupor, and, after his recovery, retained no recollection either of the accident or the operation. At the age of fifteen, during the delirium of a fever, he gave his mother an account of the operation, and the persons who were present at it, with a correct description of their dress, and other minute particulars. He had never been observed to allude to it before, and no means were known by which he could have acquired the circumstances which he mentioned. An eminent medical friend informs me, that, during fever, without any delirium, he on one occasion repeated long passages from Homer, which he could not do when in health; and another friend has mentioned to me, that, in a similar situation, there were represented on his mind, in a most vivid manner, the circumstances of a journey in the Highlands, which he had performed long before, including many minute particulars which he had entirely forgotten. * * An ignorant servant girl, mentioned by Coleridge, during the delirium of a fever, repeated passages from theological works in Latin, Greek, and Rabbinical Hebrew, which, being taken down and traced to the works from which they were derived, were found to be repeated with perfect accuracy. It turned out that she had been servant to a clergyman, a man of much learning and peculiar habits, who was in the practice of walking backwards and forwards along a passage in his house which led to the kitchen, and there reading aloud his favourite authors."* Of this class of phenomena many other examples might be adduced. There is another class, which have obtained the general name of *double consciousness.* A person becomes ill, and at his recovery is found to have forgot all previously-attained knowledge. He begins, like a child, with the alphabet, and goes through a new course of instruction. Suddenly, he recovers all that was lost, but has forgot every new idea acquired since his recovery. In some cases, the two conditions have alternated oftener than once. Dr Beattie mentions a clergyman who, on recovering from an apoplectic attack, was found to have lost the recollection of exactly four years; everything that occurred before that period he remembered perfectly. He gradually recovered the lost knowledge, partly by a *spontaneous revival of his memory,* and partly by reading histories of the period. How like is all this to what has been stated about Möser's vanishing but revivable pictures!

Many of the recorded phenomena of *dreaming* also seem to bear a strong relation to the Möser process. The metaphysicians make out a *class* of dreams as consisting of the revival of ideas which had passed out of the mind, or appeared to have been forgotten. For example, a gentleman, about to be cast in a law-suit for want of a particular document which has been lost, dreams a dream in which his deceased father or some other person appears, and informs him of the place in which it is deposited. The theory respecting such cases is that the fact was once known, but became forgotten, and the information given in the dream was only a resurrection of this deceased piece of knowledge. And that we are capable of thus utterly forgetting a piece of knowledge which we once possessed, is proved by our frequently being reminded of sayings of our own by other parties to whom we had spoken them, but of which we have no recollection. The revival of these lost ideas may be only a physical process in the brain, of the same nature with the vapouring of an occult photographic picture. Dr Watts by anticipation gives a sort of countenance to such a supposition, when he conjectures "that those very fibres, pores, or *traces* of the brain, which assist at the first idea or perception of any object, *are the same which assist also at the recollection of it.*" Even the language of the metaphysicians, vague as it generally is, seems strangely in harmony with that of our new science. They describe *conception* and *imagination* as two different degrees of activity of the intellectual powers in reviving past impressions. Dr Brown, the last and best of this series of philosophers, taught that "there is a *law of the mind* over which volition has no control, or a tendency, which is constantly operating involuntarily, to *renovate prior feelings.* This he called Simple Suggestion. When two or more objects, or two or more thoughts, primary or renovated, are present to the mind, feelings of relation arise in it independently of the will, and from a law or tendency of the mind itself. This he called Relative Suggestion. Lastly, there is in the mind a susceptibility of, or tendency to, another distinct class of feelings, called Emotions, as Grief, Joy, Pleasure, Pain, Cheerfulness, Wonder, Fear, Remorse, &c. These feelings are also involuntary. They arise *unbidden* in the mind, when certain objects are seen, or certain feelings of relation perceived." This is an abstract of the principal parts of Dr Brown's doctrine, which was given out thirty years ago.† Its relation to these curious experiments is faint and indescribable, but yet it is impossible not to see that there is *some* relation.

The Quarterly Review, a number of years ago, contained an article on the "Connection of Intellectual Operations with Organic Action," in which it was stated that, "in certain conditions of the mind, and when the eye has been for some time withdrawn from the influence of visible figures, the impressions usually recalled by the act of volition are forced upon it by causes of which we are entirely ignorant, and possess a distinctness of outline which permits us to subject them to the same examination as the permanent impressions made upon the retina by the action of highly luminous bodies. When this examination is carefully made, we shall find that *the images recalled by the memory follow the motions of the head and of the eye,* and are seen according to the very same laws which regulate the vision of those impressions which remain on the retina after the objects which produce them are withdrawn. The very same result will be obtained in the case of forms created by the imagination, so that *the two leading faculties of the mind* [memory and ima-

† We find it in the Edinburgh Magazine, 1820.

gination] *perform their operations through the medium of the organs of sense.*" This is a very remarkable assertion, and quite in harmony with the view which we have taken. If received as true, it can leave little room for doubt that mental action generally is inextricably connected with the laws of some of the so-called imponderable bodies.

MRS HOWITT'S WORK FROM THE SWEDISH.*

MARY HOWITT, who has been resident for the last few years at Heidelberg, appears in a new character—the translator of a work of Frederika Bremer, offered with the view of introducing English readers to an acquaintance with Swedish literature, of which, hitherto, little or nothing has been known in this country. Miss Bremer—as we suppose we must call her—is the daughter of an eminent merchant at Stockholm, and, since the death of her parents, has spent her time alternately in that city, and with a female friend in the south of Sweden. In her own country, and other parts of the continent, her fictions are read with avidity. They are written with much graphic truth, abound in lessons of social wisdom, and possess that depth of sentiment which renders them acceptable to the refined and reflecting readers of northern and central Germany.

The translation of one of this lady's productions is creditable to the taste and judgment of Mrs Howitt, who announces, that if the present specimen be welcomed by her countrywomen, she is ready to prepare others not less attractive for publication. We fear, however, that her half-formed anticipations in this respect will not be realised. The impression left on our mind, after an attentive perusal of the work, is, that it will not become popular in England. Consisting of a series of letters from a newly-married lady to her friend, descriptive of persons and families in a country neighbourhood in Sweden, there is not a sufficiency of *story* to interest common readers of fiction; and the style of thought, manners, and circumstances, is something quite beyond the reach of ordinary English sympathy. The names of the characters, too, are uninviting. The fair letter writer, who may be called the heroine of the piece, never addresses her husband by any other name than "Bear"—a term of endearment, which seems to speak of wild and far northern regions. "Ah, Bear," observes she one day, during a confidential interchange of sentiment, "that which makes a wife happy—what beautifies home, is not the wealth of a husband—not his great talents—not the fire of his soul—all these may destroy the peace of home. No! the happiness of the wife is, that the husband have integrity; that he be good, rational, reasonable, and regular—like you, Bear!" In passages like this, the sentiment is simple and touching, but associated with the, to us, grotesque idea of a bear, the gentle authoress fails in exciting unmixed emotions. In short, the wit, humour, pathos, sentiment of the book, are very much lost on English readers. The wit is not wit according to our ideas. The appeal almost seems to be to a human nature which is not our human nature. And thus, as in most translations from continental fictitious literature, the work, with all its merits, will be pronounced dry and pointless, and add another to the list of unsuccessful efforts to naturalise fictions of that class amongst us.

We do not arrive at these conclusions without regret, for the work is the production of a gifted authoress, who writes in the cause of virtue, and pleads powerfully for the exercise of the kindliest feelings. Much of the story refers to a mother and son, whose lives are rendered miserable by mutual irritability of temper and ungovernable passion; and the manner in which this is treated is equally tender and effective. As a specimen of the authoress's powers, we shall endeavour to compress this part of the story into our pages. A few preliminary explanations are alone necessary.

STORY OF BRUNO.

The widow of General Mansfeld is a stern and aged dame, the step-mother of three sons, from whom the utmost reverence has always been exacted: living in an old castle, she maintains a certain degree of state, and is looked up to by her servants and tenants as a feudal baroness, but withal a kind and obliging mistress. The step-sons, during the life of the General, had been made to observe the most punctilious respect in the parental home, and to address the baroness on all occasions as "Ma chère mère." From this circumstance, the lady comes to receive no other title from them in after-life; and by this she is called throughout the work. At the death of their father, the young men go out into the world, and the domain reverts to Ma chère mère, by whom it had been brought into the family; and she is left with Bruno, her only son, the story of whose fate we propose to give. The early part is related by Lars Anders (one of the half brothers of Bruno) to his young wife, shortly after bringing her home to Rosenvik:—

"Ma chère mère had, by General Mansfeld, one only son, who was called Bruno, after his father. His birth nearly cost the life of the mother, and that which she had bought so dearly was more precious to her than life itself. Many a time has she been seen on her knees by his cradle, as if worshipping him; many a time, when a slight indisposition has made his nights restless, she sat and watched by him. She suckled him herself; scarcely would permit any one beside herself to nurse him, scarcely to touch him. He slept in her bosom, he rested on her knee; her arms were his world, and they encircled him with undying love: and he, on his side, wild and despotic as he then was, hung on her neck with the utmost tenderness, and seemed to find rest nowhere but upon her bosom. It was beautiful to see them together; they were the lioness and her cub, who, in a union of savage strength and deep tenderness, combat together and caress at the same time. Thus the relation between mother and son was extraordinary, and sometimes hostile, even from the cradle. One day, as she laid him, a child of but nine months old, to her breast, either in hunger or passion, he bit her severely with his young coming teeth. Transported with the pain, the mother gave him a blow. The child let go the breast, and refused from that moment ever to take it again. He was weaned; for the mother could not tolerate the idea of his being nourished with the milk of a nurse. Afterwards, in his eighth year, as she attempted to give him a well-deserved correction, he turned like a young lion, and struck her.

Still, in the midst of scenes which exhibited on both sides the most ungovernable feelings, instances almost daily occurred which showed unlimited power of self-sacrifice; she threw herself between him and every danger, and he would kiss the very traces of her feet. When they met, even after a short separation, it was ever an outbreak of the warmest love; still, the next moment, perhaps, they would be at strife with each other. This state of feeling increased with years, for both were of the same powerful, determined character. They seemed unable to live either together or apart.

It would have been impossible to find anywhere a handsomer boy than Bruno was; and yet, although the mother worshipped him in her heart, her sense of justice was so strict, that she never, not even in the slightest instance, favoured him to his step-brothers' disadvantage. Never, if he deserved punishment, was he spared before them; never had a preference shown to him in regard of pleasure or reward; in no way had he the advantage of them, excepting in the caresses of his mother.

We were all brought up with severity; and, as regards money, were too scantily supplied. For myself, I always had an inclination towards economy; nevertheless, I was compelled to have recourse to my own innocent industry to supply myself with postage-money, or the means to obtain any little outlay which Ma chère mère considered superfluous; hence I became, in secret, a carpenter.

Bruno was naturally extravagant, and prone to dissipation; and very early, in order to gratify his palate, or to appease his thirst for pleasure, resorted to less innocent means. He purloined what he could not obtain voluntarily, first from his brothers, then from the domestics; but no one dared to punish him for this, or to represent it to his mother, for the fiery-tempered boy, gifted with almost herculean strength, had obtained power over his brothers, and was feared not only by them, but by all the household. He was beloved by none, excepting by me; I cannot exactly say what it was in him that was so captivating to me; I admired, it is true, his great natural abilities. His wild and witty tricks often decoyed me to smile, at the same time that I was compelled to blame; but what operated most upon me was the simple fact, that I really think he liked me.

But I was seldom at home at this time; for, much older than he, I had finished my academical life as he began his, and was almost always from home in the pursuit of my medical profession. The influence which a child, a little girl, had over Bruno, from his thirteenth to his sixteenth year, was very extraordinary. This was Serena Löfven. The little angel-like child interested the wild Bruno, and it was wonderful to see what constraint he had over himself, and of what self-denial he was capable on her account. He left all, to carry her out into the woods—to caress her, or to sit quietly by and watch her while she slept. On holidays, or whenever he had a holiday, he went wandering forth early in the morning with a basket of eatables in his hand and Serena on his arm, and seldom were the two seen again before evening. All this improved Serena's health, and softened the temper of Bruno. One tear, or one prayer from her childish lips, was to him a more effectual incentive, than all the commands of his mother or of his teachers.

If this better part of Bruno's nature had been cultivated—the violent repressed, and the gentle yielded to—I am convinced that he would have become a good and distinguished man; but his tutor, a person of rigid, unbending character, and still more his mother, seemed to have resolved only to make use of power in the subjection of his undisciplined will.

All this time Ma chère mère foreboded not how perilous was the course which Bruno was pursuing, and I myself knew nothing which I should have feared so much as her making the discovery; she, so proud, so sensitive on every point of honour, so rigid in her principles and her whole moral conduct! Bruno's great beauty, his remarkable abilities and natural talents, his expertness in all bodily exercises, his courage, nay, even his overbearing strength, constituted her pride, and made her eyes sparkle with delight at his approach, or even at the very speaking of his name. To have heard anything dishonourable of him must have been a death-blow to her. Bruno, too, had pride, and sense of honour, and the approbation of his mother was necessary to him; but his violent passions, and his inability to govern them, drew him perpetually into guilty conduct.

But now came a time when I passed several summer months at Ramm, and where, from what I saw of him, I hoped he had abandoned his evil courses. He had been confirmed in the spring, and now appeared thoughtful and mild. The connexion between him and his mother seemed more peaceful and affectionate than ever. I hoped he had conquered the darker part of his nature; he himself, too, said the same thing to me. But one thing I could not even then help observing; he had his own private expenses, and those to an extent far greater than his means ought to have allowed. For some time, it is true, I had been in a condition to assist him with money, and had hoped by this means to restrain him, and prevent its application to improper purposes. He frequently requested money from me, and I furnished him with as much as was in my power; but one day he requested so large a sum as astonished me. I refused; in fact, I could not do otherwise; and at the same time reproved him for this extravagance. He made no reply, but ground his teeth angrily, and left me. This was the last day we were to spend at home together; on the following he was to leave for the University, and I for S——. That forenoon he went to the city to take leave of the old Dahls and their grandchild, his little bride, as he called Serena, and was not expected back till evening.

Immediately after dinner, the book-keeper entered the room in great agitation. He had missed, he said, a sum of money, which that very morning he had placed in his desk, and he must suspect the thief to be one of the household, as no one but those accustomed to the house knew where he was in the habit of keeping his money.

It was the first time, as Ma chère mère believed, that such a circumstance had occurred in the house; she, therefore, took up the affair with the greatest warmth. Accompanied by the book-keeper and two of her oldest and most faithful servants, she went through the whole house, inspected every corner, and examined all her domestics with the greatest severity; even the oldest amongst them were compelled to submit to the search. As nothing was discovered anywhere, not even the slightest trace which could lead to suspicion, she began to think that probably the informer himself might be the thief; and thus the possessions of the young book-keeper, and even the clothes which he wore, were subjected to a yet more severe scrutiny than those of the others had been.

This young man happened to be a personal enemy of Bruno; and whether he really suspected him, or whether he spoke in the bitterness which Ma chère mère's proceedings towards him awakened, I know not, but he said, with unmitigated chagrin, 'Your honour may perhaps find nearer home what you seek!'

'What do you mean?' demanded she, with an awful glance.

'That your honour,' replied the irritated man, 'may find with your own flesh and blood that for which you have cast suspicions on innocent men!'

'Man, you lie!' exclaimed Ma chère mère, pale with rage, seizing him and shaking him by the arm.

'I will be a liar!' returned he, almost beside himself with passion, 'if one of your own sons be not a thief!'

'Follow me!' said she; and with flashing eyes and pale cheeks, accompanied by the book-keeper and the two old servants, she went into our chamber.

I had been out, and had only just returned and been informed of what had occurred, as Ma chère mère, with her attendants, entered. I cannot describe the sensation which I felt at that moment; a foreboding of the true fact passed through me; I became pale, and involuntarily seated myself on Bruno's travelling-chest, which, together with mine, stood ready packed for the journey. Ma chère mère looked at me with a penetrating glance, started, and became yet paler, whilst, with a firm voice, she said to me and my brothers, who had also come into the room—'My sons, for the honour of the house, you must submit to the same search to which all the rest in the house have submitted. I need not tell you that all this is merely *pro formâ*, and that I am convinced of your innocence.'

With this she cast upon me a glance which was at that time inexplicable to me, and passing my chest by, went and sought among my brother's things. After this she returned to the room, and opened my packed-up chest. Everything was turned out, but nothing was found which had no right to be there; and at the bottom of all they found my carpenter's tools. When all had been examined, Ma chère mère cast upon me a glance full of maternal love and joy. Alas! she had had suspicions of me—of the thoughtful man, rather than the wild youth!—and now she raised her head, and one could read, in her strong expressive countenance, 'Thank God! now I am easy.'

'Now, then, there are only the things of the young baron left,' said one of the old servants respectfully, 'but the chest is locked; and, besides this, it is not necessary.

* The Neighbours; a Story of Every-day Life, by Frederika Bremer. Translated by Mary Howitt. 2 vols. London: Longman and Co. 1842.

'That may be,' said Ma chère mère, 'but he must fare like the rest; the box shall be broken open.'

'But the young baron is not at home,' said the servant anxiously; we cannot' ——

'His mother commands it,' said she, warmly.

It was done. With her own hand the mother took out books and clothes which had been thrown in in great disorder. Presently the hand was withdrawn, as if it had been burnt by red-hot iron; she had stumbled upon a bundle of notes. It was the missing money. She took it out; turned it about in her hand; examined it, as if she could not believe her own eyes; grew paler and paler; and then, exclaiming in a voice of inexpressible anguish, 'My blood!—my own flesh and blood!'—sank as if lifeless to the floor.

We carried her out; and our exertions at length recalled her to consciousness. Terrible was her awaking. But she shed no tear, uttered no word of anger or complaint. She appeared strong and determined. She sent immediately to Pastor Rhen, the clergyman of the district. He was a man of iron; stern, strong, and one ready to combat with word or deed, in support of what he considered right; and, more than this, he was an honest and faithful friend of Ma chère mère. To him she confided this painful circumstance, and they, too, decided the steps which should be taken in consequence. I anticipated what was designed, and made use of the influence I had frequently found myself to possess with Ma chère mère, to induce her, but in vain, to resort to less severe, or, at all events, less violent measures. But all my representations were useless. She merely answered, 'Unpunished crime only induces to still further crime. Bitter must be atoned for by bitter.'"

All were assembled in the hall. The door was opened, and Bruno stepped in, paused, and started. His mother, in a voice hollow and stern, was heard to accuse him of theft; and pointing to his rifled chest "and to the money which had been found in it, she demanded his confession.

Bruno acknowledged himself guilty with an inconceivably bold haughtiness.

'Fall upon your knees, and receive your punishment!' said the stern judge. But Bruno bent not. A consciousness which, after his haughty confession, seemed to have deprived him of all volition, overwhelmed him; he stood pale as death, his head dropped upon his breast, and his eyes riveted to the ground." A scene of anger and strife ensued. The mother finally demanded whether he "would submit himself to her will, or receive her curse? Mother and son looked at each other with eyes of flame and defiance. They stood so long. Again she repeated the question; and then followed terrible words on both sides. Again all was still; the curse-speaking lips became stiff, the haughty glance dimmed, and mother and son sank fainting together. Both were carried to their separate chambers.

In the night, when all was dark and still, we heard a wild, prolonged, and thrilling cry from his room. I sprang up and hastened there. Bruno's mother was standing there alone, with a wild and agitated look; he was gone. The open window seemed to indicate that he had made his escape that way, although a descent from a height like that appeared almost incredible; but yet it was so. Bruno fled that night from his mother's roof, and never returned. We never heard tidings of him, and all inquiries were vain. He seemed as completely to be gone as if cut out from the number of the living. Seventeen years have passed since this unhappy time, and we have never discovered the least trace of him.

From the moment of Bruno's escape, Ma chère mère spoke not one word for three years. She shut herself in her own room, which was darkened; would endure neither light nor the sight of man; and spoke to no one but a single faithful attendant."

Here Lars Anders finishes his narrative. We learn, as the work proceeds, that Ma chère mère returns to a state of seeming contentment, but leaves the castle of Ramm, and betakes herself to that of Carlsfors, at a few miles' distance. Years pass on; the step-sons marry, and occasionally pay a friendly visit to the baroness. The name of Bruno is never mentioned; he is believed to be dead in some foreign clime. The wife of Lars is deeply affected with the story of his flight, and speaks of him to the gentle Serena, who musters up recollections of him in his infancy.

"'I remember yet so well how Bruno led me about in the woods, or drew me in my little carriage. The first impressions which I received of the beauty of life and nature were from this time. I remember so well, how the murmuring in the woods delighted me, and how I was enchanted with the flowers which he gathered for me. If he sang, I sang too, and when he bore me in his arms, and sprang over the mountain ravines, I felt no fear. He was never impatient or unfriendly towards me; and I shall never forget how once, when he was about to beat one of his brothers, he desisted when I wept, and called him by his name. Ah, depend upon it, that he was not wisely treated. They certainly had not sufficient regard for his ability of loving. Had they, he would not have caused his mother so much anxiety, and not have fled from his home and his fatherland.'

'And what do you suppose occasioned his flight from home?' I inquired.

'I have been told,' said Serena, 'that dissension with his mother, and severe treatment on her side, occasioned it. There was great similarity in their tempers. They opposed obstinacy to obstinacy—force against force. Bruno must have died in his exile. Poor Bruno! I have truly lamented his fate, he was so good to me!' said she with a mournful countenance, whilst a sentiment of deep sadness filled my heart also."

Impelled by an unquenchable desire to revisit early scenes, and be reconciled to his mother, Bruno returns. He beseeches the wife of Lars to intercede for him, and to procure an interview with his parent; but the attempt to mollify her hostility is in vain. Chance at length puts it in the power of Bruno to rescue his mother from a sudden death by the impetuous flight of her horses and carriage, and in doing so, both suffer serious personal injury. The mother and son, after years of alienation, now stood face to face. "Their looks seemed to pierce through each other. Ma chère mère seemed to be smitten with the wildest amazement, and stepped a little backwards. Bruno moved a step forward, and said slowly, and as with a benumbed tongue, 'You are rescued. God be praised! And for me now only remains to die, or to win forgiveness! My mother! my mother!' exclaimed he at once, as if an angel had loosened tongue and feeling, while, with a heart-rending expression, he sank down and embraced her knees. 'My mother, wilt thou not pardon? wilt thou not bless thy son? Take the curse from my brow. Mother, I have suffered much! I have wandered about without peace! I am destitute of peace yet: peace can never be mine while I am thrust from thy bosom. I have suffered; I have suffered much; I have repented; I can and will atone. But then you must pardon; you must bless me, mother. Mother, take away the curse! Lay a blessing on my head. Mother, will you not staunch the blood which flows on your account? See, mother!' and Bruno raised his clotted locks, through which deep and streaming wounds were visible; 'see, mother! if thou wilt not lay thy hand here in blessing, I swear that this blood-stream shall never cease till my life has welled out with it, and has sunk me to the grave, on which alone thou wilt lay thy forgiveness. There, there first shall I find peace. Oh, mother! was an error in young and wild years, then, so unpardonable? Cannot a later life of virtue and of love make atonement? Mother! cast me not off. Let the voice of thy son penetrate to thy heart. Bestow on me forgiveness, full forgiveness!'

Overcome by my feelings, I threw myself on my knees by Bruno, and cried, 'Pardon! Pardon!'

What during this time passed in Ma chère mère's heart, I know not. It seemed to be a contest of life and death. She moved not; with a fixed and immovable gaze she looked down at the kneeling one, and convulsive twitches passed over her pale lips. But as his voice ceased, she lifted her hand and pressed it strongly against her heart. 'My son! Oh!' —— said she, with a hollow voice. She sighed deeply; her countenance became yellow, her eyes closed, she reeled, and would have fallen to the ground, if Bruno had not sprung up and caught her in his arms.

He stood a moment still, his mother pressed to his bosom, and gazed on her countenance, over which death seemed to have shed his awful peace. 'Is it thus,' said he, with a forced calmness, 'is it thus, then, that we are reconciled, mother? Thus thou restest on the bosom of thy son, and he on thine. Thou art pale, my mother, but peaceful, and lookest kind—kind as God's propitiation. It was not thus that I saw thee the last time; but the hour of wrath is over; is it not so, my mother? The grave has opened itself, and we go down there reconciled, and heart to heart; one in my last hour, as we were one at my first sigh!' and he kissed her pale lips and cheeks with passionate tenderness.

'Bruno! Bruno!' I exclaimed, imploringly, and weeping, seized his arm. 'Bruno, you kill your mother and yourself when you go on in this manner. Come, we will lay her on a bed. We must endeavour to recall her to consciousness; we must bind your wounds.' Bruno made no answer, but took his mother in his arms, and carried her into another room, where he laid her softly down upon a bed.

I stood near her pillow; I stood between mother and son; and instead of answering her question, I drew myself back, and their eyes met each other. A beam of heavenly light, of ineffable love, kindled in them; and in it melted their souls into one. She raised herself with energy, and stretched out her hand with the warmest expression of maternal feeling, while she said, 'My son, come hither: I will bless thee!'

He stood up. The tall gigantic man staggered like a child, and sunk on his knees by the bed of his mother. She laid her hands on his bloody head, and said, with a strong voice and a deep solemnity, 'I take away the curse which I once laid on the head of my son. I bestow on him my full forgiveness. May the man atone for the error of the youth. Let the past be as if it never had been. I acknowledge that I owe my life to my son; and I pray God Almighty to bless thee, my son Bruno Mansfeld, as I bless thee now. Amen!' With that she opened her arms; she clasped his round her; bosom was pressed to bosom, lip to lip; they held one another in a long and close embrace. Every breath seemed to be full of reconciliation, of love, and happiness. Fifteen years of bitter pangs were in this moment recompensed and forgotten. I stood near them, and wept for joy and thankfulness."

We must hasten to conclude. Ma chère mère and the son, now restored to her affections, recover from their wounds, and repair to the castle of Carlsfors, where there is shortly a merry marriage party, in which Serena is the bride.

OCCASIONAL NOTES.

AN INTERESTING PAMPHLET.

A SMALL pamphlet, not unlike a pocket-almanac in shape and appearance, has just been brought under our notice. It is in Welsh, and the title runs thus—"Ar Wrteithiau: Allan o Draethawd ar Amaethyddiaeth a Diwylliant; gan James Jackson, Penicuik." The English of this is—"On Manures: Taken from a Treatise on Agriculture and Dairy Husbandry; by James Jackson, Penicuik." When we edited the treatise of this worthy example of Scotia's peasantry, and sent it into the world in the guise of our "People's Editions," we little thought that a portion of it would so speedily (albeit without permission asked), find its way into Welsh and be thumbed at the firesides of old Cambria. Yet such is the case, and we have another instance of how humble merit will sometimes push its way upward, and become known in spite of all things to the contrary. A passage in English tells us that the treatise is "highly approved of, and patronised by Sir R. W. Vaughan, Bart., Sir W. W. Wynn, Bart., and the Right Hon. the Earl of Powis." This is gratifying. There are some Welsh landowners, it appears, alive to the value of knowledge in one of the most important departments of husbandry, and whose example cannot fail, we should think, to infect others. If the recommendations conveyed in our friend Jackson's treatise were duly followed, we feel quite assured that many thousands of pounds now lost would annually be saved to the country.

IRELAND, AS A FIELD OF EMIGRATION FOR SCOTSMEN.

[The following notes as to the advantages of emigrating to Ireland from Scotland, and we suppose we may add England, have been handed to us by a gentleman who has lived many years among our Irish brethren, and is very much impressed with the truth of the observations which he has been led to make. We pronounce no opinion on the subject, and only recur to the many thousands of times told truth, that the grand reason why men of skill and capital have not repaired to Ireland in greater numbers, has been the unsettled state of the country and the terror of personal maltreatment. Let it be convincingly shown that English capital may be safely embarked in improving and working the great natural resources of Ireland, and millions of pounds, now lying useless, will be speedily transferred across the channel.]

IF the young men of Scotland were aware of the fair prospects of doing well in Ireland, in almost any walk of life, many more would seek their fortune in that country. Difficult as it may be to believe, there is, perhaps, no country in the world in which, at this moment, a steady industrious man, above the class of the common labourer, would more certainly succeed than in Ireland. The industrious mechanic, the shopman, the tradesman, &c., have there a fine field. No one can travel through Ireland without being astonished at the backward condition of almost all parts of this fertile island. Various unfortunate circumstances have hitherto prevented its improvement. But these have mostly been removed, and the political and religious ferments of the country are fast wearing out. All classes seem disposed to countenance, if not to practise, sobriety; and all appear to have awakened to the advantages of a steady application to matters of practical utility. Ireland, indeed, like Scotland after 1745, seems to be just commencing that career of improvement which Scotland has, in seventy or eighty years, so splendidly realised.

While Scotland is almost overrun with active young men seeking for opportunities or openings for the exercise of their industry in any respectable station of life, Ireland stands in need of exactly the description of persons who so much abound, but who cannot find suitable employment, in Scotland. With the exception of a very few of the principal towns on the coast, nothing in Europe equals in wretchedness the towns in Ireland. The want of tolerable inns; of shops; of tradesmen; of all and everything which constitutes an advanced state of civilisation, is distressing to the native of Great Britain who may visit this fine island. I was compelled lately to pass several days in a town in the interior, containing about 20,000 inhabitants, in which the only place of entertainment, called by Irish courtesy the Hotel, was so filthy, disgusting, and miserable, that I became actually unwell from vexation. This miserable inn was, notwithstanding its want of all proper accommodation, crowded with strangers drawn to the town by business, like myself, and all venting their unavailing complaints to the landlord. There is no want of circulation of people in the interior of the country, nor of a moderate internal trade. All that is wanting are better accommodations, better shops, better habits of business, more energy and enterprise; all of which a better educated, more civilised people, like the young men of Scotland above described, would abundantly provide, greatly to their own advantage, and to the benefit of the country.

Of late years, a number of Scotch houses of business have been established in the principal towns of Ireland, apparently with all the success which they merit. Their example has been most striking in producing better habits, and more activity amongst the native shopkeepers. Judging from the overflowing congregations in the Presbyterian churches, it is supposed that the tide of emigration has set in strongly from Scotland, more particularly as the number of those churches is yearly increasing in Ireland.

Still, the field is so ample, that thousands and thousands more might find employment, if not fortune, in Ireland. The advantages which Ireland offers to the active and industrious Scotchman are, that common rough labour

is cheap, that the various classes of shopkeepers, tradesmen, mechanics, &c., are usually idle, negligent, often extravagant, and more disposed to spend than to get money; and too many are positively dishonest in their dealings. Generally, they possess no proper system or method in managing their affairs. It is often remarked, that wherever the active and careful Scotchman enters into competition in any branch of business, in any town, with the less industrious Irish tradesman, that the shop of the latter is either soon improved or soon closed. Many of the most thriving and wealthy men in Ireland are natives of Scotland, who settled in Ireland with no capital, having nothing to depend upon but their own steady and persevering exertions, by which they have, greatly to their credit, earned large fortunes.

Though the field is ample, yet it must not be expected that it will yield fruit without toil and care. But what so many young men, natives of Scotland, have done in almost every industrious calling in Ireland, it may be fairly hoped that others can do.

THE CHINESE COLLECTION.

ONE of the principal objects of attraction in London for the last few months has been a large and highly interesting collection of articles from China. The collection is the result of twelve years' indefatigable exertions on the part of Mr Dunn, an American gentleman. That he has been carried through his undertaking by enthusiastic perseverance, is self-evident; and we have ourselves derived so much instruction and gratification from a visit to his exhibition, that we would fain shadow forth our feelings, however faintly, to readers whose distant homes deny them a similar privilege. Situated near Hyde Park, and the edifice having been erected for the purpose, let the reader imagine an apartment 225 feet in length by 50 in width, with lofty ceilings supported by numerous pillars. Or such as have but vague ideas of measured space, must understand that this chamber is vast enough to contain *many* completely fitted up Chinese rooms, and *two entire houses*, with shops, stock in trade, &c. &c. And as the last are among the startling novelties which first attract a stranger, we will begin by describing them, although they are placed nearly at the end of the catalogue; a book, by the way, to which we gladly refer when our own notes are at fault. The first is a silk mercer's shop, as seen in the streets of Canton, completely furnished, the house for the family being over the retail establishment. The figures both here and throughout the collection are so wonderfully life-like, that it is with difficulty we can persuade ourselves they will not presently begin to speak, the delusion being of course greatly assisted by the costumes, which are, in fact, veritable dresses of the Chinese. The figures are the size of life, and are modelled from a peculiar species of clay admirably adapted for the purpose, and afford specimens of a style of art altogether new in England. Though a sort of family resemblance runs through almost all the collection, we understand they are, for the most part, accurate likenesses of individuals, some of whom are yet living. High cheek-bones, small eyes, flat noses, a dingy yellowish complexion, and rather a heavy expression of countenance, seem the prevailing characteristics. In the mercer's shop two purchasers have been placed at the counter, one of whom is scrutinising a piece of silk that lies before him. The owner, behind the counter, is carelessly leaning forward, and intent on casting an account on the "calculating dish" (a strange looking thing, not very unlike a dish of wooden beads), the Chinese being no adepts at mental arithmetic; while his clerk is busy making entries in the book, in doing which he shows their method of holding a pencil, which is placed perpendicularly between the thumb and all the fingers. It is customary with the Chinese shopkeepers to eat their daily meals in their places of business; in the present instance, a servant is preparing breakfast. A circular eight-legged table, very similar to those used by our great-grandfathers, is spread at the end of the shop; among its furniture the ivory chop-sticks are the most novel; and how they do contrive to convey the food to their mouth with these loose sticks, we know not, unless they accept aid from those primitive forks—fingers; a supposition not altogether unlikely. On the left hand sits a gentleman with a pipe, perhaps a chance comer, just dropped in about meal-time; at the door, a blind beggar—probably of the unhappy class deprived of sight in infancy by their inhuman parents for the purpose of exciting compassion—stands beating two bamboo sticks against each other, an operation with which he continues to annoy all whom he visits, till he is relieved by some trifling gratuity. A small covered tub filled with tea, with a few cups close by, stands on the counter, from which we are informed all customers are invited to help themselves. We should add, that an air of order pervades the shop, and that the shelves seem arranged much after our own fashion. Here, as elsewhere, we find one or two inscriptions hung up against the wall: and we will transcribe the translation of a few of these amusing scrolls. "Gossipping and long sitting injure business." "Former customers have inspired caution—no credit given." "A small stream always flowing." "Trade circling like a wheel," &c. The "next door neighbour's" is a china repository, much on the same scale as the silk mercer's, and its rich stock is somewhat tantalising to the lovers of such ware.

Opposite to the houses and shops we are presented with the section of a religious temple, containing three colossal figures, which represent "the three precious Buddhas:" Me-lih Fuh, whose reign is already past; Heen-tsee-Fuh, that person of Buddha who now reigns over the world; and We-loe-Fuh, whose reign is yet to come. There is but little difference in these monstrous idols, which are nearly twenty feet in height, save that the last mentioned, typifying the "future" power, sits with clasped hands. They are formed of clay, and entirely covered with burnished gold.

Near to the temple is an interesting group, consisting of three literary gentlemen, a mandarin of the fourth class, and servants. One figure is supposed to be reading aloud a translation of Æsop's Fables. In the hand of this philosopher the visitor observes what he would naturally take for a smelling bottle, were he not apprised that it is a receptacle for snuff. Tobacco, transmuted into snuff, appears to be carried, not in boxes, but in small bottles, with stoppers, to which there is attached a little spoon, or shovel. With this we are told they take out the pungent dust, and place it upon the back of the left hand, near the lower joint of the thumb, whence it is snuffed up to the olfactories, there to perform its titilating office. A portion of the furniture of this compartment consists of a pair of Chinese book-cases made of ebony, the panels and other parts of which are exquisitely carved and highly polished. The books are kept in the lower section, where they are protected from dust by doors in front; the doors, however, are at present open, a servant being in the act of handing a volume to one of the gentlemen; the upper section is an open cabinet, divided into five unequal compartments, in which are arranged divers ornamental articles. The books—looking, when open, very like manuscript music, but printed only on one side of the paper—are laid in a horizontal position, and the titles are placed on the end instead of the back, each work of several volumes being preserved in an envelope or case of blue nankeen or silk. Between the book-cases are suspended on the wall a pair of silken scrolls bearing the following maxims:—"The sages taught four things—Letters, Morality, Fidelity, Truth;" and "the highest pleasure is not equal to the study of letters." The mandarin of the party, who is listening attentively to the fable, is dressed in a long silk petticoat fastened round the waist by a belt, which is united in front by a clasp. A variety of accoutrements is attached to this belt, rather military in appearance, but not at all formidable in reality. In fact, a Chinese never goes armed, as the jealousy of the government has denied the privilege of wearing arms to all except soldiers on parade. The appendages referred to are, therefore, altogether peaceful, such as a silk fan sheath, embroidered tobacco pouches, &c. The cap is cone-shaped, but not turned up at the edge, having crimson silk pendant from the crowning ball. This is a summer cap. While on the subject of costume, we may as well advert to the fact, that the dress of every grade of society in China is fixed by usage—persons in the lower class wearing coarse and dark-coloured fabrics, while those who have been more favoured in the accidents of birth and fortune, seek the gratification of their tastes in costly silks, satins, furs, broadcloths, and embroidery. There is, consequently, much variety, though "the general mode is not departed from, the usual articles being a shirt, drawers, a long gown or pelisse, buttoning in front, stockings and shoes. The shoes are singular; generally of embroidered cloth, sometimes the uppers being of one colour, sometimes another. The lower portion of the soles is leather made of hog's skins, while the intermediate space, commonly about an inch in thickness, is filled up with bamboo paper, with the edge painted white. They are quite light, notwithstanding their clumsy appearance." Blue seems a favourite colour; frequently the entire dress is of this hue, or, if not, it is greatly decorated with it.

Our readers are probably aware that coarse sackcloth is the universal mourning apparel in China; and we are here presented with a gentleman thus attired. The shoes are white; the hair and beard are permitted to grow unshaven; and an odd species of headgear surmounts the cranium. He is attended by a servant, who carries a mourning lamp, of which a number are exhibited in their funeral processions, and are distinguished from all others by the presence of the emblematic white. They wear mourning for a considerable period; and three years must elapse, after the death of a parent, before children are permitted to marry.

Not far from the mourners we find a Chinese sedan, in which the owner is comfortably seated, while he is borne gently along by a couple of *coolies*. And here, as in all the instances already alluded to, we must beg the reader to remember, that these are no miniature representations, but full-size figures, most wonderfully life-like, their dress and appendages being all real. The width of a street in Canton is delineated, and the sedan, except that it is more open and of gayer colours, is not very unlike, in construction, those used by us in the last century; the bearers, however, support it on their shoulders, instead of carrying the poles in their hands. Here, again, we learn that the distinctions of rank prevail; for private gentlemen are allowed only two bearers, civil officers four, viceroys eight, while the emperor's dignity requires sixteen. Mandarins are preceded by men bearing pendant banners, with an inscription that signifies, "Clear the way."

The extreme end of the long apartment—having the groups we have mentioned, and many others equally full of interest, arranged along the sides—is occupied by a pavilion, forming, in fact, the termination of the saloon, from which it is separated by a species of carved net-work, which seemed to us as beautiful as it was unique. The carving, forming, as it were, a magnificent frame to the scene represented within, penetrates entirely through the wood, and represents figures of animals, birds, flowers, fruits, &c., the colours being as gorgeous as gilding and paint can make them; yet they are so skilfully disposed, as to harmonise perfectly, and could not, we think, offend the most delicate taste. The room thus enclosed is a perfect fac-simile of an apartment in a wealthy Chinaman's dwelling. In the opposite corners are placed square carved tables of some hard wood, with marble tops, and hangings of embroidered velvet, on which a servant has placed some fruit for the refreshment of the guests. On the right of one of these stands a long high table, similar to a common sideboard, upon which rests ornamental stands and fruit. On each side of the apartment are chairs of a corresponding style, alternately arranged with small tea stands, with a footstool for each chair, besides flower-pots, porcelain stools, embroidered silk lanterns, and other trifling articles of furniture; while opposite to us is an aperture in the wall, which we certainly did not at first take for a door, or rather doorway, or aperture for exit; but such it is, though of an oval form, and surrounded with an ornamental fret-work similar to the exterior. Through this doorway we are favoured with a perspective view of Chinese scenery. The walls of the room are hung with a variety of decorations, chiefly long silken scrolls with maxims; and feather fans, china vases, and many ornamental articles, are scattered in profusion. The pavilion contains six figures, intended to represent the mode of paying and receiving visits. Tea and pipes seem to be served on these occasions, as well as sweetmeats or dried fruits. The common mode of salutation is to join the closed hands, and lift them twice or thrice to the head, saying, "Haou—tsing—tsing;" that is, "Are you well." "Hail! hail!" And at other times, when said to persons of whom they have before heard on first meeting them, "Ioo yang fang ming," or, "I have heretofore thought with veneration on your fragrant name."

But it would be nearly impossible to describe half the scenes which memory recalls; the company of actors in their fanciful and gorgeous dresses, the female characters being, as was once the case in England, represented by youths; the jugglers in the act of performing their frightful feats, or the artisans at their different trades—the latter, to our mind, far more agreeable objects. Perhaps a useful hint might be obtained from the manner in which the cobbler wears his spectacles. He bends over his work, of course, much as an English shoemaker does, but he is protected from the otherwise very possible disaster of the spectacles falling off, by their ends being formed as loops, which fasten easily round the ear. Not the least curious articles to which our attention was drawn, were the far-famed lanterns, several kinds being here presented to our view. They are made of horn, silk, glass, or paper, and sometimes of a netting of fine thread, overspread with a thick coating of varnish, the frame being often richly carved, and the silk which covers it elegantly embroidered. A late writer, remarking the national attachment of the Chinese to their lamps and lanterns, and the constant use of them, relates the following amusing anecdote. When Captain Maxwell passed the Bogue in the Alceste frigate, as he came up with the battery of the A-ming-hoy, the fort appeared well lighted, and a brisk cannonade was commenced upon the ship. However, after the first broadside had been fired upon the fortress, the whole place was deserted, and the embrasures were quickly as dark as before. The Chinese were thoroughly frightened, and ran off with all precipitation. At the same time, instead of concealing their flight in the darkness of the night, each man seized his lantern, and clambered with it up the steep side of the hill immediately behind the fort. The sight of so many bald-pated soldiers, with their long pigtails dangling at their backs, each with a great pointed balloon in his hand, must have been extremely ludicrous, and probably took away any slight inclination the marines might have felt to have a shot at such excellent marks. Besides these, there are many hundreds of curious implements of household use, specimens of the rich manufactures of the Chinese, as well as the ingenious contrivances for which they have been so justly famed; so that after a visit, as long as that we paid to this most wonderful collection, one feels inclined to talk of one's "residence in the celestial empire." That the Chinese are descended from the wandering Tartar tribes, there is, of course, no doubt; and it is not a very fanciful notion to trace, even in their present architecture, some remains of their original dwellings—tents. To ponder over the change that thousands of years have effected, which have converted restless wanderers into that nation of all which cover the earth, the most serried in their dwellings, and the least inclined to roam from them, is neither uninteresting, nor, we hope, unprofitable; but in their case it seems more than commonly difficult to prove, from a knowledge of the past, true prophets of the future. Shut up from the period of their very origin as a nation, denied the reflected light of the stranger's wisdom, the Chinese people have remained children in intellectual advancement; while, if we may use the metaphor, later born

nations have arrived at maturity, and some have even passed on towards the impotence, which, without the respectability of age, has sometimes been the fate of powerful kingdoms. The advancement of the Chinese is their own; they are self-educated; and their love of peace, industry, and ingenuity, as well as their reverence for learning, albeit the stream must flow only in one appointed channel, are traits in their character on which the thoughtful would fain build bright hopes for the future.

THE LYONS COURIER.

AN EXTRAORDINARY CASE OF CIRCUMSTANTIAL EVIDENCE.

In the month of April 1796—or, according to the dates of the French republic, in Floreal of the year 4—a young man, named Joseph Lesurques, arrived in Paris with his wife and his three children from Douai, his native town. He was thirty-three years of age, and possessed of a fortune of 15,000 livres (L.600) per annum, inherited from his own and his wife's relations. He took apartments in the house of a M. Monnet, a notary in the Rue Montmartre, and made preparations for permanently residing in Paris and educating his children. One of his first cares was to repay one Guesno, proprietor of a carrying establishment at Douai, 2000 livres he had formerly borrowed. On the day following, Guesno invited Lesurques to breakfast. They accordingly went to No. 27, Rue des Boucheries, in company with two other persons, one of whom, a gentleman of the name of Couriol, was invited, in consequence of his calling on the third party just as they were sitting down to breakfast. The party remained at table until nearly twelve o'clock, when they proceeded to the Palais Royal, and after having taken coffee at the Rolonde du Caveau, separated.

Four days afterwards (on the 27th April), four horsemen, mounted on good, but evidently hired horses, were observed to ride out of Paris through the Barriere de Charenton, as if on a party of pleasure. They all wore long cloaks, as was then the fashion, and sabres hanging from their waists. One of the party was Couriol.

Between twelve and one o'clock, the four horsemen arrived at the pretty village of Mongeron, on the road to Melun and Burgagne. One of the party had gallopped forward to order dinner at the Hotel de la Poste, kept by Sieur Evrard; after dinner, they asked for pipes and tobacco, and two of them smoked. They paid their bill, and went to the casino of the place, where they took four cups of coffee. At three o'clock they mounted their horses; and, following the road, shaded by beech trees, which leads from Mongeron to the forest of Lenart, they proceeded, at a foot pace, towards Lieursaint, a picturesque village in the midst of a grove.

They arrived at Lieursaint about three o'clock in the afternoon, and there made another long halt. The horse of one of the party had lost a shoe, and another of them had broken the chain of his spur by collision with a friend's horse. This one stopped at the entrance to the village, at the cottage of a woman named Chatelain, a lemonade-seller, and requested her to give him coffee, and supply him with some coarse thread to mend the chain of his spur. This woman immediately complied with his double request; and as the traveller was not very skilful in mending the chain, she called her servant, one Grossetete, who, accordingly, mended the chain, and assisted in putting the spur on the boot. The three other horsemen during this time had dismounted at one Champeaux's, an innkeeper, and took something to drink, while he conducted the horse and horseman to the village smith, a man named Motteau. When the horse was shod, the four travellers went to the café of the woman Chatelain, where they played some games at billiards. At half-past seven o'clock, after taking a stirrup-cup with the innkeeper, to whose house they returned for their horses, they mounted and rode off towards Melun.

On going in, Champeaux saw on a table a sabre, which one of the travellers had forgotten to put in his belt; he wished his stable-boy to run after them, but they were already out of sight. It was not until an hour afterwards, that the traveller to whom the weapon belonged, and who was the same who had mended his spur, returned at full gallop for it. He then drank a glass of brandy, and set off at full speed in the direction taken by his companions. At this moment the mail courier from Paris to Lyons arrived to change horses. It was then about half-past eight o'clock, and the night had been for some time dark. The courier, after having changed horses, and taken a fresh postilion, set out to pass the long forest of Lenart. The mail at this period was a sort of postchaise, with a large trunk behind containing the despatches. There was one place only open to the public, at the side of the courier. It was on the present occasion occupied by a man about thirty years of age, who had that morning taken his place to Lyons in the name of Laborde, silk merchant.

The next morning the mail was found rifled; the courier dead in his seat, with one wound right through his heart, and his head cut nearly off; and the postilion lying on the road, also dead, his head cut open, his right hand divided, and his breast wounded in three places. The postilion's wounds were evidently inflicted by sabres, wielded by two persons. One horse only was found near the carriage. The mail had been robbed of 75,000 livres in assignats, silver, and bank bills.

The officers of justice, in their researches, immediately discovered that five persons had passed through the barrier of Rambouillet, proceeding to Paris between four and five o'clock in the morning after the murder. The horse ridden by the postilion was found wandering about the Place Royale; and they ascertained that four horses, covered with foam, and quite exhausted, had been brought about five o'clock in the morning to a man named Muiron, Rue des Fosses-Saint Germain l'Auxerrois, by two persons who had hired them the evening before. These two persons were, a man named Bernard, and Couriol. Bernard was immediately arrested; Couriol escaped.

In the course of the inquiry, it became evident that the criminals must have been five in number. A description was obtained of the four persons who had ridden from Paris and stopped at Mongeron and Lieursaint, from the many persons with whom they had conversed on the road. A description was also obtained of the man who had taken his place with the courier under the name of Laborde, from the clerk at the coach office, and from those who had seen him take his seat.

Couriol was traced to Chateau Thierry, where he lodged in the house of one Bruer, with whom, too, Guesno, the carrier of Douai, was also staying. The police proceeded there, and arrested Couriol: in his possession was found a sum of money in assignats, drafts, and money, equal to about a fifth of what had been taken from the mail. Guesno and Bruer were also taken into custody, but they proved alibis so distinctly, that they were discharged as soon as they arrived in Paris.

The Bureau Central intrusted to one Daubenton, the *juge de paix* of the division of Pont-Neuf, and an officer of the judicial police, the preliminary investigations in this affair. This magistrate, after discharging Guesno, had told him to apply at his office the next morning for the return of his papers, which had been seized at Chateau Thierry; at the same time, he had ordered a police officer, named Heudon, to set out immediately for Mongeron and Lieursaint, and to bring back with him the witnesses, of whom he gave a list, so as to have them altogether the next day at the central office, ready to be examined.

Guesno, being desirous to obtain his papers as soon as possible, left home earlier than usual; just before he reached the central office, he met his friend Lesurques. They conversed together, and Guesno having explained the cause which took him to the office of the Juge de Paix, proposed that he should accompany him. They went to the office, then at the hotel now occupied by the Prefect de Police; and as Citizen Daubenton had not yet arrived, they sat down in the antechamber, on purpose to wait his arrival, and be more speedily released.

About ten o'clock, the Juge de Paix, who had entered his room by a back-door, was interrupted in his perusal of the documents, before examining the witnesses, by the officer Heudon, who said, "Among the witnesses there are two, the woman Santon, servant of Evrard, the innkeeper at Mongeron, and the girl Grossetete, servant of the woman Chatelain, the lemonade-seller at Lieursaint, who declare in the most precise manner that two of the assassins were waiting in the antechamber. They said they could not be mistaken, as one of them had waited at the dinner of the four travellers at Mongeron, and the other had conversed with them at Lieursaint, and had remained more than an hour in the room while they played at billiards."

The Juge de Paix, not believing this improbable statement, ordered the two women to be introduced separately. He then examined each of them, when they energetically repeated their statement, and said that they could not be mistaken. He then, after warning the women that life and death depended on their answers, had Guesno brought into his room. "What," said the Juge, "do you want here?". "I come," replied Guesno, "for my papers, which you promised to restore to me yesterday. I am accompanied by one of my friends from Douai, my native place. His name is Lesurques. We met on the road, and he is waiting for me in the other room.

The Juge de Paix then ordered the other person pointed out by the two women to be introduced. This was Lesurques. He conversed with him and Guesno for a few minutes, requested them to walk into another room, where their papers would be brought to them, and privately told Heudon not to lose sight of them. When they had left the room, the magistrate again asked the women if they persisted in their previous declarations; they did persist; their evidence was taken down in writing, and the two friends were immediately arrested.

From this time the proceedings were pressed on with great speed. Guesno and Lesurques, when confronted by the witnesses, were recognised by almost all. The woman Santon asserted that it was Lesurques who, after dinner at Mongeron, wished to pay in assignats, but that the tall dark man (Couriol) paid in silver. Champeaux and his wife, the innkeepers at Lieursaint, recognised Lesurques as the man who had mended his spur and returned for his sabre. Lafolie, the stable-boy at Mongeron, and a female named Alfroy, a florist at Lieursaint, also recognised him. Laurent Charbant, a labourer who had dined in the same room with the four horsemen, deposed that he was the one who had spurs affixed to his boots, hussar fashion.

On the day of his arrest, Lesurques wrote to his friends the following letter, which was intercepted, and added to the legal documents:—"My friend, since my arrival in Paris, I have experienced nothing but troubles, but I did not expect the misfortune which now overwhelms me. Thou knowest me, and thou knowest whether I am capable of degrading myself by crime; yet the most frightful of crimes is imputed to me. I am accused of the murder of the courier to Lyons. Three men and two women, whom I know not, nor even their abode (for thou knowest that I have never left Paris), have had the assurance to declare that they remembered me, and that I was the first who rode up on horseback. Thou knowest that I have never mounted a horse since I arrived in Paris. Thou wilt see of what vital import to me is such testimony as this which tends to my judicial assassination. Assist me with thy memory, and try to remember where I was and what persons I saw in Paris—I think it was the 7th or 8th of last month—so that I may confound these infamous calumniators, and punish them as the laws direct."

At the bottom of this letter were written the names of the persons he had seen on that day: Citizen Tixier, General Cambrai, Mademoiselle Eugenie, Citizen Hilaire, Ledru, his wife's hair-dresser, the workmen engaged on his apartments, and the porter of the house. He concluded by saying, "thou wilt oblige by seeing my wife often, and trying to console her."

Lesurques, Guesno, Couriol, Bernard, Richard, and Bruer, were tried before the criminal tribunal: the three first as authors or accomplices of the assassination and robbery; Bernard for having supplied the four horses; Richard for having concealed Couriol and his mistress Madeleine Breban, and for having concealed and divided all or part of the stolen property; Bruer for having received Couriol and Guesno in his house at Chateaux Thierry. In the course of the trial, the witnesses who pretended to recognise Guesno and Lesurques persisted in their declarations. Guesno and Bruer produced evidence that completely cleared them. Guesno proved his alibi in the most distinct manner, and thus insured his acquittal. Lesurques called fifteen witnesses, all citizens, exercising respectable professions, and enjoying the esteem of the public. He appeared at the bar with remarkable confidence and calmness. The first witness for the defence was Citizen Legrand, a countrymen of Lesurques, a wealthy silversmith and jeweller. He testified that, on the 8th, the very day the crime was committed, Lesurques passed one part of the morning with him. In addition, Aldenof, a jeweller, and Hilaire Ledru Chausfer, affirmed that they had dined with the prisoner on the same day at his relation's, Lesurques, in the Rue Montorquiel. They stated, that after dinner they went to a café, and after taking some liqueur, had seen him to his own house.

The painter, Beudart, added, that he meant to have dined with his friends, but that being on duty as a National Guard, he could not arrive in time, but that he had been at Lesurques's house the same evening in uniform, and had seen him retire to rest. In support of this deposition, this witness produced his billet-de-gard, dated the 8th. The workmen who were employed on the apartments Lesurques was about to occupy, deposed that they had seen him several times in the course of the 8th and 9th.

The jeweller Legrand, to corroborate his testimony, had stated, that on the day, the 8th Floreal (27th April), he had before dinner made an exchange with Aldenof, or, at any rate, that it was mentioned in his book on that day. He proposed that his book should be brought. It was examined in court, and discovered that the 9th had been clumsily scratched out, and the 8th substituted. This at once changed the favourable impression which had been produced in favour of the prisoner, and the witness was ordered into custody. He then lost all his presence of mind, and owned that he was not certain of having seen Lesurques on that day, but that, feeling convinced of his innocence, he had altered his register to corroborate his own testimony. This circumstance produced the most unfavourable effect on the judges; but in spite of the dark complexion of his case, Lesurques continued to maintain his innocence.

The discussions and examinations were closed, and the jury had retired to deliberate. At this moment, a woman, in a violent state of excitement, called aloud from the midst of the crowd in the court, for leave to speak to the president. She was, she said, urged by the voice of conscience, to save the tribunal from committing a dreadful crime. On being placed before the judge, she declared that Lesurques was innocent; that the witnesses had mistaken him for a man of the name of Dubosq, to whom he bore an extraordinary resemblance. This woman was Madeleine Breban, the mistress of Couriol, and the confidant of his most secret thoughts; who now abandoned him, and avowed her own guilt to save Lesurques.

Madeleine Breban's evidence was rejected, and the jury brought in their verdict, by which Couriol, Lesurques, and Bernard, were condemned to death. Richard was sentenced to 24 years' labour in irons; Guesno and Bruer were acquitted.*

No sooner had sentence been pronounced, than Lesurques, rising calmly, and addressing his judges,

* At that period the sentence was part of the jury's verdict.

said, "I am innocent of the crime imputed to me. Ah! citizens, if murder on the highway be atrocious, to execute an innocent man is not less a crime." Couriol then rose, and exclaimed, "I am guilty; I own my crime; but Lesurques is innocent; and Bernard did not participate in the assassination!" He repeated these words four times, and on returning to his prison, wrote a letter to his judges, full of anguish and repentance, in which was this passage: "I never knew Lesurques. My accomplices were Vidal, Rossi, Durochat, and Dubosq. The resemblance of Dubosq has deceived the witnesses."

Madeleine Breban presented herself, after sentence had been pronounced, to renew her declaration. Two parties attested that, before the condemnation of the prisoners, Madeleine had said to them that Lesurques had never had any connexion with the guilty parties, that he was the victim of his fatal likeness to Dubosq. The declaration of Couriel caused some doubt in the minds of the judges. They immediately applied to the Directory for a reprieve, who, alarmed at the probability of an innocent man being executed, applied to the legislative assemblies, for all judicial means had been exhausted. The message of the Directory to the "Five Hundred" was urgent. It requested a reprieve, and instructions on the subsequent steps to be taken. The legislative body, however, refused to interfere, on the grounds that, to annul a *sentence legally pronounced by a jury, would subvert all ideas of justice and of equality before the law!*

The right of pardon had been abolished. Lesurques was left without help or hope. He bore his fate with firmness and resignation. On the day of his death he wrote his wife the following letter:—"My dear friend, we cannot avoid our fate. I shall, at any rate, endure it with the courage which becomes a man. I send some locks of my hair; when my children are older, divide it with them. It is the only thing that I can leave them."

In a letter of adieu addressed to his friends, he merely observed—"Truth has not been heard; I shall die the victim of mistake."

He published in the newspapers the following letter to Dubosq, whose name had been revealed by Couriol:—"Man, in whose place I am to die, be satisfied with the sacrifice of my life; if you be ever brought to justice, think of my three children, covered with shame, and of their mother's despair, and do not prolong the misfortunes of so fatal a resemblance."

On the 10th of March 1797, Lesurques went to the place of execution dressed completely in white, as a symbol of his innocence, with his shirt turned over his shoulders. The day was Holy Thursday (old style). He expressed his regret at not having to die the next day, the anniversary of the Passion. On the way from the prison of the Concierge to the place of the Greve, where criminals were executed, Couriol, who was seated in the car beside him, cried in a loud voice, addressing himself to the people, "I am guilty, but Lesurques is innocent!"

When he reached the scaffold, already red with the blood of Bernard, Lesurques gave himself up to the executioners, saying, "I pardon my judges; the witnesses, whose mistake has murdered me; and Legrand, who has not a little contributed to this judicial assassination. I die protesting my innocence." The unfortunate Lesurques then submitted to his fate.

Many of the jury afterwards expressed their regret at having given credit to the witnesses from Mongeron and Lieursaint; and Citizen Daubenton, the Juge de Paix, who had arrested Lesurques, and conducted the first proceedings, resolved to investigate the truth, which could only be satisfactorily done through the arrest and trial of the four persons denounced by Couriol as his accomplices.

Two years elapsed without the conscientious magistrate being able, in spite of all his inquiries, to discover the slightest trace of the fugitives. At length, in examining the numerous warrants and registers of prisoners daily brought to his bureau, he discovered that Durochat, the individual whom Couriol had denounced as the one who had taken his place by the side of the courier, under the name of Laborde, had just been arrested for a robbery he had lately effected, and lodged in St Pelagie. At the time of Lesurques's trial, it had come out in evidence that several persons, amongst others an inspector of the post-mails, had preserved a perfect recollection of the pretended Laborde; having seen him when waiting for the mail.

Citizen Daubenton, by great exertions, secured the presence of the inspector in the court on the day of Durochat's trial. He was condemned to fourteen years' labour in chains; and as the gens-d'armes were conducting him to prison, the inspector recognised the prisoner as the same person who had travelled in the mail towards Lyons under the name of Laborde, on the day on which the courier was assassinated.

Durochat made but feeble denials, and was re-conducted to the Conciergerie, where Citizen Daubenton had him immediately detained, under a charge arising out of the proceedings against Couriol. The next morning the magistrate, assisted by Citizen Masson, an officer of the criminal tribunal, took means for transferring the prisoner to the prisons of Melun, where he arrived the same evening. After being examined early the next morning, it was found necessary to transfer him to Versailles, where he was to be tried. The magistrate and the officer set out, followed by two gens-d'armes, to convey the prisoner to Versailles. While on the journey, and in a moment of compunction, he confessed the whole affair. The true criminals, he stated, were Couriol, Rossi, alias Beroldy, Vidal, himself, and Dubosq. "I have heard," he added, "that there was a fellow named Lesurques condemned for this business; but, to tell the truth, I never knew the fellow either at the planning of the business, or at its execution, or at the division of the spoil." To this confession Durochat afterwards adhered. The magistrate present at his examination observed to him, that Lesurques had been sworn to as one of the party of four, and also that he had silver spurs on his boots, which he had been seen to repair with thread, and that this spur had been found on the place where the mail had been attacked. Durochat replied, "It was Dubosq who had the silver spurs. The morning we divided the plunder, I remember hearing that he had broken one of the chains of his spurs; that he had mended it where he dined, and lost it in the scuffle. I saw in his hand the other spur, which he said he was going to throw into the mixen." Durochat then described Dubosq, and added, that on the day of the murder he wore a blonde wig.

Some days after the arrest of Durochat, Vidal, one of the other authors of the crime, was also arrested. Although all the witnesses swore to him as one of the party who had dined and played at billiards, he denied everything. Special proceedings were instituted against him, and he remained a prisoner in the prisons of La Seine.

Durochat was condemned to death and executed. He underwent his fate with perfect indifference. Vidal was shut up in the principal prison of Seine and Oise, where the prosecution commenced at Paris was carried on.

Towards the end of the year 8 (1799–1800), four years after the assassination of the courier, Dubosq, having been arrested for a robbery in the department of Allier, where he had retired under a false name, was recognised in the prisons, brought to Paris, and thence to Versailles, to be tried at the same time as Vidal before the criminal tribunal. Dubosq, however, contrived to escape from prison, and left his companion Vidal, who was tried alone, condemned, and executed.

At length, in the latter part of the year 9 (1800–1801), Dubosq was again arrested, and immediately brought before the criminal tribunal of Versailles. The president had ordered a blonde wig to be placed on his head before the witnesses were called in. "The Citizen Perault, a member of the Legislative Assembly, and one of those who had seen the four cavaliers who had dined at Mongeron on the day of the murder of the courier, and who had recognised Lesurques as one of them, stated that there was a striking resemblance between Dubosq and Lesurques." The woman Alfroy, who had before sworn to Lesurques as one of the four, declared that she was mistaken in her evidence before the tribunal de la Seine, and that she was now firmly convinced that it was not Lesurques, but Dubosq, that she had seen. To this evidence Dubosq replied by stubborn denials; but he was unanimously condemned, and was executed the 3d Ventose, in the year 10 (22d February, 1802). At length, the last of the accomplices denounced by Couriol and Durochat—Rossi, otherwise Ferrari, or the Great Italian, whose real name was Beroldy—was discovered near Madrid, and given up at the request of the French government. Having been tried and sentenced to death at Versailles, he testified the utmost penitence, and went to execution, receiving religious attentions from Monsieur de Grandpré. After the execution, Monsieur de Grandpré stated to the president, that he had been authorised by the criminal to confess the justice of his sentence; and a written confession was deposited to that effect.

Thus terminated this long judicial drama. Ferrari, otherwise Rossi, was the sixth executed as one of the authors or accomplices in the murder of the Lyons courier, besides Richard, who was condemned to the galleys for having received the stolen property, and for having concealed Couriol, and afterwards assisted him to fly. Yet it was most distinctly proved, in the course of the trials, that there were only five murderers—the one who, under the name of Laborde, had taken his place beside the courier, and the four horsemen who rode on the horses hired by Bernard, dined at Mongeron, and took coffee and played at billiards at Lieursaint.

The widow and family of Lesurques, relying on the facts adduced at the trial, and supported by the declarations of Couriol and Durochat, the confessions of Rossi and Vidal, and the retractions of the witnesses in Dubosq's trial, applied for a revision of the sentence so far as concerned Lesurques, in order to obtain a *rehabilitation* (a judicial declaration of his innocence, and the restoration of his property), if he should be proved the victim of an awful judicial error.

The Citizen Daubenton devoted the latter part of his life, and the greater part of his fortune, to the discovery of the truth. In the conclusion of his memoir, he declared, that, according to his conviction, there were sufficient grounds to induce the government to order a revision of Lesurques's sentence. But the right of revision no longer existed in the French code. Under the Directory, the Consulate, and the Restoration, the applications of the widow and family of Lesurques were equally unsuccessful. All that the family could obtain was the restoration, in the two last years of the reign of the elder Bourbons, of part of the property sequestrated according to the law in force at the time of Lesurques's execution.

Since the revolution of 1830, the Lesurques family have again appealed to the Chambers. In the session of 1834, a report in favour of the claims of the family was made by a committee who sat upon their case. The case was then sent back for the consideration of the Minister of Justice and the Minister of Finance. Since that step, the question has remained in abeyance. The widow of Lesurques died in the month of October of this year (1842). His eldest son fell fighting in the ranks of the French army. A son and daughter only remain, whom their mother, on her death-bed, enjoined to continue the pious labour which she had commenced the day when her husband perished on the scaffold.

POEMS OF MR THOMAS POWELL.

THE followers of poesy are exposed to strange accidents of fortune. It seems as if their admission to favour, as in the case of courtiers generally, depended much more on chance, circumstance, and caprice, than on the solid foundation of true service and real deserving. For example, compare the literary lot of Michael Bruce with that of others who, like him, have entered the train of the muses. Bruce had certainly considerable talents, and of his small collection of verses a few pieces possess much beauty. He has been rewarded for them by a place, not a high but a permanent one, in the annals of poesy. Happy his fate in this respect! At the present day, only half a century or so later, the same amount of poetical merit will prove totally inefficient in giving a man a place in the temple of fame—even in its porch—or on the ledges of its very window-recesses. What is the cause of this? Is not true poetry the same thing to-day which it was yesterday, or in the time of old Homer? The solution of this enigma is in some respects easy. The time makes all the difference. Fifty years ago, the muse had few servants, and a share of favour could not but fall even to those among them of but moderate merit. Now, she has crowds of earnest and devoted worshippers, and, like an admired beauty, grows haughty, and values her smiles too highly to bestow them even on all the deserving. Verse-writers in these days may well wish that they had changed eras with their grandsires.

A new volume of poetry has led us into this train of thinking. It is one simply entitled, "Poems, by Thomas Powell;" and this simplicity is further carried out by the absence of all the ordinary prefacings and introducings.* The contents of the volume are of a high order of merit—so high, indeed, that we should think we were making a discovery of a remarkable unknown genius to the world, did we not know that many such songs are piped every day in vain, as far as fame is concerned. Mr Powell is one of the contributors to a recent volume of poems modernised from Chaucer, amongst which his version of the "Flower and the Leaf" appears to us a perfect gem. Let us see of what material his own poetry is composed. A small piece, entitled the Harp and the Poet, is as follows:—

"The wind, before it woos the harp,
Is but the wild and tuneless air;
Yet as it passes through the chords,
Changes to music rare.

And so the poet's soul converts
The common things that round him lie
Into a gentle voice of song—
Divinest harmony.

Sweet harp and poet, framed alike
By God, as his interpreters,
To breathe aloud the silent thought
Of everything that stirs."

Another little piece, containing a thought finely developed, may please the reader. The greatest defect of modern poetry is the want of mind—substantial thought. We would not have the style of the Pope era revived, when every line of verse conveyed some rhetorical stroke, or was loaded with a moral axiom, and pictures for the fancy were things condemned; but we would have verse-writers to try to convey instructive sentiment with mere description somewhat more than they do. Here we have images with a good lesson:—

INSTINCTS.

"Heaven gave the bee desire for sweets,
Nor heaven denies her flowers;
The thirsty land for moisture waits,
Nor heaven withholds its showers.
No sooner are the babe's alarms
To mother's ears express'd,
He finds a shelter in her arms—
His solace at her breast.

Nor are the instincts of the heart
Less subjects of heaven's care;
Nor would it sympathies impart
Merely to perish there—
The heart that yearns for kindred mind
To share its bless or pain;
That knows to love, shall surely find
A heart that loves again."

The piece which follows is a superstructure upon an exquisite lyric of George Herbert, two verses of which are retained:—

ALL THINGS PERISH SAVE VIRTUE.

"Sweet morn—so cool, so calm, so bright,
The bridal of the earth and sky,
The dew shall weep thy fall to-night,
For thou must die.

* Poems, by Thomas Powell. London: Effingham Wilson, Royal Exchange. 1842.

'Sweet rose'—whose fragrance now I crave,
To glad my sense and joy mine eye,
'Thy root is ever in its grave,
And thou must die.'

Sweet spring—so full of shine and showers,
It makes the weary spirit sigh,
To think, with all thy herbs and flowers,
That thou must die.

Sweet music—e'en the lovely song
Which from my harp in window nigh
Is floating on the breeze along,
E'en thou must die.

And all the bright and glistering train
Of stars that stud the deep blue sky
Must they all perish—none remain
To glad the eye?

And vales, and fields, and rushing streams,
And mountains that invade the sky,
Are they as baseless as our dreams?
And must they die?

And all that's beautiful and fair
On Nature's face—love's melody,
That makes sweet music of the air,
All—all must die!

And man, frail form of senseless clay,
Tho' now his glance is proud and high,
Perchance upon this passing day
He too may die!

But the bright soul?—*that*, shrined within—
The quenchless light in mortal form—
Tho' dimm'd by misery and sin,
Defies the worm.

When all the stars shall fade away,
And suns in their own blaze expire,
And trackless comets cease to stray
With wand'ring fire,

The soul shall ever live, nor know
The lapse of time, but dwell on high,
And share—in endless joy or woe—
Eternity."

We close our extracts with the following stanzas from an impassioned poem on "the hills:—

THE HILLS.

"The hills! the hills! the green and lofty hills!
High towers of earth, aye stretching towards the skies;
First lighted beacons of the sun, that fills
The world, and telling that his glories rise!
Acries to which the wearied spirit flies:
Pure regions of the fresh untainted gale;
Type of the heaven to which I raise mine eyes,
When earth and all its pleasures fade and fail;
Companions of the clouds, and shelterers of the vale.

The hills! the hills! the bright and snow-clad hills!
The first to feel the influence of heaven!
Ye treasuries of the pure and crystal rills
That God to glad the heart of man hath given.
Dark nurses of the earthquake that has riven
The proudest, strongest palaces of man,
When his weak might with Time itself hath striven,
And vainly made eternity his plan,
Ye stand as ye have stood since first the world began.

The hills! the hills! the freedom-breathing hills,
Mothers and nourishers of glorious deed:
Inspirers of the patriot's love that fills
The heart, and makes his common thoughts the seed
Of acts the slave would tremble but to read!
For still the mountain-born at Freedom's shrine
(Freedom, that dwells not on Italia's mead)
Lisps his first prayer! Freedom, the hills are thine!
Upon their crest thou stand'st—the deathless and divine!"

Though we have commended Mr Powell for the fine and thoughtful tone of his pieces, we must also say, since reviewers are nothing if not critical, that he is perhaps too uniformly sombre in his reflections. He is a poet, nevertheless, of much merit, and one who, if there are still any readers of poetical volumes left, may to such be confidently commended.

THE "DRENCHING SYSTEM."

THE barbarous system prevalent in this country, of charging for drugs instead of for medical services, is productive of much evil. It arose in this way:—The London College of Physicians, instead of becoming a great and useful institution for the benefit of the country—by spreading abroad, on a liberal principle, a sufficiency of proper medical practitioners to guard the health of the community—unfortunately degenerated into a narrow-minded clique of metropolitan physicians; and the English universities, not being fitted originally, and failing to adapt themselves to the circumstances of the profession, have never been able to supply a stock of graduates in medicine suitable to the wants of the country. In consequence of the shortcomings of the universities and of the college, the druggists (apothecaries) commenced the practice of medicine, putting their charges for their medical skill, such as it was, upon their drugs. Their successors are now the general practitioners of England, who still charge for their medicines, while the present race of "chemists and druggists" occupy the position originally held by the apothecaries. The system of charging for drugs is one of the greatest of the evils—as Dr Johnson agreed before the committee of the House of Commons—that affect the profession. The people of England swallow more drugs than any other nation, and have come to attach such a false value to medicines, that the druggist now-a-days, instead of charging the market price for his wares, like other tradesmen, charges after the manner of the "apothecary," as if the *drugs* possessed a virtue which exists only in their proper administration. It is evident, too, that the less a practitioner knows of a disease, the more drugs shall he have to administer for it, and consequently the more pay to receive for its treatment; for, unless he can remove the cause of it, he will administer some nostrum for each of its symptoms, which nostrums may but tend to complicate and perpetuate the mischief. It would be as proper to pay a practitioner for the gruel his patients drink, as to reward him for the medicines they consume. Medicines are substances given in quantities necessarily small, and their intrinsic value is generally so trifling, that the labour of putting them together is of more account than the materials themselves. Sensible people must submit to the barbarous usages of the apothecaries from custom, not from reason. But how are the evil effects of the "drenching system," as it is called, to be obviated? By preventing medical men from dispensing drugs, as some reformers would have it? Certainly not: that would be unjust; for, if others are allowed to dispense medicines, why should the very men whose business it is to direct the administration of them, be hindered from dispensing them, especially when it is allowed that it is absolutely necessary for them to do so in many circumstances? A surgeon is his own apothecary in the services, and on board of ship, as well as his own physician; so must he be in rural situations; but even in great towns it is necessary for him to administer drugs from his own pocket occasionally; and he must often, everywhere, to insure the exact fulfilment of his own intentions, make up his medicines himself, or have them made up under his personal superintendence. As a remedy, it is submitted that, while medical practitioners cannot be prevented, in common with other citizens, from selling drugs if they choose, they should not be allowed, more than other people, to charge more for drugs than their intrinsic worth, their market value; and that they should be, at the same time, empowered by law to sue for a fair remuneration for medical care or attendance. The system of charging for medicines instead of for medical skill is, as Dr Birkbeck says, a deception; but it is also a custom of the country, and as such, must wear out gradually; legislation cannot suddenly stop the deception, but it can divest it of legal sanction, and thus accelerate its gradual lapse into desuetude. Under the arrangement proposed, general practitioners would come to dispense drugs only in such circumstances as rendered it necessary for them to do so; the people would more rapidly perceive that drugs were not specifics; and, in the main, the mere dispensing of drugs would, as a business, become disassociated, as it ought, from the profession of medicine. The druggists, too, on this system, would gradually become less able to sell drugs as if medical skill accompanied them; and for this want of emolument from an illegitimate source, they would be recompensed by an increased amount of dispensing. The system, being founded on reason, has the advantage of adapting itself to all the circumstances of the case.—*Spectator.*

RECENT WONDERS OF STEAM.

STEAM AS A MINER.

THE following is a description of the wonderful machine called the "Yankee Geologist," which has recently obtained great celebrity in the United States, for performances which, for their extraordinary nature, and the peculiar manner in which they are described, will give them almost an air of romance; but, nevertheless, having reason to believe the "Yankee Geologist" to be an extraordinary invention, and capable of astonishing deeds, if not of all that is here set forth, I consider a notice of it sufficiently interesting to be deserving a place in your columns:—"We paid a flying visit on Saturday last to Otis' steam-excavator, in Brooklyn, where it is at work digging down the hill formerly known as Fort Green, and filling up the shallow inlet and quagmire entitled the Wallabout, or so much of it as lies above the old road to Flushing. The 'Yankee Geologist' is surely a great curiosity. He walks right into a mountain as though it were a plate of hot cakes, and dips up a cart-load at a shovelful as fast as you please. He cuts right and left a path some six rods wide through the hill, and then takes a new swath. He is locomotive, and advances by his own steam-power, whenever the earth has receded before him; grades and stakes down for himself; and only requires one man to shovel and another to look after the fire and engine, though one or two others are generally required to smooth the track before him, &c., besides tending the carts, which approach to be filled on one rail track, and go off loaded by another. If he comes to a stone weighing only a ton or such a matter, the 'Geologist' 'makes no bones' of it, but pitches it into the cart like a peck of gravel; if he comes to a stone weighing some four or five tons, he takes him up more carefully, and lays him out on the other side of his path. All this is effected by an immense shovel with a sliding bottom, at the end of an immense and complicated arm, worked by much ingenious and novel machinery. The inventor is now dead; the company had spent 30,000 dollars upon the invention, before the first machine was made, and much more afterwards. The patent, which is now secured throughout Europe, is probably worth 1,000,000 dollars. An excavator complete, costs about 6000 dollars, and will dig and load 1000 cubit yards of earth per day—equal to the labour of 150 men; cares nothing for cold or heat, rain or fair weather, but goes ahead, and minds its own business through all."—*Mining Journal.*

STEAM AS A BLACKSMITH.

Although at the late meeting of the British Association in Manchester there were many very interesting specimens of mechanism exhibited, there was, nevertheless, one in particular, which threw all others completely into the shade, when considered either as to the novelty of the invention, or its evident practical applicability to the every-day concerns of life, and may with truth be said to have been "the lion of the exhibition;" namely, a machine for the working or forging of iron, steel, &c. This truly surprising machine is quite portable, occupying only a space of three feet by four feet, and cannot be deemed other, even by the most critical judges, than one as purely original in principle, as well as practical in its application; as much so, perhaps, as was the splendid invention of the fluted roller of Arkwright, by which the art and perfection of drawing the fibrous substances became known; or that other still more splendid discovery of Watt, the condensing of steam in a separate vessel, by which the power of the steam-engine of that day may be said to have been doubled. But now for some explanation of the machine, and its probable general application. It is, then, as has before been said, very portable, not requiring more space than from three to four feet, and may be worked by steam or water power; and when moved by the former, as was the case at the exhibition, made 650 blows or impressions per minute; but from their very quick succession, and the work being effected by an eccentric pressing down, not striking the hammer or swage, not the least noise was heard. There are five or six sets of what may be called anvils and swages in the machine, each varying in size. The speed and correctness with which the machine completes its work is perfectly astonishing, and must be seen in order that its capabilities in this respect may be duly appreciated; for instance, when it was put in motion for the purpose of producing what is known as a roller with a coupling square upon it (and which had to be afterwards turned and fluted), the thing was accomplished in fifty seconds! of course at one heat, to the astonishment of the bystanders. But what appeared the most extraordinary part of the affair was, that the coupling square was produced direct from the machine, so mathematically correct, that no labour can make it more so!!! The machine will perform the labour of three men and their assistants or strikers, and not only so, but complete its work in a vastly superior manner to that executed by manual labour. For engineers, machine makers, smiths in general, file makers, bolt and screw makers, or for any description of work parallel or taper, it is most specially adapted; and for what is technically known as reducing, it cannot possibly have a successful competitor; in proof of which it may be stated, that a piece of round iron, 1¾ inches in diameter, was reduced to a square of 3-8th inches, 2 feet 5 inches long, at one heat. The merit of this invention belongs, it is said, to a gentleman at Bolton, of the name of Ryder.—*Manchester Courier.*

STEAM AS A COW-MILKER.

The "Northern Whig" (Belfast newspaper) announces a steam-impelled machine for this purpose, the invention of a gentleman at Lisburn.

EDUCATION IN INDIA.

[From the "Literary Gazette," Oct. 22, 1842.]

THE anxiety which the higher order of natives in British India have shown within late years to acquire for themselves, and to circulate amongst their countrymen, a knowledge as well of the English language as of every branch of science and literature, is one of the most remarkable events which has occurred throughout that immense empire. It must be obvious to the statesman and philosopher, that every possible encouragement ought to be held out to them, both by the government of the country and by all the learned societies of Great Britain, to persevere in this desirable course of proceeding; and it must therefore be highly gratifying to the public, that the rajah or chief of Travancore—a country which is situated on the south-west side of the southern peninsula of India—has been recently, upon the proposal of the Right Honourable Sir Alexander Johnston, as vice-president of the Royal Asiatic Society of Literature, unanimously elected an honorary member of that society, which at once associates his name, as a promoter of science and literature in his country, with the names of some of the most enlightened sovereigns in Asia and in Europe. The letter, of which the following is a copy, from Sir David Brewster—who is himself so good a judge of scientific merit—to Sir Alexander Johnston, upon the subject, shows how highly deserving the rajah of Travancore is of the honour which the society has conferred upon him, and how good an effect is likely to be produced amongst the natives of India by such a proceeding:—

My dear Sir—It gives me great pleasure to be able to send you some information respecting the great encouragement given to science and education by the rajah of Travancore. This prince is, I believe, only about twenty-six years of age: he was educated by a Brahmin of the name of Soobrow, now his prime minister, who was taught by the celebrated Danish missionary and botanist, Oloas Schwartz. This Brahmin is the author of a well-written tragedy called "Kishun Roorus," published in English at the government press of Trevandrum in 1840.

The rajah has established schools in every village, together with a mathematical school at Trevandrum, and a fine observatory, where regular astronomical and meteorological observations, under the superintendence of an English gentleman of great talents, Mr John Caldecott, with native assistants, are carried on. The rajah publishes annually a large mathematical almanac, computed by his astronomer for the meridian of his capital. I have now before me the volume for 1840, which consists of 300 pages, and would do honour to any metropolis in Europe. You, however, and all those who feel a deep interest in the intellectual improvement of the natives of India, will be gratified to learn that all the computations in this ephemeris have been made by young men, natives of Travancore, who were educated at the rajah's *free* school at Trevandrum. Mr Caldecott, the rajah's astronomer, superintended, of course, all the calculations.

I am in possession of the results of a fine series of *hourly* meteorological observations, made by the same persons, for 1839 and part of 1840, which possess a peculiar interest and value. You will find an account of the observatory, and of the instruments it contains, made by the first English artists, in the *Ephemeris* for 1840.

I earnestly hope that you will succeed in your noble object of establishing a college at Madura, a locality already interesting in Hindoo literature. Trevandrum is so near it, that if you succeed, I am sure you will find a valuable coadjutor in Mr Caldecott, whose science and knowledge, if wanted, and gentlemanlike manners, would fit him for some important situation in it. If I can be of any use in promoting your views in this or any other matter, it would be most gratifying to have an opportunity of doing it.—I am, my dear Sir, ever most faithfully yours—D. BREWSTER.

MONEY.

WE shall suppose a young man of the style of the young men of the last-century essayists, who were assailed of a morning, as they walked forth into the country, by the two contending goddesses of virtue and vice, each alike eager to secure him as a subject. He is a respectable and well-meaning young man as may be, and having as yet no knowledge of the world, he is anxious to learn the best maxims upon some of the principal concernments of his race, and particularly upon that of money. This he endeavours to do by consulting books and men, his papa and his tutor being included amongst the latter. Our object is to convey some sort of idea of what he learns from these various sources upon the subject in question.

On consulting the oracles of ancient wisdom, he finds a general inclination to pronounce a moderate amount of worldly goods to be quite enough. "Nature furnishes what nature absolutely needs," says Seneca. "That man is not poor," says Horace, "who has the use of necessary things." "Men live best upon a little," says Claudian; "nature has granted to all to be happy, if the use of her gifts be but known." Juvenal is clear that "the care of a large estate is an unpleasant thing." Even to be quite penniless is thought not amiss by some of these sages. "Naked," says the Sabinian bard—what a pretty figure he must have cut if he had done literally what he says—"naked I seek the camp of those who covet nothing: those who require much are ever much in want." And Juvenal does not fail to tell us that "the traveller without a purse laughs in the face of the robber." The same gentleman adds, rather snappishly (of course he was poor himself), "We do not commonly find men of common sense amongst those of the highest fortune." And he at once assumes, that only wealthy ignoramuses ever ridicule the worn and torn doublet, the greasy gown, and rent and patched shoe, of the poor man of talents. These gentlemen are also very severe upon avarice. The miser they hold to be poor amidst the greatest wealth. He wants as much what he has as what he has not. And his vice is constantly on the increase from its gratification. In fact, the ultra rich and careful are a good deal pitied by authors in general, as being a class of men who have no proper enjoyment of life. La Bruyere remarks, that in youth they lay up for age; in age, for death. And Cowley calls out—

> "Why dost thou hoard up wealth, which thou must quit,
> Or, what is worse, be left by it? * *
> Thou dost thyself wise and industrious deem;
> A mighty husband thou wouldst seem.
> Fond man! like a bought slave, thou all the while
> Dost but for others sweat and toil."

Only Horace has the candour to suppose that the hoarder has any pleasure in hoarding. He makes one say, "The people hiss me, but I applaud myself at home when I contemplate my shiners in the chest." Then wealth always appears to our verse-making philosophers so extremely uncertain a possession. "Fortune," according to Seneca, "keeps faith with no one." "Delighted with her cruel occupation," says Horace, "and eager to play her insolent game, she is constantly changing honours from head to head, and her more solid gifts from hand to hand."

> "Fortune as blind as he whom she did lead,
> Changing her feature often in an hour,
> Fantastically carrying her head,
> Soon would she smile, and suddenly would lour;
> And with one breath her words were sweet and sour:
> Upon stark fools she amorously would glance,
> And upon wise men coyly look askance.
> About her neck, in manner of a chain,
> Torn diadems and broken sceptres hung;
> If any on her steadfastly did lean,
> Them to the ground despitefully she flung;
> And in this posture, as she passed along,
> She bags of gold out of her bosom drew,
> Which she to sots and arrant idiots threw."

Thus was she allegorised by our own Drayton. One might almost suppose that the chief reason why these literary people despised her, was her so-dismal want of discrimination. Their spite at "the wealthy fool" has stood from the days of Juvenal down to those of Burns and O'Keefe, and will probably be kept up for a few ages to come. Talent, or even mere virtue, are in their eyes infinitely to be preferred. "The praise of riches and beauty," says Sallust, "is frail and transitory: virtue alone is clear and eternal."

Our young man will find, from a number of other expressions scattered up and down the books of remote and recent times, that money will not stay the hand of death, or even alleviate pain; that there are many diseases which it cannot cure; and that it cannot be carried beyond the grave. He will learn that it exposes to envy, that it tempts to extravagance and vice, and corrupts and destroys the souls of men. Prosperity, he will find, often obscures good qualities, which adversity developes.* He will hear Virgil exclaiming, "Oh, cursed love of gold, to what dost thou not compel the human breast!" and Seneca remarking, with the look of one giving a warning against mortal danger, that poison is generally drunk out of gold. The respectable young man, it will be thought, must begin to be much staggered by all this, and must incline to retire into some wilderness where the filthy lucre was never heard of. But not so fast. He will discover, in the course of his researches, fully as many testimonies to the value and importance of money, albeit sometimes expressed with a slight shade of ironical humour. Let us see.

That very same Augustan minstrel who spoke boldly of going naked to the camp of those who desire nothing, tells us, elsewhere, to make a fortune by honest means if possible, but by all means to make a fortune; that money is to be sought in the first place, and virtue after money; and that all divine and human affairs—virtue, fame, and honour—obey the alluring influence of riches. "Both birth and good conduct," he says, "unless sustained by wealth, are more worthless than tangle." "He is ready to do whatever you wish, who has lost his purse." "Venus and the goddess of eloquence conspire to deck out the monied swain." He speaks of the shame of being poor, and more than insinuates that it is a condition which induces meanness of conduct. How our young man is to reconcile all this with our former quotations, we do not well see. The one remark as to the man who has lost his purse, seems directly to the opposite purpose of that of Juvenal respecting the happiness of not having a purse at all. But there are more puzzling things still, for Juvenal is not consistent with himself. He tells, that whence you have wealth is of no consequence, but it is most important for you to have it. "Every man's credit and consequence is measured exactly by the cash in his chest. The oath of a poor man is not taken, because he is believed to have no sense of religion, and to be unknown to the gods themselves." "Those rise with difficulty," he says, "whose virtues and talents are depressed by poverty." Nay, more—"who," he says, "will embrace even virtue herself, if you take away her rewards?" meaning that good incomes, benefices, places, and pensions, need to go with virtue, in order to give her any chance of being followed by the bulk of mankind: which, again, is quite at issue with an assertion of our James Thomson—

> ——"the generous pride of virtue
> Disdains to weigh too nicely the returns
> Her bounty meets with—like the liberal gods,
> From her own gracious nature she bestows,
> Nor stoops to ask reward."

Juvenal tells us, that "the loss of money is deplored with real tears," and that "poverty must ever be ill to bear, because it makes men ridiculous." "Valour, Peace, Virtue, Faith, and Concord," he adds, "have their temples; but Gold, though it has none, is, nevertheless, the greatest divinity of them all." Clearly, Juvenal might as well have not said a word on the subject, for any light that our young man is to derive from him. It is the same with them all. For every panegyric upon moderation and poverty, there might be adduced an aspiration after wealth, and an assertion of the power which it gives and the pleasure which it purchases. Anacreon, an excellent authority on such a point, makes gold the best friend of love. "Vain is noble birth [younger brothers!], vain worth and wit [poor-devil authors!], in forwarding the lover's suit; so be he wants the glittering metal." Horace himself, who wished to go naked to the tents of the virtuous poor, admits that it has more than the thunder's force; that it makes its way through wakeful guards and even solid walls, and tames the most savage men. "He who has coin," says Petronius Arbiter, "may sail securely; he will get the fairest maid to wife; his verses will be thought beautiful; his pleadings in the courts will be irresistible; his every wish will be gratified; in short, he who has gold, has Jove himself enclosed in his chest." "Wealth gets honour and friends," says Ovid; but "friends are always distant from the unfortunate," adds Seneca. "The smell of gain is good, from whatever it proceeds," said Vespasian, when his son Titus reproached him for a tax upon a somewhat mean commodity. Even the simple happy time which the poets dream of as having once blessed the earth—what name do they give it but the *golden age*? Gold, says Shakspeare by the mouth of Timon,

> ——"will make
> Black, white; foul, fair; wrong, right;
> Base, noble; old, young; cowards, valiant;
> ——bless the accursed,
> Make the hoar leprosy adored; place thieves,
> And give them title, knee, and approbation,
> With senators on the bench."

Hitherto, our young man has chiefly seen the positive part of the subject treated, while the negative has only been glanced at. Let us now follow him in his direct investigations as to poverty. Poverty is generally well spoken of in books. Burns vociferously asks—

> "Is there for honest poverty,
> Wha hangs his head, and a' that?
> The coward slave, we pass him by,
> And dare be poor for a' that."

Cowper addresses the inmates of a poor cottage—

> "I praise ye much, ye meek and patient pair,
> For ye are worthy; choosing rather far
> A dry but independent crust, hard-earned,
> And eaten with a sigh, than to endure
> The rugged frowns and insolent rebuffs
> Of knaves in office."

Here special cases are in question; it is honest poverty in the one, and independent poverty in the other. But throughout the whole of literature, there are seen leanings to the proposition, that virtue generally dwells in humble scenes, and that the frugal hard-working life of the poor man is not merely upon the

* Horace.

whole, but absolutely and in all respects, the happiest. An old English poet puts the case in very sweet verse :

"Ah, what is love? It is a little thing,
As sweet unto a shepherd as a king,
And sweeter too ;
For kings have cares that wait upon a crown,
And cares can make the sweetest loves to frown :
Ah then, ah then,
If country loves such sweet desires gain,
What lady would not love a shepherd swain ?

His flocks are folded, he comes home at night,
As merry as a king in his delight,
And merrier too ;
For kings bethink them what their state require,
Where shepherds careless carol by the fire ;
Ah then, ah then, &c.

He kisseth first, then sits as blithe to eat
His cream and curd, as doth the king his meat,
And blither too ;
For kings have often fears when they sup,
Where shepherds dread no poison in their cup ;
Ah then, ah then, &c.

Upon his couch of straw he sleeps as sound
As doth the king upon his bed of down,
More sounder too ;
For cares cause kings full oft their sleep to spill,
Where weary shepherds lie and snort their fill ;
Ah then, ah then, &c.

Thus with his wife he spends his year as blithe
As doth the king at every tide or syth,
And blither too ;
For kings have wars and broils to take in hand,
When shepherds laugh and love upon the land ;
Ah then, ah then,
If country loves such sweet desires gain,
What lady would not love a shepherd swain ?"

Collate this, however, with a passage from "Nature's sternest painter, but the best"—

——"see them rising with the sun,
Through a long course of daily toil to run ;
See them beneath the dogstar's raging heat,
When the knees tremble and the temples beat ;
Behold them leaning on their scythes, look o'er
The labour past, and toils to come explore ;
See them alternate suns and showers engage,
And hoard up aches and anguish for their age ;
Through fens and marshy moors their steps pursue,
When the warm pores imbibe the evening dew.
There you may see the youth of slender frame
Contend with weakness, weariness, and shame ;
Yet urged along, and proudly loath to yield,
He strives to join his fellows in the field ;
Till long-contending nature droops at last,
Declining health rejects the poor repast ;
His cheerless spouse the coming danger sees,
And mutual murmurs urge the slow disease.
Yet grant them health, 'tis not for us to tell,
Though the head droops not, that the heart is well ;
Or will you praise that homely healthy fare,
Plenteous and plain, that happy peasants share ?
Oh ! trifle not with wants you cannot feel,
Nor mock the misery of a stinted meal ;
Homely, not wholesome, plain, yet plenteous, *such*
As you who praise would never deign to touch.
Ye gentle souls who dream of rural ease,
Whom the smooth stream and smoother sonnet please ;
Go, if the peaceful cot your praises share,
Go look within, and ask if peace be there ;
If peace be his—that drooping weary sire ;
Or theirs, that offspring round the feeble fire
Or hers, that matron pale, whose trembling hand
Turns on the wretched hearth the expiring brand."

Or, if suspicion be entertained of anything in ragged lines, read certain statistical epics prepared by certain commissions, snatches of which we have from time to time adopted into these pages.

So much for what has been *said* about money : let us just inquire, for a moment, how the thing itself has *acted* in history. Ask the sage and the poet, and they will tell you of states, like individuals, existing in a simple and uncorrupted state, secure by virtue of their having no wealth to tempt the spoiler ; but was it in the wealthiest times of England that she suffered from the predacious Dane ? Rome was corrupted by wealth, and fell ; but is Turkey falling through that cause ? We hear of poor patriots, who nobly defend their country almost without money. American independence was secured with little cash ; and France fought like a wild cat in 1793, while her assignats were depreciated as low, almost, as copper is below gold. But money is, after all, the only sinews of war that can be very certainly depended on. In the contest which Spain carried on in the sixteenth century for the re-subjugation of the Netherlands, it is acknowledged that the king, though he had the new-discovered Indies at his back, yet chiefly lost ground for want of money. His troops often mutinied for payment of arrears ; parties of them would break away altogether, seize upon some strong place as their headquarters, and plunder the country for their subsistence, paralysing their commander not merely by their absence, but the uncertainty, if active steps were taken, how many of the troops who yet nominally adhered to him would remain. Upon one occasion, from wrath at want of pay, the garrison of a town, which was the key of a series of future operations, abandoned it to the enemy. On the other hand, the Dutch troops, having comparatively regular pay, or, at least, confidence in the anxiety of their employers to settle accounts honestly, never failed in their duty. There were great principles involved in the contest ; but gold gained the victory.

Verily, the soul of our young man must now be a good deal astonished at the various reports from various, and even from the same, quarters—from talk and from fact—with regard to riches and poverty, and also moderation. Nor will his understanding of the subject be much cleared by anything he can learn from his father, tutor, and the living world around him. Moralisers and preachers will tell him that it is dreadful to give up the mind to the pursuit of wealth, and there will be a general echo of the sentiment of Beau Tibbs, that something nice and a little is best ; but the compulsion of human necessities is upon the moralists and preachers themselves, who, having wives requiring dresses, and children clamorous of bread and butter, and finding, further, that philosophy forms no excuse from the payment of Christmas bills, are eager for money at the very moment when they are theoretically declaiming against it. Almost all men of thought and feeling speak highly of virtuous poverty : it is delightful to the human heart to think of happiness and content in simple circumstances, as those of the shepherd, and hence the charm of much pastoral poetry. But while all are willing, theoretically, to praise poverty, none are willing to descend into it. All, on the contrary, are eager to escape from it, as if the chief good lay in the opposite. And there is not a merchant who, in arranging the salaries of his clerks, does not recognise the principle that the larger sum purchases the superior morality as well as the superior talent. Is it possible to draw for our young man anything like reason out of all this mass of confusion ? We shall humbly make the attempt.

It is quite true that little is absolutely necessary for our wants, as the sages have so often said ; meaning thereby our primary wants, or what tends barely to support life. But a great mistake is made in considering these as the whole range of wants. Besides the food and external comfort essential to bare existence, the mental faculties have an endless range of desires, the gratification of which is so much added to the enjoyment of life ; as, for instance, the taste for elegances of all kinds, the appetite for instruction, the delight in exercising influence over, and even in succouring and relieving, one's fellow-creatures. The desire of making fair and pleasing appearances in his person, his home, and all that is his, is one of which the gratification is less important, but it is as natural a want of man's heart as the appetite for food itself. It is no wonder, then, that the maxim as to the sufficiency of a very little has never received the least practical regard from man. He goes on ever eager to acquire, because, generally speaking, each new step in acquisition tends to gratify a newly-developed want of his nature. His acquisitions will not, it is true, save from many of the evils of life, or stay the fell hand of death, or accompany him beyond the grave ; but they will not the less, on that account, obtain many advantages to the healthy living possessor who knows how to make a good use of them ; and this all men feel in their inner nature, though men who set down their thoughts in writing speak generally in a different manner. The sneers and sarcasms at the wealthy, unless where they are really directed against the abuses of wealth, must only be regarded as escapes of bitter feeling on the part of the less fortunate. Riches, in themselves, derogate from no one. It is only when they harden or ensnare the heart, or are attended by the insanity of miserliness, that they are to be justly made a subject of ridicule or censure.

That evil results, in many instances, from wealth, is sufficiently manifest ; but it is not certain, on this account, that virtue is only safe in the midst of penury, or even in moderate circumstances. Nor, because the wealthy are often miserable, is it certain that happiness dwells chiefly with the humble. It may be quite true, that no elevation such as riches bring about, insures perfect purity and amiableness of character, and that content is found nowhere ; and yet there may be a more steady connexion between virtue and easy circumstances, and also between content and easy circumstances, than between the same things and poverty. The poor escape many temptations and many cares which beset the rich ; but, alas ! have they not others of a fiercer kind proper to their own grade ? Let the statistician make answer. It is only, indeed, to be expected, that an increasing ease of circumstances should be, upon the whole, favourable to moral progress, for it is what industry tends to ; and industry is a favoured ordination of heaven, if ever anything on earth could be pronounced to be such.

A little careful examination will show how the fact is so. In narrow circumstances, the more immediately selfish feelings are almost unavoidably called into strong play, and the very means of exercising the more generous feelings are wanting. The improvement which is to be derived from a high cultivation of intellect and taste is almost completely denied. Easy circumstances naturally tend, with the great majority of mankind, to the exactly opposite effects and consequences. It is true that the poor are often as remarkable for genuine kindness to each other as for the constancy and fortitude with which they submit to their many privations ; but it would be preposterous to expect from them either the will or the power to exercise the benevolence which finds play in so many various shapes amongst the affluent. A few candid confessions from men who have passed from the one condition to the other, would, we believe, set this question at rest in a moment. Perhaps in the wish which is naturally felt to think gently of the humbler portion of the community, the *moral* importance of money has never been fully considered. Yet it might be well for that class itself, if this point were made a little more clear. The moral importance of money is, in reality, very great ; and, amongst the wonderful powers which the poets are so fond of ascribing to it, they might have reckoned, with perfect seriousness, that of transforming men from the slave, who thinks only of selfish and present gratifications, into the free, independent, and reflecting being, who, in the very increase of his own wants, finds that he can be more generous to his fellow-creatures. For this reason, there is no revolution in the history of an individual so important, if not in itself, at least in its consequences, as that which takes place at the moment of *the first saving*. The commencement of a deposit in a savings'-bank is the crisis of many a moral destiny ; and this is simply because, from that moment, the individual ceases to be the slavish dependent, looking upward, and having no self-respect, and becomes the independent man, free from all bondage but that of kindness to his fellows, of which he now, for the first time, possesses the means.

Our young man will now see that money, while the possession of it is liable to abuse, and the want of it often is the accompaniment of virtue, while it is possible to attain it at too great a sacrifice, and while it is declaredly powerless to avert many evils, yet is, upon the whole, that desirable thing which mankind have practically, in all ages, confessed it to be, notwithstanding the proclamations of a thousand sages to the contrary. He will think it strange that there should be such importance, and particularly so much moral importance, attached to the "filthy lucre," "the dross," "the base dust of the earth ;" but here he will be only perplexed by words. If he regards it in its true light, as an accredited representative of the materials of God's world, as elaborated and refined by man's labour for man's use, according to the decrees of a benevolent and all-wise Creator, he will be at no loss to see how it is as it is, even while the fact stares him in the face, that it has also been, in all ages, connected with the grossest selfishnesses and vices of mankind.

JOTTINGS FROM THE SANATORY REPORTS.

The Poor-Law Commissioners have published two volumes of local reports from medical and other authorities respecting the circumstances affecting public health in England and Scotland, being, as we apprehend, part of the basis on which Mr Chadwick founded that singular work on public health to which we lately directed attention. These local reports are in general harmonious with the views enforced so powerfully by Mr Chadwick, or rather by the facts which he mosaiced (so to speak) into his book. Everywhere we see the health of large districts affected by wretched filthy confined habitations, unpaved filth-covered streets, open drains, &c., and classes of labouring people made wretched or happy, according as they choose to spend their earnings on the means of intemperance or otherwise. We can only hope, from such a confused mass of information, to select a few bits which, from their peculiar pithiness, may be expected to be perused with some degree of interest.

Against those who, with Dr Alison of Edinburgh, affirm that contagious fever is not engendered by a tainted atmosphere, we think we have never seen a fact more confounding than one adduced by Dr Baker in the report on Derby. There is in the outskirts of that town a street called Litchurch Street, occupied by working people, and consisting of fifty-four uniformly-built houses on the north side. In the six adjoining houses in the middle of this row, in the winter of 1837–8, sixteen persons had typhus fever, of whom five died, while the families in the remaining forty-eight houses were comparatively healthy. Here was a striking instance of the localised virulence of fever ; and it became important to ascertain the causes. It was found that, at the back of the houses, a ditch ran along through the gardens, being that which was formerly used for the natural moisture of the ground. Behind all the houses, but the six in question, this ditch was covered ; behind the six, it was open. The other forty-eight houses had all of them regular sinks and drains connecting with a proper sewer. The six had not, but sent their refuse of all kinds into the open ditch, which was full of stagnant nastiness. Could there be any doubt, in such a case, as to cause and effect ?

When James VI. of Scotland was about to return from Denmark with his young wife to Edinburgh, he wrote a most pathetic letter to the magistrates of that city, intreating that they would have the "middings" cleared away from the principal street, that the queen and her friends might not contract a mean idea of the country in which she was henceforth to live. We believe he added some other requests ; but still, the one great subject was uppermost in his mind, and he concluded with a renewed intreaty that they would attend to the various topics of his letter, "but particularly the middings." We look back to this as only a good joke against ancient times ; but, strange to say, there are still many hundreds of streets in Great Britain nearly as much defiled with refuse of all kinds as the "Hie Gait" of our northern capital was at the end of the sixteenth century. In Manchester, there are many unpaved undrained streets, upon which the inhabitants throw out slops, offal, and filth, and which no scavenger ever enters, except the pig and dog, whose services are here gratefully acknowledged by Dr Lyon. These are but samples of others in the larger towns, particularly those which contain factories. The older and denser places are imperfectly drained from of old,

and ill-scavengered apparently from indifference. The newer streets have rushed up as building speculations, without any system of draining and paving being enforced. Thus both classes of streets are bad.

The reporter from Manchester, Dr R. B. Howard, expresses, however, his belief, that the "human miasms" generated in over-crowded and ill-ventilated rooms, are a more frequent and efficient cause of fever than the malaria arising from collections of refuse and want of drainage. "I have been led," he says, "to this conclusion, from having remarked that fever has generally prevailed more extensively in those houses where the greatest numbers are crowded together, and where ventilation was most deficient, although the streets in which they are situated may be well-paved, drained, and tolerably free from filth, than in those where there was less crowding, notwithstanding their being placed in the midst of nuisances giving rise to malaria." On this point, we should like to ascertain if the latter were not the more free from destitution; for it is pretty well made out, that sufficient food and exercise fortify, to some extent, against the effects of impure air, while a deficiency in these respects form predisposers to those diseases of which the impure air is, in our opinion, the proximate or most immediate cause. On the subject of over-crowding, many facts are presented in these volumes. For instance, an Irishman employed as watchman at Mr Walker's silk-mill at Patricroft, near Manchester, and who had a house of three small rooms, was asked by his master if he could give a temporary lodging to a few new hands. Paddy regretted that he had not room, and added, "Faith, I turned out thirty of them to the mills this morning!" The reporter from Norfolk and Suffolk, Mr Twisleton, describes four classes of cottages as prevailing among the rural labouring people. The first are of one apartment, generally occupied by not more than two persons. The second, which are a very extensive class among labourers, consist of two rooms, one above the other, the lower being a kitchen and parlour, the upper a bed-room for the *whole family*, a system of things of which it is unnecessary to particularise the evil results. The next, or third class, have the addition of a small out-house behind, where washing and some other domestic duties are performed, and which of course tends to make the front low room more clean and decent. The fourth class have two rooms below and two above, which may be considered ample accommodation, unless where the family is unusually large. There are instances where labouring families, no way superior to their neighbours, occupy the better sort of cottages; but, generally, it is found that having a tolerable house accommodation is favourable to the moral condition of that class of people. Mr Lowe, of Marston, Stafford, draws this contrast, which is sufficiently instructive:—

"If we follow the agricultural labourer into his miserable dwelling, we shall find it consisting of two rooms only; the day-room, in addition to the family, contains the cooking utensils, the washing apparatus, agricultural implements, and dirty clothes, the windows broken and stuffed full of rags. In the sleeping apartment, the parents and their children, boys and girls, are indiscriminately mixed, and frequently a lodger sleeping in the same and the only room; generally no window; the openings in the half-thatched roof admit light, and expose the family to every vicissitude of the weather; the liability of the children so situated to contagious maladies, frequently plunges the family into the greatest misery. The husband, enjoying but little comfort under his own roof, resorts to the beer-shop, neglects the cultivation of his garden, and impoverishes his family. The children are brought up without any regard to decency of behaviour, to habits of foresight, or self-restraint. They make indifferent servants; the girls become the mothers of bastards, and return home a burden to their parents or to the parish, and fill the workhouse. The boys spend the Christmas week's holiday, and their year's wages, in the beer-shop, and enter upon their new situation in rags. Soon tired of the restraint imposed upon them under the roof of their master, they leave his service before the termination of the year's engagement, seek employment as day-labourers, not with a view of improving their condition, but with a desire to receive and spend their earnings weekly in the beer-shop; associating with the worst of characters, they become the worst of labourers, resort to poaching, commit petty thefts, and add to the county rates by commitments and prosecutions.

On the contrary, on entering an improved cottage, consisting, on the ground-floor, of a room for the family, a wash-house, and a pantry, and three sleeping-rooms over, with a neat and well-cultivated garden, in which the leisure-hours of the husband being both pleasantly and profitably employed, he has no desire to frequent the beer-shop, or spend his evenings from home; the children are trained to labour, to habits and feelings of independence, and taught to connect happiness with industry, and to shrink from idleness and immorality. The girls make good servants, obtain the confidence of their employer, and get promoted to the best situations. The boys, at the termination of the year's engagement, spend the Christmas week's holiday comfortably under the roof of their parents; clothes suitable for the next year's service are provided, and the residue of wages is deposited in the saving's bank; a system of frugality is engrafted with the first deposit, increasing with every addition to the fund. They are gradually employed in those departments of labour requiring greater skill, and implying more confidence in their integrity and industry, and they attain a position in society of comparative independence.

I have selected an extreme case, to show more fully the advantages derived from improved cottages, and the immoral effects of inferior dwellings, unfortunately too numerous in this union."

Cleaning, draining, cottage-building, are objects for society, or benevolent and affluent persons. But the poor are shown to have much in their own power also. The colliers of East and Mid-Lothian, with comparatively large wages, are described in several reports as generally living in very wretched filthy dwellings, while the agricultural labourers of the same counties, with much less gains (never exceeding L.25 per annum), have clean smiling cottages, which it is a pleasure to enter. The difference lies in the moral and domestic habits of the two classes, the colliers being too often given to liquor, and their wives lazy and improvident, while the farm labourers are the very reverse. Dr S. Alison, who practised at Tranent, says that he never got fees from the well-paid colliers, but always from the poorly-paid farm servants. He adds, that at Pencaitland collieries, where no liquor is allowed to be sold, the men are strikingly superior in conduct, and have better dwellings and better appointed families. Mr Twisleton says—"The cleanliness of a cottage bears no direct proportion to the earnings of the inmates. The earnings of a family may amount to 17s. or 18s. a-week; but if the man is a drunkard, or the wife has slovenly and tawdry habits, the children look neglected and dirty, and their cottage presents the most repulsive aspect." This gentleman states, that in his district (Norfolk and Suffolk) some of the dwellings of even "the paupers with small allowances are exquisitely clean and neat. 'Sir,' said a pauper of this class to me, when I was praising her for the neatness of her cottage, 'if I had not a morsel of bread to eat, as long as I can move about, I will keep my house sweet and clean.' It is easily understood that such instances are not very numerous, but still they occur sufficiently often to prove that dirt and filth are not the necessary companions of poverty, and they may tend to put benevolent persons on their guard, who might be inclined to infer unmerited privation and suffering from the neglected and squalid appearance of a dwelling." To this we can add a somewhat remarkable illustration of the same point, which has just come under our notice. At a recent distribution of prizes by a society in Edinburgh, for the tidiest and cleanest houses among the humbler classes, the first prize was awarded to a *poor blind female*, who sits in George Street playing upon a small hand organ for her bread.

The report from Kent and Sussex touches upon a certain want of proper feeling, which we do not remember seeing adverted to before, though we have known many instances of it. It is attributed by the reporter to the effects of the old poor-law, but such things exist where that law never prevailed. "I have seen," says he, "an old man come with tottering steps before a board of guardians petitioning for relief, whose grandson was at that moment mayor of one of the largest towns in the south of England. I have seen a chairman of a board produce a note from a lady living in a handsome house in the union, and enjoying an income of L.400 a-year, which note was to induce him to use his influence with the guardians to allow her brother, aged 70, a weekly allowance from the rates. I have seen an aged woman, in the extremest destitution, having lived several nights in barns, brought before the guardians; yet she had at that moment two unmarried sons, one earning 16s. a-week, and the other L.1 : 1s., both of whom had refused to contribute anything to her support. I remember a farmer, who rented 180 acres of land, coming before a bench of magistrates to be excused poor's rates, on the ground that the guardians had insisted that he should keep his aged mother, who, under the old system, had been supported out of the rates. He seemed to have no idea that it was his duty to do so, but thought that the keeping his mother should be fairly considered as a set-off to his rates. In another union, an aged couple had a son earning 20s. a-week, and who was ascertained to be in possession of L.500, yet he refused to give a farthing to his parents, and resisted to the utmost a magisterial order to pay them 2s. a-week. I remember another case of an old woman, past 80, seeking refuge in a work-house, whose son was a farmer living in another part of the county, to whom the guardians wrote, requesting him to support his mother; the answer was, 'I received your letter, and am sorry to hear of my mother's distress.' He then refused to do as requested, but at the conclusion of the letter, as if seized by a sudden impulse of affection, adds, 'when I see her, I am not against giving her a shilling.' She, however, died in a few days, and thus released him from a burden he was so unwilling to bear."

Amongst the other points of a novel nature brought out in these reports, we find one of a striking nature in that from Ayr. This town, we may premise, is one of about 18,000 inhabitants: it is a genteel county town, without native manufactures, but a large labouring class, mainly composed of colliers and weavers. Kilmarnock, twelve miles off, has as many inhabitants, but is eminently a manufacturing town. In the one place, the working-people "have scarcely any means of applying those mental qualities which nature may have endowed them with in such a way as to raise them from their existing grade." But in Kilmarnock, "we continually see enterprising clever journeymen saving a little money, forming partnerships, entering upon small manufacturing businesses on their own account, and not only raising themselves to respectable positions in society, but, by their example, affording such inducements to others to industry, sobriety, and carefulness, that the *whole class of the manufacturing population is elevated to a higher status than in Ayr*. Besides rendering themselves expert in the manual operations of their trades, they acquire a knowledge of the mechanical and chemical principles of the manufacturing processes in which they are engaged, and the modes of transacting general business; so that, with a little money and a liberal credit, they experience no difficulty in conducting similar works for themselves. The operatives of Ayr are decidedly their inferiors in intelligence, enterprise, and ambition; and I attribute this inferiority to the want of local manufacturing establishments. In Kilmarnock, the poorest operative, and the most opulent manufacturer, are linked together by an uninterrupted chain. A constant intercourse is kept up amongst the several classes of society; and whilst the increased intelligence and cultivation that obtain amongst the operatives are, no doubt, met by a lower state of refinement, and less fastidiousness in the manners and tastes of their superiors, than in more aristocratic communities, even this is not without its advantages; because, when a mechanic raises himself by successful enterprise to an equality with his hitherto more opulent townsmen, he finds that there is no great barrier, from difference of education and habits, to prevent an unrestrained intercourse with the social circle of which he has now become a member. At the same time, common feelings and interests still connect him with his quondam fellow-operatives, amongst whom are to be found his nearest relatives; and whilst they receive from him their daily wages, their histories, circumstances, characters, habits, and wants, are familiarly known to him. Hence, when distress assails a labouring family, they are not merely regarded as objects of compassion, from being fellow-creatures in affliction, but they receive the full flow of sympathy due to brothers and friends, who are only separated from their more fortunate neighbours by events of recent occurrence, and capable of being easily traced." In Ayr this pleasing condition of things does not exist, though it is acknowledged that the affluent classes in that town are remarkably bountiful to the poor.

THE GOSSIP.—A TALE.

Mrs Thompson was a widow lady "without incumbrance." At the death of her husband, who had been a functionary in a public office, she was left with nothing save a small annuity, resulting from her husband's carefulness. On this pittance she contrived to exist, renting a small house in the outskirts of the town, and keeping up an acquaintance with those families who had known her in better circumstances during the life of her husband.

Her house-rent and clothes absorbed the greater portion of her small income, and, for the rest, she leant considerably on her friends, the greater number of whom received her at their table or fireside, more from sympathy and benevolence than from personal regard. She nevertheless endeavoured to make herself agreeable and acceptable, by recounting whatever occurred to her in her peregrinations from house to house; and the day of Mrs Thompson's visit to those who favoured her with a *general invitation*, was looked upon as a day to be set apart for a general and perhaps amusing gossip.

It was never supposed by those who entertained Mrs Thompson, that, in the indulgence of her gossipping propensities, she had any desire or intention to injure those whose conduct was the subject of her animadversion; but going about as she did, day after day, she found it necessary to have *something* to say, and if that something was of a nature calculated to excite surprise, so much the better; her visit was then more likely to go off with *eclat*, and she had a greater certainty of being well received on a future occasion.

The opening of our story finds Mrs Thompson at the house of Mrs Darsie, one of those whose house and table were at all times open to the "widow and such as are oppressed," and from whom Mrs Thompson had received many benefits. After a day well spent in that kind of conversation for which Mrs Thompson had a peculiar gift, she felt nearly exhausted, and feared she would be under the necessity of taking leave, when a new chord was happily struck, by her addressing herself to Mrs Darsie, and asking, as if by the bye, whether she had seen Miss Halling who had come to town for the purpose of getting "her things" for her approaching wedding.

"Oh yes," replied Mrs Darsie; "I called to see her yesterday, at her aunt's."

"And what do *you* think of her?" again inquired Mrs Thompson; "I hear various accounts of her—some say she is very pretty, while others again call her rather plain in appearance."

"I think," answered Mrs Darsie, "that hers is a countenance depending greatly upon expression for its beauty. It will depend very much upon the humour she may be in at the moment whether she be thought pretty or otherwise. To me she appeared to possess great sweetness of disposition, and a gentleness of manner which is extremely pleasing; but I

remember her mother too well not to have made comparisons between her and her daughter, which I confess were not altogether flattering to the latter."

"Oh, by the bye, Mrs Halling was a friend of yours, I think, before you were married," said Mrs Thompson.

"Yes, she and I were most affectionate companions at school, and our intimacy continued until she was married; but she went to reside, you know, in a remote part of the country, and we gradually ceased to hear much of each other, and latterly we have been entirely estranged; but when I heard of the daughter of my old friend coming to town on an occasion so interesting, I was most happy to call and offer my congratulations."

"And was Mrs Halling really so good-looking as a girl?" pursued Mrs Thompson.

"She was, in my opinion, the finest looking woman I ever saw—I mean the handsomest in person, and the most distinguished in features and general appearance: there was a grandeur in her look, if I may so express it, that I have never seen equalled."

"Then the daughter does not resemble the mother?" said Mrs Thompson.

"Oh no," replied her hostess, warming as she continued to speak of the chosen friend of her youth: "There was a dignity of manner, a *character*, about her mother, which Miss Halling decidedly wants."

"My dear, take care what you say," jocularly interposed Mr Darsie, who was sitting quietly by the window reading the paper, and whose ear caught the last sentence uttered by his wife. "It is not safe to speak of ladies wanting characters."

"Oh, you know in what sense I mean the word to apply to Miss Halling," answered Mrs Darsie. "I repeat, there was a *something* about Mrs Halling, a distinction, which I can call by no other name than *character*, and I am sure her daughter has no claim to the title; but she is an amiable, gentle girl, and I am sure I wish her all manner of happiness in her new position, both for her own sake and for that of her good mother."

The subject of Miss Halling, after a few other remarks, soon died away, and Mrs Thompson found herself at last obliged to take leave of her kind friend Mrs Darsie.

Time, which is, or which should be, considered the wealth of the poor, was of no further consequence to Mrs Thompson, excepting that it required some degree of tact and management as to its disposal in a social point of view, so that she might not go too often to the same house; so she determined to spend the next day with Mrs Hewitt, a widow lady, with whom she had been long on terms of intimacy, and who had a family of grown-up sons, fine young men, who were all doing well in the world.

When the young gentlemen came home to dinner, George, the eldest, who was head clerk in an insurance office in town, laughingly addressing his mother, said, "Mother, I deserve an extra allowance of the good things to-day, for I have been doing double duty at the office, and I am sadly worn out; Mr Hamilton, our manager, has been absent, and I have been 'interim manager,' besides clerk."

"Oh," cried William Hewitt, one of the younger lads, "I saw him two or three times to-day with Miss Halling; I suppose they had been shopping. What a nice mild-looking girl she is, and what a luck she has had in getting such a match as Mr Hamilton."

"Ay, he's a fine fellow," said George; "and, from all I hear of his choice, she seems deserving of such a husband."

Mrs Thompson's face all at once became as it were condensed, and every feature seemed to perk out with the importance of what she had to communicate, but she was evidently at a loss how to bring it forth. An opportunity soon occurred, by one of the young men asking her whether she knew Miss Halling.

"No, indeed!" she exclaimed; "I have never seen her, but I have heard a good deal about her; only yesterday, I heard a lady remark that she was somehow or other not altogether *a person of character*."

"A person of character!" repeated all the lads at once; "surely, Mrs Thompson, you are mistaken as to the lady of whom we are speaking; you must mean some other Miss Halling, surely."

"I don't think I *can* be mistaken as to the person," persisted Mrs Thompson, "seeing that the lady who spoke of her to me had been at one time the most intimate friend of Miss Halling's mother; perhaps I am wrong in saying anything about it; but of this I am certain, that Miss Halling—*the* Miss Halling you mean—was spoken of as being decidedly a person of doubtful *character*."

This appeared conclusive testimony to the young men, whose wonder was excited in no small degree by the statement of Mrs Thompson; and it is needless to state, that before many hours had elapsed, at least a dozen of their young acquaintances had been made aware that Mr Hamilton was about to marry a young lady of *doubtful character*.

Some mornings afterwards, Mr Hamilton was sitting in his lodgings at breakfast, when the postman's knock was heard at the door, and a letter was handed in. He broke the seal, and commenced reading; but before he had got half way through the first page, his handsome face glowed with indignation, and then became deadly pale: he glanced at the foot of the second page, but the epistle was nameless, save that it purported to have come from "*a friend*;" the contents, however, appeared to be perused in anything but a friendly humour, for, in a paroxysm of irrepressible passion, he tore it across; then, as if all at once recollecting himself, he looked over it once more, and sitting down at his desk, exerted his ingenuity in patching the paper together again; and, folding it up carefully, he placed it in his pocket-book, seized his hat, and walked out.

Miss Halling sat at the window of her aunt's drawing-room, every now and then looking at her watch, and wondering what had become of her lover, who had promised to be with her very early in the forenoon, that they might walk out together for the purpose of selecting some important articles of furniture for their new home. It was now one o'clock, and still he had not arrived, and she determined to punish him for his apparent neglect, by exhibiting a little anger, when she all at once heard the welcome sound of his voice in the lobby below, and the petulance she had tried to assume was entirely forgotten.

With the solicitude which ever accompanies true affection, Miss Halling, on looking upon the face of her lover, at once detected that something had occurred to discompose him; and with the most earnest anxiety she besought him to tell her what had happened to him since they parted the evening before, when he was all cheerfulness and animation.

"I see, Eliza," he replied, "I am a bad hypocrite. I would fain have concealed from you the cause of my present annoyance, but it has pressed so heavily upon me, that I find I cannot all at once shake it off. Here is a letter," he continued, taking the anonymous epistle from his pocket, "which I received this morning; but, before you read it, I beg to satisfy you thus far, that I do not believe one word of its contents, and would have treated it with the scorn which all such communications deserve. My indignation alone, not my suspicion, has been roused, and could I only get hold of the villain who thus dares to slander *you*, I fancy I should make him repent of having subscribed himself '*my friend*.'"

The contents of this precious letter it is unnecessary to repeat; its tenor will at once be understood as bearing upon the character of Miss Halling, who sat with it in her hands, as if she did not fully comprehend what had been but now said with reference to its contents.

While her eye wandered from line to line, the expression of her sweet face underwent a thousand changes, and her beautiful swan-like throat became suddenly distended with the violence of an internal emotion, which she apparently could neither utter nor suppress; all at once it broke forth in a fit of wild hysterical sobbing, every heave of which seemed of itself sufficient to rend asunder a frame which was by nature extremely fragile.

Her unhappy lover, whose distress was more than ever apparent, though now it proceeded from a very different cause, stood with the agitated girl in his arms, endeavouring, by every soothing and endearing term, to arrest the extraordinary violence of her grief, but her mind seemed incapable of receiving any consolation; in this state she was conveyed to bed, where she lay for several hours under the influence of this excited state of feeling. Feverishness came on during the night, and next morning the envied, pretty, gentle Miss Halling, was labouring under an attack of brain fever of the most virulent kind, the victim of *false witness*.

How sudden and painful are the reverses to which even the purest and best of God's creatures are every moment liable in this world, where all is mutable! Here was an amiable, innocent woman, reduced, in a few hours, from a state of happiness as perfect as one could desire, to a condition of abject, helpless imbecility, involving not only her own safety, but the peace and comfort of all those who regarded her with affection and respect. And from what cause reduced? By no fault of hers either in word or deed. She had done nothing to bring about her own destruction; nor could it be said that she was the victim of any malignant or vindictive passion in others. She fell a prey to a chain of circumstances having their origin in ignorance, and that love of telling something wonderful, which forms so conspicuous a feature of common discourse, especially among those who have little occupation of a proper kind for their minds.

The illness of Miss Halling assumed so alarming an aspect, that it was deemed necessary to summon her parents from the country, and to them Mr Hamilton reluctantly confided the story of his griefs.

The vigorous mind of Mrs Halling immediately suggested the propriety of adopting means to discover, if possible, the writer of the letter which had produced effects so baneful to the health and peace of her beloved daughter. Mr Hamilton had already tried every method he could think of to find out the origin of all his sufferings; but his mind had been in a measure paralysed ever since he had witnessed the distressing scene with Miss Halling, above related.

Backed, however, and roused from this state of torpidity by the energetic suggestions of Eliza's mother, he set about his task with a resolute spirit, and after the most painful investigations, which it is unnecessary to follow, he succeeded in tracing the letter to a young man, a friend of William Hewitt, from whom he had had the information, and he, in his turn, referred the unhappy lover to Mrs Thompson. The consternation and dismay of this person, when Mr Hamilton called upon her, was extreme. She had not contemplated the possibility of such serious results following the information she had given at the table of Mrs Hewitt; and it was with shame and confusion she referred Mr Hamilton to Mrs Darsie, who had been, she said, her informant. To Mrs Darsie Mr Hamilton immediately proceeded, wondering, as he went, where this was to end; for the more he sought to find the origin of his misery, the farther did he seem to be from tracing it to its source.

On entering the drawing-room of Mrs Darsie, he found that lady alone; and it was with no small degree of perturbation that he asked her if she had ever made any remarks derogatory to the character of Miss Halling. The truth all at once flashed on the mind of Mrs Darsie, from the associations called up at the mention of the word *character*; and she at once repeated the conversation which had occurred in presence of Mrs Thompson, adding, that she had no doubt whatever that that had been the fabric from which the whole had been raised. She deeply regretted that she had not taken more pains to make her application of the important word character clearly understood by the simple woman with whom she was conversing; but yet it seemed, as even Mr Hamilton acknowleged, most unlikely that her real meaning could have been mistaken. On learning the sad condition to which the young lady had been reduced, nothing could exceed her distress, and she flew to make what reparation she could by the humblest apologies, to the friend of her youth, Mrs Halling. Meanwhile, the fever of poor Eliza approached the crisis which was to favour or blast for ever the hopes of her anxious and affectionate friends, who watched every movement and every respiration of the unconscious sufferer with an eagerness and anxiety which testified how deeply they were interested in the result. Though she was at length declared out of danger, it was soon apparent that the shock had been too great for one so gently formed by nature. Instead of bending to the blow, her mental energies had been prostrated at once and for ever; she recovered only her bodily health; in mind, she had become a helpless, hopeless, though harmless *imbecile!*

Who shall presume to describe the affliction caused by this event through a wide circle of sorrowing friends! Her father and mother wept in silent anguish over the wreck of the cherished idol of their home and affections; while the grief of the bereaved lover spent itself in alternate bursts of sorrow for his loss and indignation against those by whom it had been caused; and bitterly did he reproach himself for his want of caution, in having allowed his gentle mistress to gain a knowledge of the contents of the letter which had proved so destructive to her happiness and peace of mind.

Mr and Mrs Halling returned with their helpless charge to the home which had, until then, been cheered and gladdened by her presence; but what a change had been produced on *her*, the object of their fondest solicitude, during the short interval of her absence! She had left them an amiable intelligent woman, animated by the prospects of happiness which were opening up to her. She returned *externally* the same; but the intelligence was gone; instead of a source of perpetual pleasure, she had become a living sorrow, though one in which all who knew her were deeply interested.

Mr Hamilton never married; and it was his custom once every year to visit his gentle mistress, who always appeared gratified by his presence, though she otherwise manifested no consciousness of the relation which they had once borne towards each other; nor was it ever apparent that she had any recollection of the reverses which had befallen her.

Mrs Thompson, who, from no evil purpose comparable to the event, but merely through a culpable love of gossip, had wrought all this woe, met with what was to her a severe punishment; for the tragedy of Eliza Halling closed many doors against her, and she was thenceforth obliged to spend most of her days at home, where, we will hope, a proper spirit of repentance mingled with the vexation arising from the loss of her friends.

DR TURNBULL'S TREATMENT OF THE EYE.

A few weeks ago, an extract from the Literary Gazette gave our readers a brief notice of some interesting experiments of Dr Turnbull for the cure of blindness, the agent employed being the vapour of hydrocyanic or prussic acid applied to the defective organ of vision. Since that time, Dr T., it appears from the following communication to the Lancet, has been engaged in investigating the action of bisulphuret of carbon, not only for the cure of blindness, but as a remedy for deafness. It will be understood, that we present no opinion on the reality or value of the alleged discoveries, but simply do a duty to the public in laying before them the letter of Dr Turnbull in the form in which it has appeared in the Lancet and other medical works.

Sir—In October 1841, I gave an account of the action of the vapour of hydrocyanic acid upon diseases of the eye. Since that period, I have been engaged in investigating the action of various other bodies on the same organ, and under the same form.

One reason why I did not rest satisfied with the great effects produced by the hydrocyanic acid was, that its action, like that of all other medicines, decreased in power by continued application, thereby rendering it necessary to have occasional recourse to

other medicines, in order to insure a more speedy recovery. Another reason was, the reluctance of many individuals to submit the eye to the action of so potent a medicine.

The first medicines to which I shall refer, and which I have employed with some success, are the chlorocyanic acid and sulphuretted chyazic acid. The plan I pursue is that of putting a drachm of one of the medicines into a bottle (containing a small piece of sponge) of about two-ounce size, having a mouth precisely fitted to the eye, and with a ground-glass stopper.

The action of these medicines is very different from that of the hydrocyanic acid, in as far as they both stimulate the eye, and produce much greater warmth and irritation, with less dilatation of the pupil. Few, however, can bear the chlorocyanic acid to be applied longer to the eye than half a minute, though, in a minute after its application, all irritation is removed, and the eye feels perfectly at ease.

The next medicine which I have employed in the form of vapour was the chloruret of iodine. This medicine produces very little warmth or uneasiness to the eye, if continued for the space of two minutes or upwards; but a sensation of irritation, accompanied with a flow of tears, takes place on its removal. It contracts the pupil, and in no case have I seen it dilate it. Its vapour rises very readily, and does not leave the yellow disagreeable colouring on the skin produced by the vapour of iodine, when uncombined, which is a great drawback in the use of iodine in diseases of the eye.

The last medicine which I have employed is the bisulphuret of carbon, which is so volatile, that the application of it to the eye, when the bottle is held in a warm hand for a few seconds, is as much as can be borne, in consequence of the intense pricking heat and flow of tears which it occasions. Owing to this fact, I generally use it by causing the patient to shut the eyelid during its application, which can then be continued for a minute or two with the same beneficial effect upon the eye, and without inconvenience to the patient. It generally contracts the pupil, and very seldom dilates it.

I used to employ iodine by putting it into the same bottles, and immersing it in hot water, and in its state of vapour applying it to the eye; but I now find it answers much better when dissolved in the bisulphuret of carbon.

It is my intention, shortly, to give a full account of the action of these medicines upon the various forms of disease to which the eye is subject, and also what particular disease each medicine is best calculated to remove. At the same time I shall state such instances of failure as have occurred in my experience, in order that a just estimate may be formed of the value and importance of each medicine.

It may not be out of place here to state, that I have employed, with great success, the bisulphuret of carbon to enlarged indurated lymphatic glands. In the first instance, I rubbed equal quantities of the bisulphuret of carbon and alcohol upon the parts affected, but without any effect upon the glands. But as its effects were so great when its vapour was confined to the eye, I was led to apply it in the form of vapour, and by means of glass bottles similar to those I have described. By these means, I excluded the action of the medicine from the external air, and thereby prevented its speedy evaporation. When it had been applied about one minute, the patient felt the part very cold, but immediately after a gradual heat, accompanied with great prickling—the heat increasing the longer the medicine was kept in contact with the part, until it could no longer be endured. On removing the glass, the part was red to an extent two or three times greater than the part enclosed. In a few days the change in the size of the glands was very great; and by its daily repetition, a complete and speedy removal of the disease was effected. I also find that its action upon diseased glands is more decided if the surface of the skin is well moistened with water previous to the application of the bottle to the part.

The water, in fact, not only prevents the escape of the vapour between the glass and the skin, but assists the imbibition of the carbon; a point of the highest importance, inasmuch as all its action on the part depends upon the exclusion of the atmosphere from the vapour. I may here observe, that these applications occasion no injury whatever to the skin.

I have also found the bisulphuret of carbon and the chlorocyanic acid valuable medicines in the removal of deafness, depending upon a want of nervous energy and deficiency of wax. The mode of its application is substantially the same as that which I employ in diseases of the eye, with this difference only, that the bottle is formed with a small neck and stopper adapted to the size of the orifice of the ear, and held close to the organ until a considerable degree of warmth is produced.

The action of these medicines, which contain so large a share of carbon, arises from the carbon in the vapour permeating the cuticle, and coming in contact with the oxygen in the vessels, which is conveyed through every part of the frame by inspiration and otherwise, and thereby forming carbonic acid gas, which evolves heat in the ratio of the quantity consumed by the oxygen.

The following quotations from Professor Liebig, in his work on "Organic Chemistry," sufficiently prove the correctness of this position:—"It is only in those parts of the body to which arterial blood, and, with it, the oxygen absorbed in respiration, is conveyed, that heat is produced. Hair, wool, or feathers, do not possess an elevated temperature. This high temperature of the animal body, or, as it may be called, disengagement of heat, is uniformly, and under all circumstances, the result of the combination of a combustible substance with oxygen. In whatever way carbon may combine with oxygen, the act of combination cannot take place without the disengagement of heat. We can no longer doubt that gases of every kind, whether soluble or insoluble in water, possess the property of permeating animal tissues, as water permeates unsized paper."

Does not the action of medicines containing so large a proportion of carbon, which can be brought into contact with the whole external surface of the body, and thereby capable of being easily disengaged, suggest a method of relieving pulmonary disease likely to be attended with no ordinary success, by calling into greater activity the action of the skin, and thereby materially lightening the labour of the lungs? Are we not the more encouraged to expect such remedial influence in diseases of the lungs, from the fact of its great power in removing indurated glands, which are so common accompaniments of consumption? There can be no doubt of the usefulness of bisulphuret of carbon in skin diseases.

I have submitted these observations under the conviction that they embody principles which may be carried out, and made of great utility to mankind.—I am, Sir, your obedient servant—A. Turnbull, M.D.

Oct. 20th, 1842, 48, Russell Square.

A HIGHLAND CHIEF OF THE SEVENTEENTH CENTURY.

The Abbotsford Club, an association of gentlemen who print for their own private use old manuscripts illustrative of our national history, have within the last few weeks completed the impression of one of an unique nature—a memoir, to wit, of Sir Ewen Cameron of Locheil, a distinguished Highland chief of the seventeenth century. We call it unique, because no Highland chief of past time ever had the honour of so extensive a biography. The work was composed, it is believed, about the year 1740, by John Drummond of Balhadie, who may be supposed to have had all possible advantages in compiling it, both as far as family papers and family traditions were concerned, since he was either a grandson or a great-grandson of Cameron. As a minute and faithful piece of personal history, it is a highly curious production, and it throws considerable light upon some unusually obscure portions of our national annals. Nor can we doubt that the hero is worthy of such an epic; for, though some may be inclined to smile at the idea of any importance being attached to the leader of a Highland clan of two hundred years ago, the fact is, that Sir Ewen Cameron was a man of very admirable character. In majesty of personal appearance, he is said to have coped with his contemporary Louis XIV. Some of his exploits in the resistance to Cromwell call up the recollection of Wallace, Tell, and Kosciusko. And throughout a life of ninety years, though he might often have been called rebel, no one could ever attribute to him what would pass before a jury of candid men as a dishonourable action. Indeed he was a remarkable instance of the concentration of the finest qualities that belong to the peculiar rank and state of society in which his lot was cast.

The Camerons occupy a considerable territory in the district of Lochaber, in Inverness-shire, and were, in the time of Charles I., a clan capable of sending from seven hundred to a thousand armed men into the field. Ewen Cameron, born in 1629 to the unquestioned rule of this tribe, was brought up under the care of the Marquis of Argyle, the chief of the anti-royalist party in Scotland throughout the civil war. He received little school learning, but much instruction from the conversation of men, and became a proficient in all manly and warlike exercises. Never was master less successful in impressing his mind upon a pupil than was Argyle with young Locheil. All the effect of the example and tutelage of years was effaced by one conversation which the youth obtained clandestinely with the royalist Sir Robert Spottiswood, the day before his execution. Sir Robert gave him such a view of the politics of the period, that he became, from that hour, a steady royalist, notwithstanding all the opposite arguments of his tutor. Little did the venerable Spottiswood think what a weapon he was leaving for the revenge of his death upon the party who ordered it. Not long after this event, Cameron, succeeding by the death of his grandfather to the chiefship, went home to his people, who met him at the distance of a day's journey on the way, and expressed the greatest joy in finding him of so prepossessing an appearance, and animated by the loyal principles of his ancestors. A gentleman of his clan had served Montrose throughout the whole of his brilliant campaign, and, from his conversation, Locheil contracted the most eager desire to distinguish himself in the royal service. Meanwhile, there were affairs of his own to be put to rights. We hear of his leading an army of some hundreds of Camerons against a neighbour, Macdonald of Keppoch, to compel the payment of an annuity due on a mortgage, and another against the Chief of Glengarry, to enforce some arrears of feu-duty, or ground rent, long refused to weaker claims. These gentlemen soon became aware that Locheil, though only about eighteen years of age, was not a person to be trifled with. Keppoch "thought it wiser to do him justice than allow matters to be pushed to an extremity;" and the other dispute "ended in a treaty, which Glengarry observed so well, that Locheil was never thereafter put to further trouble on that account."

When, after the battle of Worcester, Cromwell's deputy, General Monk, reduced the Lowland parts of Scotland, the Highlands remained obstinately opposed to his power, and maintained a partisan warfare of the most sanguinary kind against his troops. Our young chief now found excellent opportunities of showing his valour. He joined the Earl of Glencairn, who acted as commander, with seven hundred Camerons, and soon became remarkable for taking the lead in every dangerous enterprise. Towards the end of 1652, when Glencairn lay at Tullich, in Braemar, the Camerons held a post at a little distance, between the royalists and the republican troops. The latter advanced to give a surprise, but were warmly received by Locheil, who defended the pass against them, until Glencairn had drawn off to a place of safety. In the hurry of retreat, the earl forgot to give any orders for the retirement of Locheil's people, who accordingly, with blind devotion to duty, stood opposed for hours to the whole advancing force, and, but for the advantage of ground, must have been cut to pieces. As it was, the carrying of that pass cost the English very dearly. On this occasion, we find that one half of the Camerons were armed with bows, with which they sorely galled the English cavalry. In the campaigns of 1653 and 1654, Locheil took an equally conspicuous part, and it was found necessary, among other expedients for reducing the Highlands, to establish a garrison at Inverlochy, mainly for the purpose of overawing the Clan Cameron.

The chief beheld with rage a great colony of Sassenach soldiers planted near his domains, and prowled round it for some days, but was unable to make an attack. He had dismissed all his men to their homes, excepting about thirty-five, most of whom were dunny-wassels, or gentlemen, when two vessels containing large detachments of the garrison were observed sailing into Loch Eil, their design being to gather wood and provisions on the hostile lands. One of the vessels discharged its company on the side where Cameron was stationed, and he determined on attacking them, though they were four or five times his number. Some of his friends, men who had been accustomed to the intrepid doings of Montrose, objected to the rashness of the scheme, but were persuaded to join in it nevertheless, only demanding that Locheil and his brother Allan should remain apart, as the hopes of the clan depended entirely on them. Locheil agreed as to his brother, but not as to himself, and the young man was accordingly bound to a tree, to make sure that he would not engage; yet he, after all, prevailed on a boy to cut his bonds, and went off to join the fight, where he arrived just in time to save his brother's life, by shooting an English soldier who was taking aim at him.

The English soldiers met the assault not unpreparedly, and with the greatest firmness, but in their arms and mode of fighting, they were no fair match for the Highlanders, who, having first poured in upon them a destructive fire of musketry, and then taking to their broadswords, put them at once upon the defensive. To save themselves from the blows of the broadsword, they held their muskets across their foreheads; the Camerons then struck below. Some took to their swords, but these the Highlanders warded off with their targets. Some thrust with the bayonet; but, the point once received in the Highland target, both musket and bayonet were useless. Their ranks were soon thinned, but still they fought with resolution, and when they did retire, it was with regularity.

Locheil then committed a great mistake, by sending an ambuscade party to the rear to give them the notion that their retreat was cut off, the consequence of which was, that they turned and fought with more vigour than ever. They now clubbed their guns and fought like madmen, but all was in vain; in the end, they had to fall back to the lake, leaving the greater number of the party dead and wounded on the field.

It was now that an incident occurred which Sir Walter Scott has introduced into his "Tales of a Grandfather," and which we shall here give in the words of Mr Drummond. "It was his (Locheil's) chance to follow a few that fled into the wood, where he killed two or three with his own hand, none having pursued that way but himself. The officer who commanded the party had likewise fled thither, but concealing himself in a bush, Locheil had not noticed him. This gentleman, observing that he was alone, started suddenly out of his lurking-place, and attacked him in his return, threatening, as he rushed furiously upon him, to revenge the slaughter of his countrymen by his death. Locheil, who had also his sword in his hand, received him with equal resolution. The combat was long and doubtful; both fought for their lives; and as they were both animated by the same fury and courage, so they seemed to manage their swords with the same dexterity. The English gentleman had by far the advantage in strength; but Locheil exceeding him in nimbleness and agility, in the end tripped the sword out of his hand. But he was not allowed to make use of this advantage; for his antagonist flying upon him with incredible quickness, they closed and wrestled till both fell to the ground in other's arms. In this posture they struggled, and tumbled up and down, till they fixed in the channel of a brook, betwixt two strait banks, which then, by the drouth of summer, chanced to be dry. Here Locheil was in a most dismal and desperate situation; for, being undermost, he was not only crushed under the weight of his antagonist (who was an exceeding big man), but likewise sore hurt, and bruised by many sharp stones that were below him. Their strength was so far spent, that neither of them could stir a limb; but the English gentleman, by the advantage of being uppermost, at last recovered the use of his right hand. With it he seized a dagger that hung at his belt, and made several attempts to stab his adversary, who all the while held him fast; but the narrowness of the place where they were confined, and the posture they were in, rendering the execution very difficult, and almost impracticable, while he was so straitly embraced, he made a most violent effort to disengage himself, and in that action raising his head, and stretching his neck, Locheil, who by this had his hands at liberty, with his left suddenly seized him by the right, and with the other by the collar, and jumping at his extended throat (which he used to say God put in his mouth), he bit it quite through." In this extraordinary way he put an end to his adversary.

Disengaged from this adventure, Locheil found his men chin deep in the lake, pursuing the remnant of the English party to their ship. He immediately ordered his men to give quarter to the enemy, who delivered themselves up to the number of thirty-five men; but one of the number, either not having understood this arrangement, or unwilling to submit to it, proved the destruction of the whole, for, having fired at the chief, and nearly killed him, the Camerons were so incensed at the act, as to fall upon the rest without mercy, so that only two of the whole party escaped. It is related that, while the conflict was drawing to a close, a soldier having taken a very deliberate aim at Locheil, his foster-brother, with the self-devotion common to the character in that age and country, threw himself before, and received the shot in his breast. Locheil carried the generous youth on his own back three miles to a burial ground, and interred him with all the honour it was in his power to bestow. At the close of this fight, it was found that only five of the Camerons had fallen; but almost every one of the rest was bruised or wounded. The bodies of the slain bore, as usual, strong testimony to the power of the Highland sword.

A royalist party was maintained in the Highlands till March 1655: it had no more zealous member than Locheil, who distinguished himself in so many skirmishes with the troops of the commonwealth in different parts of the country, and inflicted so many severe chastisements on the garrison at Inverlochy, that his name at length became noted. Even after General Middleton gave up the appearance of a resistance on behalf of the royal family, this single chieftain still held out, and that powerful government which caused France, Spain, and Holland, to bow to it, was treated with open contempt, and held at defiance, by a power residing on the banks of Loch Arkaig. But this could not long continue. A commission of three colonels of the army at this time visited Argyleshire on some public business. While they lay in security in a village near Inverary, Locheil, attended by the Laird of Macnaughtan, and a few of his men, burst through the hut in which they slept, and took them all prisoners without resistance. They expected nothing but destruction from one whom fame represented as a bloody savage; and their surprise was great when, conducted peacefully to Locheil's country, and there hospitably entertained, they found him as courteous and gentle as a paladin of romance; and so modest, that he could only with the greatest difficulty be induced to speak of those actions which had made him celebrated. These gentlemen contracted such a friendship for him, that they determined to exert themselves to bring him to a pacification with the government. After many debates with him on the danger and folly of his present situation, they prevailed on him to submit, and became his ambassadors to General Monk, who then exercised at Dalkeith the powers of a representative of the Protector. The matter was accommodated to the perfect satisfaction of Locheil, upon his giving his simple word to live thenceforth at peace. On an appointed day, the chief and his people, dressed in their best clothes, and with colours flying and bagpipes playing, marched to the green before the castle of Inverlochy, where the governor had his troops drawn up to receive them; and the treaty was then read and published with all the formalities due to a pacification between two great states, and "with many loud huzzas and no small appearance of joy on both sides." Thereafter the governor entertained Locheil and his men with the greatest hospitality, and they parted the best friends in the world.

Early in 1657, Locheil wedded a daughter of Sir James Macdonald of Sleat, under circumstances of unusual festivity, the wedding being attended by gentlemen from great distances, and among the rest by "a cousin of the bridegroom's, the young Laird of Glenurchy, who was already conspicuous for that profound judgment, penetration, and capacity, that afterwards acquired him so high a character, and advanced him to the peerage, in the reign of King Charles II., under the title of the Earl of Breadalbane." The clan presented their chief with a sum equal to the wedding expenses, and a Highland bard spouted an extempore epithalamium, which was not perhaps the less flattering, that he desired the chief's influence in regaining three cows that had been stolen from him. (The poet, we learn, got from Locheil and his company three cows instead, and three hundred merks to boot. "It was unlucky for him that he did not mention more of these gentlemen in his verses, for those he omitted were not so liberal as the rest.")

Locheil spent the remainder of the interregnum in peace, and it is a curious proof of the designs of Monk in his march southward, that he was accompanied by this incorruptible Highland loyalist. Locheil witnessed the entry of Charles II. into London, and by the favour of Monk, might, if his modesty had allowed, have held the king's stirrup as he alighted at his palace, for which another and less deserving person was well rewarded. It is sad to relate, that to him, as to many other sufferers in the royal cause, the Restoration brought no advantages. On the contrary, the faithful Locheil was harassed with law proceedings respecting many transactions of the time of trouble; and where Monk would have protected him by a single line of writing, the present government allowed him to be impoverished on account of acts done in its own behalf. His greatest annoyance arose from a claim of the Laird of Mackintosh for a part of his estate, which Locheil offered in vain to compound for by a sum of money. The reader will be surprised to learn, that so lately as the reign of Charles II., when Milton was writing his "Paradise Lost," and Barrow and Tillotson were preaching, a litigant party in the same island was furnished with *letters of fire and sword* against the defender; that is to say, a power of killing and spoiling all he found on the estate of his adversary. In the autumn of 1665, these two chiefs had actually drawn up their forces to fight out the dispute, when the Earl of Breadalbane interposed, and brought about a settlement of the plea, exactly *three hundred and sixty years after it had been commenced*.

Other troubles followed these; but it is not our intention to enter into them, further than to relate a remarkably characteristic circumstance which occurred when Locheil was settling some dispute of long standing with the Earl of Argyle at Inverary, in 1675. Locheil had, it seems, for some days neglected to get himself shaved, which the earl observing, offered him the services of his French valet. While Locheil was undergoing the operation, the earl observed two of his men standing up at the door with a peculiar look of jealous watchfulness, of which, when the business was done, his lordship asked an explanation. The chief, who had not observed the men, inquired what they had meant by their conduct, and learnt that, knowing he had had a dispute with the earl, they feared treachery, and had resolved, if their suspicion proved true, first to kill his lordship and then the valet. "But," said the earl, "what do you imagine would have become of yourselves, if you had done such a thing?" "That we did not think upon," said they, "but we were resolved to revenge the murder of our chief." The earl praised their zeal for their chief's safety, gave each of them money, and so dismissed them, telling Locheil that he believed there was no prince in the world that had such loving and faithful subjects.

A few years afterwards, an outrage committed by two of his clan, caused Locheil to be summoned to appear before the privy council in Edinburgh. While there, he was received with distinction by the Duke of York at his court, then held in Holyrood House. The duke put many questions to him concerning the adventures of his youth, and in the end requested his sword, with the intention of knighting him. The sword being a ceremonial one, the duke was unable to draw it; so he gave it back to the chief, saying, that "it never used to be so uneasy to draw when the crown wanted its service." Locheil, naturally bashful, could make no proper return to this compliment, but drawing the sword, returned it to the duke, who, calling on the courtiers to remark that Locheil's sword gave obedience to no hand but his own, conferred upon him the designed honour.

Though this weapon could not be more pure of stain than was the mind of Locheil of the least thought of disloyalty, he did not always escape suspicion. When in arms with his clan at Inverary for the suppression of Argyle's rebellion, he was subject to the malice of the commander, the Marquis of Athole; and a misadventure by night, in which his men fell upon a party of friends, taking them for enemies, furnished a handle for injuring him in the eyes of the government. Locheil only saved himself on that occasion by a direct appeal to the king (formerly Duke of York), in which it is odd to find him favoured by Barclay the Quaker, who was his brother-in-law, and a favourite of James. He was, however, continually exposed to legal troubles on account of claims of superiority over his estate: on one occasion, law had gone so far against him, that, a writ having been prepared for his arrest in Edinburgh, he would unquestionably have been taken prisoner, if he had not, by a bright thought of his own, retired for an evening into the Tolbooth, or public jail, on pretext of visiting a friend—a clansman, who was clerk to the establishment, favouring his plan. Here we may see a prefigurement in actual fact, of a memorable scene in modern fiction, to which it is only necessary to allude. By the personal favour of the king, Locheil had only obtained a settlement of all his troubles, when he was again thrown upon the losing side by the Revolution.

As a matter of course, the old royalist joined Lord Dundee with his clan, and took a hearty share in the endeavour to keep up the ex-king's interest in Scotland. Dundee, who saw in him a kindred spirit, and knew his great experience, trusted much to his advice, and it was by his recommendation that the resolution was formed to engage the troops of King William at Killiecranky. Though now sixty, he was as eager for conflict as ever, yet perfectly cool at all times; insomuch that, while leading on his men, feeling his shoes pinch, he sat down, took them off, and made them easier, and then rejoined his friends in time to fall on along with them. It is evident that, next to Dundee himself, the Highland army could not have had a better commander than Sir Ewen; and we are disposed to wonder that he was not raised to that honour after the death of Dundee, till we recollect that he wanted the self-esteem which forms an almost indispensable requisite for transforming a man into a leader. He escaped all the perils of this campaign, and was amongst the last to give even the most qualified submission to King William. Locheil was now, by three wives, the father of sons and daughters. The anecdote has often been told, of his seeing one of the former in a night bivouac upon snow, making up a snow-ball for a pillow, when Locheil, who was to rest in the same manner, kicked away the snow-ball, telling the youth that he must endeavour to make himself independent of such luxuries. On account of his age, he now gave over the command of the clan to his eldest son John, to whom, in 1696, he likewise transferred his estate, with the reservation of a life-rent only. He continued to keep up a correspondence with the exiled family, and in 1706 a warrant was issued to apprehend him on a charge of high treason, but not carried into execution. Years rolled on, without extinguishing the spirit of the aged chief; but when his son led out the clan in 1715 to fight for the son of his old master, Sir Ewen was nearly bed-rid with the infirmities of age. According to an account obtained by Pennant, in his tour of Scotland, the hoary chief was at last cradled like a child; but the whole extent of the fact seems to be, that, failing in his lower extremities, he had pulleys above his bed, by which he could turn himself from one side to another. In 1716, when he was eighty-seven years old, he had still sufficient strength in his grasp to make the blood spring from another man's hand. He died of a fever, in February 1719, aged ninety, without having ever had the chance, in all his long life, full as it was of perilous adventures, to lose one drop of his own blood, excepting on one occasion, when, by accident, he stepped upon a broken knife.

The life and fortunes of an individual are recognised objects of human sympathy; why may not the life and fortunes of a family, which are but an extension of the subject, be so likewise? No one, at least, can well live in Scotland without feeling that a family history may possess much of the interest due to an individual. The grandson of Sir Ewen, the amiable Donald Cameron, "Young Locheil," led out the clan in 1745, and sighed out his life three years after on a foreign strand. Then came forfeiture and dispossession for forty years; but at length a mild and generous government restored the estates to a grandson of the latter, of the same name, whose widow, a daughter of Sir Ralph Abercromby, still survives. The son of the last gentleman is now chief of the Clan Cameron, or Locheil. Colonel Cameron of the 42d regiment, who fell at Waterloo, was a grand nephew of the Locheil of 1745; in consideration of his gallantry, the honour of knighthood was conferred on his father

who only died a few years ago, Sir Ewen Cameron of Fassefern.

We cannot conclude this notice without a cordial tribute of thanks to the gentleman who has brought forward the memoir, and edited it with so much taste and ability.

THE PERIODICALS.

THE FOREIGN QUARTERLY REVIEW FOR OCTOBER.

This periodical continues to sustain a merited reputation for the soundness and novelty of its criticisms on foreign productions, which, but for its notices, would doubtless remain unknown to the bulk of English readers; another trait of character which distinguishes it is a delicacy and propriety of taste, opposed to whatever is gross and reprehensible in manners; and on this account alone, forming a fit mentor on the subject of continental literature.

These happy combinations of character in the Foreign Quarterly, have been afforded no small scope in the number now before us, in which, among other topics of interest, we find that of the American newspaper press fairly brought under notice, and exposed to that scorn which its generally infamous nature so well warrants. The article on this subject may be reckoned the best in the number, and has attracted some attention. Mr Dickens, it will be recollected, alludes to it in his late "Notes on America," and we recommend it, in its entire form, to the perusal of our readers. A few passages may be thrown together, for the benefit of those who will never have an opportunity of seeing the review.

AMERICAN NEWSPAPER PRESS.

The writer admits, at the outset, that there is a base newspaper press nearer home; that London has its infamous prints, but that the circulation of these papers is miserably low, and is, at all events, confined to the meanest quarters, and the most dissolute class of readers; such prints, therefore, must in no shape be confounded with the general newspaper press of the United Kingdom, which, in the hands of men of character and education, wages no war with the decencies of private life, and "not unworthily represents a great and generous people." We have much pleasure in adding our humble testimony to the truth of the reviewer's remarks on this point. The provincial newspaper press of England and Scotland, with all its faults, is a thing of which the nation at large has reason to feel proud—it shows that public sentiment is healthy at the core.

"On the other hand," observes the reviewer, "what is it that first occurs to us when we turn to the newspaper press of America? If we wish to judge of popular taste by the paper in largest circulation, as in London we should ask for the *Times*, in New York we must ask for the *Herald*. This is a paper published daily, in size more than a single sheet of the *Times*, and about a penny in price. Within the last month, it has boasted of a sale of nearly thirty thousand copies, and strange as it is to detect it in anything approaching to a truth, there cannot in this be much exaggeration. It may be presumed, then, on a fair average to each copy, to have for its readers some hundred thousand citizens of the United States. 'It circulates among all parties, all classes, all sects, all sexes.' Its conductor is thus self-described and named in a very recent publication: 'Owner, editor, proprietor, prophet, head man, head saint, head savan, or head devil, just as you please, J. G. B——.' Of the reported private conduct or character of this accommodating person, it is not our intention to speak. It does not interest us, nor would our readers care to know how many times he has been called dog, spat upon, or beaten. Our business is with the broadsheet of lies, the journal in largest circulation through the Union: with the popular print, in whose columns some fifty or a hundred thousand free Americans enjoy the daily freedom of taking part in the loathsome slander of the most respected of their fellow-citizens: with the organ of public opinion, which stabs at all that is eminent in station, in sex defenceless, or claiming reverence in age: with, in a word, the convicted libeller of all that is manly and decent in that country, from the judge on the bench, to the citizen in his private home.

To describe in any minute detail a publication of this nature, the reader will readily suppose to be something more than difficult; and to succeed in so describing it, would be certainly less than pleasant. It appears (by means, of course, of its evil gains) to have organised throughout the country a very extraordinary and complete system of correspondence, so that, in every chief city of the Union, it has a resident representative. And these are labourers worthy of their hire, being all such reckless libellers of everything decent, and such impudent dealers in everything vile, that the 'head devil' himself must be often hard put to it to keep his scandalous supremacy. The cue universally is—'Spare no one. Thrust yourselves into whatever home you can get, and everywhere leave your slime. In no direction fail to abuse. *Let fly* at all; the more eminent your game, the more atrocious the falsehood we want; but fly low as well as high, for the praiseworthy thirst of every free citizen to know his neighbour's affairs, extends to the affairs of every other free citizen, without frivolous social distinction. Never think a scandal can be too malignant. It is to furnish bitterness for a hundred thousand tongues, and what would be anything scant or small towards satisfaction of so many?'"

The prosecution of the person who conducts this mass of infamy is of no use; for laws are a dead letter where public feeling is against them; on conviction for libel, a fine is imposed, which he pays, and then marches off free of damage in public estimation. Having on one occasion libelled two of the judges of New York, he was prosecuted, and stood convicted:

"He had outraged justice in her sanctuary. It was not possible to imagine a stronger case; the presiding judge had denounced it from the bench in language worthy of his office; every father, mother, and husband in America, had an honest interest in the check that might now at last be given to this dishonest miscreant's career; he was to appear next day to receive his punishment; and who could doubt that the law would abate no jot of its power to punish? *Who could doubt it?* There was not a man in New York that did not KNOW the libeller would escape. With a hundred thousand readers at his back, he had only to snap his fingers at all the law and justice of America." The manner in which he escaped is related by a contemporary print, and throws a curious light over the machinery of popular election in America. "The court consisted of the standing judge, Kent, and two of the city aldermen, Lee and Purdy. A majority rules in the decision. Judge Kent, a man of eminent personal and juridical integrity, thought the crime a heinous one, and that the libeller deserved the severe punishment of imprisonment. But Alderman Lee and Purdy, *loco-foco* demagogues, through fear of the lash of Bennett's piratical, unsparing paper, and to appease the ire of the vampire, decided that the punishment should be a small fine, and the unprincipled libeller was fined about three hundred dollars, for which he drew his check, and walked out of the court-house, bidding defiance to courts of justice. It has since been stated by the *New York Commercial Advertiser*, that it was a concerted plan to get B——acquitted. The whole jury pannel was exhausted to select a jury who would not convict; District-Attorney Whiting manifested marked indifference in the case; and Alderman Lee was got on to the bench by trickery. In the regular order of things, Alderman Benson would have sat in the case, and he would have coincided with Judge Kent." And why, adds the reviewer, "were Aldermen Lee and Purdy afraid of the lash of 'B——'s infamous paper?" Because Aldermen Lee and Purdy were about to become candidates for that popular suffrage wherewith the sober exercise of the solemn duties of the bench is not held incompatible. And why did District-Attorney Whiting manifest marked indifference? Because District-Attorney Whiting was not without sanguine hope of sitting some early day in Congress as representative for the city of New York."

We close with the following emphatic observations. "One of the wisest of the movers of the [American] Revolution always dwelt on the instability of the laws, as what he feared would prove the 'greatest blemish in the character and genius of the American governments.' But he hoped that the influence of manners would gradually correct it. Could he have lived till now, we may imagine his despair. Laws—manners—the great improvers of civilisation in every other land that has pretence to either: supporting each other, correcting and moderating each other, and lifting the people that they serve, gently but surely, in the rank of nations—what is their condition in America? We say that neither can co-exist with a newspaper literature such as we have described; so accessible, so supported, and so utterly unchecked by one single encouraging tendency to the literary talent of the country to exert itself in a different direction. We have not described it unfairly. There are men of character, and of great ability, we know, connected with some of the American journals: we gladly recognise, without reference to party or to circulation, the claims of such prints as the *Washington Intelligencer*, the *Boston Daily Advertiser*, the *New York Evening Post*, the *New York American;* but we also know that in every case respectability has to fight against the want of popularity, and that the most estimable and accomplished of these men, like Judge Noah when in that position, have to sacrifice much that in private life they would most dearly esteem. Party—party—party—that is still the cry which drowns every voice less loud, and to which every consideration less involved with daily existence *must* give way. Such a man as Mr Bryant would scorn to invent a calumny, but he is driven by his party to give circulation to it; and to the universal law of universal distrust he is obliged, high-spirited and independent as he is, to make himself a slave. Governor Clinton made no distinction of the peculiar kinds of party, when, some years since, he told the New York legislature, that, at their last election, party spirit had invaded the tranquillity of private life, had violated the sanctity of female character, had visited with severe inflictions the peace of families, had spared neither elevation nor humility, nor the charities of life, nor distinguished public services, nor the fireside, nor the altar. For, in truth, all this we take to be but the maxim of *suspect every body* in its worst and most licentious form, which, in its more decent, all papers are driven to adopt. Its highest living embodiment is in the infamous *New York Herald*, which, worthily followed, as we have seen, by others only less infamous than itself, now traverses the length and breadth of America—read by every one, quoted by every one, patronised by the President, in favour with his government, patted gently by the judges—rampant, reckless, triumphant, without one restraint to its unbridled villany."

PRUSSIAN REGULARITY.

From a country in which the law can scarcely be said to bear up against the despotism of public opinion, we turn to one in which law is everything and public opinion nothing. We here allude to Prussia, whose exact police regulations form a subject of satire to that lively French writer, Alexander Dumas, although they might much more reasonably have suggested improvements worthy of imitation. The *jeu-d'esprit* occurs in a notice of Dumas's work—"Excursions on the Banks of the Rhine."

"Having entered Prussia," he observes, in his usual dramatic style, "we arrived in the coach-yard just as the horses were put to. There were lucky places in the interior, which I took, and was putting my ticket into my pocket, when my friend M. Poulain told me, in the first place, to read it.

For the convenience of travellers, it is written in German and French. I found that I had the fourth place in the coach, and that I was forbidden to change places with my neighbour, even with the consent of the latter. This discipline, altogether military, acquainted me, even more than did the jargon of the postilion, that we were about to enter the possessions of his Majesty Frederick William. I embraced M. Poulain, and at the appointed hour we set off.

As I had a corner place, the tyranny of his majesty, the king of Prussia, did not appear altogether insupportable; and I must confess that I fell as profoundly asleep as if we had been travelling in the freest country in the world. At about three o'clock, however, that is to say, just at daybreak, I was awakened by the stoppage of the carriage. I thought at first some accident must have happened; that we were either on a bank or in the mud; and put my head out of the window. I was mistaken regarding the accident, nothing of the kind had happened. We were standing alone upon the finest road possible. I took my billet out of my pocket. I read it once more carefully through; and having ascertained that I was not forbidden to address my neighbour, I asked him how long we had been stationary.

'About twenty minutes,' he said.

'And may I, without indiscretion,' I rejoined, 'take the liberty to ask why we are stopping?'

'We are waiting.'

'Oh, we are waiting; and what are we waiting for?'

'We are waiting for the time.'

'What time?'

'The time when we have the right to arrive.'

'There is, then, a fixed hour for arriving?'

'Everything is fixed in Prussia.'

'And if we arrived before the hour?'

'The conductor would be punished.'

'And if after?'

'He would be punished in like manner.'

'Upon my word, the arrangement is satisfactory.'

'Everything is satisfactory in Prussia.'

I bowed in token of assent, for I would not for the world have contradicted a gentleman whose political convictions seemed to be so firm. My approbation seemed to give him great pleasure; and emboldened by that, and by his polite and succinct manner of answering my former questions, I was encouraged to put some new ones.

'I beg pardon, sir,' continued I; 'but will you favour me by stating at what hour the conductor ought to arrive at Aix-la-Chapelle.'

'At thirty-five minutes past five.'

'But suppose his watch goes slow?'

'Watches never go slow in Prussia.'

'Have the goodness to explain that circumstance to me, if you please.'

'It is very simple.'

'Let us see?'

'The conductor has before him, in his place, a clock locked up in a case, and that is regulated by the clock at the diligence office. He knows at what hour he ought to arrive at this or that town, and presses or delays his postilions accordingly, so that he may arrive at Aix-la-Chapelle exactly at thirty-five minutes past five.'

'I am sorry to be so exceedingly troublesome, sir; but your politeness is such, that I must venture on one question more.'

'Well, sir?'

'Well, sir, with all these precautions, how happens it that we are forced to wait now?'

'It is most probably because the conductor did as you did, fell asleep; and the postilion profited of this, and went quicker.'

'Oh, that's it, is it? Well, then, I think I will take advantage of his delay, and get out of the coach.'

'People never get out of the coach in Prussia.'

'That's hard, certainly. I wanted to look at yonder castle on your side of the road.'

'That is the castle of Emmaburg.'

'What was the castle of Emmaburg?'

'The place where the nocturnal adventure took place between Eginhard and Emma.'

'Indeed! will you have the kindness to change places with me, and let me look at the castle from your side?'

'I would with pleasure, but we are not allowed to change places in Prussia.'

'Peste! I had forgotten that,' said I.

'*Ces tiaples de Franzés il être trés pavards,*' [What babblers these French are] said, without unclosing his eyes, a fat German who sat gravely in a corner opposite to me, and who had not opened his lips since we left Liege.

'What was that you said, sir?' said I, turning briskly round towards him, and not over well satisfied with his observation.

'*Che né tis rien ché tors.*' [Nothing—it was a mistake.]

'You do very well to sleep, sir. But I recommend you not to dream out loud: do you understand me? Or if you do dream, dream in your native language.'"

NEAPOLITAN SKETCHES.

Passing over several clever articles, we arrive at a review of an amusing work on Naples and the Neapolitans, by a German, Dr Karl August Mayer, in which we are presented with some lively pictures of popular manners in the capital of southern Italy. There priests and preaching friars come in for a share of notice corresponding to their great numbers and influence. The reviewer quotes a laughable anecdote of one of these gentlemen.

"Among the mendicant friars, or street preachers, of Naples, are to be found men who exercise an astonishing influence over the lazzeroni. Of one of them, Rocco, a Dominican, a posthumous fame is preserved for witty sayings and happy allusions, which, if collected, would fill volumes. He was reckless whom he attacked, and often said things which, upon any one less popular, would have

drawn down the vengeance of the public authorities; but Rocco was a man of whom even the police stood in awe. One day he was preaching to a crowd in the public market-place. 'This day,' he said, 'I will see whether you truly repent you of your sins.' Thereupon he commenced a penitential discourse, that 'made the hair of the hard-hearted multitude stand upright;' and when they were all on their knees, gnashing their teeth, and beating their breasts, and putting on all imaginable outward signs of contrition, he suddenly cried, 'Now you who truly repent you of your sins, hold up your hands.' There was not one present who did not immediately stretch out both arms. 'Holy Archangel, Michael,' then exclaimed Rocco, 'thou who, with thy adamantine sword, standest by the judgment-seat of God, hew me off every hand that has been raised hypocritically.' Instantly every hand dropped, and Rocco poured forth a fresh torrent of invective against the sinfulness and perversity of his audience."

In Naples, there is a universal stagnation of mind; the schools are few in number; the number of holidays is, alone, a sad interruption to study; as for booksellers, Naples contains one hundred and fifty, "a goodly number for a town in which neither authors nor readers can be said to abound; but of these one hundred and fifty, the greater part are mere venders of invalided volumes, or speculators who buy learning by the pound, and dispose of it at a moderate advance to certain consumers who apply books to purposes more useful than intellectual. Printers, stationers, and bookbinders, are likewise included in the list; and a shop with a tolerable assortment of books does not exist in the whole city. Publishers there are none. Authors, ambitious to see themselves in print, and willing to be at the expense, must be their own publishers, and sell their publications the best way they can. More copies are generally given away than sold; and a stranger, desirous of buying a new work, may often inquire for it in vain at every bookseller's in Naples, unless the author has taken the precaution of leaving a few copies here and there on sale or return. The truth is, that a rigid censorship, entirely in clerical hands, and a heavy duty on all foreign books, are serious impediments in the way of literature. Every octavo volume pays an importation duty of three carlini (rather more than a shilling sterling), every quarto volume pays six carlini, and every folio ten. Thus, while the absence of all protection to literary property prevents booksellers from publishing the works of native authors, the priestly censorship lays its veto on the importation of every work of questionable orthodoxy, either theological or political; and the few flimsy productions of the day that are allowed to creep in, are subjected to a duty much too high to allow a bookseller to import them as a matter of speculation."

CANADA.

We have been favoured with the following letter from Mr R. R——, a gentleman who, some years ago, emigrated to Canada, and is now visiting his native country. We formerly gave an account of his farming operations in the backwoods, and now are glad to afford a place for his observations on a subject of growing interest to emigrants with a small capital; namely, the preparation of bread-stuffs and other kinds of food for the home market. In a note accompanying the letter, Mr R. speaks of Canadian affairs as follows:—

"Canada is really but very imperfectly known; the expectations of persons of all classes emigrating there are either unreasonable as to benefit, or as to the duties, and service, and labour necessary to be performed, so that the otherwise contented man is soured by finding but half, perhaps, of the advantages he expected, while he has double the amount of energy to put forth and labour to perform. Still, the country, to particular individuals, is a good one, and would be satisfactory to many more who reach it, if they only possessed sufficient knowledge of what they were to expect. This, however, as it applies chiefly to the least educated, is difficult to accomplish, while interested parties make a business of puffing. But the principal point I wish to make your readers aware of (*especially for the benefit of small farmers*, with two hundred pounds and upwards, who hitherto have failed to perceive a market on which they could surely reckon), *is the effect to be expected from the tariff*, not only as to prices now, but what the acknowledgment of the principle of *integrality* will lead to hereafter. Our North American colonies, once recognised as integral parts of the empire, and put on a footing of real and not step-children, with as free access to the markets of the mother country *as are their obligations to consume her manufactures*, will become bound by the best of all ties, namely, self-interest, and the enjoyment of advantages which neither their annexation to the United States nor their own independence for many years could give them. Their want of this, more than local misgovernment, has caused the recent discontents and rebellion, at least in Upper Canada; for if people, for *want of markets*, were not thriving, all the oratory that could be exerted on the privileges and benefit of British connexion must fail of conviction. The converse of this, I believe, would be equally true, that if, under the autocrat of Russia, a people found themselves more prosperous than their neighbours, all the commendation of free institutions would fail of effect."

D——, *5th November*, 1842.

Sir—The privileges conceded to the Canadas by the late tariff, together with the loan of L.1,500,000 for the improvement of internal communications, appear to me so fraught with advantage to those possessions, that I am induced to solicit the attention of your readers to the subject, especially those who may have thoughts of emigrating to that province.

When I state, that, previous to the passing of the tariff, the only market for the surplus produce of Canada, with the exception of wheat, was to be found in the demand created by the immigration for the year, it will easily be seen how utterly inadequate the inducement was for capitalists to engage in farming, and how impossible to make any calculation at all encouraging to the adventurer. The consequence naturally was, that every settler limited his operations to the clearing and cultivating of just such an amount of land as sufficed for the wants of his family; and if some, more enterprising than wise, exceeded that amount (*being without the means of labour in the members of their own family*), the result almost invariably was found to be one of debts and difficulties. No country can be reckoned to be in a healthy state when the staple article of its production cannot pay the capitalist, *by hired labour*, to raise it. It is not enough that some one year should pay, but that a clear foundation should be seen to exist for a certain profit to the agriculturist upon an average of years. Such could not be the case while the markets were contingent on immigration; and yet such, to the present day, has been the situation of Upper Canada at least, and more or less of the rest of our British-American colonies.

The duties now chargeable on provisions, namely, salt or corned beef and pork, are two shillings per cwt.; on bacon and hams, three shillings and sixpence; on butter, five shillings; cheese, two shillings and sixpence; and lard, sixpence per cwt. The cost of producing and the price required by the grower in Canada to remunerate him, is about threepence per lb. for beef and pork, fourpence per lb. for bacon and hams, sixpence for butter, and the same for lard. By adding one penny per lb. to the cost-price of each of these articles, for curing and barreling, freight, insurance, and duty, &c., you will have the sum required to be obtained in the English market, before it pay the Canadian grower to export them. Now, nothing can be more plain than the above statement; nothing more certain than that, until prices in this country fall below what I have asserted will pay the Canadian, he has a sure and remunerating market. If prices in the colony rise above those in the British market, so much the better for him; it is enough for all purposes of encouragement and calculation, that he can command the latter, and that, until the Canadas become more densely peopled, the prices here are sure to be remunerating.

Any farmer will see from these facts, and what I shall presently mention about the wheat crop, that he can make something approximating to a correct calculation, even before he leaves this country, of the probable profits of pursuing his vocation in Canada. He has only to obtain the price of labour and of a cleared farm, either in fee-simple or to rent; in fact, to enter into the same minutiæ of calculation as he does in Scotland before he rents a farm, to enable him to strike the balance. What I mean to insist on, and to make the prominent object of this communication is, that the great desideratum in all business transactions, namely, a market, which has been hitherto wanting in Canada, but which has now been obtained, has placed the soil of Canada in a position to pay capital employing labour, which before, as a general rule, it did not enjoy.

It will, however, be necessary, to the acquirement of the highest prices by the Canadian farmer, that persons well skilled in the art of curing beef and pork, as well as in making butter and cheese, should go out to him—from Ireland for the former, and from Scotland and England for the latter; as what may have sufficed to preserve those things for his own use, is more than likely insufficient to suit the English market. Better, however, for him will be the erection of large curing establishments, to which his fresh meat may be delivered, or his beasts sold.*

Having now shown that the tariff gives the agriculturist in our North American colonies a sure market for his green crops, it remains only to mention, that, by the late resolution of the provincial legislature, imposing a duty on the entry of American wheat into Canada, Canadian wheat, under the assurance of Lord Stanley, will be admitted free into the British ports. This grain can be raised by the colonists for about thirty-six shillings a quarter, and landed in the markets here, in bulk, for about twenty shillings more, making the price necessary to pay fifty-six shillings; but if ground and barreled, and sent here as flour, the advantage to the colonial exporter is considerably greater. Oats and barley are generally at a fair demand in the country itself.

While on the subject of Canada, I may mention that, after an experience of ten years, I consider, that in no country in the world is a poor man, having a good character, and being industrious, so sure to become independent; and it is in this conviction, that I feel every well-wisher to Canada can not only afford to tell the truth, but to see cause for regret that so many, equally interested in its prosperity, should think it necessary to force emigration by exaggerated statements calculated to do harm.

The application of the loan of L.1,500,000, mentioned in the first part of this letter, will, for the next three or four years at least, give employment to immigrants as they arrive; at all events, to such as fail to obtain, or are immediately unfit for, agricultural employment.

P. S.—Though I have used the term Canada throughout, I mean these remarks, for the most part, to apply to what was Upper Canada.—R. R."

* I have given the minimum prices in Canada for which the articles mentioned can be raised in a state fit for the English market. I have also assumed the amount necessary to pay the Canadian for landing them, to be the minimum price in the British market for the best of each kind.

"IT IS VULGAR."

The following is extracted from Lockhart's "Life of Sir Walter Scott:"—"Lest I should forget to mention it, I put down here a rebuke which, later in life, Sir Walter gave in my hearing to his daughter Anne. She happened to say of something, I forget what, that she could not abide it—it was vulgar. 'My love,' said her father, 'you speak like a very young lady; do you know, after all, the meaning of this word vulgar? 'Tis only common. Nothing that is common, except wickedness, can deserve to be spoken of in a tone of contempt; and when you have lived to years, you will be disposed to agree with me in thanking God that nothing really worth having or caring about in this world is uncommon.'"

RAILWAY ACCIDENTS.

The comparative safety of railway travelling is forcibly shown in the late report of the officers of the railway department, Board of Trade. It is stated that the number of accidents on the railways of the United Kingdom, arising from causes beyond the control of passengers, which occurred in the year 1841, was 29, by which 24 persons were killed, and 72 injured.

The number of accidents which occurred in the same period to individuals, owing to their own negligence or misconduct, was 36, by which 17 persons were killed, and 20 injured. The description given of the several cases in this class, affords proof of the extraordinary recklessness of the individuals who have suffered. "Jumped off after his hat," occurs no less than three times; "jumped off," twelve times; "run over, crossing before a train," occurs six times. There are also several cases of persons killed whilst lying asleep on the rails, and of others killed or injured by falling from trucks on which they had been riding without leave.

The number of accidents which occurred in the same period to servants of the company, under circumstances not involving danger to the public, was sixty, by which twenty-eight persons were killed, and thirty-six injured.

The safety of railway travelling is shown by the small number of persons killed and injured by accidents arising from causes beyond the control of passengers. It would be easy to prove that the mortality and injuries occasioned during the past year by such coach accidents only as are recorded in the newspapers, were greater. Then it must be borne in mind how few persons now travel by coaches; whilst the number who travelled by railway, during the first *half* of 1841, amounted to no less than 8,901,916! It must not, however, be assumed, that the railway companies are not culpable with respect to the accidents, few though they be, which have occurred. There ought to be no accidents, and on a well-regulated railway there would be none.

THE ROBIN.

Thou comest, blythe one, when the summer sky
Hath deepen'd into autumn's richer blue,
When gorgeous sunset clouds come floating by,
Burning with golden, or with crimson hue;
And eve's first planet sparkling in the west,
Beckons the weary day to early rest.

Thou comest, sweet one, when the beech-woods wear
Their richest tinted robe—before decay
Hath touch'd a loveliness, more rich and rare
Than all the young luxuriance of May;
A deeper glow of beauty on them lies;
Their hues seem borrow'd all of sunset skies.

Thou comest with thy song, when gushing rills
Have hush'd the silver murmuring, which made
Music at summer noontide 'mid the hills,
And fill'd with melody the woodland shade.
Summer is gone!—can the bright waters leap
Half so rejoicingly adown the steep?

Thou comest, too, when memories fill the heart
Of brightness banish'd long;
When flowers grow pale, and silently depart,
Their requiem is thy song.
The blackbird's note, the nightingale's soft lay,
And lark's exulting chant, have pass'd away.

Where hast thou been through the bright summer days,
When on the air a thousand songs went by?
Oh! hast thou hush'd or treasured up thy lays,
Quenching thy bosom's hidden melody,
To pour it forth with sweeter, richer power,
Gladdening the silence of an autumn hour?

Yes! thus it is—thou comest, and wilt stay
E'en though the dreary winter tarry long,
Mourning, perchance, for summer's glorious day,
Yet ever blending in thy simple song
An under tone of hope, some note which tells
That spring will come again with opening buds and bells.

Oct. 11th, 1842.

NEW WORK OF MESSRS CHAMBERS.

The "Information for the People," which was to consist of 100 numbers, being now completed, Messrs Chambers respectfully announce that they have commenced the publication of the following new work:—

CHAMBERS'S CYCLOPÆDIA OF ENGLISH LITERATURE.

In the "Information for the People," the Editors aimed at presenting a body of scientific and general knowledge suitable to the wants of the middle and labouring classes. While that work may serve to instruct, there is need for another which may tend to refine. In the Literature addressed at the present time to the People, there appears, generally, a lack of something to awaken the higher powers of thought—reflection, imagination, and taste—and to nourish at the same time the finer of the moral feelings. These objects Messrs Chambers believe will be in some measure accomplished by the work now announced; in which will be concentrated the most exquisite productions of English intellect, from Anglo-Saxon to the present times, in the various departments headed by Chaucer, Shakspeare, Milton—by More, Bacon, Locke—by Hooker, Taylor, Barrow—by Addison, Johnson, Goldsmith—by Hume, Robertson, Gibbon—*set* in a biographical and critical history of the Literature itself. For the self-educating everywhere, such a work will be as a whole English Library fused down into one cheap book. For the more fortunate youth who are undergoing a regular education, it will be that and something besides—an Introduction to the Pantheon of English Writers, serving, but in a more systematic way and less exclusive taste, the purpose so long served by Dr Knox's "Elegant Extracts."

The "Cyclopædia of English Literature" is under the care of Mr Robert Chambers, assisted by several gentlemen of suitable qualifications, amongst whom may be mentioned Mr Robert Carruthers of Inverness. It will be embellished with Wood Engravings of the heads of the principal authors, and objects connected with their history.

The work will appear in weekly numbers, consisting of a single sheet in royal 8vo., double columns, uniform with the "Information for the People," and costing *three halfpence*; and in monthly parts at *sevenpence*. It will consist of not more than 100 numbers, forming two massive and handsome volumes.

London: Published, with permission of the proprietors, by W. S. Orr, Paternoster Row.

Printed by Bradbury and Evans, Whitefriars.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S INFORMATION FOR THE PEOPLE," "CHAMBERS'S EDUCATIONAL COURSE," &c.

NUMBER 568. SATURDAY, DECEMBER 17, 1842. PRICE 1½d

TWO OF A TRADE.

THE proverb recognises that two of a trade never agree; but there is an equally general assurance, that opposition or competition in trade is useful to the public. So, although this benefit is only to be obtained by what is sure to make some individuals bad friends, all cry out for, and are eager to support, competition—excepting only in their own particular line of business, where they are always very sensible of its mischievous effects. Hence it is, that while the utility of competition is universally acknowledged as an abstract truth, every mercantile person is seen aiming, in his own practice, at some peculiar source of gain in which he may have no rivals. All are, indeed, monopolists in their hearts, from the great patentee of some splendid mechanical invention, down to him who rejoices only in the dealing out of beer in some favoured resort of a thirsty public; or the Hibernian gentleman who stands upon some ancient crossing, which, with his broom, he defends against all deadly.

Of the general force of the maxim as to competition, there can, we believe, be little doubt. The fact is, all things tend to become sleepy and indifferent, when not stirred up by the long pole of rivalry. We have known a respectable stage-coach go on for ages between two adjacent seats of population, thinking it was doing a very fair duty by the public if it went thrice a week at the rate of five miles an hour, under a conductor by no means over-civil to people who wished to be picked up by the way. What was the astonishment of this old, steady, though slow coach, when some lighter and smarter vehicle got up, and vowed that it would convey the lieges thrice a-day at the rate of ten miles an hour, with a coachman of unsuborned civility, and at fares one half of those of the elder coach. Of course, the senior thought its young rival extremely rash and foolish, and openly expressed its general assent to the proposition, that things which run fast never run long. Nevertheless, in the long run, the Old Steady was obliged to open its eyes a little, and put on a third horse at the two hilly stages, and go once a-day, and let down its fares a small thing, just to show that it had every wish to oblige its old friend the public—the coachman, with a superadded guard, being at the same time all smiles to every tramper who wished to be an outside for so much as a couple of miles. So, also, we have known an old respectable provincial newspaper, which thought all was very well if, in its four small pages, printed in an ancient type, by no means particular about expressing the loops of e's or even the middles of o's, it gave a few choice paragraphs from the London prints, with a fair show of accidents and offences, and a good market and shipping list, not forgetting the births, deaths, and marriages for the old ladies; when, behold, up would start a rival intelligencer of twice the size, and well printed, which gave original leading articles two columns in length, and let the public know how much reason it had to be dissatisfied with everything, and gibbeted some public functionary at least once a-week, all for the same money! The old paper was indignant, looked to established character for support, and was sure of the speedy extinction of the upstart. But yet, somehow, it found it advisable, ere six weeks had gone about, to enlarge its size, and engage "a gentleman of talent from the metropolis" as editor, and look a great deal more smartly after reports of the meetings of guardians and commissioners of police than it had hitherto done: in short, it became quite a different thing. And the upshot in the two cases was, that the town had two rapid frequent-going coaches, and two smart bustling newspapers, one for each side of the question, where formerly it had only one of each, and that a dozer. Clearly, the slow coach and stupid newspaper would have gone on as they had done for ever, taking the money of the public for very so-so service, if the rivals had not started up, and this just because everybody naturally wishes to do as little for as much gain as possible. All laud, then, to competition, the soul of business—in every case except one's own.

This is the view of the question most acceptable to the public, and which experience hitherto seems, upon the whole, to have justified. Is it to be for a moment hinted before this free and enlightened nation, that there are, or can be, any circumstances (excepting in one's own case) where competition does harm? Why, the new coach may not pay, or both of them may not pay; but what is that to the public? it is only a loss to the parties engaged in the business. Let them run down each other's prices to zero, and even a breakfast-upon-the-road below it; still the public is well served, and that is all that the public needs to care for. And this line of argument may be taken in every case (always excepting the sacred one, one's own), until it shall appear that all monopolies (with that endeared exception) are thoroughly detestable and improper, and not entitled to receive the least countenance from any one who values the public good. Yet it is a little strange that there are some principles in political economy which do not quite square with this reasoning.

It is held in that science that, when any member of the community, not in independent circumstances, either does not labour at all, or labours at something which does not conduce to any useful purpose, all the food which is required for his support is as so much loss to the community. And of this, certainly, no reasonable man can doubt. It is also held, that the more cheaply, or by the less labour, anything desired by the public can be provided to it, it is the better; that, indeed, when anything which can be produced at a certain rate is, by improper methods or arrangements of any kind, provided at a higher rate, or by a greater expenditure of labour than is necessary, there is a loss to the public to the extent of the difference between the two rates or amounts of labour. And it is easy to see how this should be the case; for, supposing the difference in any instance to be exactly the labour of one man, it is evident that, as this man could be employed in producing something else equally gratifying and needful, his being employed superfluously in the other object is a complete waste of his labour. So, also, it is a law in political economy, that when anything required by the public can be produced by the outlay of a certain amount of capital, it is a waste of capital to employ more upon it, seeing that the excess could be directed to other objects, by which it would supply other needs and gratify other tastes of the public; which is also a truth very obvious to the most simple understanding, although perhaps its applications may not be so readily conceded to. Let us see how these principles, or rather varieties of one principle, bear upon some things which we see every day in the world of business.

There is nothing more common than to see a number of shops of one trade clustering together in perhaps one street of a large town—say shoe shops, or hat shops, or grocery shops, or jewellery shops—all eager so outvie each other in the smartness of a set-out in the windows, in splashiness of sign, and attractiveness of promise in advertisements—and each occupied by a master and several assistants, who are perhaps not above half employed. In country towns, we see, in like manner, half a dozen shopkeepers of one class struggling with each other for the business which might be executed by two or three at most; or rather languidly waiting for their share of that business, and spending two-thirds of their time in an idleness and vacuity absolutely benumbing to their faculties. Generally, in such cases, there is one of the set who, from old standing in the line, from superior capital or energy, gets pretty full employment, and realises tolerable returns; a second usually has a share which keeps his head above water, and hopes to be the first in time; the rest languish in a small way between solvency and insolvency, hardly able to support themselves, or only subsisting upon their little capital, or the funds of their creditors. This is no theoretical picture. We venture to say, there is not any line of retail trade in any seat of population whatever, where more than one half of those engaged in it can be said to thrive, or where one-half the number would not serve the public quite as well, and, after all, realise not more than enough to be a fair remuneration for their time, labour, and capital. In a town known to us, which contains from five to six thousand inhabitants, there were, not long since, fourteen bakers, scarcely any of whom could be considered as prosperous. And no wonder. In consequence of the division of the business amongst so many, all, except one or two who had been long in the trade, had each a very small share, the profits being at the same time reduced to something quite visionary, through the excessive competition. Now, though the public in such circumstances gets the best possible article at the lowest possible price, there remains for consideration, on the other hand, the disadvantage of having perhaps seven or eight out of fourteen tradesmen, who are, to all intents and purposes, burdens upon the community, seeing that their labours are utterly superfluous and unnecessary, while yet they must be in some way supported. Suppose that these supernumeraries were employed in elaborating from the storehouse of nature some other articles really useful to their fellow-creatures, would not the difference of the result be exactly this, that they would be useful, instead of useless and burdensome, members of the commonwealth? In two other towns known to us, situated about ten miles from each other, several bakers keep covered carts, in which they send their bread to families and small dealers in the country around, which is all very right; but will it be believed, that so eager are they for business, that they actually send their carts regularly every day *to the other town respectively*, to lay off a few loaves which, from favour or importunity, they have been allowed to supply—another baker in a village ten miles from both, also sending a cart daily to each for the same purpose! There is something affecting in such an anxiety for business as this—it reminds one of Burns's poor o'erlaboured wight,

> "Who begs a brother of the earth
> To give him leave to toil."

Doubtless, as the people in each town could be supplied by their own bakers, the whole cost of the apparatus required for carrying it is so much lost; and the man, horse, and cart, in each instance, employed in that business, might as well be set to carrying loads of sea-sand from one part of the intervening coast to another. Were the man capable of understanding his position in society, he would reckon himself as much a burden on his fellow-creatures as the idle vagrant whom he passes on the road, and be ashamed for himself and horse accordingly. But this apparatus by no means stands alone in its misapplication and inutility. The capital employed in the stone and lime of all superfluous shops, and in all the furnishings and

implements employed there, is as much lost as that which is sunk in the baker's horse and cart. And such must be the case with all capital and labour whatever, which are in the predicament of being over and above what is needed to supply the public in a satisfactory manner with any of the things which it requires.

There are some undertakings of so vast a nature, that they generally become the subject of a combination of means; that is, a joint-stock company. Canals, railways, the supply of water and of gas, are of this nature. The public, ever jealous of monopoly, usually takes measures, through the medium of parliament, for preventing any of these companies from exercising an arbitrary control over charges and regulations, seeing that competition in such affairs is perhaps unattainable. Yet there is always a great eagerness to raise oppositions to such companies, if there be the least appearance of encouragement to do so. A stranger, visiting a large town some day, with nothing in his head but the usual newspaper topics—the Affghan war, the tariff, and the state of the manufacturing districts—is astonished to find the people of this particular place engrossed to an infinitely greater degree by some dreadful war of their own, as to the propriety of setting up an opposition to some joint-stock company by which they have hitherto been supplied with some necessary of life. He adverts to the subject half in joke, hinting, that perhaps there is no need for the proposed opposition; but the inhabitants receive his remarks with a sullen and teeth-clenched fierceness, for which he was totally unprepared—much like a scene in one of Shakspeare's Roman plays.

First Citizen.—We have been too long oppressed by this tyrannical monopoly.

Second Citizen.—Look what dividends they have been getting for the last ten years.

Third Citizen.—A bad article, deficient supply, and no civility.

Omnes.—Huzza for the new company—opposition is the soul of business!

And of course the new company is started, which brings down the dividends of the old one, and perhaps advances the public conveniency in some degree, but does not insure that the new adventurers are to profit largely by their spirited effort. The fact is, that this is just one of the cases where the exception of evil, which attends the general good of competition, is most apt to befall and be felt severely. The capital of such a concern is mostly spent in what may be comprehensively called apparatus. Where one set of apparatus already existing is sufficient to serve the purpose, to make another set is a complete waste of labour, and consequently of money, just as much so as it would be to have a double set of every article of furniture in one's house, or for a farmer to keep two ploughs to do the work of one. The public says, "But if these people choose to spend their money in that way, it is no business of ours to disapprove of their design, or in any way interfere with it. We cannot be the worse from a particular set of persons laying out a few hundred thousand pounds which they have to spare." Here lies the great mistake. When money is laid out in needless labour—in that which is to produce no comfort or satisfaction to any one—it is a *loss to all*, because it might have been laid out upon something which would have had exactly the opposite results. The holders of the superfluous stock are so much the poorer by the amount of their unrequited capital, and of course have so much less to spend on their clothiers, shoemakers, bakers, butchers, and all who supply them with the necessaries and enjoyments of life. It is thus that the erroneous expenditure comes to tell upon the whole community. Suppose, for the sake of illustration, that a number of persons with some money in their pockets, but no knowledge of political economy in their heads, were to propose getting up a rival to any existing railway, at an expense of half a million sterling, on the ostensible ground, that the first railway charged each passenger sixpence more than was necessary to return five per cent.; and suppose that it was pointed out to the proposers, that there was much need for the employment of their half million in the formation of an improved harbour and pier, where it was likely their money would return a profit not less than that of the existing railway. Assuredly, if they refused to go into the harbour speculation, where there was a need of the public, and a good prospect of remuneration, and went into the railway speculation, where the case was in all respects the reverse, these persons would be acting a very foolish part, and it would only be a just and deserved result, if, while reducing the first railway profits one half, they were to get no more than the other half to themselves. Thus, it is seen that the public interest and that of all individual adventurers are bound up together. The public here remains without the required convenience of its harbour; it only gets a thing which it did not require; or, at the most, it has got rid of a bagatelle overcharge: therefore, being itself unbenefited, or only benefited in a degree quite trifling, it, as a matter of course, withholds reward. And, unquestionably, every misexpenditure of capital by speculators is thus punished—as necessarily so as that every excess in eating or drinking carries with it its own punishment—for laws of providence operate unbendingly in both cases alike. Many will say, "The money spent on the superfluous railway is not altogether lost, for it has given employment to many persons in the construction." But so would the harbour, with the *additional advantage*, that it would have been useful afterwards, and, in its profits, a means of employing more men. It may be said, "A harbour was not needed, and the money might have lain idle." But there is never any need for money lying idle; and practically, in this country, no money does lie idle. It is distributed, by means of banks and otherwise, amongst those who are able and willing to employ it, and is usually as busy as it can be in all sorts of work. We only adduce a harbour for the sake of illustration: if laid out in any other way in which it produced things useful to the community, it would have been making good our argument quite as well.

These observations will be new, and somewhat startling, to a vast number of persons, but only because there is such an universal ignorance of the very first principles of the science which perhaps most nearly concerns the worldly interests of man. Undreaming of any principle being concerned in the matter, the poor shopkeeper complains of a want of business, and a consequent narrowness of means, which, in the circumstances in which he has placed himself, are as necessary of occurrence as the rise of the wind by a local rarefaction of the atmosphere, or the befalling of darkness after the setting of the sun. It is affecting to see such as he suffer through such causes; but one can scarce behold, without a different feeling superadded, the comparatively affluent and so-called educated classes rushing into large ventures, which a science, which they might now study by the outlay of a few halfpence, would teach them to be, from unalterable decrees of providence itself, not entitled to success.

To recapitulate the whole matter—Competition is useful in as far as it stirs up and sharpens men, and keeps down profits at a moderate level; but it may be carried too far, and it is so when more go into a trade than there is fair occasion for, and when capital is spent on objects which do not tend to gratify an actual and otherwise unsupplied need of the public. That these abuses of competition should be avoided, is the interest, not of individuals alone, who suffer primarily and most severely by them, but of the whole community; for it is the concern of all that every brain, every hand, and every pound of money, should be employed to good purpose. A watchful eye may every day see providence assigning its various rewards for the obedience and disobedience paid to these its institutions; the original-minded, inventive, and active man, who addresses himself to new necessities of his kind, being usually rewarded by the best profits, while only poverty befalls those who flock to help the idle; and misexpenditures of capital are visited by shadowy dividends, all the intermediate degrees of merit and error being generally remunerated in proportion. It is not given to all to be inventive, and mistakes unavoidable must be allowed for; but certainly, if mercantile men were acquainted with the principles of the *science* of industry, they would (all other circumstances being equal) be far less likely to mispend both their labour and capital, and far more likely to realise their favourite objects in life, than they are.

SKETCHES IN NATURAL HISTORY.

ANIMALS CHARACTERISTIC OF THE DIFFERENT QUARTERS OF THE GLOBE.

SECOND ARTICLE.

THE most superficial glance at the physical attributes of Asia, is sufficient to show that it is much better fitted for the support of an extensive and varied series of animals than either of the other two continental divisions of the Old World. Extending from the vicinity of the equator to the polar ocean, it is subject to every gradation of temperature. Deeply intersected, especially along its southern coasts, by portions of the ocean, and traversed in almost every direction by mighty rivers; it is amply supplied with moisture: its tropical regions, therefore, possess the two principal conditions for the growth of plants, and exhibit a magnificent exuberance of vegetation, unequalled elsewhere, except in South America; and the amount of animal life is, as usual, proportionate to the means by which it is chiefly sustained. The mighty ridge of the Himmalaya, and its numerous subordinate chains, repeat—in the interior of the continent, and on a smaller scale, from their bases, where an almost tropical heat prevails, upwards to their summits, which are shrouded in eternal snow—the successive climatic changes which take place as we recede from the equator to the northern pole; the great table-lands of the central countries, and the *steppes* of those further to the east, present somewhat peculiar localities; while to the north-west the country becomes assimilated to Europe, and on the south-west to Africa. These and various other transitionary or subordinate features in the physical constitution of this continent, which we cannot now particularise, necessarily imply the existence of a mighty host of living creatures of the most varied description, many of which do not occur elsewhere. This is, in fact, the only great division of the globe which can be said to include an arctic and tropical Fauna—inhabited at the one extremity by the white bear, reindeer, and other denizens of the polar circle; and at the opposite extremity by the elephant, lion, and many other animals even more exclusively destined for a tropical life.

Many of the larger and more remarkable quadrupeds, as has been already hinted, occurring in Africa, are likewise found in Asia. The camel and dromedary are natives of the central countries of this continent, but from having been so long under the influence of man, it is difficult to determine from what precise locality they originated, but in all probability it was from some of the more northern regions, subject at times to a pretty severe temperature. The primitive abodes of the elephant (*Elephas Indicus*) were, doubtless, far from being co-extensive with its present distribution, modified as that has been by human agency; but they must have included most of the tropical parts of the continent, as well as the large islands to the south of it. The Indian rhinoceros is the only species to be noticed as exclusively confined to continental Asia. The latter, also, with several of the adjacent islands, is the sole residence of the graceful but savage and blood-thirsty tiger, which may perhaps be regarded as the animal most characteristic of this division of the globe. Notwithstanding the numbers which are continually falling under the rifles of Anglo-Indian sportsmen, who regard the hunting of this powerful brute as the most adventurous and exciting of all field-sports, and which has the advantage of utility to recommend it, beyond what can be said of most other similar pursuits, the tiger is still so plentiful, as to be no small scourge to many parts of the country, and even to claim some of them as almost exclusively his own. Hindostan may be said to be his cradle, or centre of dominion; and although his range eastwards and westwards is not very extensive, he is found as far north as the banks of the Obi. Many other feline animals occur throughout this vast continent, but the larger, and otherwise more remarkable, kinds are not confined to it, and are not, therefore, so strictly characteristic of its zoology. Not a few peculiar kinds of canine animals occur here. It is, indeed, far from improbable, that it was from that central region of the world, comprehended within the limits of this continent, that the primitive species of the whole of our domesticated races of dogs originated. At all events, there exists there a wild dog called the Buansu (*Canis primævus*), which is regarded in this light by some. The Thibet mastiff is likewise a remarkable dog, of large size, and singularly gloomy aspect, owing to the great dimensions of its pendulous lips, and the eyebrows forming a fold obliquely over and partially concealing the eyes. Red dogs (*Chryseus*), of various species range from the southern side of the Himmalaya ridge to Ceylon, and from China to the Mediterranean. The jackals, of which there are several kinds, the common, Indian, Syrian, &c., are well-known to the Asiatic traveller by their loud and disagreeable howling in the night. Foxes, properly so called, likewise exist in various peculiar species; such as the Nepal fox, the black fox in the northern countries, so prized for its fur, that a perfect skin sells at 400 rubles; the Himmalaya fox (usually called the Hill Fox by Europeans), and the Syrian fox, the supposed *shual* of the Hebrews, the only animal of this kind occurring in Palestine, where it greatly injures the vineyards. Possessing many ruminating animals in common with Africa, this quarter of the globe is still particularly rich in species proper to itself: of these only a few can be here referred to. The musk-deer, yielding the substance so well-known in medicine and perfumery, inhabits the lofty and rugged districts extending between Siberia, China, and Thibet. Extreme cold seems essential to the welfare of this singular animal, as it seldom voluntarily descends even to the region of pines, and the young speedily perish if taken to a mild climate. The spotted axis is a kind of counterpart of the European fallow-deer, occurring in considerable plenty in grass jungles near the banks of rivers; and it is a variety of this animal which sportsmen call the hog-deer, and which they most frequently hunt on horseback, or with greyhounds. The Rusa group of stags is exclusively Asiatic, comprehending several species, most of them of large size; that named hippelaphas, or horse-stag, has a long flowing mane, and the cervus arestoteles, erroneously called the elk by sportsmen, inhabits the warmer parts of India. The Nepaul stag is a stately animal, not unlike our own red-deer, of a yellowish-brown colour, with a large white patch over the rump. The chickara, a wild and agile creature, found in the western provinces of Bengal, Behor, and Orissa, is a small antelope with four horns. The nylghau, or blue ox, a beautiful animal, as large as a stag, is found in the jungles in the northern parts of India, and seems to be pretty frequent on the confines of Persia. The goats and sheep peculiar to Asia are very numerous: of the former, the most valuable is the Cashmere or Thibet goat, and one of the rarest and most interesting the Jemlah goat, which inhabits the central mountains. The Caucasian goat (*Capra ægagrus*) is undoubtedly the source from which all the domesticated varieties are derived. The lofty table-lands and snowy mountains of Middle Asia form the mother country of the true sheep; and Mr Blyth, who has investigated the subject with more attention than any other modern naturalist, is of opinion, that, besides the numerous species already ascertained to exist there, others will yet be discovered more nearly allied to the domestic races than any at present known, and from which the latter chiefly sprung. Of the bovine animals, or those of the ox tribe, proper to Asia, we can merely name the arnee, the yak or grunting ox, and the gayall or jungle ox.

There can be little doubt that High Asia is the aboriginal region of the horse, as it unquestionably is of all the solid-hoofed animals of the true Asinine

form. Of these there appear to be at least four species. It thus appears that, for the great majority of our most useful domestic animals, we are indebted to this division of the globe. The brown bear, which likewise occurs in Europe, inhabits a great part of Asia; but the latter has several species not found elsewhere; in particular the Malayan bear, the Thibet bear, and a singular creature called the jungle or labiated bear, a favourite with Indian jugglers, owing to its uncouth appearance. The monkeys, bats, gnawing animals, &c., peculiar to Asia, are very numerous; but even a simple catalogue of the names of these would lead us beyond our present purpose, which must be limited to the indication of a few of the more prominent zoological features.

The only African reptile we have mentioned is the crocodile; here an analogous species occurs, named the Gavial or Gangetic crocodile, which attains a large size, and is remarkable for the cartilaginous prominences surrounding its nostrils, and the length of its muzzle, armed with numerous, nearly equal, teeth.

Many of the birds of Asia are very conspicuous and interesting; and although, upon the whole, inferior in splendour to those of South America (which is unrivalled in this respect), yet not a few can be mentioned of surpassing magnificence. There is no country so rich in gallinaceous birds; the peacock, confessedly the most beautiful of all the feathered race (*facilè pulcherrima avium*, is Linnæus's expression regarding it), consisting of two distinct species; the whole tribe of pheasants, containing many different kinds, scarcely inferior in beauty to the familiarly-known gold and silver pheasants; one of them, the argus pheasant, among the most remarkable of birds; many different species of cock and hen;* the tragopaus, beautifully spotted with white on a ground colour of the most gorgeous red, and remarkable for having an erectile horn behind each eye; and, to name no others, the Impeyan pheasant, about the size of a small turkey, whose dorsal plumage reflects the most brilliant tints of gold, copper, sapphire, and emerald—are all natives of Asia. Of the parrot tribe, always among the most notable denizens of the torrid zone, the whole race of paroquets belonging to the genus Palæornis, which includes the well-known Alexandrine and Rose-ring species; the scarlet-coloured lories, and not a few others, appertain exclusively to Asia. The mina-bird, which is very common in India, is celebrated for its power of imitating the human voice. The paradise grackle, allied to the European rose-ouzel, is very useful in many Asiatic countries, by destroying the locusts by which they are occasionally devastated. An immense number of woodpeckers, kingfishers, &c., have their exclusive residence in Asia; an adjutant (*Ciconia argala*), the counterpart of the maribou of Africa, stalks about the banks of the great rivers; and the anastomes, storks of similar habits, are its frequent companions. Vultures, eagles, bustards, hornbills, and multitudes of other tribes, are represented in this continent by many peculiar species, which we cannot here enumerate.

The animals of Europe are of smaller size, and less numerous in species, than those of any other great division of the globe. This is partly owing to its inferior dimensions; but chiefly to its being situated entirely within the temperate and frigid zones, and therefore cut off from those influences which produce such a redundancy of life within the tropics. It is the only division of the globe so circumstanced; for that either of the other two northern continents might at all resemble it in this respect, we must suppose them to terminate to the south about the 36th degree of latitude. But even this would leave a wide dissimilarity between them; for land lying in continuity with a tropical region experiences various effects from the latter, which are completely interrupted by the intervention of a sea or other wide extent of water. To compensate for their comparative poverty of native animals, Europeans have borrowed largely from other continents; and a moment's reflection, aided by the information we have already given, will show how few even of our most familiar animals are indigenous to the countries where they now dwell. This view of the matter, however, is merely comparative. Europe is not, of course, destitute of an extensive and proper Fauna, beautifully adapted to the physical circumcumstances under which it is destined to live. Any peculiar feature in that Fauna can scarcely be expected to occur in the most northern regions; for all the three continents that approximate to the north pole, are there exposed to such a similarity of meteorological influences, that little scope is afforded for a diversity of living creatures. The polar bear, whale, walrus, reindeer, &c., are accordingly common to them all; such, likewise, was thought to be the case with the elk; but recent investigations seem to have established the fact, that the moose of America, and probably the elk of Tartary and Central Asia, are distinct from the European elk; the latter, in that case, will rank among the most conspicuous animals peculiar to this division of the globe. The bison, or auroch (*Bos urus*), is the most bulky of European animals, and was formerly pretty generally distributed over this continent, but now has its principal resort in the great marshy forests of Lithuania: it seems to be distinct from the Caucasian bison. Of the other ruminants, almost the only species which this continent can claim, are the fallow-deer, the roebuck, and the ibex. The red-deer, and the chamois of the Alps, although having their principal seat in Europe, pass beyond the Asiatic boundary. A single antelope only ranges within the boundaries of Europe; that is the sarga (*Antilope colus*), indigenous to Poland and Russia. The brown bear (of which the European black bear is only a variety), the wild boar, the wolf, the hedgehog, and many other animals, which occupy a prominent place in European zoology, are almost equally plentiful in the corresponding regions of Asia. Even the wild cat and the lynxes, which are the only representatives of the feline group in this continent, are not peculiar to it. Various kinds of foxes, however, do not seem to range beyond its limits, although, among these canines, it is no easy matter to determine, in many cases, what constitutes a species, and what a variety. The musmon sheep of Corsica and Sardinia has been thought by some to be the parent of some of our domestic breeds. The great majority of the known species of mice and rats, the hamsters, two species of martens, numerous weasels, one species of badger, an otter, three kinds of dormouse, a species of flying squirrel, several marmots, and the blind and common mole, are exclusively European. The last-mentioned animal is common in every part of the continent, with the singular exceptions of Ireland and Greece. Five different kinds of hares and rabbits—one of them (the Irish hare) apparently confined to Ireland, and a species of beaver, thought to be distinct from the American quadruped of that name, may also be mentioned as European; and these may be said to form the most characteristic mammalia of this continent. The entire amount of European quadrupeds does not exceed ninety species.

The total number of birds found in Europe may be estimated at nearly four hundred, but not much exceeding the half of that amount can be considered as exclusively European. A large proportion of these are referable to the Linnæan genera—Jurdus, Muscicapa, Parus, and Sylvia. There are four species of European vultures, including the bearded griffin, or lammergeyer, which is now considered distinct from that of the Himmalaya. The golden eagle, the Grecian eagle (*Falco imperialis* of Temminck), the spotted eagle, the social eagle, and the little eagle, are commonly accounted the European species. The smaller falcons we cannot here enumerate; the Iceland or gyrfalcon, the goshawk, and the kite, are among the most remarkable. Among the most characteristic of the owl tribe, are the snowy owl, the bubow or great horned owl, the barn owl, and the tawny howlet. The kingfishers, a numerous and important tribe in warmer regions are here represented by the common kingfisher, one of the most brilliantly-tinted of European birds. Of the true grouse, the largest is the capercailzie; and the most remarkable, on account of its restricted geographical distribution, is the red grouse, which does not exist anywhere but in the British Islands; it is, moreover, the only bird peculiar to Great Britain. Several species of rock-grouse (*Pterocles*) occur in Southern Europe, and two or three bustards, one of them (an occasional visitor to Briton) the largest of European birds. These examples, however, must suffice for our present purpose.

* It is not a little singular, that our common domestic races, derived from some of the Asiatic galli, should be absolutely without a special English name!

"FRIENDSHIP'S OFFERING FOR 1843."*

We are happy to observe that this, one of the oldest and most respectably conducted of "the annuals," continues to make its appearance at the proper time, while nearly all its imitative competitors, after fluttering their short hour, have faded, sunk, and died away. In the handsome and highly embellished volume for the approaching festive season, now lying before us, we think we recognise considerably more talent than public opinion ascribes to annuals in general, our esteemed young friend and contributor Miss Camilla Toulmin being amongst the most earnest and efficient of the corps of writers. New books can only be noticed here when a specimen of them can be given; and in the case of an annual, composed as it is chiefly of novelettes, or tales, this cannot be easily done. We make an effort, however, to justify the praise bestowed upon the "Friendship's Offering," by presenting one of these little narratives in an abridged form.

THE EMIGRANTS IN ENGLAND.

The tale is of the Reign of Terror during the French Revolution, and refers to the family of M. Dubarre, a gentleman who, like many other equally guiltless victims, was, at three hours' notice, dragged to the scaffold, leaving a wife and infant daughter in the midst of a scene of horror and confusion, and exposed to the pangs of poverty.

"Madame Dubarre had been for one month the mother of an only daughter, and indeed this circumstance had been the sole cause of their recent delay. Little Victorine drew her first breath in the stately mansion of her forefathers, about a dozen miles from Paris, while her anxious father was busily engaged in that city, making stealthy preparations for converting a large portion of his fortune into portable property, and for leaving his native country until more peaceful times. Alas! alas! this necessary delay was fatal. Notwithstanding the horrors which surrounded her, and the chequered future to which she looked, some gleams of joy sparkled in the face of the young mother, as she looked with pride and love upon her beautiful child, trying to trace its father's lineaments in its baby face, and confidently believing that one other week would place them in a safe haven of protection. She sat thus musing, when a hum of distant voices fell upon her ear—nearer it comes—yet nearer. Presently, a youth, whom she recognises as a faithful servant of her husband, is seen running towards the house—he rejects the more circuitous paths, and springs across some palings, and even tramples down the flowers which grow nearer to the house. He sees his mistress at a window which opens to the lawn, and neglecting all form or ceremony, springs through it. From excessive agitation—from the anguish expressed on his countenance, and the tears which still flowed, he was unable for a few minutes to speak; while his mistress implored him to tell what had happened. He looked round as if to ask if they were alone, and perceiving that Madame Dubarre must have dismissed the child's attendant before he arrived, he begged her to give the unconscious smiling infant into his arms, while she prepared to hear most dreadful news. How he broke to her the awful truth, that her husband was at that moment a mutilated corpse, neither he knew nor could she ever remember; and when she recovered from the swoon into which she had fallen on comprehending the dreadful reality, the sound which met her ears was a wild hooting, in which the hum of distant voices had increased. François was bending over her, and his first intreaty was, that she would summon all her strength and courage, and follow him, if not for her own, for her child's sake. The last appeal touched the right chord—she had yet something to live for; and contented at that awful moment with hurried and imperfect explanations, she yielded to the humble advice of François. The infuriated mob were at hand; they were coming to ransack the house, perhaps to burn or tear it down: and giving his mistress but time to secrete a few jewels about her person, and forbidding her even to take a single attendant—for François suspected that there were traitors in the house, and knew not whom to trust—he led her by a by-path from the house, on, on, for miles, to the homely dwelling of his sister. Then, and not till then, did he draw a paper from his vest, a few hurried and incoherent lines, the last agonising words of his unfortunate master. François had rightly judged, that to have delivered that precious letter at first would have unnerved Madame Dubarre, and rendered her still more incapable of instant exertion, than did the rude shock of her affliction. Well might they be hurried and incoherent lines, written even by stealth at the last awful moment, and only by a fortunate accident intrusted to François. Breathing to his wife and child the most passionate love, and proportionate agony at his doom, he yet, in that brief epistle, tried to offer some solace or comfort—a vain mockery, which the next line perhaps proclaimed it. Then did he try to explain a very complicated matter—how he had disposed of his property. And he endeavoured to relate, in a few words, his meeting with a young Englishman, in whose hands he had placed it, and who was then returning home. He told how he had been induced to trust him, at a time when few could distinguish friend from foe, half from his ingenuous countenance, and half because he knew that *he*, too, had a dear wife and only child, who, in free and happy England, were to receive the exiles as dear friends. But, alas! alas! the very words that were most important were totally obliterated by the tears which must have fallen as the letter was closed, and by the wafer which secured it; both causes had combined to render the stranger's name perfectly undistinguishable.

It is not worth while to relate minutely how vain were all Madame Dubarre's endeavours to discover the young Englishman. By degrees hope faded away, and her trusting confidence gave place to the surmise, that her husband must have been the dupe of some sharper; or would not an honest man have sought restitution to the wretched widow? Alas! she did not know that her husband's had been only half confidence, and that he was known to the stranger but by an assumed name.

In those dread days, neither sex nor age was respected; and if the strong animal instinct of self-preservation might not alone have been sufficient to rouse the energies of the bereaved Comtesse de P——, the strong but silent appeal of her helpless infant had power to do so. With the aid of the humble, faithful François, now her truest friend, she escaped to England, and the fugitives reached its hospitable shores almost penniless. In this respect the Comtesse resembled hundreds of her unfortunate compatriots; and it will be remembered, that though pensions were granted to many, subscriptions raised for some, and the houses of the wealthy and munificent thrown open to others, by far the greater number honourably supported themselves by imparting that knowledge or those accomplishments which, under far different circumstances, had been acquired for self-gratification, or the adornment of cultivated society. Madame Dubarre was of this number, and adopting that name in preference to retaining a title which seemed a mockery, she entered a second-rate boarding-school, as teacher of French and music, in consideration of which ser-

* Smith, Elder, and Co. London: 1843 (?).

vices she was to receive a small stipend, a home for herself and the little Victorine, and, as years rolled on, instruction for the latter.

What a change for the guest of princes—the visitor of the Tuileries! From refinements often carried to a degree of enervating luxuriousness, to homely if not coarse fare, and the dull routine of daily drudgery—from the gorgeous palace or mansion, to the boarded school-room; for the lively sally or brilliant repartee, the twaddle of an antiquated spinster of mediocre mind—for Madame Dubarre was not fortunate in her selection, Miss Smith, the school-mistress, having few ideas beyond the four high walls which bounded her dwelling-house; and, last of all, for the heart love, beneath whose sun her own warm feelings had expanded, she had now at best the courtesies and civilities of a not very exalted station. Still, she was human, and therefore her sorrows were softened by the wonder-working hand of time. She was a Frenchwoman, and therefore inclined to look on the brightest side of things—a wholesome habit, though sometimes sneered at. Thus, as years passed on, and the radiant beauty of the little Victorine expanded—a beauty whose bright intelligence was an earnest of the soul within—the cheek of Madame Dubarre regained in some measure that hue of peace and health which sorrow had driven away. Perhaps in the philosophy of the human mind, there are few things more wonderful than that merciful dispensation by which the heart, bowed and crushed by affliction, *does* generally rise after awhile from the stunning blow. Especially is it so in youth; for though that may be the season of keenest emotion, and the feelings, cooled by experience and disappointment, may be harder to receive impressions, they are also harder to retain. The difference is almost equal to that of the waxen image, and the graven stone which impresses it. But Madame Dubarre was still young, and though her sorrows were engraven on a heart of a texture more endurable than wax, she did, after a while, arouse her drooping energies, the earlier, perhaps, that she felt herself the sole stay and support of a child, around which every tendril of her heart seemed to cling. Thus, by degrees her position became improved, for *home* is a dear word, and most significant; and though the French are said neither to have it nor need it, both the word and its meaning Madame Dubarre learned in England. In a few years she either met with, or sought for, or heard of, many of her compatriots, who were circumstanced like herself. Some were even friends and acquaintances of by-gone years, but all seemed bound together by the tie of misfortune; and by the time Victorine was twelve years old, instead of being the teacher at Miss Smith's establishment, Madame Dubarre had removed to London, and had a home. Yes, for her quiet little lodgings were *home*, small though they were, almost mean, and in an obscure street of the dense metropolis. Like so many of her fellow-sufferers, her days were employed in giving lessons, and she chose her home in a street and in a neighbourhood for several good reasons selected by them.

It certainly was not the fashionable part of the town, yet sufficiently near to be, as the phrase is, within a stone's throw; it was situated among so many great thoroughfares, that all points seemed accessible from it, and was intersected by those second-rate streets, where, if commodities be not of the very highest quality, they are certainly to be found at the lowest price. These were recommendations to the poor emigrants, who formed, as it were, a little colony, and who, cemented by the bonds of affection or sympathy, seized gratefully those wrecks of happiness which their stormy trials had yet spared to them. So often have we heard them described, that we feel almost as if we had made one at their little re-unions. Among the kind English friends whom the worth, talents, and misfortunes of Madame Dubarre won for her, was Mrs Mowbray, the wife of one of London's 'princely merchants.' Her only daughter, who was rather younger than Victorine, was instructed by Madame Dubarre in French, music, and painting; and at first, from the idea that the companionship of the little French girl, who, of the two, spoke her own language more fluently than English, would be of service to Caroline Mowbray, Victorine was invited to pass a few weeks in Portman Square; and so gentle, so gifted, so loveable was she, that by degrees they could scarcely do without her—it was almost her home. Madame Dubarre felt grateful; for troubles had worn away that false pride which might once have made her shrink from an obligation, conferred even in the most delicate manner, and rather as if a favour were received than granted.

Years rolled on; Victorine received instruction from Caroline's finishing masters, and both were grown lovely girls. Still, Madame Dubarre's visits, under one pretence or another, continued daily, and sometimes Victorine returned almost like a guest for a week or two to her mother's *home*. How proud the mother was of her child, and how sweet the confidence between them! For so many years they had been all the world to each other, that the awe and reserve which sometimes exists in their relative positions on the younger side, found no place in Victorine's heart; she never dreamt of wilfully concealing a thought or feeling from her mother; and Madame Dubarre, despite all adverse circumstances, preserved that freshness of feeling which remembers the enthusiasm of youth sufficiently to share and understand it, and is the magnet which attracts the young, and by which they are most surely led. And yet, if each succeeding year had dulled the first keen impression of Madame Dubarre's affliction, if each year had brought her new friends, and rendered her lot more endurable, still, as Victorine approached womanhood, the anxious mother could not but contrast most painfully the lot of her child with those brilliant prospects which, alas! for the fallacy of human thought and expectation, had seemed her birthright.

It should be remarked, that, in consequence of his mercantile speculations, Mr Mowbray was frequently absent from England for several months at a time; and towards the close of one of these periods a strange change crept in—was felt rather than perceived—among the knot of united friends who assembled so frequently in Portman Square. Madame Dubarre was the first to read the riddle that was enacting around her; she saw that George Mowbray, the only and darling son of his parents, was attached to her child, and that, perhaps half unconsciously to Victorine herself, her young and innocent heart was his! Only from one look, but it was a look full of anguish, did she suspect that Mrs Mowbray had made a similar discovery; and she understood, almost intuitively, their relative positions. In the first place, she knew Mr Mowbray had lofty views for his son; that it was even rumoured he would marry into a certain noble family not rich enough to scorn the merchant's princely fortune, and not too proud to receive into its bosom a talented and highly educated commoner. But, in her own mind, she was convinced that, with the ardour and impetuosity of youth, young Mowbray gave not a feather's weight to these considerations, and that he was only awaiting his father's return to England, to implore his consent to receive the orphan exile as his daughter. Equally sure was she that he had not in open and formal words declared his love to Victorine; but while she appreciated conduct that she felt was directed by the purest principles, she sighed to acknowledge that the soul of sympathy has a language of its own, and that hearts are lost and won without much aid from direct matter-of-fact phrases. She suspected that Mrs Mowbray refrained from interference, from a fear that premature measures might fan into a flame the spark that otherwise would burn itself out. Her own plans, however, were decided almost in a moment; for she shrunk involuntarily from the monstrous ingratitude of which she felt she should be guilty to the benefactress of her child, and the kind friend whom she loved almost as a sister, if she allowed Victorine to remain another week under that friend's protecting roof. Accordingly, with true delicacy, she feigned excuses for requiring her daughter's return, for a month or two at least, to the quiet humble home of N—— Street, and not at all to her surprise, Mrs Mowbray immediately acceded to her request. The fact was, without choosing to come to an explanation, both parties understood one another.

[Before her return, Mrs Mowbray visited the humble home of Madame Dubarre.] Victorine had retired to her chamber; the two mothers were alone. For a little while both were silent, and when they looked up, both were in tears. There was very little need of explanation, though a great deal may be said in half an hour. From the present and Victorine, however, Madame Dubarre reverted to the past, a subject on which she was not very fond of expatiating, and she related far more minutely than she had ever before done, the circumstances which attended her flight from France. Now was it the turn of Mrs Mowbray to become agitated and confused; but just as she had sunk upon a sofa, apparently overpowered with her emotions, her carriage was announced, and her servants brought the startling intelligence, that Mr Mowbray had just arrived from the Continent, whence he had not been expected for some days to come.

It was the third day from that eventful evening, when a note from Mrs Mowbray, kindly, affectionately, yet strangely worded, was put into the hands of Madame Dubarre, the purport of which was to request she would call on Mr Mowbray the following morning, as he wished to communicate with her on an affair of importance. Has the reader already imagined the sequel? Is he prepared for one of those strange accidents which yet go far towards making us believe there is no such thing as accident in the world? Mr Mowbray was the Englishman to whom, eighteen years before, the Count de P—— had intrusted nearly forty thousand pounds' worth of property! When the appointed time at which he expected to receive Victorine's father in England had expired, he made every exertion to discover either him or the heirs of his fortune, but every clue was lost. Not for some years, however, did he use the gold of which he had so strangely become possessed; but at last he embarked it in his mercantile speculations, still resolving, even though expectation from year to year grew fainter, that it should be restored, if possible, to those who were entitled to it. The command of so much actual capital had been of infinite service, had, indeed, proved the foundation of his noble fortune; and convinced, from Mrs Mowbray's recital of Madame Dubarre's sufferings, that she must indeed be the widow of his early acquaintance, he only awaited the proofs which she could give him of the fact, to make ample restoration. The hand-writing and the worn fragment of that sad, but still dearly cherished letter, were quite sufficient for the purpose. This, however, was not all. Who can trace the mysterious windings of the human mind? Can we do it ourselves—are we not too well satisfied with fair results, without scanning narrowly their combining causes? Perhaps Mr Mowbray, though actuated by feelings of probity, yielded with more reluctance than he had anticipated the tens of thousands he had begun to look on as his own. Perhaps he thought love and forty thousand pounds a fairer portion for his son, than a title with only a chance of the love, and the certainty of far less money. Perhaps that dear son's intreaties had had some weight. Perhaps they would have had weight had Victorine still remained portionless. Who can tell? But it is likeliest that each and all combined to cause his decision—his hearty consent to the union of his son with Victorine."

George Mowbray heard the wondrous tidings; and, as may be supposed, hurried away to the residence of Victorine, and was soon "'the happiest man in the world.' Yes, she did accept him, and never loved him less, because she had learned to respect his long silence, and to understand that he had avoided her presence, until he could appear before her with his parent's sanction to their union. Except a life-interest of a very few hundreds per annum, it was Madame Dubarre's wish that the whole property should be settled on Victorine; and though the lawyers' settlements delayed the marriage as long as they could, why, even they had an end."

A FEW TRIVIAL NOTES.

[The subjoined notes are reduced from as many papers read before a learned society by the Rev. Professor Gillespie of St Andrews, and are here published with his concurrence.]

THE "LUCK" IMPUTED TO ODD NUMBERS.

THERE is a prepossession, which we may with some confidence pronounce to be universal, that odd numbers, and particularly the number three, are lucky. For this reason, three things are often preferred to any other, when the choice was otherwise a matter of indifference; and this predilection is seen in an especial manner to have operated in matters of superstition:

> *Thrice* the brindled cat had mewed,
> *Thrice* and once the hedge pig whined.

In all the ceremonies appropriate to All Hallow Even, we see how conspicuous is the number *three*. There is not a Scottish school-boy who does not suppose that he has a better chance of success at the *third* trial of anything than at any other attempt. An odd number of chickens or ducklings in a flock is held by every old woman to be lucky—as witness the well-known precocious verse of a great English author:—

> Here lies good Master Duck,
> Whom Samuel Johnson trod on;
> If it had lived it had been good luck,
> For then we had had an odd one.

This notion extends back into the days of antiquity. Virgil tells that the gods delight in uneven numbers. Three handfuls of sand cast over a dead body had, with the Romans, all the virtue of a funeral. Into unequal numbers were the flocks in Theocritus divided. Vegetius directs that the breadth of a fosse surrounding a camp should not be less than nine, and not more than seventeen feet, but always an unequal number. The markets at Rome were held every ninth day, and the census was taken every fifth year. Dinner-tables were there three-sided, and the guests congregated in threes. Pythagoras ascribed great virtue to *three*. Amongst his countrymen, the graces and furies were three, and the muses nine. No Grecian city could be safe without an unequal number of gates and temples. Even numbers were certainly not overlooked: the Olympic games, for instance, took place every four years; and their grammar contained a form of the verb for two persons, besides the ordinary singular and plural. But yet it is remarkable how much, amongst this and other ancient nations, with regard to miscellaneous things, odd numbers predominate. The preference could easily be traced into Egyptian and Jewish history; but this is perhaps not necessary.

Whence has arisen this apparently universal prepossession? An answer to this question—the first we are aware of having been attempted—is here offered. "It is confessed on all hands, that gambling is natural to man; it is one of those lines of separation which are said to distinguish him from the brutes, and the lower the state in which we find him, the more fearfully is he addicted to this propensity. What kind of games are naturally adopted by man in the early stages of his social progress? Such, assuredly, as appeal immediately and directly to fortune, and depend the least upon time and skill; such, in fact, as we ourselves, when at school, were most in the habit of using. Now, of all these, I may safely aver that *odds and evens*, or, as the Romans expressed it, *par impar*, was the most common. This method of gambling has the advantage to recommend it to children and to savage man, that it determines the thing at once, and that it may be played at in any place, at any time, and with such apparatus as is generally at hand. A few acorns, nuts, marbles, or pence, and you have all that is necessary for setting to work. In this game, has a person calling odds any advantage over him who calls evens? If so, we shall have discovered one reason in nature and original habit why odd numbers should be considered as more lucky than even. In throwing the dice, in pitch-half-penny, and in other games of pure chance, odds has no advantage over evens; because, an even number being always

used, the chances in this case are always equal. But in the game of odds and evens, this is not the case. Suppose that there is an unknown number of marbles in my pocket, and that I take out an *unknown* proportion of that number in my shut hand, and challenge you to say odds or evens, and that you always say odds. The number of marbles in my hand must either be one or more than one. [The learned professor then goes on to explain that, in the first three numbers, 1, 2, 3, there are *two* odd numbers, against *one* even—consequently that the chances in favour of odds are here *as two to one*.] Advance to 4, and you have 2 to 2, but still the evens have no advantage. Take 5, and it is 3 to 2 in favour of odds. Every successive odd number gives a superior chance to the cry of *odds*, in a constantly diminishing ratio, but still a superiority; and the reason is manifest; the odds and the evens do not start fair—odds takes the precedence, and whilst evens is still diminishing the advantage, it never does, and never can, overtake its predecessor." It is certainly conceivable that, though this principle might not be detected in early times, its results might be observed, and that a superstitious veneration for odd numbers might be the consequence.

HISTORY TRACEABLE IN LANGUAGE.

It is very curious to find in language—in mere words—traces of the moral and political history of mankind, leading to the conclusion, that, supposing no history had ever been written, or that it was entirely lost, some glimpses of past transactions and conditions might be obtained through the medium of philology. When a Scotsman speaks of his *shackle-bone*, he not only conveys an idea of his wrist, but discovers, by the very term made use of, that slavery or vassalage had continued so long in Scotland as to impress itself indelibly on the language of his country. *Kitchen* is a term applied in Scotland and Ireland to that kind of food which serves as a relish to less palatable viands: for example, the barley or oaten bread may be *kitchened* by cheese or milk. The word is unknown in this sense in England, from which we may infer that many things, which were dainties in Scotland and Ireland, were common fare in the more favoured land of South Britain. Kitchen, then, is a historical monument of the better feeding of the English, in comparison with the Scotch and Irish, throughout a considerable portion of their existence as nations. An equally good memorial of the conquest of the Anglo-Saxons by the Normans exists in our language. At the time of that event, the animals chiefly tended and preserved for food were the ox and calf, the sow, sheep, and deer. When the ox was at his pasture, under the care of a Saxon serf, he was naturally designated by a Saxon term, ox (bull and bullock are also Saxon, as are cow and kine); but when the animal was killed, and sent piece-meal to table, he was meat for a different class of society, the Norman gentry, and the flesh was accordingly called *beef*, a word of their language. The live animal has since been Saxon, and the flesh Norman, accordingly. So also the sheep was Saxon while alive, but became French or Norman, *mutton* (*mouton*) when dead. The pig ranged the forest under a Saxon herdsman, and was sow or hog accordingly while in life; but no sooner had he been hung up for use, or sent to the table, than he became bacon or pork (French, *bacon* and *porc*), by which terms his flesh has ever since been denominated. The Saxon *deer*, by death and translation of his materials, became in like manner *venison* (French, *venaison*). Even the poor calf is snatched from its Saxon dam and its Saxon keeper, to figure in the shape of good French *veal* on a Norman board. It is remarkable that the horse, ass, fox, wolf, dog, and other animals, not in like manner kept, or in like manner used, have only single names. It will thus be observed that, if we had no written history of the Norman Conquest, we should be able to draw some evidence of the fact from the language alone.

Some words carry us back by their etymology to the earliest age and condition of mankind. *Tempest* (Latin, *tempestas*) is of this character. It is so called from *tempus* (time), because, in a primitive state of society, eras are chiefly marked by the occurrence of great storms, and other such events. Farmers and rural people, generally, will yet be heard dating facts from the great snow-storm, the wet summer, and so forth, of their early days. *Silva*, Latin for a wood, being derived from the Greek *suluo*, to howl, may be considered as a living record of those savage times, ere yet man had gained the supremacy over the wild animals of the forest.

The Romans spoke of so many *head* of men—a phrase which we limit to cattle—thus plainly intimating, through the indestructible testimony of language, the light in which the great mass of human beings was viewed by a nation where the slave population was generally as three to one. The word *virtus* contains within itself the history of civil society. It commences with the period when personal strength and courage are all in all: *virtus* was at first simply military hardihood amongst the Romans. It then passes into that advanced and better regulated state of society, when high moral qualities were esteemed above the mere soldier's praise: *virtus* was then employed to signify these qualities. It afterwards sinks, in the middle ages, into any distinctive and predominating quality whatever. We now speak of one thing being done by virtue, that is, by mere force, of another; and by *vertu* the descendants of the Romans now imply a taste in pictures and objects of curiosity; while the Scottish peasantry, accustomed to value a rigid economy and good household management, mean by "a vertuous woman" one who carries on the affairs of her house in an active and thrifty manner.

NATURAL CAUSE OF THE ROMAN WAY OF RECKONING THE DAYS OF THE MONTH.

For the benefit of those who are not acquainted with the Roman way of reckoning the days of the month, we may explain that, taking January as an example, the 1st day was called the Kalends, the 5th the Nones, and the 13th the Ides of the month; the days onward from the Kalends being reckoned the 4th from the Nones, the 3d from the Nones, the 2d from the Nones, the Day before the Nones; those onward from the Nones being reckoned in the same manner as the 8th from the Ides, the 7th from the Ides, &c.; while, after the Ides, the reckoning was, the 19th from the Kalends of February, the 18th, and so on. Whence this system of anticipation? It is submitted that it originated in the national habits of the Romans, which mainly referred to war, and to festival-keeping and shows. The Kalends, Nones, and Ides, were the grand days of the public shows, in which the people were so much interested. Eager for this periodical enjoyment, they had it, of course, much in their minds, and it must have been a general feeling amongst them to *long* for the arrival of these periods of the month. Hence would arise a habit of counting the days *onward* to these festivals, as *four* days from the Nones, *three* days from the Nones, and so forth. Every school-boy has a ready illustration of this supposition in his own practice with regard to holidays and vacations. He reckons, *five* weeks from Christmas, *four* weeks from Christmas, *three*, &c.; and afterwards *five days* from Christmas, *four days* from Christmas, *three days* from Christmas, and finally, the *Day before Christmas*, equivalent exactly to the *Pridie Nonas*, or *Idus*, or *Kalendas*, of Roman chronology.

THE MANCHESTER LYCEUMS.

HAVING had occasion, a few weeks since, to pass through Manchester on our way to Edinburgh, we felt a great curiosity to visit the various establishments existing in that town for the improvement and recreation of its operatives. We were stimulated to the inquiry by previous acquaintance with a few startling, almost appalling facts—facts which show an amount of ignorance and vice amongst our poorer brethren by no means flattering to the benevolence or even common policy of the better informed and more affluent classes of the British public. For instance, the cost of maintaining prisoners at the New Bailey (or jail of Manchester), during the last twenty-one years, amounted to upwards of L.200,000; and the county rate payable by the township of Salford alone (a suburban portion of Manchester), chiefly for the above purpose, amounted, during the same period, to L.2000 a-year. Thus much is contributed for the punishment of crime; but where are the funds raised to prevent it? What provisions have been made for the moral and intellectual improvement of those hard-working masses, whose limited leisure is employed in drunkenness and crime, instead of in those enjoyments which their ignorance denies them? The only answer to these queries will be found in the succeeding account of the three excellent but inadequate and ill-supported Lyceums. Again, from the lately published report of the registrar-general of births, deaths, and marriages, we learn that in Manchester and Salford, taking the average of the two previous years, sixty out of every hundred persons were unable to write their own names! Now, it is fair to presume that a large number of this proportion could not read, and are thus deprived of a most productive source of amusement, to say nothing of instruction. After ten or more hours of hard labour, there is—there must be—a natural craving for relaxation or recreative excitement, which is now, unhappily, satisfied in the public-houses, sometimes to the amount of four hundred and eighty-four visits a day to a single dram-shop.* One effect of this vicious mode of spending time and money, may be seen in the rapid increase of crime in Manchester. In the year 1840, no fewer than 13,000 individuals were taken into custody by the Manchester police, out of a population something under a million.

Full of these facts, we were anxious to learn, from personal inspection, what provisions Manchester possesses for altering and improving this state of things, and, as may be expected, first directed our steps to the "Mechanics' Institute" of Manchester. Former experience of similar establishments, however, induced us not to place much faith in the efficiency of this one for bettering the intellectual condition of the lower classes. Generally speaking, the sort of persons who belong to them render their title a misnomer. From the comparative expensiveness with which they are conducted, their members, instead of mechanics, usually consist of merchants, manufacturers, clerks, shopkeepers, tradesmen, artists, and others of that grade.* This is true of nearly all the so-called Mechanics' Institutions we have seen; and without meaning the smallest disrespect to that of Manchester, which appears to be admirably conducted after its kind, we may observe, that it is as little adapted for the working men of Manchester as the Royal Society of London. To support its large building, extensive library, salaried officers, and expensive succession of lecturers, the charge to each member is necessarily fixed at the high rate of L.1 per annum, a sum quite beyond the means of a Manchester operative, even when in full work.

As a means, therefore, of enlightening the darkness of the sixty out of every hundred of the Manchester people who cannot write, the Mechanics' Institution is next to useless; and we turned our attention to other establishments of a lower grade in point of expensiveness, which are better calculated for that object; namely, to the Lyceums. In going over these humble institutions, we were extremely fortunate in having the company of a gentleman who was mainly instrumental in originating them; and the manner in which he accomplished his object forms an important lesson in what may be called the natural history of benevolence. Feeling that it was not by merely printing circulars and soliciting subscriptions that such institutions are commenced, and that even when formed, it is difficult to induce the persons they are intended to benefit to join them, he went, pencil and paper in hand, into several of the back streets—the haunts of ignorance—and personally solicited the poor, the illiterate, and the vicious. To one who was unable to read and write, he said, "Would you like to learn? If so, I am providing means for that purpose." And in the event of an affirmative answer, he put down the name of the person addressed. To another who could read, he asked, "Would you wish to be provided with useful and amusing books? Because, if you would, I am about to collect a library on purpose for your use?" Thus he went from one to another, until, aided by the voluntary contributions of the more wealthy, he obtained a sufficient number of subscribers to commence the undertaking with a prospect of success. This was four years ago; and since that period, three Lyceums have been established, one in Great Ancoats Street, one in Salford, and the third in Chorlton-upon-Medlock, another suburb of Manchester.

Such are the institutions which we set out to visit. The Ancoats Street establishment, situated about half a mile from the Exchange, first occupied our attention. The house is moderately sized, but commodious. It contains a library and news-room on the ground floor, a reading-room above, and several class-rooms; one of which, comprising the entire floor, together with that of an adjoining house, is sufficiently large for occasional use as a lecture-room. The amount expended in the fitting up of the institution, the purchase of books, &c., was about L.220, which was contributed by wealthy friends of the institution. For the first year and a half, the number of members averaged 500 and upwards, and the income nearly L.250. The library contains about 1500 volumes. The reading and news-rooms are comfortable and cleanly, holding out every inducement in those respects for the frequent visitation of its members. A few persons were busily employed in reading; this was evidently not a mere lounging-place; all were perusing the print before them with eagerness. They just raised their heads on our entrance, to see who the intruders were, and then continued their employment as industriously as if we had not appeared. It appears that thirty-eight newspapers, of different sorts, are supplied periodically for the use of the members.

The small back room used as a library was so filled with applicants for books, that we had some difficulty in entering; and it was as much as the female librarian, assisted by her daughter, could do, to supply the wants of the members, each of whom, however, waited his or her turn with patience and decorum. The average circulation is 450 volumes per week amongst the 390 persons who are entitled to their use. By this instance, we see that, when the working-classes can obtain the privilege of reading, they fail not to avail themselves of it to a large extent.

In an up-stairs room we were introduced to a female writing-class. This consisted of girls and women, some of them from the factories. Nothing can exceed the diligence and attention with which they pursued their lessons. Some of them were of an age which renders it extremely probable that, but for this institution, they would have passed through life without being able to write their own names. This class meets twice a-week, and the average attendance is from 32 to 44.

In a large apartment at the top of the house, some forty to fifty men and boys were employed in cyphering, with a degree of order and attention which caused us to wonder how so many persons could be assembled without any especial restraint upon them, and be so silent. The conduct of every member we had seen was unexceptionable; their appearance also denoted that attendance at this institution had engendered in them habits of cleanliness, to which persons of their class are unfortunately too often strangers. Careful washings, combings, and brushings, had evi-

* See Extracts from Love's "Hand-Book of Manchester," in No. 555 of this Journal.

* In the Eighteenth Annual Report of the Manchester Mechanics' Institution now before us, it is shown, that out of 1092 members, only 91 come under the denomination of "mechanics, mill-wrights, and engineers."

dently taken place between the work hours and that of appearance in their classes, both amongst the male and female members. In reference to the danger which might be apprehended from adults of each sex belonging to the same institution, our informant assured us, that not a single case of any impropriety had come to his knowledge from either of the three establishments since their formation.

The Salford Lyceum, which we next visited, we found to be similar in all respects to that in Ancoats Street, except that it was recently found expedient, on account of the circumstances of some subscribers, to make a weekly, instead of a monthly or quarterly subscription. Here we saw an elocution class, and heard two recitations delivered with very good effect. This institution has had greater difficulties to contend with, and has perhaps been the least successful of the three. Salford possessed a Mechanics' Institution like the Manchester one, too high in its subscription, which excluded newspapers, and made no provision for female education. The Lyceum, when first started, had an undivided field, but the Mechanics' Institution has since altered its plan, so as to resemble more nearly that of the Lyceums. Hence the resources of both are crippled; and although struggles have been made to concentrate the resources of all the establishments by proposing a junction of the more affluent of the Mechanics' Institutions with the Lyceums, the negotiations have in two instances failed. The Chorlton-upon-Medlock Lyceum we had not time to visit, but were informed that it differed in no essential point from the others. Its present house is a large and commodious one, and was at first the most flourishing of the three. During one quarter, there were no fewer than 1300 members. The number, however, has since fallen to between 300 or 400. Attached to the building is a considerable plot of land, upon which gymnastic apparatus is erected. Various games are also permitted during the summer months. The lectures are delivered in the large class-room of the institution, and occasionally in the Chorlton town-hall, which, however, is incapable of accommodating more than 400 persons. The rent charged by the Commissioners of Police is 16s. per night. The institution possesses a large and well-selected library.

Thus the Lyceums, although totally distinct from each other, are connected by identity of design, and sympathy on the part of the conductors. Each is governed by a board of 24 directors, a deputy treasurer, and honorary secretary, who are directors *ex officio*, annually chosen by ballot amongst the members of eighteen years of age, and not less than three quarters of a year's standing. Each Lyceum has its president, vice-president, and treasurer, generally influential residents in the neighbourhood, who are not directors by the constitution, although their presence and counsel is gladly welcomed at the meetings. This regulation was thought desirable, in order to combine complete self-control with some advantage from influential patronage, and to prevent undue interference on occasional questions by those who, from their station, were not likely to take an active part in the regular management of the institution.

The subscription to each Lyceum is two shillings per quarter, without any payment at entrance. In the Ancoats Lyceum, females are admitted at eighteenpence. There are a few honorary subscribers of a guinea and half a guinea, who are allowed some additional privileges.

The advantages to which this very moderate amount of subscription entitles the members, are as follow:—

1. A circulating library of well selected books of history, voyages, travels, biography, the arts and sciences, with a considerable admixture of works of fiction and imagination. The exclusion of the latter from a Mechanics' Library appeared to be neither expedient nor just, although the proportion admitted is even less, in general, than in the subscription libraries supported by the wealthier classes. Novels and poetry are the source of high gratification, as well as even improvement, to the taste and feelings; and those whose occupations are long and exhausting, may find in them agreeable mental excitement, when more serious reading would be distasteful. The library, when adequately supplied with new books, is found to be one of the most attractive parts of the institution, and perhaps is the most useful, because affording resources which the workman can enjoy at home and share with his family. Indeed females, it is stated, occasionally take out tickets for their younger brothers, in order that these may attend the classes, and may bring home books for them (the sisters) to peruse. The great difficulty which the directors find, is to supply sufficient novelty. The recent publications of Messrs Chambers, the Novelist Newspaper, and the cheap pamphlet reprints of Smith, Moxon, and others, enable them, however, to some extent to do this, and at a very small outlay. Shillings will now go almost as far in this direction as pounds some years ago.

2. A news-room, supplied with daily and weekly journals of various shades of politics. In the furniture and fitting up, attention has been paid to warmth and comfort. This is essential to compete effectually with the inn tap-room, to which the workman is obliged in most towns to resort to see a newspaper.

Youths under sixteen or seventeen are excluded from the news-room by express by-law, it having been found that it injuriously tempted them away from the class-rooms, and their presence in any number caused annoyance to the elder members. A distinct room, or else a table in the library, supplied with the lighter periodicals, is appropriated to their use.

The news-rooms, like those frequented by the merchants and other classes in Manchester and most towns, are of course open on the Sunday. It has been thought desirable, however, to restrict the time to about three hours in the evening, from half-past five to half-past nine.

Lectures upon interesting subjects, popularly explained and illustrated, are delivered as nearly as possible once a-week. But this, as the funds seldom admit of paid lecturers, depends of course upon procuring the gratuitous services of friends.

Classes meet four or five evenings per week for the instruction of the members, juvenile and adult, in reading, writing, arithmetic, and grammar, without any extra charge. In the Ancoats Lyceum, the onerous duty of conducting the classes has been performed from the commencement by gratuitous teachers. The directors make it a point of duty to visit them frequently; the more attentive pupils are sought out and promoted, the teachers encouraged, and two or three persons appointed to the care of each class, so as to prevent the possibility of any being left without a teacher. In the other Lyceums, a paid teacher is employed, who receives occasional assistance from the directors. This involves expense, but perhaps is the best means of securing punctuality of attendance, and a uniform system of tuition. There are also, I believe, in all the Lyceums, classes for vocal music, elocution, and mechanical and landscape drawing, to which the members have access on payment of an additional subscription.

One of the greatest difficulties in the maintenance of the classes is the want of an efficient system of visitation of the pupils' homes, in order to secure their regular attendance. Without some check of this kind, the younger children frequently absent themselves, and by their consequent slow progress, their parents are disappointed, and withdraw them from the institution.

But the Lyceums do not, as we have seen, confine their advantages to males only; arrangements have been made in them from the first for the improved education of females. These classes receive instruction nightly in reading, writing, grammar, sewing, and knitting. The directors have been much indebted for the services of a number of ladies who have superintended this important branch in each institution, and without whose assistance it could not have been undertaken with any satisfaction, or perhaps propriety. In two of the Lyceums, paid female teachers are employed. Separate rooms, and as far as practicable, separate entrances, are provided for the male and female classes. The former assemble and are dismissed half an hour later than the latter. This important feature of female education, which the Lyceums claim as peculiar to themselves, will be more conveniently provided for in buildings which have been projected for two of the Lyceums. It is intended to appropriate a portion of the building exclusively to their use, for day schools and evening classes, with a separate entrance at the side, and only communicating with the library by a door behind the librarian's counter, through which the female members may enter to receive their books.

An Essay and Discussion Society meets weekly or fortnightly in each of the Lyceums. There is no limitation as to subjects, except the good sense of the members themselves, who decide by a majority whether any particular question shall be discussed or not. No evil effects are found to ensue from these discussions, as the subjects of debate always consist of some harmless literary or historical topic. It is a rule worthy of imitation, that the question discussed is never put to the vôte. These societies, meeting frequently, to discuss subjects of pressing interest to the man, the workman, and the citizen, tend powerfully to benefit individual members by stimulating the spirit of inquiry and self-improvement; strengthening the powers of thought and expression; banishing prejudice; and promoting universal toleration; whilst they keep alive in the institution the interest of the members, and draw out the abilities of those best qualified to serve the institution as directors, as lecturers, or as teachers. An entrance fee of sixpence, without further payment, is charged to each member. The directors seldom interfere as a body, but individually attend and take part in the discussions as frequently as possible.

Occasional tea-parties, concerts, and soirées, afford to the members of the different Lyceums and their families opportunities of harmless recreation and amusement. These are sometimes conducted by the Essay and Discussion Society, and although charged so low as sixpence a-head, considerable profit is realised, frequently as many as six or seven hundred persons being present. The amusements, which are generally furnished gratuitously by members of the institution and their friends, consist of instrumental music, singing, recitations, and philosophical experiments. In the Chorlton and Salford Lyceums, tea-parties and dancing have been introduced, to the great satisfaction of the members. Great care is, of course, required, and great care is taken, to prevent the intrusion of improper persons. They are almost exclusively confined to members of the institutions. The mothers and elder female relatives of the female members frequently accompany them, bringing with them also the younger children, who partake in and enjoy the festivities. The amusements are varied by a few glees or recitations, and sometimes by an address from one of the directors, in support of the objects of the institution, and inviting assistance and support. Enjoyment cannot be greater than is exhibited on these occasions, nor could rules of propriety be more strictly adhered to.*

To dilate upon the utility of such establishments as these would be wasting time; whilst to urge their extension, where they do exist, and their establishment in manufacturing places where they do not, too much cannot be advanced. In effecting this object, mere passive charity is useless. The simple contribution of a yearly guinea, or single donation, does but little good. It is the kind of active benevolence brought into operation by the founder of the Manchester Lyceums, which alone can render them of effect. The frequenters of dram-houses and beer-shops will not come to a place of instruction of their own accord; they must be reasoned with, persuaded, enticed. To this end, a kind of mission should be undertaken amongst the habitations of those who dwell in darkness, poverty, and ignorance, and the advantages of moral and intellectual instruction familiarly pointed out to them. No other plan can possibly answer. Legislative enactment may restrict the daily period of work, but at the same time it augments the hours of relaxation, and these are the periods which are in all cases so viciously, while they might be so profitably, occupied. Provision may be made in every factory for the education of the children employed in it: but how is the adult, who is unable to read or write, to be taught? Certainly not by act of parliament, which cannot force instruction upon a man or woman, though it may upon a child. The main remedy, therefore, for all the ignorance which exists amongst our operative manufacturers, is active and unwearied private benevolence.

* For the information collected during our gratifying visit to the Lyceums, we are indebted to their indefatigable promoter, Edward Herford, Esq., of whose obliging company we had the benefit.

A WORKING-MAN'S ACCOUNT OF AMERICA.†

William Thomson, an operative wool-spinner of Stonehaven, a small town on the east coast of Scotland, having returned from a visit to the United States, must needs give the world an account of his travels, seeing, as he sagaciously observes, no good reason why he should not write a book as well as his betters. And so here is his book, a modest specimen of typography from the Stonehaven press, and far from discreditable as a literary effort. Tramping through the country to seek employment, sometimes working at a factory, and at other times picking up a job from a farmer, the hero of the piece is enabled to describe matters out of the reach of ordinary tourists, while, on some points, he altogether differs from them. Others, for example, complain of the rudeness of the Americans; he is surprised at their politeness. The working-men, he observes, say "Sir" when they address each other, and their whole conduct is marked by self-respect. Employers are equally courteous to those whom they employ; and throughout society, wherever he goes, though known to be an operative, he is uniformly treated as a gentleman. In passing through Glasgow, on his return home, and when looking at a public monument, he is addressed by a girl asking her way—"*Man*, can ye tell me where aboot," &c. Such a piece of barbarism would not have occurred in America, where even one of the poorest class would have premised the question with "Please, Sir." And we take the liberty of asking, why the same species of politeness should not be practised in this country? There is nothing in our institutions or social arrangements, as far as we are aware, to prevent even the most humble classes from using the language of courtesy, if not kindliness of manner. It would cost little trouble, and lower no dignity, to use the terms "Sir," "If you please," "I will thank you," "Would you be so obliging," and so on, in the ordinary intercourse of the workshop, which we can see no reason should not be as polished as that of the drawing-room. It is at least tolerably evident, that as long as working-men generally—we say *generally*, for we are happy in knowing many creditable exceptions—as long as they address each other coarsely or intemperately, and act as if they had a contempt for refinement of manners, they can expect no great courtesy from employers, or be viewed as equals by the better-bred portion of the community.

Gratified as is our operative wool-spinner with the exterior forms of American society, he is shocked with what appears to strike every traveller, high and low, with amazement—the practice, as he terms it, of people taking the law into their own hands, and by which human life in some quarters of the Union is really less protected than it is in Turkey, or India. To punish a white man for homicide, seems scarcely within the compass of the law; such are the many quirks by which those convicted of crime may escape, provided the offence is not repugnant to public opinion. On a late occasion, a judge, in passing sentence of death on a convicted murderer, drily observed, it was the third or fourth time he had performed this unpleasant duty on the same individual. These things

astonish our plain Scotch artisan not a little; and some cases of stabbing and shooting that he hears of, impress him with a most unfavourable idea of the constitutional liberty of America. The following account he gives of a bank-mob may appropriately enough conclude the present notice.

A BANK-MOB.

"While I was in Cincinnatti a very serious bank-mob took place. In order that this case may be understood, I may mention that there were a number of small banking establishments which, although not strictly legal, managed, by 'hook or by crook,' to get a large quantity of their notes into circulation, and as the times grew worse, they fell in value. Such a thing as getting cash for them at *par* was never heard of in the best of times; and now, as there was some prospect of the State passing an act, compelling all to resume specie payments, these establishments got embarrassed, and some of them began to fail in being able to redeem their issues with notes of other banks. Several throughout the state, and in the city, became bankrupt in the most fradulent manner. The people were roused, and made a run upon them. One morning, the run upon the Miami Exporting Company's Bank was so great, that their funds also run short. Now, although their notes bore to be payable in specie, the people only demanded the notes of other banks in which they had a little more confidence. However, they stopped about ten o'clock in the morning, and a shout ran through the crowd to mob them. Immediately the window-frames were smashed, the doors broken, and the establishment completely gutted—counters, desks, books, papers, money, &c., being promiscuously hurled to the street, amidst the shouts and execrations of the mob.

When I got to the scene of action, which was at the corners of Main and Third Street, a party of sixteen or eighteen soldiers had taken possession of the ransacked building. The mayor and the marshal of the city attempted to address the mob, but in vain, for they could not be heard. The marshal, a bold, active man, was on horseback, riding through the streets, calling upon all good citizens to disperse, but few such were to be found. They then tried a *ruse*—they rung the city bells to the startling and well-known tune of 'Fire,' but this also failed. The firemen and many of the citizens, with the involuntary movement of well-trained soldiers, started at the word of command, and began to run to their stations.

At this time I was standing on the steps in front of the Old United States' Bank, which was crowded with spectators looking down upon the scene, when I observed one of those little incidents that have turned the fate of greater field-days than this. As the firemen and others were running past, just opposite to where we stood, a fellow got up on a cask or box, at one of the shop doors, where he stood conspicuous, with his thumb at his nose, and his fingers stretched out, thereby intimating, in his way, that a deceit was about to be practised on them. The people 'smelled a rat,' and immediately returned to the work of demolition in greatly-increased numbers, and apparently more exasperated, both at the cheat practised on them, and at the sight of the soldiers. They stood at bay for some minutes, moving a little backwards and forwards, evidently preparing for a struggle. The troops had their bayonets fixed and their muskets levelled. There was not more than ten yards between them. The crowd began to throw brick-bats. Two or three of the company fired. The crowd then came forward like a wave of the sea; the company fired a volley, and several of the rioters fell wounded. Such a shout was then raised, all along the crowded streets, and from the spectators on the tops of the houses, as I never heard before; for I had never seen the 'sovereign people' in a rage till now.

By the time the smoke and dust cleared away, and the astonishment of the moment past, there was not a feather of the soldiers' caps to be seen. The authorities ordered them to fall back to the mayor's office, which was immediately in the rear. This was a wise movement; for, I think, if they had remained other five minutes, it would have been doubtful if any of them would have 'chewed their cud' over their pork that night. I believe the mayor had strong doubts whether he had any legal right to shoot the citizens on such an occasion; and no more soldiers appeared that day. It is true, all the *companies* were ordered out, but they paid no attention to this order; in fact, the greater part of them had not time, for they were busy, in the mob, helping to wind up the affairs of the banks; and this they did effectually before night.

After this, the mob had complete possession of the city, and the *run* upon the banks continued; but they gave them fair play. As long as they were able to redeem their notes they allowed them to go on, but the moment the funds ran short, smash went the windows and doors, and the work of destruction commenced. The bankers fled for their lives. In this way they demolished the inside of five of these 'shin-plaster manufactories,' as they called them, before night.

There were a great number of special constables sworn in, and they came out about two o'clock, each with a handkerchief tied round his hat to distinguish them. They threw themselves in lines across the streets leading to the mobbed parts of the city, allowing everybody to pass away from, but none towards, the disturbed districts; but it would not do. The people broke through; and I do not think the constables cared much. The sympathies of the most respectable citizens were with the people; and I observed many of them, in the streets, rubbing their hands with glee, and laughing, as one after another of these swindling establishments were turned inside out. The mayor was even suspected of not doing all he could, and was tried for it afterwards, but acquitted.

The mob went to work very deliberately, and, after they had everything their own way, with good humour. I was pleased with the spirit of 'fair-play' shown to the Planters' and Mechanics' Banks, which were thought to be weak. The cry to pull them down was frequently raised, but a number of the active rioters defended the premises stoutly, and they continued, through the day, to redeem their notes. The run upon them was tremendous, but they stood out the storm; and, at night, posted bills, stating that they would open next morning an hour before the usual time.

There were several of those engaged in the riot apprehended throughout the day, some of them with considerable sums of money on them. Everybody had plenty of money that day, such as it was. The very children were running about with handfuls of dollar bills, several of which fell to my share; and I have them yet as trophies, and an evidence of the mode of regulating the currency in the 'Queen City of the West.' There were several other banks in the city, respectable establishments, in which there was plenty of good money and specie, but the mob never made the slightest move towards them. These are examples enough, to give some idea how the Americans execute judgment when they take the law into their own hands."

PERIODICAL LITERATURE OF FRANCE.

REVIEW OF THE TWO WORLDS.

THE gay, susceptible characteristics of the French nation demand, from its popular literature, amusement rather than utility: hence, there is scarcely a publication which issues from the French press that does not contain a proportion of imaginative pieces. Even the daily newspapers are obliged to waft their dry details of fact—of public occurrences and political discussion—upon the wings of fiction; for almost every journal has about a quarter of each page ruled off for the reception of tales, or sketches of character; though sometimes biography, dramatic and musical criticism, &c., are admitted into this department, which is usually called the *Feuilleton*. In fact, many of the most popular novels have been originally published thus, from day to day, to be afterwards reprinted in volumes. In like manner, the magazines and reviews, whose main and avowed objects are of a more grave and sober cast, seem to exist under a pressing necessity for filling some of their pages with the fancies and devices of the novelist; presenting to an English reader the same out-of-place appearance that a tale by Bulwer would have in the Quarterly or Edinburgh Review, or a romance of Ainsworth "continued" in the *Times* newspaper.

The *Revue des Deux Mondes* (or Review of the Two Worlds), a publication resembling, in outward appearance, our own monthly periodicals, but published fortnightly, is no exception to the above-stated rule; an original imaginative article appearing in nearly every number. The rest of its sheets are filled with original contributions to geographical and statistical science, biography, literary criticism, and political discussion. But what should make this periodical interesting to the inhabitants of this side the channel, is the attention it bestows upon Great Britain; for, in almost every number, our manners, literature, the aspect of our country, our political institutions, or foreign possessions, are honoured with some kind of notice; and, taking the present year down to September, we find that, out of seventeen *livraisons*, or parts, twelve of them contain articles on those subjects. The first we light upon is entitled "Littérature Anglaise," which, true to French tastes, is a critique, not upon English literature, but upon English romances and novels, many of which do not deserve, in our own estimation, to be classed as literature. Indeed, the only really literary works reviewed or named in the course of the essay, are "Alison's History of Europe," and "Ritson's Posthumous Letters;" but the most curious part of the article is a complaint against the periodical mode of publishing continuous novels, as practised occasionally in England, but daily in France. "These unconnected fragments," proceeds the reviewer, "supersede the old laws of composition—cohesion of parts, unity, and finish. The author only thinks of the 'number' he has got to produce, and of the twenty guineas he is to have for it; the pages which have preceded, and those which have to follow, seldom trouble him. Each successive number must contain a stage effect, a bait for the perusal of its successors. There must be excitement—unnatural incident; the attention of the reader is violently suspended, truthfulness is sacrificed to astonishment, simplicity to improbability; the curtain is lowered at the moment that emotion is excited, when the hero is about to perish, when the heroine is in tears, when the heart of the reader beats with expectation. Miserable literary juggling! How, without connexion, without revision, without conscience, is it possible to write, not great works, but even rational or interesting ones?"

In a succeeding number, a long notice occurs of Sir Walter Scott, in connexion with English romance, and is ably written. "Scotland in 1840" is a statistical account of that country, compiled from our own gazetteers, with many of the proper names mispelt; for example, Mrs Millar, who introduced the spinning of Holland thread into Paisley, is transformed into "Mrs Wittar." To a sketchy article, entitled, "A Journey to London," a considerable degree of interest attaches, as giving, in a lively though flippant strain, a foreigner's impressions of the great city. "I had," commences the author, "passed the night at a masked ball. There is nothing so wretched as the day after a ball, and I took a violent determination. I resolved to treat my dullness upon the homœopathic plan; for, some hours after, having had scarcely time to take off my caftans, poignards, and the rest of my Turkish attire, I was on my way to London, the native city of spleen."

Arrived in the Thames, the traveller, by a stretch of imagination somewhat extravagant, compares a part of its banks to Thebes and Babylon. "On the banks of the river I began to distinguish trees, houses crouching low on the shore, one foot in the water and a hand extended to seize in their transit bales and packages of merchandise; timber-yards with their enormous sheds and skeletons of unfinished ships; also, a forest of colossal chimneys, in the form of towers, pylones, and obelisks, giving to the horizon an Egyptian appearance, suggesting a vague outline of Thebes or Babylon, or an antediluvian city, of enormous objects altogether extraordinary."

Similar ideas of vastness seem to have arisen from a sight of the West India Docks; although some abatement must be made for that exaggerated mode of expression which it is usual to pardon in modern French writers. "The East India Docks," exclaims this journalist, "are something so enormous, so gigantic, that they surpass human proportions! It is the work of Cyclops and Titans. Above the buildings, the warehouses, the wharfs, the water-steps and other heterogeneous structures, you behold a prodigious alley of masts prolonged to infinity; an inextricable labyrinth of rigging, spars, ropes, which surpasses, by the density of their interlacement, the most entangled portions of an American virgin forest!"

The wonder thus excited having in some degree subsided, another source of astonishment presents itself to the tourist. It is Sunday when he lands, and he is greatly surprised "at the solitude and profound silence" which reigned in the parts of the town through which he had occasion to pass. To the denizen of Sabbath-breaking Paris, London on this day appeared like a Necropolis, "one of those cities peopled by the petrified inhabitants read of in Oriental tales. All the shops were closed, not a single human visage appeared at the windows. The few passengers glided by like shadows. This mournful and deserted scene contrasted so forcibly with the notion of animation and bustle which I had formed of London, that I did not recover from my surprise till I remembered that it was Sunday, and London Sundays had already been described to me as the incarnation of inactivity. This day, which is with us—at least amongst the lower classes—a day of rejoicing, of promenading, of festivity, and dancing, is on the other side of the channel passed in the most inconceivable gloom. The taverns are shut on the eve of midnight; the theatres have no performances; the shops hermetically closed; and unless provision is made on the preceding evening, it is difficult to get anything to eat. Life seems to be suspended. All the wheels in London cease to revolve, like those of the chimney-clock when one places a finger on the pendulum. For fear of disturbing its Sabbath solemnity, London does not indulge in a single movement, and scarcely permits itself to respire. On this day, after having heard a sermon from the pastor of the sect to which he belongs, the good Englishman shuts himself up in his house to meditate, and to rejoice before a good coal-fire on the happiness of being at home, and that he is neither a Frenchman nor a Papist. At midnight (!), the charm is broken; the vital principle, impeded for a time, becomes re-animated; the houses re-open; life returns to the immense body so lately fallen into lethargy; it awakens at the call of money-making Monday, and then continues its march."

Such is the difference in the national habits and modes of thought between even such near neighbours as the French and the English, that, by reversing this picture, by stating its converse in every particular, we shall be presented with the impressions of nine Englishmen out of ten who visit Paris. *Their* astonishment would be drawn from the antitheses of the statements made by this French visitor to London. The English stranger in Paris would exclaim with wonder, "All the shops are *open*, all the inhabitants are from home, promenading the streets and public gardens. The greatest animation and gaiety prevails; the taverns are filled with guests; and although it is the Sabbath, they actually perform plays in the theatres! This day, which is with us—at least with the majority of us—a day of rest and thanksgiving, is passed in Paris in feasting, dancing, and revelry; and it is not till Monday arrives that the ordinary business of life is resumed." Thus those things which habitual familiarity renders commonplace and unnoticeable to a resident, strike the stranger with astonishment from their (to him) extreme singularity. The veriest Cockney will not, however, fail to acknowledge the truth of the remarks contained in our traveller's vivid description of the sooty appearance of the metropolis, caused by that smoky fog which Charles Lamb has designated, from its unequalled density, "the genuine London Particular." The tourist continues:—"One thing which gives to London a most peculiar aspect, besides the breadth of its streets and pavements, and the lowness of its houses, is the uniform black hue which shadows every external object. Nothing can be more doleful and lugubrious; it is a kind of black that has none of those brown and vigorous tints which time has given to the ancient edifices of less northern countries; it is an impalpable and subtle dust, which sticks to everything, penetrates everywhere, and from which there is no defence. A stranger would say, that all the monuments had been sprinkled with black-lead: the immense quantity of coal which is consumed in London for fuel, is one of the principal causes of the general mourning worn by the chief

edifices—the oldest of which have literally the appearance of having been covered with blacking. This effect is especially visible in the statues. Those of the Duke of Bedford, the Duke of York, which is placed on the summit of a high column, and of George III., on horseback, resemble negroes or chimney-sweepers, being made equally black by the quintessence of coal-dust, which is always falling from a London sky.* The prison of Newgate, with its dark niches and rusticated masonry, the old church of St Sepulchre, and several Gothic chapels, the names of which I do not remember, seem to have been built of black granite, rather than to have grown dingy by years. I have never contemplated that mournful and opaque tint, which lends to the edifices, half hidden in fog, the appearance of enormous funereal canopies, without finding sufficient explanation for the spleen which tradition gives to the English."

The general tone and character of the *Revue des Deux Mondes* present a most favourable specimen of French periodical literature, from its comparative moderation in the discussion of political subjects, and from the talent with which the scientific and historical departments are filled. We shall, from time to time, present our readers with other extracts from its pages.

ENGLISH AND ARABIAN HORSES.

THE following anecdote, illustrative of the enervating effects of the artificial mode of training horses practised in this country, is related in a recently published pamphlet by M. Hamon, who passed eight years in Egypt as chief veterinary surgeon to Mehemet Ali.

While Kourchid Pasha was governor of Nejd—a country of Central Arabia, which produces horses held in high estimation—some Englishmen, who possessed several thorough-bred British horses, challenged the Bedouins to undertake a race with them. The Arabs accepted the challenge, and the English demanded forty days to "train," they said, their horses for the event. The Arabs, whose steeds are always in readiness, could not understand why it was necessary to train horses to run, smiled at the condition, but still consented to it; and at the end of the period agreed upon, arrived at the place of meeting. "Choose yourselves," said the Bedouins, "from amongst our stock which of our horses shall run against yours." The choice was made, and the Arabs inquired how many days the horses were to run. The Europeans stared with astonishment, and answered, "One hour will suffice." The men of Nejd refused so insignificant a struggle. "And is it for the race of an hour," they cried, "that you have required forty days' preparation? This gives us a most unfavourable notion of your breed of horses, which you say sprung from ours."

"Such is the custom of our country," replied the Englishmen; "but after the training they have had, our racers will distance yours as they have beaten others in Europe."

Again the Bedouins smiled, for in the meantime two small sickly-looking men, arrived in top-boots, leading two immense moving machines, but lean withal, which they soon discovered were horses. These were enveloped in cloth, from the tip of the nose to the hoofs, the eyes only remaining uncovered. The Arabs, who had hitherto never seen an English horse, inquired what they were going to do with those great beasts. "Run them against yours," was the reply; "to prove to your tribe that the racers of Great Britain are the first in the world."

The Arabs, taking this answer as a joke, retired, believing that the strangers intended to hoax them. The latter protested, insisted, and, at length, succeeded in persuading the Bedouins to return. Kourchid Pasha, who was present, also spoke to them, and by his advice they consented to run their horses. The sight of the two small thin jockies strangely excited the curiosity of the natives, and they begged their antagonists to tell them in what remote corner of the earth they found such extraordinary beings. "They are the jockies," answered the Britons; "men whose business is in our country to ride race-horses, and who also undergo a severe training."

The surprise of the Arabs now reached its height; and but for the assurances of Kourchid Pasha, they would have finally declined to oppose their men and horses to creatures whom they designated by the title of Mascara.†

At length, while an attenuated groom leaped into the saddle, a tall and vigorous Bedouin mounted a native horse of ordinary points, which gambolled round the tent inhabited by his family. The wife and children came out to caress the animal, which, by its movements, seemed to promise them victory. It is decided that the race shall last for three hours. At a given signal, the horses started together. During the first half hour, the English kept in advance of their adversaries; but soon the Nejis overtook, passed them, and the Europeans arrived at the goal a considerable time after the Arabs. The English horses, breathless, remained exhausted on the spot, showing every symptom of distress. The Arabian steeds, on the contrary, were active, impatient; they pawed the ground with their hoofs, neighing loudly, as if inviting their adversaries to another trial.

Perceiving the English horses so much distressed, the men of Nejd approached the strangers, who were occupied in rubbing down their steeds, and inquired how it was that a race of three hours so completely exhausted a European horse. "We train them," was the reply. "How do you mean?" continued the Bedouin. "Why, during two or three months, the horses are allowed to live in idleness in a large paddock, having no work to do." "And this—to train the horse for a long time before the race, and to abandon him to idleness for several months after it"—observed the Arab, "signifies that your horses bred in *an artificial state* are but of little use to their owners." In taking their departure, the Bedouins exclaimed, "Allah preserve us from such customs!"

* The French critic on a London climate is not perhaps aware that these statues, being composed of bronze, would, wherever placed, present a dark-coloured appearance.

† Mascara is the western province of Algiers, the diminutiveness of whose inhabitants has passed into an Eastern proverb.

THE PASSING GUEST.

BY CAMILLA TOULMIN.

'Tis pleasant in the summer time a passing guest to be,
And share 'mong dearly cherish'd friends their hospitality.
Yet strangely thrills the human heart, that wheresoe'er we roam
We kiss the chain whose farthest links are twined around our home.
And this, methinks, is something like the way it comes about,
Though kind attentions but increase, without one thankless doubt;
Nay, better far one little week among all household ties,
Can make us know and love a friend, than years' formalities.

We've been the pretty rides and walks—a day's excursion too—
A pic-nic where the rising hills command so fine a view:
"You mark the distant spire that peeps above that mass of green,
A little to the left, and there the ocean may be seen;
That line of light—yon drooping cloud provoking in the way."
It might be so, and this I know, we had a merry day.

New friends are made, and visits paid of country etiquette,
And of the little children all I've my peculiar pet.
The eldest son, a noble boy, confides to me the thought,
The hope that soon for him will be a gun and pony bought;
He hints at glorious days to come, when school no more shall shackle,
And then explains the mysteries of his new fishing tackle.
His sister dear, 'tis very clear, dreams in her heart so still,
How very fine to be grown up, and do just what one will!

Ah, foolish girl, strive not to shake the steady glass of Time,
For woman's heart and woman's care ring oft a mournful chime.
The world hath harsher fetters far to thwart the rebel will
Than thou canst image, girt but by the bonds that guard from ill.
Woven by love, enwreath'd with flowers, so lightly do they press,
It were a blessed boon to know for aye such happiness!

So weeks pass on with rapid flight, for they are gaily pass'd,
And yet upon our distant home some anxious thoughts are cast;
A letter comes—or, it may be, the want of one has power
To make us fix, 'gainst wishes kind, the parting day and hour.

The wind has whistled all the night, in threatening accents loud,
But now the sun is struggling with a canopy of cloud;
And through the trees the autumn breeze declares the day will be
Not cold nor warm, but just the one we most desired to see.
The house is in unusual stir, and boxes crowd the hall,
And something over which, by chance, a travelling cloak doth fall;
One corner peeps of wicker-work, and now I know the rest,
For goodly things are often found within a *hamper* press'd.

I thought I miss'd the snow-white goose and chickens; and "the birds"
Were what they meant last night, though I but half made out the words.
Although I wept, I do not think 'twas for their hapless fate,
Though cut off in their very prime, nice appetites to sate:
How strange the chord; how slight the touch will waken smile or tear!
And very unromantic things oft marks of feeling bear.

But few our words; for tongues that are like streams unbound from frost,
At meeting, are the very ones that parting fetters most.
"Put to the horses; we can do the distance in an hour
Unto 'the station,' after which we care not for a shower."
The house-dog wags his bushy tail in token of delight,
("Is it at last you know me, sir, or think to go is right?")

The station gained (we pique ourselves on punctuality),
And so have leisure here to say our very best "good bye;"
To give the tearful kiss, and press the hand with cordial grasp,
And own how much we'll try next year the very same to clasp.
Oh! blessings on the power that doth, or fair or foul the weather,
"Annihilating time and space," bring loving hearts together!

And home is reached with all its joy; the tongue *is* loosened now,
A very cataract of words in rushing stream doth flow.
Our dog not only wags his tail, but to my shoulder leaps,
And shawls and bonnet fall about in most disordered heaps.
Though tired, we look in every nook; I'm sure I can't tell why,
Since walls and floors I never heard were very apt to fly.

Once more, though not till late, my couch I press with wearied frame,
And when I wake, a moment pause, to ask how *there* I came?
For dreams have been of those dear friends whom now but dreams can bring,
The children's prattle, Lion's bark, or some familiar thing;
The chestnut-trees beneath whose shade the spell of silence reign'd,
That spirit food which never yet was in the city gain'd;
All seem'd to haunt my slumbers deep, and soothe a dreamer's ear,
Home lured me back, but still I'm glad they've ask'd me for next year!

LONDON, *Oct. 1st*, 1842.

CASTLE BUILDING.

The habit of what in common parlance is called "building castles in the air," has a most pernicious influence on the health of the mind. There is a legitimate exercise of the imaginative faculty which is advantageous to the understanding, and to this no reasonable objection can be urged; but when the fancy is allowed "to body forth the forms of things unknown," without being under proper discipline, much evil will result. Individuals endowed with an unhealthy expansion of the imagination create a world within themselves, in which the mind revels until all consciousness of the reality which surrounds them is lost. The disposition to reverie is very pernicious to intellectual health. Many habituate themselves to dream with their eyes open, without the senses being literally shut; they appear to be insensible to the impression of objects external to themselves. This condition of mind borders closely upon the confines of insanity. If the imagination be thus permitted to obtain so predominant an influence over the other faculties of the mind, some particular notion will fix itself upon the fancy; all other intellectual gratifications will be rejected; the mind, in weariness or leisure, recurs constantly to the favourite conceptions, and feasts on the luscious falsehood, whenever she is offended by the bitterness of the truth. By degrees the reign of fancy is confirmed; she grows first imperious, and in time despotic; the fictions begin to operate as realities, false opinions fasten upon the mind, and life passes in dreams of rapture or anguish.—*Winslow's "Health of Body and Mind."*

RUTHVEN'S PLAN FOR PROPELLING STEAM-VESSELS.

One of the greatest drawbacks to steam-navigation is the contrivance by which steam-boats are propelled. Paddle-wheels, besides destroying the "clear run" of a vessel, impair the speed by their bulk, and in rough weather destroy the trim or even motion of the boat, by being either lifted quite out of the water on one side, or sinking too deeply into it on the other. Their liability to accident is another serious objection. For these reasons, many attempts have been made to supersede them, but hitherto without effect; and it was with no little expectation and curiosity that we attended a lecture by Mr Lees, lately delivered in Edinburgh, explanatory of a fresh invention for the above much desired purpose. The new plan is simply an adaptation of the principle of Dr Barker's mill to the purposes of locomotion. The Messrs Ruthven propose to supply the place of paddle-wheels with two large nozzles or tubes, through which they cause water to rush with great force, so as to create a motion opposite to the direction in which the column of water falls into the sea. The water is to be supplied by means of several small ducts opening in the head of the vessel just below water-mark. The engine raises it to the two tubes, by which it exits by a contrivance similar to the Archimedes screw.

The advantages of this invention, as pointed out by the lecturer, are, first, the relief of the ship from unwieldy paddle-boxes; second, that the engine need never cease working even when it is requisite to stop the vessel, for, by turning the nozzles (by means of machinery upon deck) downwards, the locomotive power is directed vertically instead of horizontally, and the motion ceases, or can be modified at pleasure, in proportion as the tubes are made to slope towards the sea; third, should the rudder be lost, the vessel may be steered without one, by stopping or lessening the supply of power on either side, as a row boat is guided; fourth, the disagreeable motion caused by paddle-wheels will of course be obviated, the action will not be obtained by impulses, but in one regular stream, as it were, from the violent issue of water from the tubes. All experiments with models being, to a certain extent, delusive, we forbear offering any opinion on the practicability of this ingenious invention.

A PLEASING IMPROVEMENT.

Mr J. C. Loudon, in a letter to the London journals, calls attention to a highly commendable act on the part of the Commissioners of Woods and Forests; that of naming the collection of trees and shrubs which were planted a few years ago in Kensington Gardens and St James's Park:—"In addition to the scientific name, the English name is given, the natural order to which the tree or shrub belongs, and the year of its introduction into Britain. Thus, in the case of the sugar maple, we have the words below painted in white on a black ground—

'Acer saccharinum *L.*
The sugar maple.
An aceraceous tree.
A native of North America.
Introduced in 1735.'

I need not enlarge on the entertainment and instruction that this enlightened and liberal act on the part of the Commissioners of Woods and Forests will afford to the public frequenting these gardens, or even to those who, living remote from the metropolis, can visit them occasionally. Suffice it to say, that it will create a new sense in thousands of persons, and enable them to derive a degree of enjoyment from trees and shrubs which they had no idea of before. It will enable the citizen or extensive proprietor, intending to plant, to make choice of those trees and shrubs which he thinks most ornamental, or most likely to answer his purpose; and thus, by improving the appearance of individual estates, it will contribute to increase the beauty and variety of the woody scenery of the whole country."

BENEVOLENT SAYING.

The celebrated saying of the Emperor Titus, "I have lost a day," when he had suffered one to pass without some act of charity, has been often quoted as a proof of his exalted character. Dr Granville, in his work on the Russian empire, relates the following expression of the empress mother, which is not less remarkable than that of Titus, and appears indeed to have arisen from the moving principles of her actions: "Notre séjour sur le terre est si court, qu'on doit regretter le tems perdu sans faire du bien."—"Our sojourn on earth is so short, that we ought to regret the time which is lost without the performance of some good."—*Flowers of Anecdote.*

THE STRUGGLES OF PETER HOOLEY.*

PART I.

HOW HE STRUGGLES WITH POVERTY.

IT was at the close of a short and bitter winter's day, that a squalid-looking and thinly-clad man knocked gently at the door of a decent house on the outskirts of a secluded village. The summons was unanswered. After waiting a considerable time, during which he cowered close to the door-cheek, to try to shelter himself from the bitter wind, he ventured to repeat the knock, and soon heard the shuffling of feet along the lobby. The door was not opened, however; some bolts were withdrawn, and it still remained fastened by a chain, when the latch was just removed, and a voice, in no very agreeable accents, asked, "Who's there?"

"Let me in, for God's sake, Sally," said the man; "I'm perished with cold, and well nigh famished."

"Thou'st come the wrong gate to mend thysel', man; but come in."

The door was opened, and Peter Hooley, for such was the man's name, groped his way along the pitch-dark passage towards the kitchen, but suddenly stumbled against some obstacle, and fell forward on it.

"Oh," said Sally, "wait while I bring the light."

She made her way to the kitchen, which was on the ground floor, at the farther end of the lobby, and shortly returned, bearing, in a broken tin candlestick, an inch or two of rushlight, which, from the current of air along the passage, she was obliged to shade so closely with her hand, that its dim and flickering light was scarcely perceptible. When they got to the kitchen, there was a sparkle of dull fire glimmering at the bottom of the grate, and the starved pedestrian sat down on the floor, and placed his frozen hands almost on the bars.

"Have ye not a bit o' turf, Sally?"

"Not a mite: the mistress gave me out what she said must serve me, and that's the last o't."

"Where is she?"

"Gone to Barnleigh for her money; it's quarter-day."

"She's out late."

"Ay. The garden crop's not turned out well this year, so she said she couldn't afford a chaise as usual, and she's gone i' Mrs Foy's market-cart. She'll not be at home this half hour yet."

"Sally, have you a crust o' bread? I'm sadly hungered."

"Bread, did you say? why, I coudn't get at a bit o' bread if your life depended on it. Mistress always locks it up."

"What! from you?"

"Ay, from me."

"She keeps you pretty close, I daresay."

"I'll tell you what, man, I'd half a red herring for my dinner."

"And what had the mistress?"

"Oh, the same, the same: I must say that for her, she fares the same. I' th' summer, we've beans out o' th' garden, and a mite o' drippin' wi' em; and i' winter weather like this, we've potatoes and a red herring every day, and mistress cuts it fair i' half."

"And does she never have no better?"

"Scarce ever. The neighbours are often sending her nice bits, whyfor, I know not, except they're a' lookin' to her money; but, bless you, she's hardly heart to eat 'em, though they cost her nought."

The conversation was here interrupted by the creaking of cart-wheels, which presently stopped, and two or three rude and heavy knocks at the door announced the arrival of the mistress, Miss Bridget Maclaren.

Sally quickly piloted her way through the dark passage; and Peter, more dubiously, followed. With his help, and not without some difficulty, Miss Maclaren was lifted from the bottom of the cart, where she lay on a mattress, and brought into the house. She was an elderly person, tall, and strongly limbed, with a shrewd intelligent countenance. Her joints were distorted with the severe rheumatism to which she had for years been subject, and her usual stiffness and helplessness was now increased almost to paralysis by the intense cold. She was placed in an arm-chair on the hearth, and then Mrs Foy told Sally to light a candle, as she wanted her own lantern.

"I haven't a scrap," said Sally.

"Not a scrap!" said her mistress; "why, Sally, I left you a piece."

"Yes, ma'am, but it's burnt long since."

"And what need had you, Sally, to burn candle when I was out? It is such wasteful work."

"Here, wench, keep the lantern a while: I've another i' th' cart. And now, hast ou no fire nor tea for the mistress? She's right cold, I'll promise ye."

"I know not how I am to get fire and tea," said Sally, sulkily; "there's water i' th' kettle, but it's no abune milk-warm yet, though it's been on an hour."

"Well, come along with me, and ye'se have my kettle; I'll warrant it boiling long syne. Well, deliver me from riches, say I, if this is the comfort they bring."

Owing to Mrs Foy's friendly help, Miss Maclaren was soon seated at tea, which she poured from a broken spouted black earthenware tea-pot into a cup minus a handle, which reposed on a saucer of a different pattern. A piece of stale loaf, and a little dirty-looking rancid butter, graced the board, which was illumined by a fresh piece of rushlight.

Revived and invigorated by these creature comforts, Miss Maclaren was able to take her visitor to task:—

"And what has brought you all this way from your wife and family, Peter?"

"We are very ill off, ma'am, and I came to see if you would give us a little help."

"You have left your work to very little purpose, then," said she, sharply.

"I had no work to leave, ma'am."

"Worse still; people may always have work if they're so disposed."

"Indeed, ma'am, I'd be very thankful to work; but times are so bad, there's very little weaving given out, and I can only have a piece in my turn; and we're all but starved."

"Humph! some people think they're starving if they're not rioting in luxury."

"I don't know, ma'am, exactly what you mean; but, as I hope to be saved, nothing has passed my lips this day but a draught of buttermilk, which a farmer's wife gave me."

"And a good wholesome drink it is; but, however, if you *are* hungry—Sally, give him the plate of minced veal which Mrs Collins sent to me the other day; here's the key."

"Why, ma'am," muttered Sally, as she took the key, "I doubt whether even *he* can eat it now."

And for a moment the famished wretch did start with loathing from the ill-savoured mess which was handed to him; but hunger conquered, and he cleared the plate. Even the miser seemed struck with the avidity with which he devoured the mouldy victuals, and with a trembling hand she cut him the crust off the loaf on her table: he thanked her humbly, and it soon disappeared.

He then ventured, with much humility and earnestness, to implore a little pecuniary aid to redeem him from his present distress. Work had been so scarce for some time, that it was all he could do to put food into his children's mouths, without attempting to lay by for his rent, which was eighteenpence a-week. This had gone on from week to week, till now his landlord would trust him no longer. They had already pawned or sold every article they could part with for food, and they had no means of paying their landlord, unless Miss Maclaren would help them.

"I cannot afford it, Peter; I cannot afford it. You see now the folly of being married."

"It's ower late to think of that now, ma'am; I've been married twelve year, and never wished it undone yet."

"Then you must take the consequences, and go to the workhouse."

"That's it, ma'am," said he, starting up; "that's it; I thought you'd save your own flesh and blood from that disgrace."

"It's no disgrace to me, Peter; nobody can answer for all their relations. I have been prudent and careful myself, and it is no reflection on me if you have been otherwise. It seems to me the best thing you can do; your wife and children will be taken care of at any rate."

"Yes, but they'll be taken away from me; I shan't see them; I shan't have them. I'd live on bread and water, and work my fingers to the very bone, and think it all right, if so be I could look at their bonny faces, and not see them starving too."

"This is all very fine to talk about; but you've brought yourself to this pass, and must get out of it as ye can. I cannot afford to pay your rent. Here's half-a-crown for you, and it's more than I ought to give you, for it's more than I can afford."

And certain it is that Sally turned in amazement at her mistress's unwonted generosity.

With a heavy heart, the disappointed Peter Hooley took his leave, and Miss Maclaren having given the usual modicum of stale bread and bad butter, and discoloured water, miscalled tea, to her servant, addressed herself to the agreeable and oft-repeated task of conning her banker's book, feasting her eyes with peculiar delight on the newly-entered figures. She then carefully took a certain well-worn parchment from a certain well-known corner of her handsome but antiquated-looking mahogany escritoire, and unfolding it, read it over for the thousandth time with unabated interest. It was the inventory of her silver plate, of which, by bequests and other means, she had amassed a large quantity, and which had now been for several years in the custody of her banker. She carefully replaced these papers in their accustomed corner, locked her escritoire, watched her servant take out the remnant of fire from the grate, gave her out a modicum of wood wherewith to relight it in the morning, and then, by her assistance, got up stairs, was undressed, and put to bed.

But not to sleep. The unaccustomed journey on a cold day, in an exposed and open cart, had a serious effect on her frame; it produced an accession of her accustomed rheumatism, which thrilled through all her joints, and she tossed and tumbled the whole night in agonising pain.

The night was cold, bitter cold, and windy, and Peter Hooley pressed forward with what heart he could muster, for he had several miles to walk. By and by, however, a shower of sleet and snow began to fall, mingled with hail, which was driven with such force

* We have here much pleasure in presenting a contribution by Mrs Stone, authoress of an ingenious volume, the *Art of Needlework* (usually advertised as edited by the Countess of Wilton), and of the recently published novel, entitled the *Cotton Lord*.

against him by the wind, that it cut his face like the pricks of needles. Miserable alike in body and in spirit, and only half clad, the poor fellow could brave it no longer, and eager as he was to get to his expecting wife, and to the wretched cellar, which, now that it could be his home no longer, seemed almost a palace to him; still he was fain to give way beneath the biting and bitter blast, and turned aside to a cluster of haystacks, hoping to find a sheltered nook amidst them. In this he was not disappointed. One was half cut away, so as to leave a sort of angle perfectly sheltered from the quarter in which the wind and snow were driving; but a traveller had been beforehand with him, and was there, apparently asleep. Peter, however, noiselessly nestled near him on some loose hay. His companion was a well-dressed young man; but Peter took little note of his appearance, for his mind was filled with other things. His eye, however, was caught by the glister of a bunch of gold seals. He started, and why, he could hardly tell; he looked again and again, and leaned down to examine them more closely. Then stooping lower, and holding his breath, he drew his hand gently, softly, over the person of the sleeper, and there—yes, he could not be mistaken—there was a purse in the trouser pocket. He looked again on the youth who slept sound as a rock; he looked fearfully round; not an eye beheld him; he shook from head to foot; he gasped for breath; but he gently put his hand into the pocket, and drew out the purse. It was heavy; he had it in his hand, and still the sleeper moved not—stirred not. Peter grasped the treasure hard, his teeth were set, and the sweat burst out in large beads on his brow. Once more he looked slowly and fearfully round, cowering, as it were, over the purse; but he saw no one. He attempted to get up, but some power seemed to hold him down; and as he slowly again raised his head toward the sky, he saw the dark cloud breaking, and a single star faintly glimmering in the blue depths beneath. That star he knew was over his own cabin; he and his wife had looked at it many a time on closing the door for the night. He started to his feet, and in his agony of feeling, shouting aloud, "God have mercy upon me," he flung the purse on the ground, and darting off at his utmost speed, he relaxed not his pace till he found himself at the door of his own cellar.

Dismal was the greeting between him and his poor wife, and agonising were the tears she shed; for, despite of her long knowledge of Miss Maclaren's character, she had clung to the hope of help from her in this strait. And thus they sat, cold, supperless, and unhappy, brooding over to-day's disappointment and the morning's anticipated sorrow, when he recurred to his walk home, and his adventure amongst the hay-ricks. Betty listened with attention, but that soon deepened to the most intense interest; and as he told of examining the watch seals, and feeling for the purse, a deep colour flushed her face, and she fixed her eye, now bright and tearless, intently upon him.

"An' ye took the purse, Peter?" asked she, in a fearful whisper.

"Oh, Betty, surely the evil one himself was at my elbow, then, to tempt me."

"An' ye *did* tak it, then?" shrieked she, starting up.

"Woman! woman! NO! The thought o' you an' our babbies cam ower me, an' I put it back."

"An' ye're sure ye havena got it?"

"Not one halfpenny o't, Betty."

"Then, thank God yet," said the true-hearted woman; "an' for the rest, Peter, we'll bear it, let it be what it may."

So they went to bed, the bed that was to be distrained to-morrow for rent. The man slept sound almost directly, as men can and do under any circumstances; but the woman lay long awake, though she smothered her sobs for fear of shaking or disturbing the four youngest children, who were huddled on the same bed with their father and mother. At length, nature did its gracious best by her, and she slept also. Unconscious of to-day's toil, or to-morrow's sorrow, free from care, unknowing of pain, the father and mother, and seven children, clustered in one damp cellar, forgot all deprivation in sound, healthy, and refreshing sleep. If they wakened in the morning to trouble, they wakened also with invigorated bodies and renewed spirits.

Not so Miss Maclaren. Scarcely had the morning begun to dawn, when she called to her grumbling and unwilling servant to procure her the refreshment which, indeed, she sorely needed, and yet which even now consisted only in weak black tea of the coarsest quality. And even this meal, slight as it was, lost all relish to Miss Maclaren, from her own inability to superintend, personally, the preparation of it, and her fear lest her servant should waste an atom of fuel or a crumb of bread. Medical advice she would have none, for she could not afford it; and, besides, she knew by experience, she said, that flannel and patience were the only cures for rheumatism; and therefore it would be merely suffering her pocket to be picked in a genteel way if she called in a doctor. Miss Maclaren had much bodily fortitude; she bore pain well. Her chief misery, during her constrained confinement, was from the idea of the peculations of her servant; and her condition was not assuaged by the intelligence of the death of her only brother, to whose well-saved property she became the sole heir. This accumulation of money seemed only to increase her cares, and she became more penurious than ever. Her maid perpetually threatened to leave her, and was as perpetually lured to remain by trifling bribes, which, however, became more frequent and more valuable, as she felt her increasing consequence to her mistress, who had become almost helpless with rheumatism. Writing or working were of course out of the question, her fingers were so disabled; and she could not see to read. Sally could not read to her, neither would Miss Maclaren have a person who could, lest her own bank-book and inventories should be looked on with unhallowed eyes. She never used her parlour in winter, because even she could not do without a morsel of fire, and she could not afford the expense of two, so she sat in the kitchen with her maid. How she beguiled the time it was not easy to say; but time did pass.

It was passing rapidly with her kinsman, Peter Hooley. On the morning succeeding that night, the occurrences of which have been described, Peter and his wife did not rise very early, for they had neither fire nor candle, nor had they work to do. They therefore lay still till the broad daylight gleamed in at the chinks of their cellar door, and the children began to stir. But they had been long awake, and had had serious and sad communing together. Their debt to their landlord amounted to seventeen shillings, and they likewise owed fifteenpence at the shop. If they had hoped that, by offering the half-crown Miss Maclaren had given them to their landlord, they could have obtained a little further grace from him, they would have taken it to him at once, and fearlessly braved the starvation of the day; but they knew this would be of no avail. They therefore resolved, that for the last time they would have the luxury of a warm and wholesome meal together. So, while Betty and her eldest daughter dressed the children, and put the cellar "a bit to rights," Peter proceeded to the shop, paid his debt, and returned home laden with threepenny worth of fuel, and sixpenny worth of oatmeal, and with yet a few pence in his pocket. A mess of hot stir-about was soon smoking on the old deal chest which usually contained the family wardrobe, and which now served for a table; and the happy children crowded round it, while the father and mother kept filling the mouths by turns with the only two spoons they possessed; and if, despite herself, the woman's tears did every now and then mingle with the porridge, the delighted youngsters saw them not. But all delights must have an end, even that, the intensity of which the famishing only can know, and the satisfied children one by one withdrew themselves from the board, and the mother put the remnants by to serve for supper, if, by any happy chance, they might sup all together again. And seating themselves on the chest which had served as table, with their children playing about them, Peter and his wife waited, with what philosophy they might, for the great event of the day.

It could not now be far off, for it was past eleven, and by noon the landlord was to be expected on his final errand; and Betty started and trembled, and caught hold of her husband's arm, for her quick ear caught the sound of voices and feet approaching their door. She was not mistaken: people drew near, stopped a moment in conversation, and finally knocked. Peter and Betty both started to their feet, but could neither of them muster voice to speak; when the knock was repeated, and the door immediately opened from without, and there entered, not the dreaded landlord and his myrmidons, but two gentlemen, one of them a young one, in whom Peter recognised, with a thrill of terror, him whose purse he had taken the night before.

"Is your name," said this gentleman, "Peter Hooley?"

"Yes," gasped Peter, trembling from head to foot.

"You robbed me of my purse last night."

Peter was ghastly pale, but did not speak.

"You took my purse, I say," repeated the young man.

"No, no, no," shrieked his wife.

Betty, though a woman who was at all times governed more by feeling than judgment, was shocked at the fearful charge thus made against her unhappy husband; while the children, seeing something was wrong, clung to her, and began to cry.

"Calm yourself, my good woman," said the elder gentleman; "my son saw your husband take his purse in a moment of temptation, but he also saw him conquer the temptation, and throw down the purse; I have it now."

Betty burst into tears, and clasping her youngest child close to her breast, sat down on the side of the bed.

"Now, Peter, tell me what drove you to this act?"

"Desperation and starvation, Sir," said Peter, who was recovering his voice; "if I don't pay my rent to-day, we go to the workhouse, and I have not a friend in the wide world."

"Yes, *you have*. You were, I must say, strongly tempted, but you strove manfully against it. My son assures me of this, for he had fallen only into a momentary doze from the fatigue of a long walk, and your exclamation wakened him, though he did not stir. Now, only observe the misery and disgrace from which you have been saved. My son followed you a part of the way, and learned who you were from a person whom he met. But of all this *you* knew nothing. Pray, let me know how much is this debt for rent?"

"Seventeen shillings, Sir."

"And what else do you owe?"

"Not a penny in the wide world."

"That's well; that looks well. Now, Peter, here are two sovereigns; take one and pay your rent, the other will provide your family with food and fire till you hear from me again, which you shall do before long."

Peter could not speak, nor did the gentleman seem to require it; he and his son were gone instantly.

Several days passed on, and the rescued family were still living happily and hopefully on the stranger's bounty, when he came again, accompanied by another gentleman, who had the appearance of a clergyman. There were no pallid faces, no tears, no alarms now. With bright and smiling faces, Peter and Betty rose to welcome their benefactor.

"So, so," said the gentleman, "this is as it should be. I have brought Mr Heartly, Peter, the clergyman of Y——, who wishes to have some talk with you."

Betty looked about, but there was not a chair to offer the gentlemen. They saw her embarrassment, and soon relieved it; one sat down on the side of the bed, and the other enthroned himself on the table, deal chest, or wardrobe.

"I have been making inquiries about you, Peter," said Mr Heartly, the clergyman; "and it is but fair to tell you, that I have heard an excellent character of you."

"I defy any one to say a word agen him," interrupted Betty. Her husband pulled her gown, to silence her.

"But I want some further information from yourself. You can read and write, I hear, and" ——

"Ay, that he can; and reckon as quick as the book-keeper at the mill. He's taught all the childer, and"——

"Whisht, woman, whisht," interrupted Peter, angrily.

"I wunna whisht, Peter; ye wull na' speak a word for thysel', I know; and why should not the gentlemen know what ye really are."

Both gentlemen laughed, but Mr Heartly begged Betty to be quiet, assuring her that he would *make* her husband speak for himself.

"You have taught your children, then, to read and write?"

"Yes, Sir, such of them as are big enough."

"I should like to examine them myself."

Some tattered remnants of initiatory books were produced, but Betty could not help intimating that the two eldest could read in the Bible. The Bible was produced, but we shall not accompany the gentlemen through their examinations; we have only to do with the result. It was the offer to Peter of the mastership of the district school in Mr Heartly's village; the salary was forty pounds a-year, and there was a small cottage attached to the school for the master's residence. The present master was leaving, having obtained a better situation; but he would initiate the new comer into his routine of duties before he himself left.

"Well, as that matter is settled," said Mr Orwell, when Peter and his wife had tried to express their joy and thankfulness, "I have a word to say to you, Mrs Hooley. This tidy girl, your eldest, what do you mean to make of her?"

"Anything, Sir, that is useful and proper."

"Very well; my wife wants a girl who has been honestly brought up, to assist the nursery maid, who has too much to do; what say you to it?"

"Sir, I should be very proud and very thankful."

"Then let her come to-morrow for a month on trial. Her clothes look in bad condition—but never mind that—we'll see to that. Can she sew?"

"A little, Sir."

"Her mother's beautiful at her needle, Sir," said Peter.

"Is she? She will have no difficulty in obtaining needlework in our village."

And in their new home they were shortly afterwards settled. Peter had enough to do through the day, but the evenings were his own. These he generally passed with his family; in summer, occasionally he rambled with them in the fields, flying their kites, and joining in their romps; but more frequently he worked in his own little garden, where the bigger ones soon learnt to be useful to him.

But in winter, about the time when Miss Maclaren would be gone to bed, to save fire and candle, and the necessity for supper, then Betty Hooley, having put her younger children to bed, would draw the checked curtain close over the window, would stir up the brisk and cheerful fire, would place a pan of potatoes on the bar to prepare for supper, would light a thicker candle than was allowed for ordinary purposes, and would address herself industriously to her needlework; while her husband sat by the fire, and the elder children clustered round. And sometimes they read aloud, and sometimes they talked, and sometimes they were too happy to do either; and more especially was this the case when the wind howled round the little tenement, and the hail beat against the window, for then memory, unbidden, would recur to the night of Peter's last

visit to Miss Maclaren, and he would say, "Oh, Betty, woman, but it was a blessing o' Providence that her heart was steeled against us that day."

"Ay, Peter, but was it not a still greater blessing that you resisted the temptation that was put before you on the way home? That was lucky, indeed, for I reckon it to have been the beginning of all our comforts."

POPULAR INFORMATION ON SCIENCE.

RIPPLE-MARKS AND TRACKS OF ANIMALS ON ROCK-SURFACES.

Geology may in part be studied as one walks the streets. In many of our cities—we can, from personal observation, particularly instance Manchester and Edinburgh—amidst the slabs composing the foot pavement, are to be found some which present a ridgy or wavy surface. Sometimes this is a good deal obliterated, or even worn quite off; but still there generally remain certain shadings in the stone, which indicate its having originally been ridgy. Hundreds pass over these stones without observing anything particular about them, and many who observe the peculiarity do not give themselves the trouble of considering whether it be of any importance, or what may have been its cause. It is, in reality, a natural hieroglyphic, telling a most wonderful circumstance in the history of our earth. These slabs have all been dug from quarries of sandstone, of one of the kinds which split or break off in thinnish layers. Such quarries generally are profound pits, out of which vast quantities of slabs have been dug, each being, as it were, peeled off the surface of that beneath it, like leaves successively torn out of a book lying upon one side. Yet still, go as deep as you please, you here and there find extensive surfaces of the rock marked in that ridgy or wavy manner. They are so marked, let us repeat, notwithstanding that such large quantities of slabs have, till the time of quarrying, lain above them. It is only when surfaces of some extent are found thus marked, that an ordinary observer is likely to perceive the resemblance which they bear to an appearance often observed upon a sandy beach after the ebb of the tide; namely, a far-spread wrinkling or waviness in the sand, somewhat like a ripple on the surface of the sea itself. Such inequalities are found to extend over many square miles of beach in Devonshire, Lancashire, and indeed wherever the coast is composed of a gently-sloping surface of sand. They are washed out again by each successive tide, and renewed once more if the sea has receded tranquilly, being, in fact, produced "by an oscillatory motion of the lower stratum of water in contact with the sandy bottom, as communicated to it from the superficial waves."* They are easily imitated, by agitating to and fro a vessel of water, with a flat bottom on which sand has been strewed.

The ridgings of the slab-surfaces resemble those of the sandy beaches left exposed at low water; but is there anything in this resemblance beyond mere accident or coincidence? Those who have not gone through the steps by which the fact is ascertained, will be surprised to learn, that the resemblance is that of identical things. The slab-surfaces were all at one time sandy bottoms of seas, and their ridgings were as certainly made by the oscillations of those seas as the ripple-marks on the shores of Morecambe Bay, or upon Leith Sands, were made by the last fall of the tide. It matters not that the quarries are found in the centre of the country, a hundred miles from any existing sea, or that they are, or have been, covered over by piles of sandstone hundreds of feet in thickness. The earth has undergone many changes, and amongst these not the least remarkable have been changes of level in its crust, so that there is no part of its surface which has not been alternately sea and land. The rock, therefore, from which the slabs are taken, is nothing but a pile of successive layers of sand laid down by the sea, indurated into stone by heat and pressure, and ultimately heaved up into their present situation by a force from below. The immediate hardening of each surface, so far as to resist the obliterating power of the next tide, is not easily accounted for, if we are to suppose tides like those which now exist; but perhaps this supposition is not necessary in the case. A tranquil subsidence of the sea at less frequent intervals might be produced by other causes. Anyhow, the geologist, knowing what he does, cannot doubt that the markings upon the stones are ripple-marks, wherever he may find the stones now placed. They are often seen in situations where the sea, and all connected with it, is shut out from the thoughts of the observer. We remember, in a rural excursion in Lanarkshire, while bent on exploring the ruins of the ancient castle of the Hamiltons at Craig Nethan, finding in the rocky channel of the stream below, amidst a wilderness of wild shrubs, platforms of sandstone of the carboniferous formation, jutting out from the precipice, and played over by the glancing rivulet, which were entirely covered over with these infallible marks of the spot having once been the shore of some still sea of the primitive world. In the quarries of the oolite rock (more recent than the carboniferous sandstone), scattered over a broad band of country between Bradford in Wilts and Tetbury in Gloucestershire, these surfaces are found in such circumstances as to argue their being miles in extent. In that district, the mark is seen chiefly where the rock is in very thin layers (*laminæ*), but not unfrequently on the surface of slabs eight or ten inches in thickness. "It affects indifferently those which contain a large proportion of clay, those which are highly calcareous and crystalline, and others in which sand and oolitic grains, or minute fragments of shells, predominate."* Generally, the rippled surfaces are covered by a thin seam of clay, which, we may suppose, helped to preserve them; and it is worthy of remark, that the superincumbent seam, or bed, is always marked below by a perfect *cast* of the mark in all its minutiæ. In some instances, the surfaces of this oolite formation present double systems of markings, the one crossing the other; a result, probably, of changes occurring in the undulatory movement of the water by a shift in the direction of the wind.

These curious tablets of memorial of a former condition of the earth's surface, bear, in some instances, what we may call *additional inscriptions*, the work of certain animals. On the surface of slabs both of the calcareous grit and Stonesfield slate, near Oxford, and on sandstones of the Wealden formation in Sussex and Dorsetshire, Dr Buckland has found "perfectly preserved and petrified *castings* of marine worms, at the upper extremity of holes bored by them in the sand, while it was yet soft at the bottom of the water, and, within the sandstones, traces of tubular holes in which the worms resided."† Man did not exist to impress with his foot those early beaches; but there were other animals to walk over them, and, as might have been anticipated, foot-prints of some of these have been found on the surfaces of various rocks of the formations already referred to. In the lower part of Dumfriesshire, there are extensive beds of the *new red sandstone*, which are worked in various parts of the country. At the quarry of Corncockle Muir, near Lochmaben, the surfaces of successive layers, or slabs, of this rock were observed many years ago to bear marks as of the feet of animals; but the phenomenon was disregarded till, in 1827, Dr Duncan, minister of Ruthwell, presented an accurate account of it to the Royal Society of Edinburgh. It appears that the beds in that quarry dip or incline at an angle of thirty-eight degrees, a slope greater than that of any ordinary hill. Slab after slab has been taken away to a depth of forty-five feet; but one after another (though not in all instances) has been found marked by the tracks of animals, up and down the slope. These impressions are generally about half an inch in depth, and the matter of the rock is raised round them, exactly as clay or mud is seen raised round a foot-print of yesterday. The observer clearly traces the double track made by an animal which has two legs at each side, the hind foot, of course, approaching near to the fore one. The prints are about two inches in width, and present the appearance of five claws, of which the three in front are the most distinct. It is worthy of remark, that the fore-feet give the deepest impressions, as if the animal had been heaviest in that quarter, and this in the ascending, as well as the descending tracks. In one case, where the dip of the exposed surface is at an angle of forty degrees, there are clear evidences of the foot-marks having been made upon a surface very steep at the time of the impression, for the animal appears to have put forward its fore-feet cautiously, and inserted them deeply and firmly; while the marks of the hind-feet are comparatively slight, and indeed scarcely perceptible. Generally, however, there is a small rise of the substance of the rock either in front of or behind the prints, according as the tracks are descending or ascending, showing that the surface sloped more or less in its present direction at the time when the impressions were made.‡ Dr Buckland conceived it likely that the marks had been impressed by animals allied to the land-tortoises of the present day; and, on setting such an animal to walk up and down slopes of soft sand, clay, and unbaked pye-crust, he found the footsteps to be remarkably like those of the Corncockle quarry. He makes the following just remark upon the experiment in his Bridgewater Treatise:—"This evidence of footsteps is one which all mankind appeal to in every condition of society. The thief is identified by the impression which his shoe has left near the scene of his depredations. Captain Parry found the tracks of human feet upon the banks of the stream in Possession Bay, which appeared so fresh, that he at first imagined them to have been recently made by some natives: on examination, they were distinctly ascertained to be the marks of the shoes of some of his own crew, eleven months before. The frozen condition of the soil had prevented their obliteration. The American savage not only identifies the elk and bison by the impression of their hoofs, but ascertains also the time that has elapsed since each animal had passed. From the camel's track upon the sand, the Arab can determine whether it was heavily or lightly laden, or whether it was lame." It is remarkable that none of the series of foot-marks at Corncockle are across the slab; all are nearly straight up and down. This is exactly what would happen upon a sloping sea bottom or beach, which the animals had occasion to traverse in one direction only, backwards or forwards. Specimens of the Corncockle slabs have been deposited with the Royal Society of Edinburgh.

Since these curious facts were made public, foot-marks of animals have been traced upon rock-surfaces in various parts of the world. Mr Poulett Scrope found his rippled surfaces to be marked with numerous tracks of small animals (apparently crustaceous), which had traversed the sand when it was in a soft state. These tracks are in double lines, parallel to each other, showing two indentations, as if formed by small claws, and sometimes traces of a third claw. There is often, also, a third line of tracks between the other two, as if produced by the tail or stomach of the animal touching the ground; and where the animal passed over the ridges of the ripple-markings on the sand, they are flattened and brushed down. More recently, some fossil footsteps of a much more striking character have been found in the quarries at Hessberg, near Hildburghausen, in Saxony, upon the upper surfaces of beds of grey quartzose sandstone; in alternation with which, it may be remarked, there are beds of red sandstone nearly about the same age with those of Dumfriesshire. The vestiges of four different animals have been made out. One has been apparently a small web-footed animal, probably allied to the crocodile. The footstep of another bears a striking though grotesque resemblance to the human hand, from which the supposed animal itself has been named the Cheirotherium. A specimen on a slab which has been placed in the British Museum, is fully the size of a human hand, the only remarkable difference being in the comparative thickness of the fingers, and the absence of the appearance of joints. The fore-feet are less by one half than the hind-feet, before which they are always advanced about an inch and a half, an interval of fourteen inches being between each pair. Professor Ksup conjectures that this animal has belonged to the marsupial family, the oldest, it is supposed, of the families of land quadrupeds, and a link connecting these with reptiles. It is worthy of notice, that the kangaroo, a well-known specimen of this tribe, has a great disproportion between the size of the fore and hind-feet.

In the New Red Sandstone in the valley of Connecticut, there have been laid bare in quarries, along a considerable tract of country, surfaces presenting foot-prints of many various species of birds, apparently belonging to the order *Grallæ*, or Waders. The discovery is remarkable on more accounts than one, as it gives evidence, for the first time, of the existence of birds at that early period of the earth's history. "The footsteps appear in regular succession, on the continuous track of an animal in the act of walking or running, with the right and left foot always in their relative places. The distance of the intervals between each footstep on the same track is occasionally varied, but to no greater amount than may be explained by the bird having altered its pace. Many tracks of different individuals and different species are often found crossing each other, and crowded, like impressions of feet upon the shores of a muddy stream, where ducks and geese resort." The smallest of these prints indicates an animal with a foot about an inch long, and a step of from three to five inches; but they vary upwards in size, till they reach something which may well be regarded as gigantic. Let it be remembered, that the African ostrich, which weighs a hundred pounds, and is nine feet high, has a foot of ten inches, and a leg four feet long. It is the most stupendous of existing birds. But the largest of the foot-prints in the Connecticut sandstone being fifteen inches in length, exclusive of the largest claw, which measures two inches, and the steps being from four to six feet apart, denote a considerably larger bird, the legs of which, probably, were not less than seven feet in height. This has well been styled the *Ornithichnites Giganteus*. Another, ranking next to the above in size, exhibits "three toes of a more slender character, measuring from fifteen to sixteen inches long, exclusive of a remarkable appendage extending backwards from the heel eight or nine inches, and apparently intended, like a snow shoe, to sustain the weight of a heavy animal walking on a soft bottom. The impressions of this appendage resemble those of wiry feathers, or coarse bristles, which seem to have sunk into the mud and sand nearly an inch deep; the toes had sunk much deeper, and round their impressions the mud was raised into a ridge *several inches high*, like that round the track of an elephant in clay. The length of the step of this bird appears to have been sometimes six feet."*

That in all these instances the marks are really vestiges of animals which lived on earth long before man, there can be no doubt whatever; but we still need facts to make the whole subject clear, particularly as to the circumstances under which the successive layers were imposed one above another. Perhaps we have some light from an account which has been given of a peculiar formation occurring on the shores of the island of Anegada, one of the group called the Virgin Islands, in the West Indies. Not having access to the original document, we borrow from a small book which has fallen into our hands. "The beach of Anegada is found in many places to be coated with a grey siliceous and calcareous substance, apparently deposited by the waves, which, as the tide retires, hardens, and slowly assists in increasing the size of the island. In some parts of the interior of the island (but where, perhaps, at no very remote period, the waters depo-

* We here use the explanation given by Mr Poulett Scrope, in a paper in the Journal of the Royal Institution: 1831.

* Mr Poulett Scrope. † Bridgewater Treatise, i., 260.

* Buckland, quoting an article by Professor Hitchcock, in the American Journal of Science and Arts: 1836.

sited this peculiar substance), the impressions of birds' claws and of human feet are distinctly visible: the latter from the outward turn of the toes, are supposed to be those of the Indians, who inhabited the neighbouring coasts. These impressions are not of very recent formation, for they have existed beyond the memory of the oldest inhabitant of the island, and in some places grass has grown over them; but they are highly interesting, as proving to the student in geology that such impressions, frail and perishable as they usually appear, may, under some circumstances, become permanent. And if these footsteps have been preserved for fifty or a hundred years, we may as well suppose those in the Red Sandstone to have remained unchanged for untold ages."*

We may remark, in conclusion, how well these detections of the presence of early animals correspond with the other facts of geology. We have an evidence now familiar to us as to the animals which existed at the time of the deposition of the New Red Sandstone beds, in the remains of them found imbedded in the rock. There were fishes and certain other marine animals, but no creatures walking on the land and breathing the atmosphere. If on these slabs we had found the mark of the hoof of one cow or horse, we should have been as much startled by it as Robinson Crusoe was by seeing the foot-print of an Indian on the beach of his lonely isle. But what are the creatures whose foot-prints we actually find? *Tortoises*—an order of reptiles—other reptiles being already found in the very next series of strata above—namely, the Shell Limestone. *Grallæ*—an order of birds, and the commencement of that class of the Vertebrata, but the very order that might have been expected to be created first, seeing that the earth then presented much swampy surface. *Marsupialia*, an order of mammifers linking with the reptiles, and, of course, that which might have been expected to appear first on earth. In all this there is a harmony delightful to a scientific observer—delightful not only as confirming a beautiful system, but as reflecting light on the perfections of Creative Wisdom and Omnipotence.

EQUESTRIAN AMPHITHEATRES.

Homer, in the fifteenth book of the Iliad, employs the following comparison, as rendered by Pope:—

> "So when a horseman from the watery mead,
> (Skill'd in the manage of the bounding steed),
> Drives four fair coursers, practised to obey,
> To some great city through the public way;
> Safe in his art as side by side they run,
> He shifts his seat, and vaults from one to one;
> And now to this and now to that he flies,
> Admiring numbers follow with their eyes."

In this passage, the old Greek poet gives a clear and correct description of an equestrian performance which modern times have seen revived as something entirely new. So long ago, it appears, as the sixth or seventh century before Christ—for such may be said to be the era of Homer—the feats of Mr Ducrow were in vogue in Greece. The education of horses for these singular purposes has been brought to the highest perfection at the Cirque Olympic (Olympic Circus) of Paris, and the Amphitheatre of London. To use the words of a French writer, "the stable of the Messieurs Franconi (proprietors of the Parisian establishment) is for quadrupeds what the Royal Academy of France is for learned men. It is the hot-bed of equine genius, the conservatory of the classic step, of the antique trot—the sanctuary of the brilliant gallop." Indeed, the Cirque Olympique latterly possessed the high honour of being a kind of government establishment. As the steeds of Astley's Amphitheatre are lent to the citizens of London on Lord Mayor's day, for the use of the men in armour who figure in the procession, so the French circus is charged with the supply of animals to princes and sovereigns during any great official solemnity. And these horses, like certain courtiers, have always been at the service of every possible dynasty or shade of political opinion. Thus, in 1814, at the temporary restoration of the Bourbons, a dapple-grey, called "La Noble," bore the future Charles X. (the Count d'Artois) on his entry into Paris, and afterwards the Dukes of Berri and Angoulême. When Napoleon escaped from Elba, the same charger carried him on the 20th of the following March, at the time of his triumphal return to the city by torch-light. After the well-known "hundred days," this identical horse conveyed into Paris the princes of the Bourbon family, deporting itself with the same pride and enthusiasm, as on former occasions.

Equestrian performers of the present day feel the effects of the march of intellect quite as much as others. Feats of horsemanship, which anciently excited the greatest admiration, now appear vulgar and commonplace; and it has become as difficult to acquire distinction in equestrianism as in literature. Formerly, a simple change of feet during full gallop, or an epigram, were sufficient to earn a high reputation for a horse or a poet; but now celebrity is only to be obtained by the aid of difficult dances on three legs, or by means of several thick volumes of prose and verse. On the other hand, could the wonders exhibited by Mr Ducrow in England, and by the Franconis in France, have been witnessed by our forefathers, their astonishment might have had a fatal effect upon the prosperity of the equestrians, as may be inferred from the following anecdote of an event which took place in 1664:—

A Neapolitan, called Pietro, possessed a little horse, by whose docility and sagacity the master obtained a good livelihood. He called it Mauracco, and exhibited it without saddle or bridle, and with no rider to guide its motions. The diminutive animal would lie down, fall on its knees, bound, curvette, or, in short, do whatever its master desired. It would carry a glove or anything of the kind to any person pointed out in the crowd. In a word, it would perform all sorts of amusing tricks.

After having so profitably travelled over a great portion of Europe, as to have saved a sufficient fortune, the master made up his mind to retire; but in passing through Arles, he determined to make a last exhibition of his clever pony. The marvellous animal astonished the whole town, but the people carried their wonder to such a height, that they denounced both the horse and his master as sorcerers, and poor Pietro, with his faithful Mauracco, were burned as such in the public square of Arles.

BIOGRAPHIC SKETCHES.

ALLAN CUNNINGHAM.

The life of Allan Cunningham, which terminated on the 29th October last, was a fine example of native talent and perseverance overcoming all obstacles, and undebased by any of the alloys which too often accompany their exertion. Our countrymen are sometimes charged with an undue and overweening nationality, and it must be admitted that we occasionally lay ourselves open to attacks on this score. Blood is warmer than water, as our homely proverb says, and the keen winds of our mountains seem to bind us closer together in amity and concord, that we may present a united but friendly front to the more populous and wealthy ranks of the Southron. We have cause, however, to be proud of many of our native authors. In historical composition, Scotland long bore off the palm; and in the wide realms of fiction, who but Shakspeare can compete with Scott? In science and philosophy, we have many eminent names. Jeffrey still lives to vindicate our right to stand at the head of modern criticism; and, above all, we may feel an honest pride in reflecting, that our country has produced a ploughman like Robert Burns, a shepherd like James Hogg, and a stone-mason like Allan Cunningham. Allan was born (December 7, 1784) at Blackwood, in Dumfriesshire, a beautifully situated mansion on the Nith, two or three miles from Ellisland, the farm soon after tenanted by Burns. His father, at the time of his birth, was gardener to Mr Copeland of Blackwood, but soon after, from his superior intelligence and abilities, was preferred to take a charge of the estate of Mr Millar of Dalswinton, the landlord of Burns, to which place the family was accordingly removed. Allan's recollection of his early days was remarkably vivid and distinct. Every incident—every scene and person—was impressed on his memory; and he used to delight in telling that, when about six years old, he heard Burns recite Tam O'Shanter to his father, while he stood by his knee, and looked up to the robust frame and animated eyes of the poet with childish wonderment and enthusiasm. He received the common education of the country, being merely taught to read and write, and cast accounts, without any tincture of classical or grammatical instruction. His father's family was numerous, and two of them, besides Allan, rose to some distinction. Thomas became foreman to Mr Rennie, the engineer, and was a man of great scientific talent, as well as a tolerable poet and song-writer. Peter is now a surgeon in the navy, and author of a work, "Two Years in New South Wales," which is still one of our best books on that country. From the humble home, thus honoured and endeared by the virtues and intelligence which prevailed under its roof, Allan went forth, when a boy, to learn the business of a stone-mason. He was an insatiable reader, and the summer mornings and winter nights were spent in poring over books. While yet a stripling, he tried his hand at versifying, but we are not aware that any specimens of his earliest productions have been preserved. An accidental event was soon, however, to call him into the field of print, though under somewhat extraordinary circumstances.

Mr R. H. Cromek, a London engraver, and an enthusiastic admirer of Burns's poetry, had devoted himself to the task of collecting unpublished remains of the Ayrshire bard, in the course of which he was led to Dumfriesshire. There he became acquainted with Allan Cunningham, who ventured to lay before him some of the lispings of his muse. Cromek regarded them with an indifference to which perhaps they were only justly entitled, but gladly availed himself of Mr Cunningham's services in gathering relics of Burns and of popular traditionary poetry. In 1810, he published a volume, entitled, "Remains of Nithsdale and Galloway Song," in the preface to which, after much rather turgid sentimentality about Scottish cottages and their tenants, he says—"To Mr Allan Cunningham, who, in the humble and laborious profession of a mason, has devoted his leisure hours to the cultivation of a genius naturally of the first order, I cannot sufficiently express my obligations. He entered into my design with the enthusiasm of a poet; and was my guide through the rural haunts of Nithsdale and Galloway; where his variously interesting and animated conversation beguiled the tediousness of the toil; while his local knowledge, his refined taste, and his indefatigable industry, drew from obscurity many pieces which adorn this collection, and which, without his aid, would have eluded my research."

Let no London engraver ever again venture to collect Scottish poetry! The finest pieces in Mr Cromek's volume, to which he refers with the highest admiration as genuine relics of antiquity, were in reality compositions by Mr Cunningham himself, which, Chatterton-like, he had composed in imitation of the old manner, in order to gratify a taste which he thought prejudiced against what was acknowledgedly new, but which appeared ravenous for whatever was presumedly old. There was a warmth and glow of the language in these pieces which might have warned the collector against the deception, for nothing could be further removed from the simplicity and directness of the genuine ancient ballad; but in his eagerness for relics of the eldern muse, he had overlooked all critical warnings. Apart from all consideration of the history of Mr Cunningham's ballads, they are exquisite effusions of a young and overflowing fancy. We transcribe one entitled "Bonny Lady Ann," with Mr Cromek's prefatory note:—

BONNIE LADY ANN.

[A fairer specimen of romantic Scottish love than is contained in this song, is rarely to be met with. It was first introduced to Nithsdale and Galloway about thirty years ago, by a lady whose mind was deranged. She wandered from place to place, followed by some tamed sheep. The old people describe her as an amiable and mild creature. She would lie all night under the shade of some particular tree, with her sheep around her. They were as the ewe-lamb in the Scripture parable; they lay in her bosom, ate of her bread, drank of her cup, and were unto her as daughters. Thus she wandered through part of England, and the low part of Scotland; esteemed, respected, pitied, and wept for by all! She was wont to sing this song unmoved, until she came to the last verse, and then she burst into tears. The old tree, under which she sat with her sheep, is now cut down. The schoolboys always paid a kind of religious respect to it. It never was the "dools," nor the "butt;" nor were the "outs and ins," nor the hard-fought game of "England and Scotland," ever played about it; but there, on fine Sabbath evenings, the old women sat down and read their Bibles; the young men and maidens learned their psalms, and then went home full of the meek and holy composure of religion.]

There's kames o' hinney 'tween my luve's lips,
An' gowd amang her hair,
Her breasts are lapt in a holie veil,
Nae mortal een keek* there.
What lips dare kiss, or what hand dare touch,
Or what arm o' luve dare span
The hinney lips, the creamy loof,
Or the waist o' Lady Ann!

She kisses the lips o' her bonnie red rose,
Wat wi' the blobs o' dew;
But nae gentle lip, nor simple lip,
Maun touch her Ladie mou.
But a broider'd belt wi' a buckle o' gowd,
Her jimpy† waist maun span,
O she's an armfu' fit for heaven,
My bonnie Ladie Ann!

Her bower casement is latticed wi' flowers,
Tied up wi' silver thread,
An' comely sits she in the midst,
Men's longing een to feed.
She waves the ringlets frae her cheek,
Wi' her milky, milky han',
An' her cheeks seem touch'd wi' the finger o' God,
My bonnie Ladie Ann!

The morning cloud is tassel'd wi' gowd,
Like my luve's broider'd cap,
An' on the mantle which my luve wears
Are monie a gowden drap.
Her bonnie eebree's a holie arch
Cast by no earthlie han',
An' the breath o' God's atween the lips
O' my bonnie Ladie Ann!

I am her father's gardener lad,
An' poor, poor is my fa';‡
My auld mither gets my wee, wee fee,
Wi' fatherless bairnies twa:
My Ladie comes, my Ladie gaes
Wi' a fou and kindly han',
O the blessing o' God maun mix wi' my luve,
An' fa' on' Ladie Ann!

Another, entitled "Hame, Hame, Hame," referring to the feelings of a Jacobite exile of the last century, was stated to be from Burns's Commonplace-book, "in the editor's possession," yet is understood to have also been the production of Cunningham.

HAME, HAME, HAME.

Hame, hame, hame, Hame fain wad I be,
O hame, hame hame, to my ain countrie!
When the flower is i' the bud, and the leaf is on the tree,
The larks shall sing me hame in my ain countrie;
Hame, hame hame, Hame fain wad I be,
O hame, hame, hame, to my ain countrie!

The green leaf o' loyaltie's begun for to fa',
The bonnie white rose it is withering an' a';
But I'll water't wi' the blude of usurping tyrannie,
An' green it will grow in my ain countrie.
Hame, hame, hame, Hame fain wad I be,
O hame, hame, hame, to my ain countrie!

O there's naught frae ruin my countrie can save,
But the keys o' kind heaven to open the grave,
That a' the noble martyrs wha died for loyaltie,
May rise again and fight for their ain countrie.
Hame, hame, hame, Hame fain wad I be,
O hame, hame hame, to my ain countrie!

The great are now gane, a' wha ventured to save,
The new grass is springing on the tap o' their graves;
But the sun thro' the mirk, blinks blythe in my ee,
'I'll shine on ye yet in yere ain countrie.'
Hame, hame, hame, Hame fain wad I be,
Hame, hame, hame, to my ain countrie!

* To peep, to take a stolen glance. † Slender. ‡ Lot, fate.

The morality of the whole transaction will be viewed differently: those disposed to take a severe view of it should consider at least the youth, circumstances, and temptations of the poet. Cunningham had long admired the tact of Burns in pouring his genius into the outlines of our rude lyrics. "He could glide," he said, "like dew into the fading bloom of departing song, and refresh it into beauty and fragrance." Admiration soon led, as in most young minds, to imitation, and Cromek supplied the enticement and the opportunity. In later years, Allan wrote several songs, but they were not pitched in a key to be popular; and only one, "A Wet Sheet and a Flowing Sea," seems to be generally known or sung.

About the year 1810, Allan left his native county, led probably by some vague hopes of improving his fortune. He worked for a time in Edinburgh, where, we have been told, he hewed many of the stones which constitute one of the most beautiful places in a city of palaces—Charlotte Square. In time he reached London, abandoned his art, and commenced literary life in earnest, by obtaining an engagement in connexion with a newspaper called "The Day." The late hours and slavish labour of reporting were foreign to his taste and habits, and he left the press to become foreman to a sculptor named Budd. Shortly afterwards (about the year 1814), he was without employment, and threatened with some of the evils of poverty, which were the more alarming, as he had now attached to himself for life a sweetheart from the banks of the Nith, and was the father of several children. At a moment when his pecuniary resources were sunk to almost the lowest ebb, an advertisement of Mr Chantrey, the sculptor, for a superintendent of his workshop or place of business, met the eye of the poet; he applied, and was immediately accepted. This was a situation highly agreeable to Cunningham in all respects, and in none more so than as concerned the character of his employer, which included all that was amiable and respectable. Chantrey modelled the bust or figure in clay, and Cunningham overlooked the artisan who transferred it to marble—wrote letters, paid accounts, and attended to business of all kinds. The friends—for such they became—were useful to each other. In Chantrey's studio, the poet had opportunities of meeting with men of talent of all grades and distinctions; while the artist, in the early part of his career, was not a little indebted to the friendly critiques and encomiums which his assistant scattered through the magazines and newspapers. Cunningham soon became known. Walter Scott was, from the first, certain that he was the author of the pseudo-antique songs in Cromek's work, and Professor Wilson expressed the same opinion, in a paper in Blackwood's Magazine. Allan now wrote a series of tales for Blackwood—was a contributor also to the London Magazine—and published two volumes of "Traditional Tales," and a dramatic poem called "Sir Marmaduke Maxwell." There was genius in all he did, but it was wild and undisciplined—diffuse in style, and improbable in fable. He also threw off some novels—edited a collection of Scottish songs—and wrote a copious and manly memoir of Burns. Sir Walter Scott honoured him with a flattering notice in the introduction to the "Fortunes of Nigel," and thus, as Cunningham remarked, "gave his name to fame." The atmosphere of art in which he now breathed, imparted a new tone to his tastes, and he set to describing picture galleries, and writing memoirs of eminent painters, sculptors, and architects. These lives were published in five volumes, in "Murray's Family Library," (1829), and are by far the best of his prose compositions. The style is free and vigorous, the narrative lively, and the reflections interspersed throughout the work marked by originality and penetration. His attainments in the fine arts are perhaps a more remarkable feature in his history than his early ballad strains.

He made but one more effort in verse, by the publication, in 1832, of "The Maid of Elvar," a poem in twelve parts, founded on a Dumfriesshire story of the sixteenth century. This poem is in the Spenserian stanza, and more carefully elaborated than almost any other of his works. It is thus closed:—

> My song is ended: may my country see
> Order and beauty in my rude design:—
> My song is ended; I have poured it free:
> May they who read it deem its roughest line
> Tastes of fresh nature like well-flavoured wine.
> My song is ended: it was long to me
> As light to morn—as morn to Solway brine—
> As showers to corn—as blossom to the bee;
> And *dearer since, dear wife, 'twas pleasant unto thee.*

But in literary matters, it often happens that that which is most studiously toiled for is most disappointing, and the "Maid of Elvar" fell almost still-born from the press.

All this time, Mr Cunningham was attending to his daily duties in Chantrey's establishment. He was engaged there from six in the morning till six in the afternoon—often later; and in the evenings he poured out his mind on paper with the regularity and never-failing copiousness of a machine. His little study in Belgrave Place might truly be denominated *his forge*, the name by which Sir Walter Scott used at one time playfully to designate the apartment in which he wrote. The result of this industry was seen in the increased comfort and importance of the poet's household—in his well-filled library—and his daily extending reputation and acquaintance. He was familiar with almost every person eminent in art and literature. His conversation was rich, various, and full of anecdote. There is a dark, as well as a bright side, however, to the distinction conferred by such unremitting exertion. The daily business of the sculptor's establishment was full occupation for any man ordinarily constituted, or even for one more robust than the average, and the literary labours pursued at night were so much over and above what a due regard to health would have sanctioned. The industry and self-denial were admirable, and the glory was precious to a poet's soul; but nature's institutions are not to be outraged in vain, even by those who seem her favourite children. Here it may be remarked, that, while Allan Cunningham had made wonderful acquirements in the criticism of both literature and art, he had advanced less in more solid pursuits: he knew nature only in her external beauty and expression, not in those mysteries by which she leads us to contemplate the perfections of her own Author. The remark has often painfully occurred to us, that a slight knowledge of what modern science has elicited on the subject of mind—what, unfortunately, he and many like him only deem fit matter for ridicule—would have, in all probability, saved him for a hale old age, since it would have made him aware that the brain is no more to be misused with impunity than any other organ of the system. The consequence of his extreme labours—his being a man of business by day and an author by night—was, that, about three years ago, paralysis paid him a premature visit. The week after Sir Francis Chantrey had been struck on one side of his body, Allan was struck on the other; and thus, as the latter used to remark, with a melancholy smile, they made but one man between them, and that a damaged one. Both partially recovered: the intellectual power remaining uninjured, they were able once more to attend to business, and even to enter into society; but they never appeared quite the same men they had been. Even in gay society, Allan bore a sad and still expression affecting to look upon, and the flow of cheerful anecdote and remark for which he used to be remarkable, was gone

In November 1841, Sir Francis sunk under another attack, leaving Cunningham intrusted with the duty of winding up the affairs of his studio, and bequeathing a handsome annuity to him and his wife conjointly, a tribute by no means more than deserved, seeing how much of the best of his life he had given to the testator. Allan was then engaged in writing a memoir of his friend, Sir David Wilkie, and this task he had brought to a conclusion, when death stepped in to claim his part.

Allan Cunningham left, besides his excellent widow, three sons and a daughter, all grown up. Two of the former were provided for many years ago by appointments in India. The other, Peter, who has a government situation, has already shown an aptitude for the pursuits of his father. His acquirements in our literary history pointed him out lately to Mr Murray, as a fit editor of "Campbell's Specimens of English Poetry." The life of Allan Cunningham affords excellent lessons, but of an opposite kind; it shows a man of talent and pure worth rising to distinction through many difficulties, and thus may nerve the minds of many who sigh, as he once did, for distinction; and it warns against that excessive application to mental labour, which, though an error that leans to virtue's side, is scarcely less fatal to genius in these days, than were dissipation and vice in the days of our fathers.* A further specimen—a very beautiful one—of the poetry of Cunningham is here appended.

THE TOWN CHILD AND THE COUNTRY CHILD.

> Child of the country! free as air
> Art thou, and as the sunshine fair;
> Born, like the lily, where the dew
> Lies odorous when the day is new;
> Fed 'mid the May-flowers like the bee,
> Nursed to sweet music on the knee,
> Lull'd in the breast to that glad tune
> Which winds make 'mong the woods of June;
> I sing of thee: 'tis sweet to sing
> Of such a fair and gladsome thing.
> Child of the town! for thee I sigh:
> A gilded roof's thy golden sky,
> A carpet is thy daisied sod,
> A narrow street thy boundless road,
> Thy rushing deer 's the clattering tramp
> Of watchmen, thy best light 's a lamp;
> Through smoke, and not through trellis'd vines
> And blooming trees, thy sunbeam shines:—
> I sing of thee in sadness: where
> Else is wreck wrought in aught so fair?
> Child of the country! thy small feet
> Tread on strawberries red and sweet;
> With thee I wander forth to see
> The flowers which most delight the bee;
> The bush o'er which the throstle sung
> In April, while she nursed her young;
> The den beneath the sloe-thorn, where
> She bred her twins, the timorous hare;
> The knoll, wrought o'er with wild bluebells,
> Where brown bees build their balmy cells;
> The greenwood stream, the shady pool,
> Where trouts leap when the day is cool;
> The shilfa's nest, that seems to be
> A portion of the sheltering tree;
> And other marvels, which my verse
> Can find no language to rehearse.
> Child of the town! for thee, alas!
> Glad nature spreads nor flowers nor grass;
> Birds build no nests, nor in the sun
> Glad streams come singing as they run:
> A maypole is thy blossom'd tree,
> A beetle is thy murmuring bee;
> Thy bird is caged, thy dove is where
> Thy poulterer dwells, beside thy hare;
> Thy fruit is pluck'd, and by the pound
> Hawk'd clamorous all the city round;
> No roses, twinborn on the stalk,
> Perfume thee in thy evening walk;
> No voice of birds—but to thee comes
> The mingled din of cars and drums,
> And startling cries, such as are rife
> When wine and wassail waken strife.
> Child of the country! on the lawn
> I see thee like the bounding fawn;
> Blithe as the bird which tries its wing
> The first time on the winds of spring;
> Bright as the sun, when from the cloud
> He comes as cocks are crowing loud;
> Now running, shouting, 'mid sunbeams,
> Now groping trouts in lucid streams,
> Now spinning like a mill-wheel, round,
> Now hunting echo's empty sound,
> Now climbing up some old tall tree
> For climbing's sake. 'Tis sweet to thee
> To sit where birds can sit alone,
> Or share with thee thy venturous throne.
> Child of the town and bustling street,
> What woes and snares await thy feet!
> Thy paths are paved for five long miles,
> Thy groves and hills are peaks and tiles;
> Thy fragrant air is yon thick smoke,
> Which shrouds thee like a mourning cloak;
> And thou art cabin'd and confined
> At once from sun, and dew, and wind;
> Or set thy tottering feet but on
> Thy lengthen'd walks of slippery stone,
> The coachman there careering reels
> With goaded steeds and maddening wheels;
> And commerce pours each poring son
> In pelf's pursuit and hollos' run.
> While, flushed with wine, and stung at play,
> Men rush from darkness into day.
> The stream's too strong for thy small bark;
> There nought can sail save what is stark.
> Fly from the town, sweet child! for health
> Is happiness, and strength, and wealth.
> There is a lesson in each flower,
> A story in each stream and bower:
> On every herb on which you tread
> Are written words which, rightly read,
> Will lead you from earth's fragrant sod,
> To hope, and holiness, and God.

* In the above memoir, we have introduced a few passages from a sketch published in the *Inverness Courier*.

A VOICE FROM THE PAST.

It is certain that the mode of settling disputes by sound arguments is superseding that of deciding them by hard blows. Right used to have its knight-errants and mailed champions, who vicariously, or in their own vindication, entered the lists in defence of truth and justice. Men discuss more and fight less, and the club and the spear have yielded to the pen and the tongue. As supply follows demand, so this second reign of Saturn has called into action a class of combatants different from those who signalised the age of physical force. It is not Theseus or Hercules, Guy of Warwick, Amadis de Gaul, or the noble Cid, whose aid the injured seek, but certain braves, denominated gentlemen of the press, who do not use missiles that kill the body, but discharge volleys of paragraphs, aimed often with deadly effect at the ethereal part of the oppressive foe. Columns of words, not of warriors, fill the arena; reasons, not battalions, are placed in hostile array; interests are weighed, not armour or weapons of mortal strife; and the public voice, not the thunder of the battering-ram or arquebuss, proclaims, in harmonious concord, and without appeal, on which side is the right, that of the victor or the vanquished

Reflecting on this great change, this superseding of force by intellect, the thought naturally arises, whether many of the corporal struggles of these latter days have not been wasted efforts; whether they have secured a single object which might not and would have been attained by the quiet diffusion of intelligence. France offers on this question a very pertinent illustration. Here she is, after swinging over the fiery gulf for half a century, reposing under a Bourbon, under a constitutional prince, under a representative legislature, under responsible ministers, and under a responsible judicial administration. These are nearly the limits which the Constituent Assembly of 1789 assigned to her, and which the science of the period indicated as her legitimate boundary. All efforts to force her beyond this, apparently her natural position, have proved nugatory. The military glories of the empire were illusive; the alarm and slaughter of her Reign of Terror were fruitless of abiding results. Both fill pages of deep interest in her annals, but the interest arises more from the wildness and stirring character of the incidents, than any lasting influence they have exerted on the progress of the community. They were, in truth, surplusage—a noisy but needless accompaniment in the development of her chief drama; and it may be doubted whether they either averted or essentially altered any of the fixed conditions to which our neighbours seem des-

tined. They lacked steady support in the general taste and sentiment; and, like a pendulum, without sustaining power, the impulses, though violent, of necessity ultimately ceased. France, through all the vicissitudes of her civil convulsions, has been seeking a resting-place, and that place seems marked for her, as for every other community, by the weal and knowledge of her people.

Anterior to the burst of the French Revolution, great meliorations were in progress in the chief European states, under the quiet influence of a long peace and inquiring spirit. Whether that event tended to arrest or accelerate their march, is a problem unsuited to our pages to investigate. But it is certain that violence never made such illustrious and influential converts as were made by reason and philosophy. Under the auspices of the chief continental sovereigns, and those of the vast body of men of letters whom they patronised, the character of European society had been changed, partly in its outward forms, in its institutions, laws, and usages, but more in its inward spirit and substance. The influence of a powerful priesthood had been circumscribed; the Jesuits driven out; the monastic orders greatly reduced in number; and the flames of religious persecution quenched in their ashes. The odious practice of judicial torture had been abolished in Germany in 1776 by Joseph II., and his example was soon after followed by his brother Leopold in Italy. The Spanish Inquisition had been rendered almost innoxious—its last victim being an unfortunate woman at Seville, who, in 1781, was burnt alive for a crime which was absolutely supernatural. In Hungary, Bohemia, and Russia, personal slavery was being gradually alleviated. Agriculture was promoted, and the pursuits of commerce no longer esteemed degrading. Artificial distinctions and titles of honour had still a ceremonious precedence allowed them in private life; but the nobility indulged as little in supercilious pride and exclusiveness as in the barbaric pomp of their feudal predecessors. In competition with the more intrinsic realities of industry, historical recollections had abated of their pride of place; and whatever prescriptive rights might remain to the privileged orders, they formed no impassable barrier to a more equal and kindly intercourse among the different ranks of society.

In our own island, contemporary advances had been made in justice and wholesome policy. There was less of selfishness and monopoly; and the conviction had become apparent, that social benefits, to be enduring, must be common, not partial or exclusive. This spirit was evinced in the new treatment adopted towards Ireland—in unfettering her commerce, in giving greater scope and encouragement to her domestic industry, and in treating her, not as a colonial dependency subservient only to the greatness of the parent state, but as a partner having co-equal rights, and alike identified in the general prosperity of the empire. While these and many other encouraging circumstances were occurring, all at once a check was given by the riots of Lord George Gordon. By these fanatical outrages, the metropolis was brought to the brink of destruction. People became alarmed at the evidences of ignorance and violence which these disorders afforded; and before the panic had faded from remembrance, out burst the French Revolution in all its unhappy fury. Altars, thrones, and privileges, were all menaced with destruction. Even private property and persons hardly seemed safe. These fears might be groundless, they might be unreasonable, but they existed, and were the means of uniting all possessed of weight and influence in defence of what was termed peace, law, and order. So great was the panic, that reason was silenced. No talk of meliorations could be listened to, and the slightest approach to imitation of our Gallic neighbours, in the way of change or amendment, was resolutely opposed, as pregnant with undefinable ruin.

The lesson has often been repeated in subsequent domestic history. Inquiry and discussion have been gradually working their way in the public mind, when their fruits have been lost, or indefinitely deferred by some sudden explosion of popular excess or extravagance. Violence always recoils on itself; unreasonable claims seldom attain their purpose; they only cement and strengthen the power of resistance. These are natural results. If men seek only what is useful, or pertains to them, the common sense and feeling of mankind plead for them, and procure co-operative support; but if they seek that which is hurtful, or compromises antagonist rights, then they either lose adherents, or rouse into activity and combination an insurmountable opposition. From these obvious and commonplace principles, may generally be predicated the success or failure of every public enterprise. We have only to balance conflicting interests—those likely to be benefited, and those likely to be endangered—to arrive at the ultimate issue of the impending struggle.

According to this test may be tried the remarkable popular agitations which followed in quick succession the general peace of 1815; and, descending from national examples to minor illustrations, derived from the conflicts of capital and industry, we shall find further confirmations of our general conclusions in favour of peace, moderation, and respect for mutual rights. The great contest between machinery and manual industry is now almost a century old. It began with the discoveries of Watt, Wyatt, and Hargraves, soon after the accession of George III. Riots ensued, lives were lost, but opposition was fruitless. Resolutions were drawn up by the chief magistrates and manufacturers, stating that, if the new inventions were not adopted in Lancashire, they would in some other county, or in some other country; so that other people would reap the benefit if they did not.* Had the populace been successful in preventing, by tumults, the introduction of the new machinery, it is not likely they could have prevented the introduction of the cheaper commodities it had produced elsewhere. Competition would thus have wrought far more depressive effects on the condition of the spinner and weaver than mechanical ingenuity, and would have involved in its superseding tendency not the operatives only, but their employers, merchants, manufacturers, and tradesmen. This, indeed, is the general law (though we do not recollect to have seen it adverted to before) of all new contrivances for the abridgment of labour. Workmen must meet them either as competitors in the market of labour or as competitors in the market of commodities; in the former case, they may suffer temporary inconvenience, but in the latter both they and their employers are sure to be ruined, with the further disadvantage, that a benefit which science might have conferred on their own town or their own country, is lost without equivalent, and passes to the stranger or foreigner.

A permanent excess in the supply of labour has the same operation on the condition of the workmen as contrivances for its abbreviation. It tends to lower its price, and for this we fear there is no allowable or feasible preventive, except either lessening the redundancy of the commodity in excess, or finding new outlets for its employment. In the work just referred to, the subject is examined in its chief bearings, and many instances given of futile attempts to keep up wages, in the face of an overstocked market of industry, by turnouts and combinations. Of these, the disastrous results seem mostly to have been either to force trade from places where it was thriving, to stimulate contrivances for superseding skilled occupations, or to entail great pecuniary sacrifices on trade-unionists. The last is a serious and certain consequence, of which there has recently been some bitter experience. In the strikes of late years, there has been expended by the Glasgow cotton-spinners, L.47,000; the Manchester cotton-spinners, L.375,000; the wool-combers, L.100,000; the Leeds mechanics, L.137,000. The recent turn-outs in Lancashire must have been far more costly than all these, and yet have ended, we regret to say, without satisfactory results either to men or employers—leaving only to both an augmentation of difficulties to contend against.

The commercial and industrial position of the country seems such as not to need any addition to its perplexities by profitless dissensions. Violence, as we have endeavoured to show, has rarely or ever abated public wrongs; nor is it likely to do so in the existing juncture. It has seldom achieved, but often frustrated or delayed, relief. Discussion and inquiry are the natural resources of a civilised age; and if to these be superadded mutual concession and forbearance, there seems little doubt that both the body politic and the body physical would soon be convalescent.

* Wade's History and Political Philosophy of the Middle and Working Classes, p. 41, Chambers's People's Edition.

AN OLD HOUSE IN THE MERSE.

WITHOUT derogating from the interest attached to the more magnificent class of ruins—castles, abbeys, and cathedrals—we often feel that there is as much, or more, associated with the remains of some simple dwelling, at least if it be one which stands in some situation not vulgarising. Even the ruined cottage which we encounter in shooting over some lonely hillside, is an object which cannot be passed without an effusion of human sympathy, for within its walls hope, fear, joy, and sorrow, have been felt; and we can never forget, what a celebrated living writer has remarked, that the death of every peasant is the fifth act of a tragedy. But I know no object that comes home to the heart with more power, and to which I would more willingly devote a summer's day, than some deserted family residence, which has seen generation after generation flourish and decay, where love has shed its purple light over hearts long buried, where the still sad music of humanity has been heard, but is now silent for ever, where beauty has pined into an early grave, where fiery youth has ripened into sober maturity, where noble minds have been o'erthrown by sad vicissitudes, where hope deferred has sickened the heart, where the return of the long-absent has shed light and gladness, where age has indulged its recollections of the past, and childhood its bright anticipations of the future, where marriages have been celebrated with song and with dance, where birth-days have been kept with befitting carousals, and where the dead have been carried forth with solemn ceremony, and amidst all the pageantry of woe.

I say this much by way of preface to an account of an old house in the Merse, or lower district of Berwickshire, which, from particular circumstances in my own history, I regard with an unusually lively interest. About six miles above the junction of the Whitadder with the Tweed, on the south side of the former, stands the now uninhabited house of Hutton Hall. It is built on the top of a steep bank, beautifully wooded, between which and the river stretches a large green *haugh*, as a strip of alluvial ground is called in Scotland. Around this the Whitadder makes one of those windings which occur so frequently in its course, and from which it is supposed to derive its name. Farther up are the woods of Whitehall—another uninhabited house—which in autumn are variegated with the richest hues. In front of the house is a large and beautiful park, containing some of the finest trees in the district, and which has that quiet and venerable look of age more common in English and in Scottish pleasure-grounds. Behind the house, in the bank overhanging the haugh, is an extensive rookery, whose sounds alone now break the silence of a place where, in olden times, a castle stood in feudal pride, and which, in modern days, was enlivened with the sounds of gaiety, and brightened with the smiles of beauty. The visitor, after passing through the well cultivated fields of the Merse, in which industry is at work on every hand, and of which the rich plains and valleys show like so many gardens, is surprised to find himself suddenly in a spot where there is nothing to tell of the present generation, but where everything carries him back to those which have been.

It was a little to the west of the present house that the ancient castle of Hutton Hall stood; and, judging from its situation, it must have been a place of considerable strength. The house has still much of the old border aspect, and part of it was obviously erected at a period when security from hostile attacks was more looked to than comfort or elegance. The part to which we allude is a square tower with frowning battlements, built in that massive style which was necessary for defence against the "Northumbrian prickers fierce and rude." Whether this was an appendage to the ancient castle, or was erected immediately after its destruction (for of its having seen at least three centuries there can be no doubt), we shall not take upon us to determine. The rest of the house is more modern, and marks the transition period of architecture, as well as of society.

The ancient castle of Hutton Hall was destroyed in the year 1497. It was taken and sacked by the Earl of Surrey, who led the English forces against Perkin Warbeck, when that impudent pretender had inveigled James IV. into a war with England. It is curious to find Ford, in his drama of "Perkin Warbeck," mentioning Hutton Hall, along with several other places in the neighbourhood, in the tirade which he puts into the mouth of Surrey. The orthography of the ingenious Templar is perhaps as correct as could have been expected.

> "Can they
> Look on the strength of Cunderstine defaced?
> The glory of Heydon Hall devastated?—that
> Of Edington cast down?—the pile of Fulden
> O'erthrown; and this the strongest of their forts,
> Old Ayton castle, yielded and demolished,
> And yet not peep abroad?"

According to a date which was recently to be seen above the principal door, the present house of Hutton Hall was built in 1573. It is somewhat in the Elizabethan style, though with less architectural embellishment than is to be seen in the old family residences of the south of a similar age. The interior is fitted up in a comparatively modern style, some of the rooms being after the manner of the last century. But the concealments, the narrow and winding stairs, and the involved passages, tell of an earlier period. The kitchen and servants' hall are arched, and present something of a monastic appearance. The principal stair is of stone; but having been worn away by the footsteps of many generations, it has been covered, at an apparently recent period, with plain wood. There is no furniture remaining in the house; and having been uninhabited for several years, it is fast going to decay.

Our readers will remember the Seven Spears of Wedderburn, who are mentioned in the Lay of the Last Minstrel, as having come to the aid of Branksome against Belted Will Howard and Lord Dacre. To one of these Hutton Hall belonged in former times. Of this we believe there is sufficient evidence furnished by the charter chest of Wedderburn; and above the principal door the arms of the Homes are still to be seen engraved in stone. But of those times there is no tradition preserved with regard to Hutton Hall. Indeed, when we consider that the country all around must have been the scene of many a hard-fought encounter between the rival borderers, it is strange that this kind of lore should be so rare among the people of the neighbourhood. The early period at which systematic agriculture was pursued in this district, and the complete change in the character and habits of the people that in consequence ensued, is the only circumstance that seems adequately to account for the fact. The plough, no less than the loom and the steam-engine, dispels the old stories of prowess and romance.

From the Homes, Hutton Hall was purchased about the beginning of the seventeenth century by the Johnstons of Hilton, whose family seat it was until a few years ago. The first of the family of Hilton was a cadet of the famous house of Annandale. The Johnstons had property in several of the surrounding parishes, and, along with the Homes and Swintons, were the leading gentry of the Merse. During the reigns of Charles II. and James II., they were on the side of the government. At that time Daniel Douglas was minister of Hilton, a man whose memory is still preserved among the people of the neighbourhood. He was a staunch Presbyterian; and tradition tells that his faith was so strong, that he would sow

chaff, doubting not that wheat would grow. In the small rural church of Hilton, of which the ruins still remain, the congregation had assembled, among whom was Johnston. Douglas was addressing the people; and, perhaps, in preaching to the times, expressed some sentiment which gave offence to Hilton. Suddenly the latter rose from his seat, drew his sword, and marched up to the pulpit. He seized hold of the clergyman, and dragged him down. Douglas was slightly wounded, and some blood was shed. The preacher was filled with indignation, and, giving vent to his feelings on the spot, he prophesied against him the prophecy of Elijah against Ahab—"In the place where *thou hast done this*, shall dogs lick thy blood, even thine."

Time rolled on; Douglas, getting into trouble with the government, had retired to Holland, and Johnston had forgotten the prophecy. It happened one winter, that the Earl of Home had gone to London, where he tarried long; and his lady, to relieve her solitude, had invited some of her friends to spend the Christmas holidays with her at Hirsel. Among these were the Laird of Hilton, and his neighbour the Laird of Ninewells—the latter, it may be remarked, was ancestor to the celebrated David Hume. These two were playing one evening at cards with Mr William Home, the earl's brother, and sheriff of the Merse. The sheriff had bad luck; he lost a great deal of money, and he felt as men generally do on such occasions. Some high words passed, reflections were thrown out, and in this humour they separated for the night. Hilton had retired to bed, when suddenly the sheriff entered his room, with a candle in one hand and a drawn sword in the other. He called on the sleeper to rise and give him satisfaction. As Hilton was getting up from his bed, Home ran him through the body with his sword, and gave him several other severe wounds. In the mean time, Ninewells, who slept in an adjoining chamber, hearing the noise, came to see what had happened, but was stabbed by the sheriff as he entered the room, and instantly expired. The murderer, who had horses at command, immediately fled. Johnston lingered for a few days, and died. His remains were put into a temporary coffin, to be conveyed to Hutton Hall for interment. On their way to that place, the persons who were intrusted with them being overtaken by a storm of snow, stopped for a while at Hilton. The coffin, for greater decency, was put into the church, where the men waited until the storm should abate. In a short time, they were surprised to observe blood flowing from the coffin on the ground. The dogs that accompanied them ran forward to the spot, and in spite of all efforts to prevent them, fulfilled the prophecy of Daniel Douglas.

The part of this story which relates to Daniel Douglas and his prophecy rests only on popular tradition; but the murder of Johnston is fully related in a letter written at that period by the steward of Lord Derwentwater to his lordship in London, and has also been particularised in "Law's Memorials." The writer of that work adds the following note:—"Before his death, he [Mr Home, the murderer] is said to have returned to Scotland, smitten with remorse, and anxious to obtain pardon from a near relation of Johnston's, then residing in Edinburgh. This gentleman, in the dusk of the evening, was called forth to the outside stairs of the house, to speak with a stranger muffled up in a cloak. As he proceeded along the passage, the door being open, he recognised the murderer, and immediately drawing his sword, rushed towards him, on which the other nimbly leapt down from the stairs into the street, and was never again seen in Scotland." Lord Fountainhall states, that the unhappy man was killed in the wars abroad. His name has been omitted from the account of the family in the peerage.

The sisters of the last proprietor of Hutton Hall were distinguished beauties in their day, some fifty years ago. There were four of them. One was Mrs Oswald of Auchencruive, the subject of Burns's "Wat ye wha's in yon town?" and of whom a portrait has been introduced into the work entitled "The Land of Burns." Like many ladies of that period, they were distinguished for their equestrian skill, and for their zeal in fox-hunting. Of the true Diana Vernon school, these qualities did not impair their grace, their delicacy, and their wit. They all made good marriages. On the wedding-day of one of them, Lady Baird of Saughton, a tragical incident occurred, which must have thrown a mournful shade over the marriage festivities. The bridegroom had not arrived before the appointed day, and, when on the morning he came to the other side of the Whitadder, which it was necessary for him to cross, the river was in flood. To ford it would have been attended with the utmost danger; but the wedding was not to be delayed. A rope was attached to a boat, which was held by persons stationed on the bank. Four domestics of the establishment entered the boat, with directions to shout if there was any danger, when they would be immediately drawn to land. They had rowed to about the middle of the stream, when those on shore imagined that they heard the signal which they had directed to be made. They pulled the rope; but whether from the force of the stream, or from some other cause, the boat upset, and the four men were drowned. The story is still current in the neighbourhood, as one of the many instances that show how, in the midst of life, we are in death.

Many other tales connected with this old house our space forbids us to narrate; nor can we now describe the popularity which the last proprietors enjoyed in the neighbourhood, their connexions with other distinguished families, and that gradual diminution of their lands, which marks their history like that of so many others of our old gentry. "As is the race of leaves, so is that of men," says the great poet of Greece. The philosopher will acquiesce in the wisdom of that arrangement of the social system by which generation succeeds to generation, and family to family; and he will perceive how necessary the change of property is for maintaining the health and energy of a great and free nation. But however paramount the views of reason and utility ought to be in such considerations, there are feelings of melancholy interest connected with particular instances, which it is good to cherish. Thus, amidst the "glory of Heydon Hall devastated," and the desolate beauty of its grey walls and neglected park, whence have passed for ever the warlike prowess of the Homes, and the gaiety and elegance of the Johnstons, it is well to reflect that families, no less than individuals, have here no continuing city or place of abode. And salutary thoughts will be suggested by the contrast between the changes of many-coloured life which such a spot has seen, and the goodly spectacle still presented by its noble trees, its green fields, and its beautiful river. But it is needless, in the vein of sentimentalism, to regret the barbaric splendour of the feudal times, or the one-sided civilisation of the ages that followed. The one and the other have passed away, never to return. Ancient families may fall, splendid houses may sink into ruins, and the cherished memorials of the past may yield to the plastic influence of the spirit of the times; but the spread of knowledge among the people, the social progress of the great mass of the community, commercial enterprise, manufacturing skill, wise and salutary laws, science, art, and peace—these form the glory of our age, and the earnest of still brighter days.

IMPORTATION OF FOREIGN LEECHES INTO ENGLAND.

[From the *Medical Times*, November 19.]

It is not generally known, that the leech trade is one of very great extent in this country, and few people are aware from whence this most useful amphibious animal is procured, to supply the great demand that is made for it by private patients, as well as the public medical institutions that abound in this metropolis, and throughout Great Britain. In former years, Lincolnshire, Yorkshire, and other fenny counties, were able to supply the demand; but since the letting of blood by means of the lancet has been partially exchanged for the more efficacious application of the leech to the injured parts, they have been entirely exhausted. At the conclusion of the peace with France, in 1815, several dealers and speculators visited Paris, where they found leeches were easily to be obtained, and at a moderate price. The herbalists and apothecaries who supplied the hospitals, used then to purchase them in small quantities from the conductors of the Diligences coming from Niort, Tours, Orleans, St Quentin, and other parts of the interior, not as an article of commerce, but only sufficiently to meet their demands. The arrival of Englishmen in the French capital soon excited their suspicions *that money was to be made;* and the conductors were soon on the *qui vive*, that they might make a good market with John Bull. At that time they charged only 10 or 12 francs per thousand, leaving themselves a good profit, as they were able to procure them from the peasantry at 5 or 6 francs. There are various species of leech—the grey or *sangsues grises*, commonly called the speckled, the green, and the black. The first was the only one much in use, being the same species as that formerly caught in England, although the green are equally as good; but the bite being more acute than the speckled, there was a prejudice against them. The black, or horse leech, was strongly depreciated by medical men, as it is considered rather venomous, and sure to cause inflammation: that species is never used either in England or France. The demand from 1815 to 1823 for the London market was, on an average, annually from 3,000,000 to 10,000,000. This increased call soon made the French conductors and dealers turn the leech into an important article of commerce. From 15 francs they gradually rose to 25, 30, 40, 50, 100, and, at last, by their becoming exhausted throughout the whole country, to 200 francs. The departments that, in 1815, were so abundant in leeches, are now dried up, and the French themselves are obliged to import them from other countries, so as to meet the demand for their own consumption. The great cause of this annihilation of the species, is the over-eagerness of the fishermen to take them, whereby millions were destroyed before they came to a state of puberty, being only *cocons*, or spawn. Such has been the profit in the leech business, that many of the Paris conductors and petty apothecaries, who had but a few hundred francs, are now independent men, and extensive *proprietaires*, worth L.20,000 to L.30,000 in funded and landed property. The deficiency in the supply of the leech made the London dealers turn their attention to Hamburgh, where it was found a great traffic in this useful creature was carried on to a very great extent by the Jews: it is, therefore, from that commercial city that the English market is now supplied through the expeditious communication by steam. The Hamburgh merchants procure them at a great expense (as the mortality is very considerable) from Hungary, Poland, Wallachia, and the borders of Turkey; but it is expected that the species will, in a few years hence, be entirely exhausted throughout Europe. They are caught in Spain, Portugal, Switzerland, and Italy, but of the green species only, and of so very sickly a constitution, that they will not support the fatigue of a journey to any distance, although they are well packed in wet canvass bags filled with moistened moss. Such is the scarcity of the speckled leech, that it is with difficulty they are now procured; and although there has been for years a prejudice against the green, they are the only species that can now be obtained, and that at an enormous price, being sold in the London market at L.8 per thousand, when they formerly could be purchased for 10s. and 12s. This high price, added to the scarcity, has caused a most astonishing falling off in the demand; and on an average, the annual importation from Hamburgh and Paris is not more than 3,000,000 to 4,000,000—as the hospitals and other institutions are only enabled to use them but in cases of the greatest necessity, where bleeding by the lancet would not be so efficacious. Nothing can be of more general use than the leech in a surgical point of view, as it can be applied with the greatest safety to the parts affected, and it is deeply to be lamented that it is so near becoming extinct. The mode of taking the leech used to give employment to thousands of men, women, and children, who entered with their bare legs into the gentle running streams, and disturbing the water with a stick, these blood-suckers soon attached themselves to their bleeding legs, when they were instantly placed into jars. Many attempts have been made to propagate them in *reservoirs*, but without effect, as they will not breed except in marshy grounds and undisturbed running waters. The mortality among the peasantry who are engaged in the leech fishery is very great; not so much from the constant loss of blood, but the effects of exposure in the unhealthy swamps, thereby causing agues and premature death.

BURYING ALIVE.

Not many years since, in St Petersburg, a young nobleman who had squandered his fortune found his sister, to whom he had applied to relieve his wants, not in the least inclined to sacrifice her patrimony to his taste for dissipation. As he considered himself her heir, he determined to destroy her, and, with this view, found means to give her a draught, which was probably intended to kill, but only produced a deep sleep. The news, through his means, being publicly circulated that she was dead, he prepared, with all the external show of the deepest sorrow, for her interment. The arrangements being completed, the corpse, as is the custom, was placed upon the altar, and the priest was already in the act of pronouncing the last blessing, when one of her friends, who was passing through the place, and had been informed of her death, went into the church with the intention of pressing one farewell kiss on her cheek previous to the interment. Hastening to the coffin, she seized her hand, and found it rather flaccid, but not rigid. She then touched her cheek, and imagined that she felt some natural warmth on it. She therefore desired that the ceremony should be postponed, to try if her friend might not be recalled to life; but her request was refused, and neither the brother nor the priest would listen to her solicitations, but, on the contrary, ridiculed her suggestions, and treated her as an insane person. In the hurry of her feelings, and in the anxiety of the moment, she hastily threw herself into her carriage, and drove to the neighbouring seat of government. Here she found a hearing, proper persons were appointed to accompany her to investigate the affair, and she returned back with all convenient speed. But the lady had been buried from the day before, and the inhuman brother had already taken possession of her property, while there were hosts of priests and crowds of suborned witnesses ready to attest that the unfortunate woman was really dead; and as among the Russians it is accounted heinous impiety to disinter a corpse, the desire of the generous friend to satisfy herself, by ocular demonstration, of the truth or falsehood of her suspicions, for a long time experienced the most violent opposition. At length, from some circumstances which transpired, the commissioners of inquiry conceived some suspicion of the case, and determined on opening the grave, when it was discovered that the lady had been buried alive, as her face was much lacerated, and impressions of her nails were found on the coffin-lid. The brother and a priest were then taken into custody, confessed their crime, and underwent the punishment they so richly deserved.—*Binns on Sleep.*

OTHER IRONS IN THE FIRE.

Mrs B—— desired Dr Johnson to give his opinion of a new work she had just written; adding, that, if it would not do, she begged him to tell her, for she had other *irons in the fire*, and in case of its not being likely to succeed, she could bring out something else. "Then," said the doctor, after having turned over a few of the leaves, "I advise you, madam, to put it where your *other irons* are."

A NEW USE FOR SLAVE-SHIPS.

It is a fact, which must be gratifying to every individual who rejoices at the downfall of slavery, that out of twenty-six Wesleyan chapels in Sierra Leone, the roof-timbers, the flooring, and other wood-work of twenty is composed nearly exclusively of slave ships, which have been taken by her majesty's men-of-war on the coast, and condemned by the Mixed Commission Court.—*Sierra Leone Watchman.*

CORN-STALK MOLASSES.

By taking off the ear of corn early, the farmers in Indiana (America) are enabled to make molasses from the corn-stalk in considerable quantities—two gallons from eight of juice. They are about to try the experiment for sugar.—*Literary Gazette.*

Column for the Boys.

A YOUNG HERO.

About eighty years ago, there lived a little boy in Ireland, of the name of Volney Beckner, whose heroic conduct deserves to be commemorated, as a model for young persons. Volney was born at Londonderry, in 1748; his father having been a fisherman of that place, and so poor, that he did not possess the means of giving his son a regular school education. What young Volney lost in this respect was in some measure compensated by his father's instructions at home. These instructions chiefly referred to a sea-faring life, in which generosity of disposition, courage in encountering difficulties, and a readiness of resource on all occasions, are the well-known characteristics. While yet a mere baby, his father taught him to move and guide himself in the middle of the waves, even when they were most agitated. He used to throw him from the stern of his boat into the sea, and encourage him to sustain himself by swimming, and only when he appeared to be sinking, did he plunge in to his aid. In this way young Volney Beckner, from his very cradle, was taught to brave the dangers of the sea, in which, in time, he moved with the greatest ease and confidence. At four years of age, he was able to swim a distance of three or four miles after his father's vessel, which he would not enter till completely fatigued; he would then catch a rope which was thrown to him, and, clinging to it, mount safely to the deck.

When Volney was about nine years of age, he was placed apprentice in a merchant ship, in which his father appears to have sometimes sailed, and in this situation he rendered himself exceedingly useful. In tempestuous weather, when the wind blew with violence, tore the sails, and made the timbers creak, and while the rain fell in torrents, he was not the last in manœuvring. The squirrel does not clamber with more agility over the loftiest trees than did Volney along the stays and sail-yards. When he was at the top of the highest mast, even in the fiercest storm, he appeared as little agitated as a passenger stretched on a hammock. The little fellow, also, was regardless of ordinary toils and privations. To be fed with biscuit broken with a hatchet, sparingly moistened with muddy water full of worms, to be half covered with a garment of coarse cloth, to take some hours of repose stretched on a plank, and to be suddenly wakened at the moment when his sleep was the soundest; such was the life of Volney, and yet he enjoyed a robust constitution. He never caught cold, he never knew fears, or any of the diseases springing from pampered appetites or idleness.

Such was the cleverness, the good temper, and the trust-worthiness of Volney Beckner, that, at his twelfth year, he was judged worthy of promotion in the vessel, and of receiving double his former pay. The captain of the ship on board which he served, cited him as a model to the other boys. He did not even fear to say once, in the presence of his whole crew, "If this little man continues to conduct himself with so much valour and prudence, I have no doubt of his obtaining a place much above that which I occupy." Little Volney was very sensible to the praises that he so well deserved. Although deprived of the advantages of a liberal education, the general instructions he had received, and his own experience, had opened his mind, and he aspired, by his conduct, to win the esteem and affection of those about him. He was always ready and willing to assist his fellow-sailors, and by his extraordinary activity saved them in many dangerous emergencies. An occasion at length arrived, in which the young sailor had an opportunity of performing one of the most gallant actions on record.

The vessel to which Volney belonged was bound to Port-au-Prince, in France, and this voyage his father was on board. Among the passengers was a little girl, daughter of a rich American merchant; she had slipped away from her nurse, who was ill and taking some repose in the cabin, and ran upon deck. There, while she gazed on the wide world of waters around, a sudden heaving of the ship caused her to become dizzy, and she fell over the side of the vessel into the sea. The father of Volney, perceiving the accident, darted after her, and in five or six strokes he caught her by the frock. Whilst he swam with one hand to regain the vessel, and with the other held the child close to his breast, Beckner perceived, at a distance, a shark advancing directly towards him. He called out for assistance. The danger was pressing. Every one ran on deck, but no one dared to go farther; they contented themselves with firing off several muskets with little effect; and the animal, lashing the sea with his tail, and opening his frightful jaws, was just about to seize his prey. In this terrible extremity, what strong men would not venture to attempt, filial piety excited a child to execute. Little Volney armed himself with a broad and pointed sabre; he threw himself into the sea; then diving with the velocity of a fish, he slipped under the animal, and stabbed his sword in his body up to the hilt. Thus suddenly assailed, and deeply wounded, the shark quitted the track of his prey, and turned against his assailant, who attacked him with repeated lounges of his weapon. It was a heart-rending spectacle. On one side, the American trembling for his little girl, who seemed devoted to destruction; on the other, a generous mariner exposing his life for a child not his own; and here the whole crew full of breathless anxiety as to the result of an encounter in which their young shipmate exposed himself to almost inevitable death to direct it from his father!

The combat was too unequal, and no refuge remained but in a speedy retreat. A number of ropes were quickly thrown out to the father and the son, and they each succeeded in seizing one. They were hastily drawn up. Already they were several feet above the surface of the water. Already cries of joy were heard: "Here they are, here they are—they are saved!" Alas! no—they were not saved! at least one victim was to be sacrificed to the rest. Enraged at seeing his prey about to escape him, the shark plunged to make a vigorous spring; then issuing from the sea with impetuosity, and darting forward like lightning, with the sharp teeth of his capacious mouth he tore asunder the body of the intrepid and unfortunate boy while suspended in the air. A part of poor little Volney's palpitating and lifeless body was drawn up to the ship, while his father and the fainting child in his arms were saved.

Thus perished, at the age of twelve years and some months, this hopeful young sailor, who so well deserved a better fate. When we reflect on the generous action which he performed, in saving the life of his father, and of a girl who was a stranger to him, at the expense of his own, we are surely entitled to place his name in the very first rank of heroes. But the deed was not alone glorious from its immediate consequences. As an example, it survives to the most distant ages. The present relation of it cannot but animate youth to the commission of generous and praiseworthy actions. When pressed by emergencies, let them cast aside all selfish considerations, and think on the heroism of the Irish sailor boy—Volney Beckner.

GAS LIGHTING.

The Drummond light, the Gurney, or Bude light, and the Boccius light, exclusive of the "Light of All Nations," are the Great Lights of the Age. The first is the oxy-hydrogen, the union of oxygen and hydrogen gas on lime, and at a very high temperature. The second is the oxy-oil, a jet of oxygen being introduced by means of a very peculiarly shaped conical jet into the centre of an ordinary oil-wick flame; this was perfected, we believe, under the auspices of the Trinity Board, having been intended to be used in light-houses; and we have heard it designated to that view by a high authority, as an arrangement affording the greatest possible amount of light in the smallest possible space. The third is a coal-gas light; and of this we make the chief mention. This light, of course, is no recent discovery; it was known so long ago as 1688; but since then, what an increase of knowledge of the properties of coal-gas has been gained, and what great mechanical improvements have been arranged for its combustion! Of the latter character is the Boccius light, or, perhaps, more correctly speaking, the Boccius gas-lamp. The one set up opposite Northumberland House, crowned with ugliness, consists of three ring-burners, large, lesser, and less, perforated so thickly with holes, that the flames form, as it were, three leaves of light; these are protected from the lateral currents of air by a glass screen, and are thrown down and around by a metallic reflector. The illuminating power is very considerable. Contemplating the vast establishments, in the present day, for the manufacture of coal-gas—the numerous improvements for its thorough combustion, mechanical and chemical, of the latter especially—Lowe's naphthalised gas, the perfection of artificial light—we cannot help reverting to the extent of the knowledge of gas and its properties, as mentioned in a letter addressed to the Royal Society, May 12, 1688, by Mr John Clayton, rector of Crofton, at Wakefield, in Yorkshire, and contrasting the bladders of 1688 with the gasometers of 1842. Speaking of the thunder in Virginia, and its dreadful effects, the writer says—"I have been told by very serious planters, that thirty or forty years ago, when the country was not so open as now, the thunder was more fierce; and that sometimes, after violent thunder and rains, the roads would seem to have perfect casts of brimstone; and it is frequent, after much thunder and lightning, for the air to have a perfect sulphureous smell. Durst I offer my weak reasons, when I write to so great masters thereof (meaning the Council of the Society), I should here consider the nature of thunder, and compare it with some sulphureous spirits which I have drawn from coals, that I could no way condense, yet were inflammable; nay, would burn after they passed through water, and that seemingly fiercer, if they were not overpowered therewith. I have kept some of this spirit a considerable time in bladders; and though it appeared as if it were only blown with air, yet if I let it forth, and fired it with a match or candle, it would continue burning until all were spent."—*Derham's Miscel. Curiosa*, vol. iii., p. 290. Mention is farther made of gas in another paper, about the year 1691, sent by the same writer to the Royal Society; and we do not remember seeing these remarkable facts mentioned by any writer on the subject.—*Literary Gazette.*

NEW MANUFACTURE OF CLOTH.

At the last meeting of the Society of Arts, a very interesting communication was made on a new process of the manufacture of cloth by felting, in which all the processes formerly effected by manual labour are performed, and cloth of much greater dimensions can be produced. The bat of wool is formed by means of a travelling apron, 37 yards in length, which receives the thin slivers of wool from the carding machines; which process is continued until the slivers are accumulated, one upon another, throughout the whole length of the apron, in sufficient numbers to give the degree of substance necessary for the purpose for which the cloth is intended. The bat is then cut and transferred to a machine called a "hardener," in which it is made to pass through a series of rollers, by which it is compressed, the felting being effected by an alternating motion of the upper rollers, while the cloth receives the requisite heat and moisture from steam issuing from perforations in pipes placed between the rollers. The cloth, after passing a second time through this machine, is transferred to a third, where it is farther compressed by rollers, which work in a bath of soap and water, by which it is so thoroughly cleansed, that the time required for beating it in the fulling-mill is very short compared with that required for woollen cloth. After these operations, the cloth is susceptible of any degree of finish that may be required, and this by the ordinary methods. The manufacture is peculiarly fitted for carpets, horse-cloths, and such fabrics as pilot coats, and it can be made at a much less cost than woven cloth. —*Newspaper paragraph.*

FRENCH LABOURERS.

From my daily habit of riding or walking through the retired parts of this country, I am, to a certain extent, able to speak of the situation of the labouring poor. It is, in one respect, superior to that of my own countrymen; inasmuch as, should the cow be wanting, the large garden-plot and the pig are pretty general among them. Their wages, it is true, are lower than those of the English labourers; but then their wants are fewer, and thus the account is balanced. They make their articles of food go much farther than an English labourer does; and what they do gain by their daily labour is never wasted in intemperance, but spent on their families, for the real necessaries of life. I am told that some of their employers give them cider to drink in harvest; but I confess I have never seen them supplied with it. A French labourer, however, having made his repast of either soup or coffee, is not tormented with thirst, as those of our country are, after eating solid and exciting food. That occasionally the extremities of indigence are to be found in a French labourer's cottage, is too true, and there is much suffering from severe weather; so much so, I am informed, that it is not unusual to see several entire families huddled together in one house, to avail themselves of the animal heat emanating from their own bodies. The children of the labouring poor appear to me to be better dressed than those of our own country. —*Nimrod Abroad.*

THE CROPPING SYSTEM IN FRANCE.

According to the Parisian journals, it appears that the wholesale dealers in human hair have had a most successful harvest this year, not less than 200,000 lb. weight having been procured. Brittany is the province of France in which the traffic is mostly carried on, and all the fairs are regularly attended by purchasers, both male and female. The Breton peasants have particularly fine hair, and generally in great abundance; their beautiful tresses they are perfectly willing to sell; and it is no uncommon sight to see several girls sheared one after the other like sheep, and many others standing ready for the shears, with their caps in their hands, and their long hair combed out and hanging down to their waists. Every successive crop of hair is tied up into a whisp by itself, and thrown into a large basket, placed by the side of the operator. The highest value given by these abominable hair-merchants for a fine crop of hair is twenty sous, but the more frequent consideration is a gaudy but trumpery cotton handkerchief, worth about sixteen sous. The profit thus netted by these hairmongers must be enormous.—*Newspaper paragraph.*

NAPOLEON'S COMPASS.

A small compass has lately been offered for sale to the French government by a Chevalier Auriol, to which a curious history is attached. This little instrument, which is in a plain gilt case, and of English manufacture, was first sent, with other astronomical instruments, to Louis XVI., by a descendant of Sir Isaac Newton. It appears that it was afterwards given by the unfortunate monarch to the Dauphin, who had it with him in prison, and while there gave it to a faithful dependant who had tried to assist him to escape. This party had been at school at Brienne with Napoleon, and accompanied him to Egypt. There he happened to show the little compass to Napoleon, who admired it, and it was accordingly presented to him. Napoleon, on returning to France, and having become emperor, being, as is well-known, superstitious, set great value on the instrument; had the letter "N" and his imperial crown engraved on it, and made use of it in his campaigns, and never parted with it until his captivity in St Helena; and then, either considering it as a useless talisman, or as the best means of acknowledging the disinterested kindness of the party, he presented it to Madame Auriol. Marshal Soult is now in treaty with the Chevalier d'Auriol for the purchase of it, with the view of placing this royal and imperial relic among the other objects preserved in the Hotel des Invalides, as having been about the person of Napoleon.—*Newspaper paragraph.*

HUGE WIRE ROPE.

A friend of ours, who has just returned from Antwerp, informs us that he saw landing on the quays there, from a vessel arrived from Newcastle, a huge coil of wire rope, which excited much astonishment. It was stated to be 5300 yards in length, and to weigh twelve tons, and he understood that it had been purchased by the Belgian government for the celebrated inclined plane on the railway from Antwerp to Liege. It is with pleasure that we record this instance of the superiority of British manufacture, as we understand that wire ropes are also manufactured in Belgium, and have only lately been introduced into this country. This rope was made by Messrs Newall and Co. of Gateshead, and is the longest and strongest rope ever made. Mr Newall is a native of Dundee. A rope made for the Glasgow railway, of hemp, is not so long as the one referred to by nearly half a mile.—*Dundee Courier.*

NUMBER 570. SATURDAY, DECEMBER 31, 1842. PRICE 1½*d.*

THE FUTURE.

AN inclination to pry into the future seems to be as natural to man, as it is for him to look back to, and dwell with a mournful interest upon, the past. And many have been the efforts made, and means adopted and put faith in, for bringing before us and realising the events as yet buried in the womb of time, particularly those which bear upon our own individual interests. The superstitions and quackeries which have thus been set on foot amongst mankind, present no exalted view of our common nature; but we must not be too ready, on this account, to overlook them. In history, they take an important place amongst moving and influencing causes, from the days of Roman augury down to modern fortune-telling. The disregard paid by a Roman naval commander to the omen of the sacred chickens refusing to eat, and his throwing them contemptuously into the sea, proved the cause, by dispiriting his forces, of his losing a battle; and Montaigne tells us that the predictions circulated in favour of Charles V. in Italy, actually terrified a French commander, who had seemed an honest man, out of his allegiance to his own king; and, by inducing him to revolt, nearly caused the loss of an immense number of fortresses to the enemy. Nor must we overlook that, though the well educated are generally exempt in our days from these follies, there are still a vast number of persons who either fully believe in the possibility of ascertaining future events by supernatural means, or at least have not their minds quite made up to the opposite conclusion.

The most prevalent form of this delusion is that of common fortune-telling, the mention of which almost induces us to recall what has just been said with respect to the educated classes; for we believe the fact is, that there never is wanting in London or Paris a seer, male or female, who is in the receipt of a large income entirely drawn from the pockets of the wealthy. The present practitioner in the latter capital is a Madame Normand, who not only tells those who come before her in person of many wonderful things, but, after the manner of another class of pretenders, transmits fortunes by post, a due fee having previously been transmitted to her. We have been assured, upon excellent authority, that a very large proportion of the trade of this mystic personage is with the English of the upper classes who visit Paris. It seems almost absurd to enter into a reasoning against such delusions; but we shall merely adduce the pointed argument which has been urged against the reality of all such pretensions to supernatural knowledge; namely, that, if it were real, the possessor of it might be expected to turn it to account in fund speculations, an obviously more rapid and efficient means of acquiring wealth than taking guineas from weak people of fashion. After such examples of credulity, the faith which serving maids place in gipsies is not to be wondered at, however much it may be deplored. It may be sufficient at present to point out to them the absurdity of expecting fortune from persons who are themselves so little blessed with it as to be in rags and beggary; how easy it is to promise where there is no personal obligation to fulfil the promises: how much reason there is to suspect only an interested motive in such promises; in one word, the Vicar of Wakefield's answer to his daughter on being told that she had given her half-crown to a vagrant who foretold her marrying a squire, "You fool, I would have given you an earl for half the money!"

There is still a considerable inclination to believe that a presentiment, or vague consciousness of coming evil, occasionally arises in the minds of individuals. Many believe or half believe in this form of divination, who deny all others. Many striking instances could be adduced. For example, a widow lady resident in Edinburgh, where she was the delight of a brilliant literary circle, spent an evening in the company of her friends previous to the day when she was to pay a visit to a nobleman in the country. Though apparently quite well, she left her friends with desponding language upon her lips, saying that she would never see them again. In about a fortnight, they heard the sad intelligence of her sudden death at the house which she was visiting. This seems a very good example of the anecdotes told about what are called presentiments. The explanation is, that where a real feeling exists, it is a physical sensation premonitory of the actual event—something perhaps not easily describable, but which is, nevertheless, essentially connected with the result prognosticated. Though this lady seemed in perfect health, yet it is not unlikely, since she did die suddenly a few days after, that she had a dim experience of some sensations betokening what did befall, or perhaps only depressing her spirits and raising melancholy ideas. But in a vast number of cases there is probably no real feeling, but only a casually excited idea, which the mind is too weak at the moment to shake off. In the multitude of cases, one now and then proves true, and is cried up as something wonderful, while the failures are forgotten, or pass unnoticed. The only way in which presentiments could be proved as things of possible occurrence, would be to note all the instances of vague apprehensions of evil arising in the mind from no observable causes, and ascertain a vast disproportion of the instances of failure to the instances of realisation; but this plan has never yet, as far we are aware, been adopted.

A reference from dreams to future events is perhaps amongst the earliest and most natural superstitions of mankind. A dream presents a state of things, at least as to arrangement, quite different from ordinary realities; and as this proceeds from no act of will on our part, but is apparently forced upon our observation, it has been of course presumed that the strange phenomena connected with dreaming must have some meaning. The notion has probably derived support in many instances from the ideas of the dreamer being occasionally realised in the manner which we shall presently advert to. Happily, the days are now past when the ladies of a family in the middle walks of life would regale themselves every morning by a relation of the dreams which they had experienced during the past night; but a faith in this kind of divination still prevails extensively amongst the less educated classes. There is a class of cheap publications, called *Dream-books*, giving explanations of every kind of dream—as how fire denotes sudden news, losing teeth the death of a friend, seeing a dead horse good luck, and entering into water some impending evil; these, we can state with confidence, are amongst the most widely circulated of all existing books. Probably not two female servants in ten, at an average, wants one in her chest. The folly of all such means of discovering the future is so great, that we can scarcely condescend to use an argument on the subject. One, however, being ingenious and appropriate, is worthy of being noticed; namely, that we dream less frequently of the living as dead, which is an event likely enough to happen, than of the dead being alive, which is impossible. No doubt, a dream may occasionally be verified, and that in two different ways. For instance, we may dream of the death of a friend who we know is seriously ill; but this is a mere transcript of a series of ideas which has gone through our mind when awake, according to the ordinary laws of dreaming. We know, awake, that the friend is dangerously ill, and have probably imaged the event of his death. This recurs in sleep, with only this change, that the event is supposed to have happened. Or it may even be, that the idea of a probably fatal termination to the illness has only occurred in sleep, for such processes of reasoning are within the powers of the mind in that state. The only difference between the conclusion drawn awake and that in the dream is, that, in the latter, the event comes before us generally in a more decided manner, with images which we shrink from in our ordinary moments, and thus makes a greater impression upon us.

On the other hand, the knowledge of an event not looked for, and which does not come within the ordinary range of probability, may at a rare time be acquired through the medium of a dream; but this can only be considered as a mere casual coincidence. Thus, we may dream of a person being drowned whom we did not know of even being at sea. This may turn out to be true, and we then conceive that something supernatural has happened, not taking into account that there are innumerable dreams portending similar events which prove not to be true, excite but a momentary sensation in the dreamer himself, and are soon forgotten. In the dreams of even a healthy person, everything seems confused and distorted, and hardly a night passes but we connect things together in our dreams in such a manner as we never do in our waking moments. We find ourselves in familiar conversation with people we never saw, and who are totally out of our sphere. We find ourselves in a church, and see persons in the pulpit the most unlikely to take their station there. It is not surprising that, amongst the infinite variety of improbable circumstances continually presenting themselves, it may happen, at a rare time, that a real event quite unlooked for may be announced to us.

The kind of vaticination called Second Sight—the only wonderful thing about which, is its being local to the Scottish Highlands—may be disposed of much in the same manner. Men of imaginative character and melancholy temperament, living in a solitary manner, and brooding over their own thoughts till the mind gets into a morbid state, announce that they see visions of tragical occurrences happening, or about to happen; as, for instance, the perishing of a friend in a distant boating excursion, or the funeral of one now in perfect health. A very common form of such visions is the person referred to, with a shroud more or less drawn up towards his head. Probably such visions are in many instances as real as they are alleged to be, but only so in the natural manner now familiar to medical men. It is now perfectly understood that, in particular diseased conditions of the mind, its notions take the form of actual objects of sense, or appear as a picture before the eyesight. Such is probably the explanation of most cases of alleged second sight. The realisation of the vision is probably an occurrence of the same rarity as the realisation of a dream, and to be accounted for in the same manner. We hear only of the lucky hits, but never of the much more numerous failures.

Having now discussed all the false modes of looking into the future, let us inquire what are the true, and how far we may really, by sound inferences, calculate upon what is to come.

It may be pretty safely set down as a general proposition, that man, in possession of his ordinary powers, only divines or supposes the future by the light which he derives from experience. From the regularity and perseverance of certain occurrences up to this time,

he presumes that they will continue to occur, and considers them, therefore, as certain. Some which occur with less unvarying regularity, he considers as probable; some of still less constancy of occurrence, he deems only possible. Thus there are the Certain, Probable, and Possible.

The Certain are again of two kinds, Definite and Indefinite. The motions of the heavenly bodies, which can be exactly measured, and the very eccentricities of which are regular within a certain range, are examples of Definite Certainties. So, also, are the divisions of time into days, lunar months, and years, and the periodical recurrence of seasons, which flow from those motions. The term certain, it may be remarked, is only comparative. Man is not, strictly speaking, certain of any of these events; for anything he can tell, the whole of the sidereal motions may stop to-morrow. But, as compared with any knowledge we have of (for example) the weather of to-morrow, the anticipation of the phenomenon of sunrise may be held as a certainty.

While the recurrence of seasons is, as a general fact, a definite certainty, it is indefinite also, because no one can be sure of the exact time when any season is to commence or end. Other examples of Indefinite Certainties are presented in the destruction and reproduction of animal and vegetable life. We know that all living things will die, but we cannot say when with certainty. In our times, however, though the termination of the individual life remains as indefinite as ever, diligent observation and calculation have enabled us to form tolerably accurate conclusions with regard to the average duration of life amongst men and women, and this knowledge has been applied to various useful purposes.

The next class of future events is the Probable, which is a very large one, since a vast number of the common affairs of life supply matter for it. A great proportion of probable events come so near the certain, that, in the ordinary course of things, men must treat them as such. For example, in proposing to travel by a stage-coach, we deem the event of our arrival at our destination so certain (though it is only probable), that we never scruple to pay our fare beforehand.

What we here mean by Possible is the reverse of Probable, and might rather be termed Improbable, since it is an exception to the ordinary course of probability. An event happening, which we reckon merely possible, but improbable, may be, or rather in general must be so, from our ignorance of minute circumstances connected with it. For instance, a person may set out on a day's journey, apparently in good health, thus rendering his accomplishing the journey highly probable. When we discover afterwards that he has been stopped half-way by illness, we call this stop an improbable occurrence; while, if we were fully acquainted with the state of his health, the delay might be reckoned rather probable than improbable. But here we must act upon our limited knowledge, and it would be quite absurd to do otherwise. If the journey we have mentioned was a highly necessary one, and the traveller himself not aware of any approaching ailment, it would be improper to tell him to put it off, merely because it was possible he might be stopped by illness.

This acting upon ordinary probability need not be dwelt on, as it is almost the whole business of our life. There are cases, however, where it would be imprudent to act upon probability; for possibility, though ranked as improbability, must always be taken into account in looking forward to what is to come after, for it will sometimes take place when we least think of it, and it may be seriously injurious if it overtake us unprepared. A ship-master, in traversing a wide ocean where there was no intermediate port at which to stop, would be much to blame if he had not provision for his ship's company during what may be called an improbable length of voyage.

If the minor or least probable be of much greater importance than the major or most probable contingency, it is then the former we chiefly look to in our calculation. For instance, if, in the case of some adventure, our total ruin were to be in the proportion of one to ten, and a partial gain in the opposite proportion, few people would like to run the risk. But, reverse matters, and suppose, as in the case of the lottery, the minor or least probable was a great gain, and the major a small loss, few would object to such a chance; still, as in the other instance, it would be the improbable to which our attention would be directed.

The Scripture expression, "The race is not to the swift, nor the battle to the strong," would, for a ready apprehension of its meaning, be more correct if thus paraphrased, The race may not be to the swift, nor the battle to the strong. For probability is in favour of swiftness and strength, though, in the course of providence, cases may happen otherwise. Making the best of contingencies is a great part of the business of life.

In using the experience of the past as a guide to a knowledge of the future, great care is necessary, for fallacies beset the inquirer on every hand. Physicians of the most extensive practice admit that medicine is still in an imperfect state. Acute diseases, such as fevers, are often assuming new appearances, where experience is completely set at naught. Even diseases, which are pretty uniform in their symptoms, affect different constitutions so variously, that the same treatment proves beneficial to one person and hurtful to another.

In short, as to those probabilities which approach to certainties, we are allowed to look but a short way forward. This is particulary the case with respect to the weather, as to which there are so many methods of prognostication. We have, at the most, but a few hours' certain indication of changes as to temperature or moisture, and often no time at all. To plan out the seasons for years, or even for months, has never yet been attempted upon principles acknowledged to be scientific. There is nothing wonderful in guesses occasionally proving true; but this is the most that has been done. Even the barometer, though unerring in indicating the existing condition of the surrounding atmosphere with regard to moisture, gives but a short, and for the most part uncertain, notice of the future. Sometimes we have a very low state of the glass, with hardly any change in our own locality; though we afterwards learn that there have been storms and earthquakes elsewhere. Still, this is rather an indication of the present than the future.

It appears from the whole inquiry, that it is given to man to have but an obscure perception of the future; and this is only consonant with that wise benevolence which reigns over all mundane things; for it is easy to see, that it would not be well for man to anticipate future events too clearly. There are, however, some of the probable class of events which he may, without any great effort, calculate upon, and which it is only a duty to provide for. From our experience of the past, we know what are the necessities and duties to which we may in certain circumstances look forward; as, for instance, if we marry, we may presume that there may be a family to support; or, if we incur a debt, that the creditor will in time be claiming its payment; and for these contingencies every wise and good man will be anxious to be prepared. Vaticination upon events of this order may, therefore, be considered as laudable; and it may safely be said, that if the one half of the attention had been paid to them which has been bestowed in divining who is to be the future spouse, or whether life is to be crowned with fortune, there would have been much less misery in the world.

SKETCHES IN NATURAL HISTORY.

ANIMALS CHARACTERISTIC OF THE DIFFERENT QUARTERS OF THE GLOBE.

THIRD ARTICLE.

North America, the next division of the globe whose peculiar zoological features are to be noticed, possesses a very extensive Fauna, a considerable portion of which does not range beyond its boundaries. Widely separated from the old continent, except at points where few animals are capable of existing, the resemblance its zoology bears to that of Europe, is owing to the circumstance of a large portion of it occupying corresponding parallels of latitude. Extending from the arctic circle to the equator, its climate and productions are infinitely varied; and still further scope is allowed for diversity by the character of the surface, which consists of lofty mountains, immense rivers, inland lakes of such dimensions, that they may almost be called a series of Mediterranean seas, elevated table-lands, and extensive grassy flats, or prairies, to which there is nothing precisely analogous in the Old World.

The most remarkable and characteristic animal of the northern regions is the musk ox, or ovibos, which, as the latter name implies, combines, to a certain extent, the properties of the ox and sheep. It congregates in small herds, and is scarcely ever seen to the south of the 70th degree. In most of the icy regions which it frequents, grass or herbage of any kind is but scanty, and it therefore feeds chiefly on lichens—plants of low organisation, and capable of existing in almost any climate. The flesh of this animal is well flavoured, but highly impregnated with the odour of musk. Regarding the elk, or moose deer, as distinct from the elk of Europe, it forms one of the most conspicuous quadrupeds of the northern parts of this continent. It frequents swampy ground, assembling, at certain seasons, in small herds. Its northern limit is nearly where the southern range of the musk ox terminates; but it formerly extended far to the south, although now, receding before the advancing tide of population, it is never seen but to the north of the great lakes. There is some reason to suppose, that the reindeer of North America is specifically distinct from that of Europe and Asia: at all events, two well-marked varieties exist of this invaluable animal, one of which is named the caribou deer. The prairies stretching from the base of the Rocky Mountains, still support immense herds of bisons (*Bos Americanus*), although the rifle has extirpated these singular looking animals from many of their former haunts. The grizzly bear, familiarly called "Caleb" by the hunters, by much the largest land species of his tribe, and the most formidable of the American carnivora, has his principal seat among the Rocky Mountains, although examples have occurred as far south as Mexico. The American black bear, and the barren ground bear, are the other species; but it is doubted by many whether the latter be more than a variety of the first mentioned.

The districts of North America so well-known as the fur countries, are inhabited by a numerous race of the smaller animals, chiefly belonging to genera found in other continents, but, for the most part, peculiar to America as species. They consist principally of the Canadian otter, the sea otter, raccoon (remarkable for a singular instinct of eating nothing which has not previously been dipped in water), badger (very distinct from our own animal of that name), the taxels, several kinds of martens, in particular that which yields the sable of commerce (*M. Zibellina*), a fur which, with other good qualities, has the peculiar one of lying in any direction in which it may be turned;* various weasels, squirrels, marmots, foxes, wolverines, the beaver, and the Canadian lynx. Of the latter, about 9000 skins are annually obtained by the Hudson Bay Company, and an immense number of many of the others; yet, such is the prolificacy of these animals, and the extent of the country over which they range, that there is little chance of the supply becoming exhausted.

Nearly allied to the martens are the skunks, a tribe exclusively American, and pre-eminently distinguished by the intolerable fetor they emit when irritated or pursued. The intensity of this odour is described as being almost incredible; if a single drop of the liquid producing it fall on any article of dress, it is rendered quite useless, as no washing will remove it, and the stench is diffused throughout the whole house. Several singular animals, allied to the mole, occur in America, particularly the shrew-mole, the long-tailed mole, or star-nose, and Forster's shrew. Our European field mouse is represented by an analogous species, the *mus leucopus*. A rather remarkable kind of porcupine, the urson of Cuvier, the coendous, the souslik, a kind of marmot with cheek-pouches, no fewer than sixteen species of lepus or hare (of one of which, the American hare, no fewer than 25,000 have been killed in a single season at one of the stations of the Hudson Bay Company), the musk rat, and the neotoma of the Rocky Mountains, are a few others of the more remarkable smaller quadrupeds peculiar to North America.

The Rocky Mountains are inhabited by a large and strong-bodied sheep, which has been thought well fitted for being introduced into this country, and also by a goat of a peculiar species. Of the other ruminants, one of the most conspicuous is the stately Canadian stag or wapiti (the elk of the Anglo-Americans), which is one-fourth larger than our stag, and inhabits all the temperate regions; similar to it is the *C. occidentalis*, found in the north-western countries. The Virginian stag is less than ours, but more elegantly formed; its name indicates its chief locality, although it occurs over a considerable portion of the continent. It is remarkable for its enmity to the rattlesnake, which it kills by suddenly stamping upon it with its fore-feet, then bounding away, and returning again to the attack, till the reptile be completely disabled. The prong-horned antelope inhabits the hills and open plains around Hudson's Bay, as well as the banks of the Columbia; its northern range being about the 53d degree. The long-tailed and the black-tailed deer, are two other species deserving of being named.

Such are a few of the more characteristic quadrupeds of this continent; many others deserving of notice of course occur, but of these some of the more remarkable, such as the puma, or American lion, as it is called, have their chief seat in South America. To the North American birds, of which the catalogue is very rich, we can devote only a few sentences. Perhaps the most noticeable in the more northern regions is the grouse family, of which about a dozen peculiar species inhabit the fur countries. The most important of these is the cock of the plains, which has long and sharp-pointed tail feathers, giving it the appearance of a pheasant. The Turkey buzzard, very common in the United States, the great Californian vulture, nearly the size of the condor, numerous kinds of *Falconidæ*, the great cinereous owl, and the arctic horned owl, claim precedence among the accipitrine birds; the king-bird, remarkable for its bold and pugnacious disposition, the mocking-bird, so celebrated for its power of imitating almost any sound, the American robin (very different from our own domestic bird), the blue-bird, the Baltimore bird, which constructs an elegant pensile nest, and the tanager, are among the best known of the passerine tribes. The common turkey occurs in profusion over a considerable portion of this continent, and another splendid species has been discovered in Honduras. The two latter may be considered the most characteristic birds of North America. No fewer than sixty-eight different species of birds are peculiar to Mexico alone.

Of the numerous reptiles found in this continent, the rattlesnake and syren may be mentioned as the most distinctive.

South America possesses every imaginable attribute favourable to the existence of an extensive and diversified system of animals. This may at once be inferred from its geographical position, and its general physical aspect and properties. But even when every allowance is made for these, the reality is found greatly to transcend the highest expectation. It is difficult for one who has never been out of Europe, and especially for an untravelled native of Britain, to form an adequate conception of the teeming exuberance of vege-

* The fur of the common mole is set vertically in the skin, by which it has no grain or particular direction—an admirable provision for enabling it to run backwards and forwards in its galleries with equal facility.

table and animal life in some of the tropical portions of this continent. In many places, the surface of the ground seems actually alive with living creatures. You can scarcely take a step without running the risk of destroying some form of animated existence. The air is filled with insects, most of them of the most brilliant colours, and not a few of such a size that they would cover nearly half of the page on which the reader's eye now rests. Birds of the richest hues are seen in every direction. The trees are peopled to overflowing; and their dense foliage, often continued for many miles together without break or interruption, forms a platform, on which multitudes even of large animals habitually dwell, never voluntarily descending to the earth. A much greater proportion of peculiar animals exist here than in any other quarter of the globe; indeed, a full enumeration of them would be nearly tantamount to a complete Fauna of the country. In these circumstances, only a few of the more remarkable can be mentioned.

On the American continent, as we proceed southwards, monkeys first begin to appear in the vicinity of Mexico; in many parts of South America they occur in the greatest profusion. Brazil alone, in which may be said to be concentrated the zoological wealth of the whole continent, produces about seventy species. The whole of Cuvier's great section of Quadrumanous animals, entitled *Platyrrhini*, is, with very few exceptions, South American. The stentors, or howling monkeys, utter their hideous yells in the night; the spider-monkeys, so called from their slender limbs and sprawling movements, occur in Guiana and Brazil; the beautiful little marmosets are found in small parties in different quarters of the continent. The bat family is here represented by two very extraordinary groups, the Phyllostomes, which have immense ears and a large leaf-like membrane placed perpendicularly on the nose, which gives them a most unearthly aspect; and the true vampires, which appear to feed entirely on blood, piercing their victims with their exceedingly sharp-pointed canine teeth, which are so arranged, that they inflict a triple puncture, like that of a leech. Of the feline Carnivora, by far the most conspicuous are the jaguar and puma; the former of which may be said to represent the tiger, the latter the lion of the Old World. The jaguar, or American panther, as it is frequently called, is confined to South America, but it occurs in almost every part of it, and often in very great plenty. The puma, although most plentiful here, ranges northwards as far as Pennsylvania. Next to these may be mentioned the ocelots, graceful and beautifully-marked animals; as well as the colocolo and chati, species of similar size, and scarcely inferior elegance. The marsupial mammalia (so named from the female having a pouch or fold of skin on the abdomen, in which the young are carried) occur only in America, New Holland, and a few of the islands of the Indian Ocean. The whole of that section containing the opossums, amounting probably to between thirty and forty different species, is exclusively American, and, with one or two exceptions, confined to the southern portion of it. The Virginian opossum is nearly the size of a cat, but the majority are small, and, were it not for their pointed muzzle, might be mistaken for rats and mice. One of them, the yapach, has semi-palmate toes, and resembles an otter in its habits. Of the South American Rodent animals, we may mention the echymyds, small rat-like species with rough hair intermixed with spines; the coypu, of which thousands of skins are sent to Europe, where they are used by hatters like those of the beaver; the capybara, the largest animal of this section; the well-known cavies, or guinea-pigs, of which six or seven species are known; and the beautiful little chinchilla of the Peruvian and Chilian Andes, so celebrated for the delicate fineness of its fur. Among the most extraordinary of South American quadrupeds are the sloths: a want of knowledge of their peculiar habits has led even such men as Cuvier to make the strangest assertions regarding them. They live habitually on trees in the most densely intertangled forests, hanging to the branches by their limbs, and moving about with the utmost facility. All their peculiarities are most fully developed in the species named the Ai. The whole tribe of armadillos are South American, as well as the largest known species of ant-eater. The South American tapir was long the only animal of the kind known; it occurs throughout the whole continent, and often in great abundance. Its flesh is eaten. This, also, is the exclusive locality of the peccaries, animals allied to the hog. The lamas are by far the most remarkable of the Ruminants. They have the peculiar structure, internally, of the camel, and a good deal resemble that animal in external appearance. They inhabit the Peruvian Andes, have been long domesticated, and, besides being used as beasts of burden, yield both food and raiment to the inhabitants. The best known of the Ruminants is the alpaca, or Peruvian sheep, which, there is every reason to believe, would thrive well among our Scottish mountains, and has therefore been strongly recommended for introduction; the cloth manufactured from its fleece has a beauty and lustre resembling silk.

The great majority of the feathered tribes of South America are peculiar to it, and they are the most remarkable, whether viewed in relation to structure or external appearance, of any quarter of the globe. The king-vulture inhabits the Pampas and the other warmest regions of the continent; the condor, which flies higher than any other bird, the most elevated regions of the Andes. The harpy, or destructive eagle, frequents the thickest forests: its claws and beak are of terrific size and strength, and it has been known to cleave a man's skull with a single blow of the latter. Sloths are its ordinary prey. Paraguay produces what is called the burrowing owl, which takes up its residence in the deserted holes of a species of marmot—a singular deviation from the ordinary habits of its kind. Tyrant fly-catchers, manakins, trogons, tree-creepers, tanagers, chatterers, and multitudes of other smaller birds, exhibit examples of the most splendidly ornamented of the feathered race. The largest of the parrot tribe, the superbly-coloured macaws, have their metropolis in Brazil; so, also, the toucans, so remarkable for the enormous dimensions of their beak. The curassows and guans (*Penelope*) are large gallinaceous birds, domesticated in South America; and bearing some relation to these, the hoazin, perhaps the most insulated bird of the whole class. Two species of rhea, or ostrich, occur here; the largest is about half the size of the African ostrich, and is much less plentiful than the latter. The scarlet ibis, entirely of a bright-red colour, is a very conspicuous bird; and scarcely less so is the screamer, larger than a goose, and having a long, slender, horny stem springing from the top of its head. The fairy humming-birds may be regarded as among the most characteristic of South America. A hundred and ninety species are now known, and that number is constantly receiving accessions. The smallest, when stripped of its feathers, is less than our common yellow-banded humble bee, and the largest is nearly equal in size to our common swift. Two species only range to the northwards of the isthmus of Darien, one of which (*T. colubris*) is well known by its annual migrations to the United States and Canada, pushing at times so far northwards as Saskatchawan and the banks of the Elk river.

Caymans, or alligators; dragonets, which are huge lizards with caudal crests, often attaining a length of six feet; and boas, of enormous dimensions, are among the most remarkable of South American reptiles.

New Holland, with the adjoining island of Van Diemen's Land, is, in many respects, one of the most remarkable portions of the globe. The peculiarity of its vegetable productions is well known; in most cases, they are altogether *sui generis*, having little resemblance to those of any other region. A like peculiarity is observable in its animal productions, scarcely one of which are common to it with any other country. Almost the sole indigenous mammalia consist of marsupial animals, varying in size from nearly the dimensions of a wolf to those of a small mouse. Most of them bear a considerable resemblance to each other, and the number of different species is very great; probably not less than a hundred. Of these the best known are the kangaroos, the largest of which is the great kangaroo (*Macropus giganteus*); but the most common is Bennett's kangaroo, called the brush kangaroo in Van Diemen's Land, which is much esteemed as an article of food, and its skin used for making boots and shoes. The thylacinus is not unlike a large dog, and is called by the colonists of Van Diemen's Land the tiger, hyæna, and zebra-wolf; it preys on kangaroos and other small animals: and the ursine dasyure, which somewhat resembles it, and is invariably called the *devil* by the colonists, is very destructive to sheep and poultry. Many of the smaller marsupials are exactly like the flying squirrel, and are, in fact, so denominated. The wombat is a lumpish, inactive animal, which burrows in the sand, and feeds on roots and grasses; the echidna is covered with spines like a hedgehog, which it resembles, but it has not the power of rolling itself into a ball. Few animals have excited more attention than the duck-bill, or ornithorhynchus, which was at first thought to partake of the properties both of a quadruped and a bird. It is the lowest in the scale of the mammalia yet discovered, and even evinces, in many of its anatomical characters, a considerable approach to the class of reptiles.

The most characteristic bird of this great island is the emu, a tall and remarkable animal, fleeter than the swiftest greyhound. Its flesh has nearly the same consistency and flavour as beef. The cereopsis is allied to the geese, but it has longer legs, and never enters the water. Several groups of very remarkable parrots are peculiar to this island; in particular, a tribe of large cockatoos (*Calyptorhynchus*), with black plumage, a very powerful beak, and whose food consists of the seeds of the eucalypti; many kinds of white cockatoos; and a race of long-tailed parroquets, with very beautifully mottled plumage, which have their feet adapted for running on the ground, and are therefore called *ground-parrots*. The maenura, or lyre-tailed pheasant, is another singular bird, and seems to be the largest of the singing tribes.

The islands of the Indian Archipelago exhibit, in several respects, a very distinct zoology, quite dissimilar, at least in some of its features, from that of the nearest continental land. Perhaps every one of the larger islands will be found to produce something peculiar to itself, both in the vegetable and animal kingdom. The great island of Borneo is the headquarters of the huge apes called ourangs; at least three species are known to occur here which have been found nowhere else. The largest of the bat-tribe, called rousettes, goblins, or flying dogs, some of them measuring five feet and a half across, inhabit the Moluccas and Sunda Isles. The galugos, or flying lemurs, are confined to these islands; so also are several small bears, of gentle and playful disposition, called sun-bears. They produce also several large spotted cats, of which the tiger-cat of Sumatra may be mentioned as an example. Not a few small marsupials occur in the Moluccas and New Guinea. Sumatra and Java have each a peculiar kind of rhinoceros; and there are not a few peculiar species of small deer and antelopes; among the latter, the best known is the cambing-outan, or antelope of Sumatra. Of the numerous and very remarkable birds which frequent these islands, we can only mention the most characteristic group; namely, the superbly plumed birds of Paradise, which consist of many different kinds, all of them of very rich colours, and presenting singular developments of some portion or other of their feathery covering; and the cassowary, the largest species of bird, next to the African ostrich.

The great island of Madagascar, while presenting some analogy in the character of its animals to the opposite coasts of Africa, may be said to have a zoology in some measure its own. It is the sole residence of the lemurs, which are numerous in species, and appear to replace here the monkey tribe, which are said not to exist in this island. The structure of the aye-aye is so peculiar, that systematists have had great difficulty in assigning it a proper place in their arrangements. The insects and lower animals of this comparatively little known island, appear to be even more peculiar than the quadrupeds.

The preceding details (although necessarily limited, considering the extent of the subject) will enable the reader to determine what groups of animals are most strikingly characteristic of the different quarters of the globe.

FAMILIAR QUOTATIONS.

Some time since, a little article was given on the subject of Familiar Quotations—that is to say, on lines and phrases known to everybody, yet of unknown origin. A few additional examples have since occurred to us. For instance, how often do we use, and see used, the phrase of "Though last, not least," the alliterative aptitude of which is peculiarly tempting. It occurs in literature, for the first time we believe, in Shakspeare, being addressed by Lear to his youngest daughter, the unflattering Cordelia.

> "Now, our joy,
> Although the last, not least,"

says the aged king. After all, when her father was so markedly fond of her, Cordelia, without any detraction from honesty and rectitude, might, we think, have been a little more warm in her expressions of filial affection. But this is a digression.

In Young's tragedy of *Revenge* occurs a line much quoted, though the poet, we imagine, only put into pointed form an idea previously shadowed forth by others. The line is—

> "Beyond all Greek, beyond all Roman fame."

Still more frequently is the following couplet seen in writings, and heard in conversation:—

> "For he that fights and runs away,
> May live to fight another day."

Collet, in his curious book entitled "The Relics of Literature," tells us that these lines were, on one occasion, the subject of a heavy wager at Bootle's Club. The scholars present were all of opinion that the lines were from Butler's Hudibras, and twenty to one was laid in support of that side of the question. Dodsley, the noted publisher and writer, was referred to as the arbiter, but he ridiculed the idea of consulting him on the subject, saying, "Every fool knows that the couplet is in Hudibras." George Selwyn answered, "Pray, sir, will you be good enough, then, to inform an old fool, who is, at the same time, your wise worship's very humble servant, in what canto they are to be found?" Dodsley turned to the volume, but he could not find the passage; on the next day he searched with no better success: and, at last, the sage bibliopole was obliged to confess, that "a man might be ignorant of the author of this well-known couplet, without being absolutely a fool." In reality, the lines occur in a small and obscure collection of Miscellaneous Poems, written by Sir John Mennes, and published in the reign of Charles II. Butler, nevertheless, has an expression extremely like the one in question:

> "For those that fly may fight again,
> Which he can never do that's slain."

Scylla and Charybdis are allusions almost as common as the frying-pan and the fire, though the line in which the simile is originally made is in a dead tongue, not universally known. The majority even of scholars imagine Virgil or Ovid to be the source of

> "Incidis in Scyllam, cupiens vitare Charybdim,"

which may be Englished,

> "Shunning Charybdis, you on Scylla strike."

But the line is to be found in an obscure writer of Latin verse, by name Philip Gualtier, who flourished in France in the sixteenth century.

Familiar to every one is the fine thought in Benjamin Franklin's epitaph on himself, in which he compares his condition, when dying, to that of a work about to undergo a republication at the hands of its great author. Franklin was not the first, however, to use this simile. He had before him two epigrams,

turning on the same idea, from the pens of older English authors. The first runs as follows :—

" The world's a book, writ by th' eternal art
Of the great Author; printed in man's heart;
'Tis falsely printed, though divinely penn'd,
And all the *errata* will appear at the end."

The second is an expansion of the thought :—

" The world's a printing-house; our words are thoughts;
Our deeds are characters of several sizes;
Each soul's a compositor, of whose faults
The Levites are correctors; and heaven revises;
Earth is the common press, from which being driven,
We're gather'd, sheet by sheet, and bound for heaven."

Franklin, it must be allowed, has greatly improved on these first draughts, both as regards expression and application.

In all the long roll of stray quotations, few have been so often repeated as one traceable to Spenser, which paints the lovely heroine of his Fairy Queen as making

" A sunshine in a shady place."

The exquisite glow of loveliness figured forth in this image renders it worthy of all reiteration. A line of Wordsworth, referring to the same heroine, has been scarcely less quoted, and has been pronounced by a great critic to be indeed "divine." The thirty-ninth of the miscellaneous sonnets, on Personal Talk, ends thus :—

" The gentle lady married to the Moor,
And *heavenly Una with her milk-white lamb.*"

Immense numbers of Wordsworth's sonnets contain lines and phrases which of late have been again and again the subjects of citation. For example, in the same sonnet just referred to, occur the following lines, which have been selected ere now, and very appropriately, as a motto to books :—

" Dreams, books, are each a world; and books, we know,
Are a substantial world, both pure and good;
Round these, with tendrils strong as flesh and blood,
Our pastime and our happiness will grow."

But to quote at length from Wordsworth, whose poems, to the redemption of their endangered credit, his countrymen are now beginning fully to appreciate, would be a departure from the purpose of this little paper.

It was formerly mentioned that Dryden's strong, sententious lines were often cited by many who knew not to whom they were contracting a debt in so doing. Absalom and Achitophel, for example, abounds in passages familiar as the following :—

" A fiery soul, which, working out its way,
Fretted the pigmy body to decay,
And o'er-inform'd the tenement of clay."

" Was every thing by turns, and nothing long."

Another writer, of sententious repute, Dr Samuel Johnson, has given amazingly few lines of verse to the general stock of quotations. In his tragedy we do not find one well-remembered phrase; and in the Imitation of the Tenth Satire of Juvenal, which might have been expected to be rich in citabilities, we discover only one or two old friends, such as—

" Superfluous lags the veteran on the stage."

" In life's last scene what prodigies surprise,
Fears of the brave, and follies of the wise?
From Marlborough's eyes the streams of dotage flow,
And Swift expires a driveller and a show."

" He left a name at which the world grew pale,
To point a moral or adorn a tale."

These are certainly among the "old familiar faces," but they are positively nearly all the noted lines of verse which we owe to Samuel Johnson. Goldsmith, who, through inferior powers of display, was compelled to figure as second fiddle all his days to the literary Colossus of Bolt-Court—though Irene and Rasselas are not for a moment to be compared with She Stoops to Conquer and the Vicar of Wakefield, and even the Rambler is far inferior in genial wisdom to the Citizen of the World—Goldsmith, we say, has left numerous lines which the world deem worthy of keeping in remembrance, to supply a better point to an occasional sentence than they themselves could hope to furnish. Loved acquaintances, indeed, are such lines as—

" And learn the luxury of doing good."

" Princes and lords may flourish, or may fade,
A breath can make them, as a breath has made;
But a bold peasantry, their country's pride,
When once destroy'd, can never be supplied."

" And even his failings leant to virtue's side."

There is so much manly and generous sensibility, however, in Goldsmith, that scarcely any one can fail to tell his lines from those of any poet in the language.

A window-pane immortality has fallen to the lot of the subjoined quatrain.

" Whoe'er has travell'd life's dull round,
Whate'er its stages may have been,
May sigh to think that he has found
His warmest welcome at an inn."

This stanza came from the pen of Shenstone, and is a confession scarcely to have been anticipated from him, seeing that his home at Leasowes has been often described as a very model of comfort and even of luxury.

Finding it difficult to speak its admiration of Shakspeare in language commensurate with the subject, the world has for a long time been contented to use certain phrases, left cut and dry for the purpose, by a variety of authors. For instance, we very frequently say that he

" Exhausted worlds, and then imagined new."

For this we are indebted to an address written by Samuel Johnson (another line due to the doctor, by the by), and spoken by Garrick at the opening of Drury-Lane Theatre. Churchill has the same idea in the Rosciad. Shakspeare, it is there said,

" Called into being scenes unknown before,
And, passing nature's bounds, was something more!"

Churchill was only a boy at school when the great Sam, who afterwards hated him so heartily, penned his prologue for Garrick: so he must be considered as the imitator in this case. Churchill also uses a well-known phrase,

" A noble wildness flashing from his eyes."

Gray comes in with a familiar line on the same great subject—

" To him the mighty mother did unveil
Her awful face."

Scarcely less familiar are the lines of Milton and Ben Johnson on the wonder of the Avon.

We believe that many people would ascribe the line

" Thoughts that breathe, and words that burn"

to Lord Byron, though it really occurs in the Ode on Poesy of so old an acquaintance as Gray. Both Gray and Collins are rich in quotable lines, but are too well known for our present aim. To some of the waifs traceable to others of our poets, we shall turn on another occasion. In the mean time, instead of indicating the source of any further lines at present, we shall point to one of which we *cannot* tell the origin. It is a familiar friend—

" Welcome the coming, speed the parting guest."

Goldsmith or Parnell, one would at first say, must be the author of this fine hospitable line, but it neither occurs in Sweet Auburn nor The Hermit.

MECHANICS' INSTITUTION AT LIVERPOOL.

When we had gone over the humble Lyceums of Manchester, a detail of which appeared in a previous number, a striking contrast was presented to us on our arrival at Liverpool, in the admirable Mechanics' Institution of that town; which is, out of all question, the most extensive and complete establishment of the kind in Great Britain. Its exterior appearance is far more imposing than many buildings of higher pretension, exhibiting towards Mount Street, where it is situated, a massive stone front of Ionic architecture, and from which, at the principal entrance, a bold pediment projects. In the interior, the vestibule, so lofty and capacious, with its fluted pillars and marble statues, gives the visitor the idea of a structure raised by affluence, for the resort of highly-cultivated taste, rather than for the accommodation and advantage of mechanics. The secretary's office is entered from the left side of this hall; and even here the business-like appearance of the desks and account-books is relieved by art; a picture representing Britannia crowning a mechanic, is hung in a conspicuous situation. The library, entered on passing through the office, though spacious, is not large enough to contain all the books belonging to it, and a gallery is already thrown up around the four sides of the room; shelves for the 10,000 volumes that form the library requiring no little space. It appears that the average circulation of books amongst the 3767 members, who, according to the last report, subscribe to the institution, is 274 volumes per day throughout the year; but in winter, which may be called the reading season, a far greater circulation of books takes place. Busts of several literary and scientific worthies are tastefully distributed in various parts of the library. The board-room adjoining is adorned with paintings and engravings.

Before describing other parts of the building, it will be necessary to say a few words on the educational system which is pursued within its walls. This may be said to consist of three schools; the higher and lower, held in the day-time, for the children chiefly of members; and the evening school, for the benefit of members themselves, in common with their children and apprentices. In the high school, there are at present 311 pupils; in the lower, 575. The average attendance at the evening classes is 400 persons. Every useful and polite branch of education is taught in this institute, by no fewer than forty-five instructors. Nearly the same routine which is gone through in the schools during the day is repeated in the evening, so that here the office of teacher is no sinecure. The funds of the institution, however, enable it to offer adequate remuneration to the most eminent instructors that can be procured; and they have generally, according to the official reports, given great satisfaction. Besides these, normal teachers are admitted who are instructed and trained by the masters, and who receive a small salary whenever they are able to afford material assistance. This establishment is fortunate in possessing a business-like, zealous, and scholarly secretary.

The preparatory schools are situated in the west wing of the building. Being designed to prepare pupils for the senior schools, they are occupied by very young scholars, who are taught the rudiments of education exactly after the plan adopted towards the more advanced pupils. Each department of education has, besides its separate teachers, its separate room, and the students move in classes from one to the other at hourly intervals. Even in the play-yard, a wholesome system is adopted; at the moment of entering school, each class assembles at a stone sunk in the ground, and they march in to their studies with a degree of order and precision almost military. These juvenile pupils are provided with a library adapted to their acquirements, and under their own management. Besides a museum, which contains objects for the illustration of their lessons, the walls of this department are hung with diagrams, illustrative of natural history, physiology, the arts, and manufactures.

Returning to the vestibule, we pass the board-room door to arrive at the laboratory, where all the instruments are to be found necessary to performing the most essential chemical experiments; near to it are the classrooms of the mathematical and philosophical departments; also a philosophical apparatus room, in which the chemical class is taught, containing models for the purpose of illustrating the leading principles of chemics. On opening a side door in the passage between those rooms, we find ourselves upon the platform of the lecture theatre, one of the most capacious and best adapted for its purpose we ever saw. It is capable of holding 1500 persons, and is not unfrequently filled with auditors. Besides lectures on two evenings in each week, musical entertainments are sometimes given in it, and to make them of greater effect, an organ is intended to be placed in a loft constructed for its reception. The principal entrance to the theatre is in the hall, between the two staircases, which ascend, opposite each other, to the upper rooms. The right-hand side of the building, on the ground floor, is occupied with the English, mathematical, writing, and drawing departments of the lower school.

Ascending one of the staircases, we are introduced to rooms occupied chiefly by the high school. The first apartment, appropriately surmounted by a bust of Socrates, is that in which the classics are studied. Two rooms are devoted to the acquirement of the French language, which is taught upon a most advantageous system. The pupils are instructed simultaneously; no books are used, the oral method being substituted. The master pronounces, in a loud and distinct voice, a French sentence, which the students render into English, re-translate into the original language, and, having repeated it after the master, they write it on their slates, whilst he is himself inscribing it on a black board, which, being visible to all the pupils, enables them to correct their own mistakes. "Thus," in the words of the report for 1841, "the ear, the organs of speech, the memory, and, to a considerable extent, the judgment, are all exercised. The hand and the eye being kept in almost constant employment, the temptation to listlessness is greatly diminished. The simultaneous repetition saves time; the impression of the sounds on the ear and memory is stronger and more lasting; and the pupils are more easily guarded from a faulty imitation of each other's accent. The practice, besides, of loud speaking for a moderate time, is eminently healthful, and in some degree counteracts the evil of a sedentary occupation. The object constantly aimed at is to economise the time, by devoting it to those exercises which seem best calculated to give to a large class a facility, not only in reading and translating from books, but in understanding spoken French, and in speaking the language. It is conceived, that the structure of French is best learned from the living words and phrases of the language itself, as exhibited by its best authors. No suitable opportunity is neglected of comparing the language with those of which the pupil may be supposed to have some knowledge, but chiefly with their own native tongue, so as to make the study of a foreign language contribute indirectly to a more correct knowledge, and a juster appreciation, of the power and beauty of their own." That, however, the elements of this "language of phrases," as it has justly been called, shall be duly impressed on the mind and memory, tables of the principal declensions and conjugations, legibly written upon black boards, line the walls of the class-room. The classics are taught upon a rigidly analytical principle, each sentence being demanded from the pupil in Saxon English wherever it is possible, the phrase in each language being afterwards compared. The number of pupils at present on the roll of the day schools is 893.

The east wing of the building includes one of its most interesting apartments—the sculpture gallery—where all kinds of drawing are taught. The collection of casts, models, &c., for the use of pupils in every department of the art, forms quite an exhibition. Indeed, we question whether a more judiciously selected set of models—a more admirably furnished drawing academy—elsewhere exists. Opposite to the door of this room is the museum, which, although in existence but for a short period, has a large gallery, and is well filled with carefully arranged objects. It divides the preparatory high school from the other apartments. This is one large room, ninety feet long, each set of classes being separated from the other by cloth curtains. A long passage conducts us to the top of the right-hand staircase, which is here connected with the other by a corridor ornamented with six well executed pictures by Rippingile, illustrating the progress of intemperance. This staircase is surmounted with a full-length portrait of one of the greatest benefactors to the institution, Mr Fawcett, the celebrated engineer. In the centre of the corridor is a clock which strikes, so as to announce to the pupils their periodical changes from one class to another. In short, two things are fully apparent in every part of this establishment—tasteful ornament and rigid sys-

tem. With these elements, its success, above all others, need not excite wonder.

Members pay one guinea, or, if they be ladies, half a guinea a-year, which entitles them to attend the lectures, library, and evening schools, and to all the privileges of the establishment, except the day schools, which are charged for extra. The sons or apprentices of members become members by paying five shillings; those of non-members by subscribing half a guinea per annum. Each of the schools is superintended by a special committee, who make their reports to the general board. An exhibition of fine arts, manufactures, and natural history, occasionally takes place: that in 1842 occupied twenty rooms, five of them nearly ninety feet in length: it was only open six weeks and two days, yet realised the handsome sum of L.4000, which left a clear balance of L.2000, having attracted nearly 100,000 visitors—the charge for whose admission varied from sixpence to a shilling each. The gross annual revenues of the institution, including the sums contributed to the building fund, and those paid by the school pupils, amount to about L.7000, while the salaries of officers cost at least L.5000.

The Mechanics' Institution of Liverpool, from what has been above stated, must certainly be regarded as a truly noble institution—the most complete educational establishment, of an elementary nature, in Great Britain; but we should be leading readers into an error, if we did not explain to them that its advantages are embraced almost exclusively by the middle classes, those of a humbler rank, for whom it was more specially designed, and whose name it bears, having given it, we are sorry to understand, but a very slender measure of support.

THE STRUGGLES OF PETER HOOLEY.

PART II.

HOW HE STRUGGLES WITH WEALTH.

It was on a beautiful summer evening, somewhat more than three years from the time we last saw him, that Peter Hooley, the schoolmaster of Y——, was lounging in his little garden, with his family about him. His eldest girl, Alice, who still remained in Mr Orwell's family, as assistant to the nursery-maid, had called to see him, and was lingering moment after moment on taking leave, partly to gossip with her mother and father, but partly also to fondle a little sister, a few months old, whom Mrs Hooley was nursing. She was now a fine girl of fifteen. The eldest boy, too, was placed with a shoemaker on trial, and had slipped down the street on his way to the Hall with a pair of shoes, just to bring one of his younger brothers a kite which he had made for him. The evening, as we said, was beautiful; but the sun was declining fast, and the dew was falling, and Peter, with good-humoured determination ordering his wife to take her baby into the house, fairly pushed the laughing truants from his garden gate, and was closing it after them, when he was hailed by the postman, who was seen at a few yards' distance holding a letter towards him. The wife returned from the house, and the boy and girl re-entered the garden, all eager to know what tidings this unwonted messenger—a letter—could bring to them. Peter opened it, started as he read it, and becoming very pale, folded the letter, and turned away.

"Nay, Peter man, tell us what it is," said Betty.

"Miss Maclaren's dead," said Peter.

"Well, peace be with her; but that's little matter to us, Peter, that ye should look so grave upon it, if that be all."

"But it's not all, wife: the letter says that we are to have all her money."

"Praise be for that," said Betty; "and how much is there, Peter?"

"More than we can easily count, Betty; and more than we shall know how to spend."

"No fear of that; no fear of that," said the mother, as she exchanged a glance of pleasure with her daughter, and kissed her baby's soft cheek, as if congratulating it also.

"Go home, my children; go home to your places," said Peter to his two eldest.

"But, father, I suppose I shan't be a shoemaker now?" said Jem.

"Go home, boy; go home to your work," said Peter somewhat angrily.

The boy *said* no more, but he looked what his father might not quite have approved, had he noticed it. Alice was already whispering some earnest requests to her mother, but turned away with her brother, and the two proceeded down the lane, at a snail's pace, and in earnest conversation.

Miss Maclaren had died alone, unfriended, untended. When her illness assumed a threatening aspect, and she knew that it did so, she called in medical advice, indeed, but she could not be prevailed upon to engage a nurse, or to purchase any of the delicacies which were usual in her circumstances. Sally was her only attendant; and Sally, who was naturally selfish, had become hardened almost to brutality by her several years' training with Miss Maclaren. She attended her carelessly and grudgingly, and at the moment she breathed her last, was engaged in one of her numerous peculations, having, during the course of her mistress's illness, removed, by degrees, at various times, everything that was removable by her, or saleable. As soon as she found that all was over, she hastily informed some neighbours of the fact, and went away, lest she should be taken to task for the thefts she had committed.

Without prayer or blessing, Miss Maclaren breathed her last; and no tear watered her grave. As nearest of kin and heir-at-law, Peter Hooley was chief mourner at her funeral; but it were absurd to attribute any reality of mourning to him. His mind was in a tumult; he was agitated by many contending feelings, but certainly no grief for the deceased found place. The other hired attendants of the funeral scarcely restrained their jests and merriment within the bounds of decency during their professional services at the obsequies of one who had outraged every holy charity of life.

Peter, or, as we must now call him, Mr Hooley, scarcely believed in the reality of his position; it seemed like a dream, and bewildered him. Last week, he was a humble industrious village schoolmaster, "passing rich with forty pounds a-year:" this week, he was the possessor of some thirty thousand pounds in the funds, besides plate and various other property in mortgages, bonds, &c. His first thought, his very first thought, was, that his industrious wife need no longer wear her decaying eyes with fine needle-work; she might live at ease and have a servant. His second thought was, that he could now afford to pay apprentice fees with his children to lucrative trades. These were his first ideas on obtaining his wealth, and they were natural and honourable, and such as might be anticipated from a humble-minded worthy man, who had never heretofore indulged a thought or a wish beyond the station in which he was placed. Things were now entirely changed. He and his family were thrown into a condition of which they had no previous experience. They had never been accustomed to have more than a few shillings, or at most pounds, at command, and now they had the disposal of what seemed an inexhaustible treasure. Peter's natural sagacity might have accommodated him in time to his altered position; but it was otherwise with his wife and family, who, guided by no sense of propriety, and regardless of admonition, were prepared for plunging into the most ridiculous excesses. As may be supposed, Peter's cares now really began. His first trouble was, his son and daughter's desertion of their place, in which step both were countenanced by their mother. Remonstrance was vain. In a storm of hostile and perplexed feeling, the distressed father left the family circle, and went, almost for the first time, to the public-house, where he spent several hours ruminating over his sorrows.

Through sickness, through sorrow, through adversity, through starvation, through deprivation of every kind, this family had clung—closely clung to each other. Tears there had often been, but they were tears of sorrow and of natural sympathy, not of indignation, of opposition, or of anger. Those were balm from heaven, and softened and soothed the heart as they fell; these were like scorching lava, which irritated and fostered the evil passions in which they took their rise. That sacred bond which no poverty or privation could sever, had melted beneath the first touch of unaccustomed prosperity.

The next morning, Peter waited on Mr Orwell, to apologise for his daughter's conduct, and to express his own thanks for that gentleman's undeviating kindness to her and to them. Mr Orwell good-humouredly excused the girl; said, that doubtless her head was a little turned at the sudden change in her father's position; that it was very natural, &c. He concluded by congratulating Peter on his change of circumstances, venturing, however, to express a hope, that it might eventually prove a subject for congratulation. In the conversation which ensued, Peter was recommended by his kind friend to remove from the present scene as soon as his successor in the school could be installed; and that, above all things, he should place his son and daughter with persons able to undertake their education on a liberal and rational footing.

To all these plans Peter thankfully assented; but he was no longer the controller of his household. To any project for the education of his children, Mrs Hooley objected as useless; and to the removal of the family from Y——, she put in a point-blank refusal. Peter's persuasive eloquence was thrown entirely away in combating these resolutions. Mrs Hooley had her own reasons for wishing to remain on the spot. She had long looked with secret envy at the dashing parade of the butcher's wife, whom she was now resolved to outshine, both as to dress and domestic elegances. Peter gave up the point; staid in the place, removing only to a villa in the neighbourhood, to which he had been recommended by the law agent, in whose hands he felt it necessary to put himself. Henceforth this gentleman acted the part of friend of the family—the general counsellor in all things touching the proper mode of spending the money in a gentlemanly way.

Mrs Hooley was now wallowing in delights; she had everything she wished; and yet she was far from happy. No sooner was one whim gratified, than another rose to view; and to be told that any one had things more splendid or higher priced, threw her into a fit of discontent. She purchased articles, not because she wanted them, but because others had articles of the same kind; and many things she bought, of the use of which she was altogether ignorant. A still worse torment afflicted her; nobody whom she had been in the habit of envying paid her any court; worst of all, the butcher's wife laughed at her. A circumstance occurred which shocked alike the self-love of mother and daughter. Alice, or, as she was now called, Miss Hooley, fully more inflated by change of circumstances than her mother, and far more offensive in her assumption of it—Miss Hooley was passing the butcher's shop one afternoon, when his wife, who was standing on the step with her knitting, good-humouredly asked her what joints her mother would want. Now, this was a familiarity which the ex-schoolmaster's daughter would, under any circumstances, have felt to be offensive; but it was just now peculiarly so, as she happened to be in company with a gentleman, an officer with whom she had become acquainted. Burning with vexation, therefore, that the butcher-wife's familiarity should be seen by her companion, and such a companion, she determined to repel it in lofty and dignified style; and for this purpose imitating, *as she thought*, the manner as well as the expression of the young ladies, whose attendant she had been, she replied, with a toss of the head, "That her *mamma* would send the order by the footman." The scornful laugh of the butcher's wife resounded along the street, a laugh of contempt and enmity, but Alice heeded it not; she saw a smile on Ensign Barnett's countenance, and that, doubtless, was caused by admiration of her spirit.

This Ensign Barnett, and a young brother officer, had, partly from curiosity, partly as a frolic, to relieve the tedium of country quarters, called on the Hooleys, thinking, correctly enough, that the want of etiquette, or, in plain English, the impropriety of the action, would not be understood by the *nouveaux riches*. Poor Mrs Hooley, taking it all as a compliment, was flattered beyond measure, and Alice was out of her wits with joy at associating with red-coated officers. The young men were loaded with civilities, pressed to stay to dinner, to which they, nothing loath, and highly amused, consented; detained till a late hour in the evening, and pressed to return next day. This the one, rather ashamed of himself, eluded, but Ensign Barnett came again and again.

One of the most flaring exhibitions which our newly-elevated family made was at church, when they appeared there for the first time in the pew attached to the house which they now inhabited, and which pew happened to join Mr Orwell's, in front of the gallery. Mrs Hooley and her younger children were as fine as money and feathers could make them; and if Alice were not so too, it was not because she had in reality a much better taste than her mother, but because she had the shrewdness to guess that Miss Orwell's dress would be correct, and the cleverness to have hers an exact model—a thing which her long residence in their family, and her acquaintance with their tradespeople, rendered easy. The feelings of the young ladies and their mother may be imagined on seeing their late under-nurse, placed so close as to appear one of their party, in a dress precisely copied from their own. The puce silks seemed off the same piece; the dark feather drooped in precisely the same way; and they had caught a glimpse even of the same delicate-hued pale primrose gloves, which, however, Nancy soon took off, unaware that her sprawling hands were red and coarse, but conscious of having them garnished with some sparkling and dashing rings. She behaved with tolerable decorum through the service; the more especially, as she had still some regard for her father's displeasure, who was wont to keep a strict eye on their conduct at church. He, though by no means unconscious of, or indifferent to, his new dignity, yet conducted himself here with unobtrusive propriety, until his attention was somewhat disturbed by the evident notice his own family attracted. He could not account for it. The children were smart, to be sure; but they had a right to be so; he could afford it. Alice, somehow, they looked at her—but she was a very pretty girl, and no wonder. His wife—he wondered, indeed, to see her keep her seat, but, perhaps, she was a bit put out with the strangeness, and so sat to keep quiet; the fact being, that Mrs Orwell, from extreme delicacy of health, being obliged to remain in a sitting posture during the service, Mrs Hooley, who supposed it must be *genteel* to do so, adopted the same position. Peter saw none of the glaring absurdities and inconsistencies of his family, which were so obvious to others; yet so strongly did nature and habit work in him, that he could never again be prevailed upon to present himself in this conspicuous pew with them; and as he felt the strangeness of going to another part of the church, the result was, that the hitherto exemplary Peter Hooley was seldom seen in church at all.

The next Sunday, the Misses Orwell came in an entirely new costume of dark-green silk. The sight took Alice's breath away at first, but she soon recovered her composure, and addressed herself to the task of impressing on her mind the exact colour, shape, and style, of these dresses. On Monday she proceeded to the *modiste* of the young ladies, and, by dint of powerful persuasions, prevailed on her to let her have a suit to correspond with theirs. Her mother gave some intimation about needless expense, but was not at all regarded; she had herself been the first to disregard that consideration.

When Alice appeared at church again, the Misses Orwell could scarce believe their eyes. Their father, too, who had good-naturedly smiled away their vexation before, and most effectually soothed it by giving them a *carte-blanche* on his purse for new dresses, even he felt that this coincidence could not be accidental.

He had been somewhat vexed and disappointed that his old protegé had so entirely disregarded his advice with regard to residence, and to the disposal of his eldest daughter; and he felt now justly irritated to see that very girl offensively aping his daughters, and that also, as he naturally supposed, with her father's consent and approbation. He judged of matters by the weight that that father's opinion *once* had in his family, little guessing his present diminution of authority; and still less supposing, that of the present matter of complaint, Peter had not the slightest knowledge or suspicion.

It was not surprising that, under these impressions, Mr Orwell's manner, when he again met Hooley, should be marked by a very unusual degree of haughtiness and coldness. Peter, unconscious of offence, was vexed, and, in consequence, less respectful than usual; his patron quickly noticed the change, and ceased to speak at all. And thus in a very short time was the schoolmaster sundered from his hitherto fast friend.

But the vexation this caused him was lost in a heavier one—no other than the expulsion of his eldest son from the school where he had placed him. His vulgar pride and insolent and ignorant conduct had embroiled him with his schoolfellows from the first day; his master's admonitions had been totally disregarded; severer punishments proved also ineffectual; and finding all his endeavours unavailing to maintain the wonted harmony of his school, its conductor at length took with reluctance the only step left him, and expelled the black sheep. Jem returned, fortified with a very small modicum of Latin grammar, much knowledge of dogs, horses, and fighting cocks, which he had acquired in a neighbouring stable-yard (where all his real holidays, and a good many which he took without leave, were spent), and a wonderful facility in smoking cigars. He soon struck up a friendship with Ensign Barnett; and in the hope of a commission, which he was resolved, by hook or by crook, to obtain from his father, he began to assume the costume *militaire*, of which the most distinguishing marks were the riding-switch in his hand, the cigar in his mouth, the spur screwed into the high heel of his boot, and the most insufferable swagger and assumption in his gait.

These things hurt and grieved his father, whose good sense pointed out the folly of them; but domestic vexations were crowding thick upon Peter, who was not himself certain of the right course to adopt, and who wanted firmness to enforce his commands, even when he knew they were right. His good friend, Mr Orwell, had soon forgotten his own vexation, and had spoken to him seriously and feelingly of the wrong course he and his family were adopting, and most especially of his daughter's intimacy with Ensign Barnett, whose character was profligate, and whose only object in his attentions to Miss Hooley was the money her father might give her. Shocked and alarmed, the anxious father hurried home, and told his wife and daughter what he had heard, supposing he had only to name it to obtain their concurrence in the young man's instant dismissal. He was mistaken, however. Miss Hooley affected to disbelieve the charge altogether. Her mother did not go so far; but she went far enough, in saying, that "young men would be a little gay;" that "there was no putting old heads on young shoulders," &c. &c. The conference terminated, as such conferences often did now, very angrily, and Peter forbade the young man his house, and peremptorily commanded his daughter to abstain from meeting him. It was too late. A few days afterwards, Alice did not appear at table; search was made for her, and she could not be found; and it was not till pursuit was hopeless, even if her heart-broken father had had spirit for pursuit, that it was discovered that she had eloped with Ensign Barnett, her brother being also the companion of her flight, to Gretna Green. But the bitter, the dark and bitter drop in this cup of sorrow, was, that Mr Hooley feared his wife was not ignorant of her daughter's intention to elope; he did not seek to ascertain the point, for he *feared* to do it.

As to the minor troubles of his ever-turbulent home, we have not time to dwell on them. Not a few of them arose from Mrs Hooley's utter incapacity to superintend such an establishment as in her folly she had insisted on having, instead of the respectable but quiet and unassuming *ménage* which Peter wished to have, and which his wife, with a little patience and practice, might have become fully adequate to regulate. Now, Peter saw her familiarly sitting amongst and gossiping with her servants one hour, and the next her voice might be heard lecturing them with most insufferable disdain. She was perpetually dismissing them for not showing her proper respect, an omission which it never enters the head of a lady to conceive possible; of course, as soon as the nature of the household became known, respectable servants ceased to offer themselves; then all sorts of frauds and peculations were committed, which, when discovered, raised the ire of Mrs Hooley to the utmost. At first Peter tried to regulate these matters, but he soon gave up the attempt. He gradually yielded more and more to circumstances; interfered less and less in arrangements, external or domestic; and acquired the habit of passing the long evening hours alone with his wine bottle.

It may seem strange that Betty Hooley, the industrious wife, the affectionate mother, whose exemplary conduct no adversity could touch, should appear so different now. But it is not so in reality. We referred, in a former sketch, to that peculiar juxta-position of petitions in our solemn litany, for deliverance "in all time of our tribulation, in all time of our wealth." One trial Betty Hooley had stood unscathed, under the other she sank. Unwonted riches called forth those latent tendencies in her character, self-will and a love of display, which, hitherto dormant and unexcited, had been harmless and unsuspected.

Yet is the evil not in the money itself, which is a great boon to those who want the comforts of life, a great blessing to all around, when placed in hands which know how to apply it usefully, honourably, and ornamentally. This knowledge or art poor Betty did not possess. She had been nurtured in penury, had lived the chief part of her life in penury, and her ideas were naturally and necessarily limited by the range of objects to which she had been accustomed. Wealth was a new world to her, and her course was as erratic as we might suppose his to be, who, without nautical skill, or even knowing the points of the compass, should be left to navigate a ship on the ocean.

But all her follies, and blunders, and extravagances, might have been laughed at or overlooked. Her error, her sad and irretrievable error was, making light of the authority of her husband. This led to her own degradation; this paved the way for the disobedience of his children, and their subsequent ill-doing; this made Peter's home unhappy, and drove him to solitary habits, and to drinking. But we have lingered too long over our details, and must hasten to the conclusion of our tale.

One day, as Peter was rejecting his son-in-law's application for money—importunities which came thicker and faster, and more in the shape of demands than petitions—and while the young man was enforcing his demand with insolence, Alice with pertness, Mrs Hooley with crying, and as Jem and a younger brother (the former with a cigar in his mouth) were tying a dog and a cat together by the tails in a corner of the room, a stranger was announced, and it was evident by his countenance that his tidings were full of import.

They were so indeed. He came to say that a first cousin of Miss Maclaren's, long supposed to be dead, had seen in his distant abode in India the announcement of that lady's death, and had hastened home to take possession of her property. He was the real next of kin, being the son of her father's brother. Peter Hooley's claim was more remote; he was the grandson of an aunt.

Peter Hooley could only, of course, yield up every thing to the new claimant; things were in the greatest confusion; and the intriguing agent in whose hands he had placed everything, saw fit to abscond. Mr Maclaren met with some heavy losses in consequence of the roguery of this gentleman; but he behaved with kindness and consideration to his unfortunate cousin, and settled a hundred pounds a-year upon him. He also had means, owing to his connexions in India, to obtain for Jem a situation there; and thither, without his own consent asked, the youth was speedily shipped. Alice, his companion in disobedience, went with her husband to a distant station, whither his regiment was ordered, and there we leave her.

The latter part of Peter Hooley's career was unhappy. He had acquired habits which he could not shake off, though no longer able to indulge in them as formerly. With a spirit broken, and a body enfeebled, he became a prey to intemperance, and sunk so low as to be even despicable to himself. His once vain and foolish wife, on whom might be charged the disgrace of bringing the family to ruin, was now equally broken-spirited, and fully more debased. But why extend the picture? Impoverished, wretched, unconsoled, and unpitied, were the last years of a pair who manfully battled with *poverty*, but proved themselves incompetent to struggle with the embarrassing obligations of *wealth*.

POPULAR ENGLISH FESTIVALS.

CHRISTMAS.

CHRISTMAS—the Day of the Nativity of our Lord—may be said to stand at the head of Christian festivals, in all sections of the church in which festivals are observed. As the celebration of an event the happiest that ever took place on earth, it is peculiarly a festival of joy, and this has always been particularly the case in "merry England," though not so much in these latter days as in those of the Tudors and Stuarts. Another feature of the day—the mingling in brotherhood of all classes, baron and retainer, servant and master, "gentle and semple"—was beautifully appropriate to the great feast-day of a religion which proclaimed all men to be brothers, and, alike in its promises and threatenings, is no respecter of persons. Perhaps we have no poetical recollections more perfectly pleasing than those which refer to the Christmas of old times, when

"'Twas merry in the hall, *because* beards wagged all."

The celebration of Christmas is all but traced to apostolic times. Clement, who lived in the first century, exhorts the brethren to "keep diligently feast days, and truly, in the first place, the day of Christ's birth." Church services for the day were ordained in the *second century*, when Theophilus, bishop of Cæsarea, recommends its celebration on whatever day *the twenty-fifth of December* shall happen. This shows how early the particular day of the year, which is still celebrated, had been adopted, and makes it extremely probable that the 25th of December had been handed down from the apostles as actually the birth-day of Christ. So early as the middle of the fourth century, the festive observance of the day had been carried to such a pitch of excess, that Gregory Nazianzen deemed it necessary to exhort the Christian community to celebrate the day somewhat more spiritually, and less temporally.

On the spreading of Christianity to the northern nations, it found a grand heathen festival observed at this season, namely, that of *Iol*, or *Yule*, which appears to have been simply a rejoicing at the *turn* of the season, and the re-ascending of the sun through the tropics—Iol being considered as a word signifying revolution, and the root of the Latin *vol-vere*, to turn, and of the English word *wheel*. The missionaries took advantage of this Pagan festival to engraft the Christian festival upon it, so as to give as little disturbance as possible to popular habits; and thus Christmas is still called *Yule* in the north of Europe, as well as in Scotland and the northern counties of England. Perhaps the French *Nuel* is from the same source, and it is curious to find that *Jul-lom* is the term used by the Arabians for the first day of the year. The Greenlanders, who came from a Norwegian stock many centuries ago, still keep a *sun feast* about the *twenty-second* of December; and the Icelanders commence the year with Yule, or Christmas. Yule, like all the other festivals of the northern nations, was celebrated by the kindling of great fires; those in summer out of doors, those in winter within; and the Yule fire was retained in the Christian festival, in the form of what was called, and is still called in some parts of England, the *Yule Clog*; that is, a huge block of wood thrown upon the chimney on Christmas eve, and which a reserved brand from the preceding Candlemas fire was always employed to kindle. As the servants were entitled to ale at their meals while the block lasted, they usually endeavoured to get as large a one as the fire-place would admit of; and hence it is scarcely surprising to learn, that, in the time of the Civil War, a good house in England (that of Hagmond Abbey, near Shrewsbury) was burnt down in consequence of the kindling of a too large Yule clog. It was either a general or local custom to have the block bandaged round in nine places, and as each bandage, in succession, was burnt off, to hand round a service of ale, mingled with spirits, to the party assembled.

The festivities of Christmas Eve seem to have been altogether, or nearly, as lively as those of Christmas itself. Towards evening the parish-bells rung out merrily; blithesome parties gathered round the fire; all the more blithesome if they could really sit round it, which was the case in most country houses a century or two ago: the Yule clog was brought in and kindled; and convivialities and sports then commenced. Listen to the chirruping of divine Robert Herrick—

> Come, bring with a noise,
> My merry, merry boys,
> The Christmas log to the firing;
> While my good dame she
> Bids ye all be free,
> And drink to your heart's desiring.
>
> With the last year's brand
> Light the new block, and
> For good success in his spending,
> On your psaltries play
> That sweet luck may
> Come while the log is a-teending.*

At the house of Sir —— Holt, Bart, at Ashton, near Birmingham, and perhaps in others of the same sort, there was a particular amusement practised on Christmas Eve, down to the end of the last century, as thus described:—"As soon as supper is over, a table is set in the hall. On it is placed a brown loaf, with twenty silver threepences stuck on the top of it, a tankard of ale, with pipes and tobacco; and the two oldest servants have chairs behind it, to sit as judges if they please. The steward brings the servants, both men and women, by one at a time, covered with a winnow sheet, and lays their right hand on the loaf, exposing no other part of the body. The oldest of the two judges guesses at the person, by naming a name, then the younger judge, and lastly the oldest again; but if they do not, he takes off the winnow sheet, and the person receives a threepence, makes a low obeisance to the judges, but speaks not a word. When the second servant was brought, the younger judge guessed first and third; and this they did alternately, till all the money was given away. Whatever servant had not slept in the house the preceding night, forfeited his right to the money. When the money is gone, the servants have full liberty to drink, dance, sing, and go to bed when they please." Furmety was always the supper on Christmas Eve, and there was a prevalent superstition that bread baked then never would turn mouldy.

In the Romish church, immediately after midnight, there is a grand mass to usher in Christmas morn; and, at an early hour in the morning thereafter, the birth of our Saviour is celebrated by another service. The Reformation abolished such services in England, but could not extinguish certain simpler customs of the people. The peasantry in the south-western counties, and perhaps in other districts, still believe that, if you steal quietly into the cow-houses at midnight of Christmas Eve, you will see the cattle kneel down immediately after twelve o'clock, as commemorating the

* Burning.

supposed similar procedure of the oxen in whose resting-place Jesus of Nazareth was born. It is also supposed that the bees will be heard to sing at the same hour in their hives. These are superstitions, but superstitions based on the principle of adoration, and as purely poetry as the Iliad. It has also been the custom of the common people in England, for many centuries, to go about in bands at an early hour in Christmas morn, serenading the neighbours with what are called *carols*, namely, songs referring to the event of Christ's birth. A collection of these, from the popular voice, and from old manuscripts and books, has been made by Mr William Sandys, and published in an octavo volume, with several of the airs, which are extremely pretty, as are many of the carols themselves, although generally in the simplest strain of popular poetry. The custom is undoubtedly a memorial of the "Gloria in Excelsis" of the Bethlehem shepherds, which Jeremy Taylor, in his fanciful way, calls the first Christmas carol. One can enter into the feelings of a writer in the Gentleman's Magazine for 1811, who tells us that, visiting a town in the North Riding of Yorkshire, about six o'clock on Christmas Day, he was awakened by a sweet singing under his window: "surprised," he says, "at a visit so early and unexpected, I arose, and looking out of the window, I beheld six young women and four men welcoming with sweet music the blessed morn." Goldsmith, it will be recollected, says of the rustic parishioners of his immortal vicar, "They kept up the Christmas Carol." One of these simple compositions is as follows:—

God rest you merry, gentlemen,
Let nothing you dismay,
For Jesus Christ our Saviour
Was born upon this day,
To save us all from Satan's power
When we were gone astray.
O tidings of comfort and joy,
For Jesus Christ our Savour
Was born on Christmas day.

In Bethlehem in Jury
This blessed babe was born,
And laid within a manger
Upon this blessed morn;
The which his mother Mary
Nothing did take in scorn.
O tidings, &c.

From God our Heavenly Father
A blessed Angel came,
And unto certain Shepherds
Brought tidings of the same,
How that in Bethlehem was born
The Son of God by name.
O tidings, &c.

Fear not, then said the Angel,
Let nothing you affright,
This day is born a Saviour
Of virtue, power, and might;
So frequently to vanquish all
The friends of Satan quite.
O tidings, &c.

The Shepherds at those tidings
Rejoiced much in mind,
And left their flocks a-feeding
In tempest, storm, and wind,
And went to Bethlehem straightway,
This blessed babe to find.
O tidings, &c.

But when to Bethlehem they came,
Whereas this infant lay,
They found him in a manger
Where oxen feed on hay,
His mother Mary kneeling
Unto the Lord did pray.
O tidings, &c.

Now to the Lord sing praises,
All you within this place,
And with true love and brotherhood
Each other now embrace;
This holy tide of Christmas
All others doth deface.
O tidings, &c.

Another is even more fanciful, though of perhaps a lower character in composition:—

I saw three ships come sailing in
On Christmas day, on Christmas day;
I saw three ships come sailing in
On Christmas day in the morning.

And what was in those ships all three,
On Christmas day, on Christmas day?
And what was in those ships all three,
On Christmas day in the morning?

Our Saviour Christ and his lady,
On Christmas day, on Christmas day;
Our Saviour Christ and his lady,
On Christmas day in the morning.

Pray whither sailed those ships all three,
On Christmas day, on Christmas day?
Pray whither sailed those ships all three,
On Christmas day in the morning?

O they sailed into Bethlehem,
On Christmas day, on Christmas day;
O they sailed into Bethlehem,
On Christmas day in the morning.

And all the bells on earth shall ring,
On Christmas day, on Christmas day;
And all the bells on earth shall ring,
On Christmas day in the morning.

And all the Angels in Heaven shall sing,
On Christmas day, on Christmas day;
And all the Angels in Heaven shall sing,
On Christmas day in the morning.

And all the Souls on Earth shall sing,
On Christmas day, on Christmas day;
And all the Souls on Earth shall sing,
On Christmas day in the morning.

Then let us all rejoice amain,
On Christmas day, on Christmas day;
Then let us all rejoice amain,
On Christmas day in the morning.

Some of the poets of the early part of the seventeenth century condescended to write Christmas carols: there is one of most delightful poetry by George Wither; and it is probable that the following, which was presented at court with music, was not by a meaner hand than that of Jonson. It is called the "Star Song, a Carol to the King."

The flourish of music; then followed the song.

1. Tell us, thou clear and heavenly tongue,
Where is the Babe but lately sprung?
Lies he the lily-banks among?

2. Or say, if this new Birth of ours
Sleeps, laid within some ark of flowers,
Spangled with dew-light; thou canst clear
All doubts, and manifest the where.

3. Declare to us, bright star, if we shall seek
Him in the morning's blushing cheek,
Or search the beds of spices through,
To find him out?

Star. No this ye need not do;
But only come and see Him rest,
A princely Babe, in 's mother's breast.

Chor. He's seen! He's seen! why then around
Let's kiss the sweet and holy ground;
And all rejoice that we have found
A King, before conception, crown'd.

4. Come then, come then, and let us bring
Unto our pretty twelfth-tide King,
Each one his several offering.

Chor. And when night comes we'll give him wassailing;
And that his treble honours may be seen,
We'll choose him King, and make his mother Queen.

It is to be remarked, that Christmas carols are sung in France, Spain, and Italy, as well as in England. No trace of the custom exists in our northern region.

Christmas Day itself had first honour due paid to it by its appropriate service in church, which was decorated with ivy, holly, and other evergreens for the occasion. Worship over, the spirit of festivity and gambolment broke forth, and prevailed throughout the remainder of the day. A sprig of the misletoe being put up in some porch, door-way, or passage, any clever fellow who could inveigle a maid under it was privileged to kiss her, a practical joke which never failed to excite an immense deal of merriment. "Then," says an old writer, "were servants running here and there with merry hearts and jolly countenances; every one was busy in welcoming of guests, and looked as snug as new-licked puppies; the lasses were as blythe and buxom as the maids in good Queen Bess's days, when they ate sirloins of roast beef for breakfast. Peg would scuttle about to make a toast for John, while Tom ran *harum-scarum* to draw a jug of ale for Marjory." The leading feature of the afternoon was a feast given by men of consequence to their families and dependants, a feast presenting good cheer in almost wasteful abundance, and of which all partook on a footing of comparative equality. In the middle ages, the kings, and leading lords spiritual and temporal, together with the colleges and inns of court, "held their Christmas," as the phrase went, on a scale which might be called stupendous, as far as meat and drink were concerned, and attended with revels, plays, and diversions not ceasing, in many instances, till Twelfth Night. Whatever might be said of the propriety of the festivities, it is certain that they led to a community of feeling between high and low. "The comforts and personal gratification of their dependants were provided for by the landlords, their merriment encouraged, and their sports joined. The working man looked forward to Christmas as the portion of the year which repaid his former toils; and gratitude for the worldly comforts then received would occasion him to reflect on the eternal blessings bestowed on mankind by the event then commemorated."

The dishes peculiar to Christmas were brawn, capon, turkey, pudding, and mince-pie, the last being composed of neats' tongues, chicken, eggs, sugar, currants, lemon, and orange-peel, with various sorts of spices; and in great houses, a boar's head was presented. Roast-beef and plum-pudding have latterly, we believe, been the favourite Christmas dinner in England; but two hundred years ago, it was as has been stated. A *wassail-bowl*, filled with *lamb's-wool*, a liquor composed of warmed ale, with roasted apple, toast, sugar, and nutmeg, was carried round amongst the guests, and largely indulged in.

The religious service of Christmas Day receives but a small share of attention from old writers. In fact, the day was chiefly distinguished by the popular festivities. Besides those features of its celebration to which we have alluded, there was another not to be passed over in silence. In England it was customary to elect a person as *Lord of Misrule*, who went about taking the lead in every kind of extravagant sport and merriment which the wit of man could devise. The election and functions of this personage were perhaps the most singular part of the festival. According to Stow, "at the feast of Christmas, there was in the king's house, wherever he lodged, a Lord of Misrule, or Master of merry Disports, and the like had ye in the house of every Nobleman of honour or good worship, were he spiritual or temporal. The Mayor of London, and either of the Sheriffs, had their several Lords of Misrule, ever contending, without quarrel or offence, who should make the rarest pastime to delight the beholders. These lords, beginning their rule at Allhallond Eve, continued the same till the morrow after the Feast of the Purification, commonly called Candlemas Day: in which space there were fine and subtle disguisings, masks and mummeries, with playing at Cards for Counters, Nayles, and Points in every house, more for pastimes than for gaine."

The management of the plays usually acted at Christmas in the halls of colleges and law societies, fell to the care of the Lord of Misrule. The particular functionary elected in the inns of court in London, after exercising all the duties, and going through the parade of royalty for a fortnight, at an expense of a couple of thousand pounds, was knighted at Whitehall by the real sovereign of the land. In Scotland, before the Reformation, the religious houses had a similar officer for the Christmas revels, called the *Abbot of Unreason*, whose particular functions are graphically portrayed by Scott in his novel of "The Abbot." The custom was suppressed by statute in 1555.

Though kept up in England as a religious festival, and as a day for the assemblage of all the scattered members of a family at dinner, Christmas has shrunk into something very different from what it was in days of yore. We will indulge but in one remark, that, whatever improvements may have been made during the last two hundred years in England, the extinction of a festivity which in so peculiar a manner bound all ranks and conditions of men together, cannot surely be considered as one of them. We conclude with the delightful passage in Marmion about the Christmas of ancient times:—

On Christmas Eve the bells were rung;
The damsel donned her kirtle sheen;
The hall was dress'd with holly green;
Forth to the wood did merry-men go,
To gather in the misletoe.
Then open'd wide the baron's hall
To vassal, tenant, serf, and all;
Power laid his rod of rule aside,
And ceremony doff'd his pride.
The heir, with roses in his shoes,
That night might village partner choose.
The lord undergoating, share
The vular game of "post and pair."
All hail'd, with uncontroll'd delight,
And general voice, the happy night,
That to the cottage, as the crown,
Brought tidings of salvation down.
The fire with well-dried logs supplied,
Went roaring up the chimney wide
The huge hall-table's oaken face,
Scrubb'd till it shone, the day to grace,
Bore then upon its massive board
No mark to part the squire and lord.
Then was brought in the lusty brawn,
By old blue-coated serving-man;
Then the grim boar's-head frowned on high,
Crested with bays and rosemary.
Well can the green-garb'd ranger tell,
How, when, and where, the monster fell;
What dogs before his death he tore,
And all the baitings of the boar.
The wassol round in good brown bowls,
Garnish'd with ribbons, blithely trowls.
There the huge sirloin reeked: hard by
Plumb-porridge stood and Christmas pye;
Nor fail'd old Scotland to produce
At such high tide, her savoury goose.
Then came the merry masquers in,
And carols roar'd with blithesome din;
If unmelodious was the song,
It was a hearty note and strong.
Who lists may in their mumming see
Traces of ancient mystery;
White shirts supplied the masquerade,
And smutted cheeks the visors made:
But O! what masquers, richly dight,
Can boast of bosoms half so light!
England was merry England, when
Old Christmas brought his sports again.
'Twas Christmas broached the mightiest ale,
'Twas Christmas told the merriest tale;
A Christmas gambol oft would cheer
The poor man's heart through half the year.

CONSTRUCTION OF GRATES.

These important articles of our domestic wants have been afforded little of the attention of qualified persons since the time of Rumford, whose successful efforts were an instance of the advantageous application of science to such objects. But there has not been enough of such knowledge prevalent amongst those concerned in the manufacture of them, even to preserve attention to the rules he laid down; hence by degrees grates have become more and more defective in their construction. The surrounding the fire with brick instead of metal, which he so rigidly enforced, has, on account of the trifling reason of the former not lasting so long, been very generally given up. To place burning fuel in such an iron receptacle as an ordinary grate, is as wasteful and ignorant an act, though not commonly perceived to be so, as to employ a cracked vessel or a cullender to hold an expensive liquid. So large a part of the heat leaks away, that the fuel is chilled into extinction where it touches the metal, and much of it smoulders away instead of burning at a high temperature, which would cause it to consume more oxygen, and give out much more heat. From a fire which burns dully, all that can be volatilised passes off unconsumed; and of the solid carbon, a large part unites with oxygen in the first proportion, forming carbonic oxide; and thus giving out little more than half the heat developed when the combustion is complete, and carbonic acid is the product. This evil has been increased by the immense mass of continuous metal of which modern stove-grates are made.—*Medical Gazette.*

[The object aimed at in the above, is to induce people to employ fire-places with brick sides. But this involves building; and as brick is less neat in the eyes of a housewife than smooth iron, it will not be easy to cause an alteration of the present practice.]

Column for the Boys.

GASSENDI.

Success in life depends very much on powers of observation, and whatever these may be originally, it is certain they may be greatly improved by use and cultivation. Some boys are so dull, that thousands of things pass under their notice without attracting their attention, or causing them to inquire into their meaning, while to others almost nothing takes place which is not sharply observed and made the subject of inquiry.

About two hundred and fifty years ago, there lived at Chantersier, a village in France, a little boy called Peter Gassend, a name which has been changed by learned men into Gassendi. Young Gassendi was so observant, that nothing escaped his attention. While yet a child, and before he was able to read, he drew knowledge from every object in nature and art that came under his notice. He was particularly sensible to the magnificence of a starry sky. When only seven years old, he felt a secret charm in the contemplation of the stars, and, without the knowledge of his parents, he sacrificed his sleep to this pleasure. One evening, a dispute arose between him and his young companions about the motion of the moon and that of the clouds. His friends insisted that the clouds were still, and the moon moved. He maintained, on the contrary, that the moon had no sensible motion, and that it was the clouds that passed so swiftly. His reasons produced no effect on the minds of the children, who trusted to their own eyes rather than to what could be said on the subject. It was therefore necessary to undeceive them by means of their eyes themselves. For this purpose Gassendi took them under a tree, and made them observe that the moon still appeared between the same leaves, while the clouds sailed away out of sight.

His father was so struck with these happy dispositions, that he resolved to cultivate them. He spoke to the clergyman of his parish, who engaged to give him the first elements of letters. This was the food that the mind of young Gassendi demanded, and he applied to study with so much ardour, that, not contented with working in the day, he also studied during part of the night by the light of the church lamp. His progress was extremely rapid. At the end of three years he understood and spoke Latin very well. M. de Boulogne, bishop of Digne, coming upon a visitation to Chantersier, Gassendi, who was then only ten years old, harangued him in Latin with so much grace and vivacity, that the prelate, equally surprised and charmed with his premature talents, said aloud, "That child will one day be the wonder of his time, and before he has attained the age of maturity, he will be cause of admiration to the learned." Young Gassendi fulfilled these predictions. So accomplished was he as a scholar, that, at sixteen years of age, he was invited to become professor of rhetoric at Digne; and from this he was, in three years later, promoted to a professorship at Aix. His reputation as a scholar and natural philosopher becoming widely spread, he was, in 1645, appointed royal professor of mathematics at Paris. After this event, he wrote many works of great merit, and died, in 1658, at the age of sixty-three, leaving a name which stands in the foremost rank of men of science.

If, when a boy at Chantersier, Gassendi had occupied himself in frivolous pursuits, and been unmindful of the great operations of nature passing before him, he could never have risen above the rank of a cowherd, and his valuable services to science would have been entirely lost to the world.

BENEVOLENCE.

A disposition to grasp, and keep entirely for their own use, money, toys, or any other articles, is always odious in children; while, on the other hand, it is delightful to see young persons liberally sharing with their brothers, sisters, and companions, any good things which fall to their share. A fine anecdote, exemplary of this species of liberality, is told of two boys, the sons of the Earl of Elgin, who were permitted by their father to associate with the poor boys in the neighbourhood. One day, the earl's sons being called to dinner, a lad who was playing with them said, that he would wait till they returned. "There is no dinner for me at home," said the poor boy. "Come with us, then," said the earl's sons. The boy refused; and when they asked him if he had any money to buy a dinner, he answered "No!" When the young gentlemen got home, the eldest of them said to his father, "Papa, what was the price of the silver buckles you gave me?" "Five shillings," was the reply. "Let me have the money, and I'll give you the buckles again." It was done accordingly, and the earl, inquiring privately, found that the money was given to the lad who had no dinner.

HONESTY.

Boys placed in circumstances of temptation cannot be too deeply impressed with the conviction, that "honesty is the best policy;" that is to say, that in the long run they will make more by being honest than by taking that which is not their own. The following is a case in point. A nobleman travelling in Scotland, a number of years ago, was asked for his alms in the High Street of Edinburgh, by a little ragged boy. He said he had no change; upon which the boy offered to procure it. His lordship, in order to get rid of his importunity, gave him a piece of silver, which the boy conceiving was to be changed, ran off for the purpose. On his return, not finding his benefactor, whom he expected to wait, he watched for several days in the place where he had received the money. At length, the nobleman happened again to pass that way; the boy accosted him, and put the change he had procured into his hand, counting it with great exactness. His lordship was so pleased with the boy's honesty, that he placed him at school, with the assurance of providing for him.

OLD DIRECTORIES.

An old street directory of any of our large cities may be said to be as productive of interesting recollections as the tombstones in a churchyard. We learn from it who were the notables of their day, where they lived, and what were the professions in vogue in days gone by. We also get at some curious facts in family history; who were the fathers and grandfathers of the present race, and whether the existing members of a family have risen above, or are depressed beneath, the circumstances of their predecessors. The principal matter of interest, however, is the great change which has taken place in the character of localities. Streets which had been fashionable half a century ago, are so no longer. Houses which had been inhabited by men of high professional standing, are now, alas! the dwellings of the humblest class of citizens; the change affording a fine lesson as to the transitory glory of all earthly things. We have been induced to make these few remarks from a perusal of the following notice of certain old Glasgow directories, which appeared a short time ago in the *Glasgow Herald*:—

We have had lately in our possession two records of the olden time, which show us, as it were, in their everyday business aspect, a race of Glasgow citizens who have almost all passed to their long account, namely, the Glasgow Directories for 1783 and for 1790, the former printed and published by John Tait, and the latter entitled "Jones' Directory," and printed by Joseph Galbraith. Though the value of these little books is now great in the eyes of those who own them, their appearance in point of paper, style, and printing, is scarcely more respectable than the old penny histories and ballads which used to inundate the country before the palmy days of cheap literature came upon us; and they as little resemble the goodly tome which now annually issues from the office of Mr Graham, as the tiny Glasgow of 1783 resembles the vast city of 1842. And to make the comparison understood, it may be proper to state, that the population in 1780 was 42,832; in 1735, it was 45,889; and in 1791 it was 66,537; while, by the last census, the population of the city and suburbs falls very little short of 300,000. The directory of 1783 appears to have been the first ever published in Glasgow, and it is "dedicated with the greatest submission to the magistrates and town council." The publisher does not give his guarantee that it is absolutely perfect; and he accounts for any imperfections in the following quaint paragraph in his preface:—"As the difficulty of a private person knowing every one and his connexions, without the assistance of the people themselves, must be apparent to every one, it cannot be expected but that some errors and omissions will appear, which he hopes the indulgent public will excuse; notwithstanding the publisher did make an actual survey of a great number of houses, shops, warehouses, &c., in Glasgow, with a view to be as exact as possible; but many had scruples of giving information, as they imagined it was for another purpose he was taking up their names." The book begins by enumerating the public bodies, or important professional characters in the city: first, the magistrates and council; second, the "reverend ministers of the gospel," of whom there appear to be only 18, both established and dissenting, in the whole city; third, the professors in the university; fourth, the faculty of procurators; fifth, the officers of excise; sixth, the physicians, of whom there are 16; seventh, the midwives, of whom there are 10; and lastly, the messengers at arms, of whom there are 11. Having made these honoured distinctions, the compiler then sets out by giving merchants, manufacturers, grocers, vintners, lint-hecklers, "hocksters," &c., *in cumulo*, but at the same time in something like alphabetical order. At this time the great bulk of the business community seems to have been gathered in High Street, Saltmarket, Trongate, Gallowgate, Candleriggs, Bridgegate, and the Wynds. Queen Street, which must have been in course of formation, is occasionally mentioned, but it was then much better known by its olden name of the "Cow-loan." For instance, we find "John Marshall, sheriff-substitute," residing in the Saltmarket; "John Wilson, one of the city clerks," resides in Gallowgate; there are no fewer than four members of the legal profession to be found in the Laigh Kirk Close: others are located in the New Wynd, Moodie's Wynd, &c.; and one of them "hangs out" at the Saracen's Head Inn—then, we believe, the principal hostelry in the city. We find that the town's hospital and infirmary are placed in Clyde Street, where the former is situated up till this time; but now even its days are numbered. Compared, however, with the splendid temple which benevolence has reared adjoining the cathedral, for the cure and alleviation of disease, we cannot well divine what must have been the infirmary of 1783 in Clyde Street.

"Jones' Directory" for 1790-91 brings the business-history of the city, so to speak, a little further down, and the numbers are now appended to the houses, which are not given in the former publication. It is a crown 12mo., and consists of 82 pages. To give some notion of the extent of the business population in these times, we may mention that under the letter B there are only 170 names; while in the directory published in the present year, the number of business people in the city whose names begin with this capital amounts to as near as may be 1000. Truly, this little book, read at this distance of time, proves as convincingly as the longest homily, that the days of frail man are as the grass; for out of the long lists of the university and city clergy, there are now only two in the land of the living, and even these have ceased to be, so far as regards their public labours. John Campbell, junior, Esq., the Lord Provost of the city, has his "lodgings" in Jamaica Street; the well known and highly respected (late) Kirkman Finlay is found at "James Finlay's, Bell's Wynd." David Dale, merchant, has "lodgings" in Charlotte Street; and David Dale, junior, manufacturer, has "lodgings at the head of the Green." This, it must be remembered, was nearly a generation before Monteith Row was called into existence. Then we have Andrew Foulis, the celebrated printer, who has his office in Shuttle Street, and his lodging in the College. And there is Captain Archibald Paton, whose name has been wedded to heroic verse by Lockhart, and who has a "lodging facing the Exchange." We notice the name of one gentleman still alive, who is known to all over the west of Scotland for deeds of manufacturing enterprise and munificence, who has been a member of parliament, and is the owner of a princely estate in the upper ward; who has been the architect of his own fortune, which enables him to "close a youth of labour by an age of ease;" and yet, in these early times, he appears to have lodgings in the modest suburb of Anderston. There are also designations here which now-a-days would look very queer in a directory, such as, "Miss Dunlop keeps a mangle, Copland's Close, High Street," and "Miss Aird, dealer in dead crapes." The coaching advertisements are not the least curious things in the little book. It appears that two or three of the principal inns despatched coaches to Edinburgh daily; but we select the announcement from the Black Bull, which says, "A coach to Edinburgh at 10 o'clock, to the White Hart Inn, Grassmarket, for 8s. per seat. A neat diligence, containing three passengers, to Mr Cameron's hotel, 2 Prince's Street, at 12 noon; if taken in whole, at any hour the company pleases, 10s. 6d. per seat." Here is another: "The Glasgow and Edinburgh Mercury 'setts' out from A. M'Gregor's, Candleriggs, at 11 o'clock every day. If taken by any party in whole, will 'sett' out two hours sooner or later." Here we have some Greenock "Flys," the fare of which is 5s. 6d. per seat, which "sett" out on stated days, but, like the others, will move at any hour the company thinks fit, if taken in full. What would these venerable Jehus say to see the Greenock railway on a Saturday afternoon and Monday morning, in sea-bathing time, when thousands are whirled along on the wings of the wind? or what would they have said to have witnessed the business done by the Edinburgh and Glasgow railway on the week of the queen's visit?

SIR WALTER SCOTT AND A SCOTCH BLACKSMITH.

It happened, at a small country town, that Scott suddenly required medical advice for one of his servants, and, on inquiring if there was any doctor at the place, he was told that there were two, one long established and the other a new comer. The latter gentleman, being luckily found at home, soon made his appearance—a grave, sagacious looking personage, attired in black, with a shovel hat, in whom, to his utter astonishment, Sir Walter recognised a Scotch blacksmith, who had formerly practised, with tolerable success, as a veterinary operator in the neighbourhood of Ashestiel. "How, in all the world!" exclaimed he, "can it be possible that this is John Lundie?" "In troth is't, your honour; just a' that's of him." "Well, but let us hear; you were a horse-doctor before; now it seems you are a man-doctor; how do you get on?" "Ou, just extraordinary weel; for your honour maun ken my practice is very sure and orthodox. I depend entirely upon twa simples." "And what may their names be? Perhaps it is a secret." "I'll tell your honour," in a low tone; "my twa simples are just laudamy and calamy." "Simples with a vengeance!" replied Scott. "But, John, do you never happen to kill any of your patients!" "Kill?" Oh ay, may be sae! Whiles they die, and whiles no; but it's the will of Providence. Ony how, your honour, it wad be lang before it makes up for Flodden!"—*Reminiscences of Sir Walter Scott.*

GOOD CONFERRED BY OMNIBUSSES.

The individual who first started an omnibus thought of nothing beyond the conveyance of passengers in this novel fashion from one end of the town to another, and sharing the profits of hackney-coach and cabmen. He did not fancy that he was going to change the face of London, extend its suburbs for miles, and contribute essentially to the health of its population. But such is the case. The rental of the city, in the shape of residences or dwelling-houses, is reduced to an extraordinary degree; there is a daily and hourly migration of tens of thousands to the outskirts, where they live and breathe a healthful air, instead of being smoked and smothered in narrow courts and alleys. To receive them, innumerable cottages and villas have been built, and a wonderful mass of property created; and with a change in their mode of life, there has arisen a change in their feelings and manners. They mix more with general and chance society, and they learn much from every day's casual intercourse with strangers. Their amusements and their domestic habits take a different turn; and, in short, an Iliad of alteration may truly be ascribed to *the starting of a buss!*—*Literary Gazette.*

SLEEP SEEKERS.

Macnish often coaxed himself to sleep by repeating some well-known rhyme half a dozen times; and a gentleman in the town of Milford has learned to fall asleep at will, by fixing his eyes in one direction for a few minutes. Dr Elliotson knows a lady who often remains awake till her husband rubs her foot: and to many persons the having their hair combed is a soporific. John Philips, the poet, delighted, when a boy, to have this office performed for hours together; and Isaac Vossius was so critically curious in combing, that he preferred its performance rhythmically. He liked to have it done by barbers or other persons skilled in prosody, so that their pectinating movements might imitate iambics, trochees, &c., to his great delight. In these cases, reverie rather than sleep was produced; but in other instances the effect is that of a simple narcotic. Thus, Sir John Rennie, the architect, was regularly put to sleep by having the hair at the back of his head combed, and rubbed with the palm of the hand.—*Medical Times.*

"MY LITTLE ROOKERY."

I HAVE had a kind of sneaking affection for crows as long as I remember. Their convocations on the green fields and the ploughed furrows; their twilight migrations, precisely at the same hour, to their nightly roosts in the old plantation; their weddings, funerals, and other festivities; all that I saw of them during a boyhood spent in the country, has given me an enduring interest in these clergy of the feathered world. True it is and of verity, that these early predilections were not incompatible with certain acts of depredation on my part, accompanied with some risk, and producing loud and prolonged remonstrances, amidst their domestic establishments. Yet, upon the whole, we have generally lived on good terms; and of late years, in particular, my intercourse with at least one of the species—the rook—has ripened into mutual trust and confidence. My knowledge of the vocabulary of that portion of the family* has been enlarged, and their haunts and sentiments have become familiar to me. They, again, on their part, take no notice whatever of my presence or absence; and I walk in and out amongst them, a second Mr Spectator, unchallenged and unsuspected.

When one surveys a large community, his attention is distracted and confused by the multiplicity of movements which are going on at the same time. There is such a succession of action and reaction, of influences, modifications, and results, that the mind is bewildered, and the judgment brought to a stand. But when the subject is viewed as it were in miniature, and the elements are simplified and reduced in number, a more distinct and satisfactory result is obtained. This last alternative I have been lucky enough to realise, in my possession of a little rookery, consisting of some fifteen or sixteen families, which, for these fourteen years, have been submitted to my daily and hourly inspection. Nor can I have the smallest doubt, that the same phenomena which are exhibited in this reduced field of observation, obtain in larger communities and establishments.

On or about the 1st of March, in ordinary seasons, the rooks, which have been absent all winter, come down all at once upon their old settlements, with a loud and varied discharge of vociferation. Long and severe is the contest amongst them for tree, branch, and even twig. Everything is disputed, and everything changes possessors with amazing rapidity. The struggle continues from day dawn to the gloaming, when quiet is at length restored only by the departure of the contending parties. But with a new day commences anew the war of sounds and movements. At last some one ventures to twist a twig from the top of the yet unleafed tree, and places it in a cleft where three branches meet; but, ere he has succeeded in adding a second, the first has become the property of another, who rejoices in the maxim, "that they should take who have the power, and they should keep who can." This leads to a duel, and many feathers are shed on both sides; at last, a cessation of hostilities takes place, and the work of nest-building recommences. But the law of gravitation, as well as the rocking blasts, are sad disturbers; and days and weeks are often spent by an anxious pair, ere the foundation twigs have been fairly fastened, and the future nest has assumed shape and meaning, if such terms can be fairly applied to what is at best a kind of hovel, no more to be compared with the neatly wrought dwellings of the hedge birds, than an Irish cabin with an English gentleman's mansion. Some one has said, that man is by nature a thief. However this may be, I am quite sure that the rooks are so, and that they exercise very considerable talents in carrying their dishonest impulses into execution. They will carefully watch the time when the owner of the advancing erection is absent, and in a very few minutes the whole shall have disappeared. Then back come the true owners of the property; but there is not a stick left to mark the spot where their future progeny was to be hatched and reared. Astonishment seems at first to paralyse exertion; but the desire of revenge is strong in the heart of rook and man: so, woe be to the depredator. His ill-got gains are recovered without process of law, and he is forced to retreat to a distant tree. Often have I thought how lively an illustration the rooks afford of the general loss which unavoidably arises from individual dishonesty; for it is evident that nests for the whole of my rookery might be provided in half or a fourth of the time, if each abstained from molesting or robbing the others. Enormous is the misexpenditure of labour from this cause, and I may say of capital also, for, in the struggle, vast quantities of twigs fall to the ground, whence, from a strange instinct of the bird, none of them are ever again raised.

At last, after innumerable failures and back-goings, the work of building the nest is completed; and, with the complacency of a young goodwife, the female seats herself in her home, tries it in all directions, east and west, north and south; she is all bustle and importance, whilst her lord sits in a dignified attitude upon the topmost branch, cawing her into moderation. The great work of incubation commences, and her nature and habits seem to have undergone a complete change; she is now all silence and sobriety; no ejaculation of anger or of triumph, of victory or revenge, although, perhaps, other five or six ladies, in equally interesting circumstances, are nestled in adjacent branches of the same tree. There she sits, like patience on a monument, from morn to night, and from night to morn, whilst her beloved helpmate is abroad in the newly-turned-up furrows or freshening fields, collecting the necessaries of life for her and himself. He comes home at wonderfully short intervals; and his arrival is announced by a peculiar crow of recognition, which passes between them. His bill is instantly in the throat of his partner, and the process is repeated three or four times, till he has emptied his own throat of its contents. All this while, the wings of the female bird are in motion, and her expressions of gratitude and satisfaction are loud and long. But her kind and considerate partner knows that exercise is conducive to health; so, without any fine speeches, he at once takes her place in the nest, whilst she is occupied in adjusting her dress, and essaying her powers of flight. But her heart is at home; and, in the course of a few minutes, you observe her with her tail feathers projected at one side of the mansion, and her bill at the other, motionless as a mummy.

But one fine morning you hear a small, sharp, chirping noise. It is her eldest child, who has just found the shell too narrow for his amplitude, and has burst his way into daylight. He is, in a few days, joined by a second, and a third, and a fourth, till the whole nest teems with noise. Now is the time for increased activity and providence on the part of both parents; they are ever going and returning; yet their cawing brood seem never to be satisfied. "Oh, ma'am," said a female black servant to my wife one day, "they never resses in their nesses!" alluding to the incessant flutteration going on in a tree level with, and very near, our nursery windows. And here I may remark, that a rookery very near a house, though a venerable and somewhat aristocratic-looking appendage, is apt to be a little troublesome from the noise, if not the motion, constantly going on in it. "Why are you so out of humour to-day?" said one gentleman to another whom he was visiting, seeing him every now and then walk fretfully to the window. The person addressed pointed to a rookery, which, having been originally fixed in a grove near a suburban mansion, was now in the centre of a suburban square, and said, "Don't you *hear* the cause [caws]?" He was quite worried, in short, with our friends the rooks, which, nevertheless, were rather liked by the inhabitants of the square generally; so that, on a proposal being made to extirpate them, and a paper handed about in which all concerned were desired to express their sentiments, it was carried "Crows" against "No crows" by a considerable majority. But I am digressing. I was speaking of the wakeful appetites of the young brood, and the anxiety of the parents to satisfy them. At this stage of affairs, I am quite within mark, when I say that you cannot look into a rook's nest at any time, without seeing at least four bills held up, open, ready, and clamorous. Here the justice which is so sadly wanting in the matter of nest-building, reigns supreme. The parent birds deal with rigid impartiality amongst their young, giving each a mouthful in turn, and never two to any one till all the rest have been once served. Young Hopeful, the eldest cheeper, may be a favourite of mamma for anything I know, as eldest sons are apt to be with human mothers; but, nevertheless, let him clamour as he will, he must wait his turn.

About the middle of May, the now feathered progeny begin to entertain an ambition for travel. They not only look over the nest, but even venture at last upon a projecting branch; their parents, meanwhile, giving them every encouragement to go the whole hog—to take it boldly. But all will not do; the young navigators of air have an idea, seemingly, that the earth is at an immense distance from them, and that a fall would be fatal. And, in some instances, it is so. A young *brancher*, more lively than prudent, essays a flight, and lights by the side of the garden wall. Grimalkin has him in an instant; and, in spite of most vociferous remonstrances from the whole rookery, bears off his victim to that retreat whence no live birds or mice are seen to return. But what are all the war-depredations of grimalkin to those of man? It makes my very blood boil within me when I hear, in passing some old manor house with its surrounding rookery, the frequent report of the murderous fowling-piece. Young master is at home from school, and his leisure hours, and those of his young companions, are spent in murdering, mangling, and torturing every live thing that their elders do not set a value upon. Rooks, old and young, parents and children, fall beneath their weapons, and many are the childless and the orphan left mourning in despair. But nature will avenge herself; and I almost rejoice to think that the snail and the grub-worm will, for this, do their work of destruction upon

* Most people have rather confused notions about the crow tribes. We shall endeavour, in a very few words, to clear up the matter. There is, first, the Raven, the *Corby* of the Scottish peasant, a large and voracious bird, found in every clime. Secondly, there is the Carrion or Common Crow (*Corvus Corone* of Linnæus), somewhat less than the raven, and remarkable for the distance at which it learns (by sight, not smell) the existence of that particular kind of food from which it takes its name. This is more particularly the bird which is seen flying in such vast flocks of an evening towards the woods. Then there is the *Corvus Cornix*, the *Duncrow* of the English, and *Hoody Craw* of the Scottish rustic, remarkable chiefly for its migrations. Next is the Rook (*Corvus Frugilegus* of Linnæus), comparatively a domestic bird, since it generally builds in groves near houses. This is the bird chiefly referred to in the above paper. The Jackdaw, Pie, and Jay, are the chief remaining species.—ED.

the neighbouring fields unmolested. It is dangerous to break a link in the chain which nature has fabricated. The very flies are her scavengers; and the rooks are not less useful in the ploughed field, and amongst the brairding grain.

In spring 1827, I had occasion to witness a fact which interested me not a little. One of those beings who go about early in the morning with fire-arms, seeking what they may deprive of life, happened to mark two rooks on one of my trees feeding their young The fatal tube was immediately levelled, and, in an instant, both birds lay gasping in the agonies of death at my feet. An idiot laugh, and a hurried retreat upon observing that I was a spectator of his morning's achievement, were all that I could make of him; but I observed the poor orphan progeny, all unconscious of the calamity which had so suddenly reached them, still stretching out their bare, featherless necks, and raw, open mouths, in expectation of the wonted supplies. My heart sunk within me at the sight; and I could not help moralising on that cruel unthinking disposition which marks so many of our race. For twelve long hours, whenever a returning rook intimated that food was in the act of being supplied to surrounding gullets, did these poor, hungry, and seemingly perishing nestlings solicit supply. At last I observed a bird, seemingly more considerate than the rest, in the act of surveying the perishing family. With much difficulty, a small dole was brought up from the throat-reservoir, which was devoured with screams of delight; another and another succeeded in this work of charity, till, I verily believe, the best fed progeny in my little rookery were these pauper dependants on common charity. "Here, then," said I—"here, at least, there is no use for poor laws! since nature has established a principle even in the breasts of rooks, which leads them to feed the hungry and support the orphan."*

While thus shocked at the barbarity of shooting crows during the infancy of the young, I should only be affecting a virtue which I have not, if I pretended to be superior to the relish which my countrymen have, in general, for a *crow pie*. But this is a delicacy which is never indulged in till the new brood are fully reared, and the number of the tribe is at its greatest. Early in June, it is a favourite amusement of old and young in Scotland to proceed to some ancient crow wood, and climb the tall trees for a selection of young branchers, wherewith to make a crow pie. For this purpose there is no nice discrimination as to species: I suspect that three kinds, at least, are liable to be popped into the mess. It is not quite so good as pigeon pie, but yet has its charms, especially for those who do not often get anything so delicate as birds to regale upon. And it is sometimes even seen upon the tables of the country gentry. Ideas as to what is good for food are, after all, extremely local. Some French officers, prisoners living upon parole in a Scottish country town, were one day entertained at dinner by a gentleman of the neighbourhood. Amongst the dishes was a crow pie. Great was the amusement of the company, to observe the tokens of repugnance manifested towards this dish by a set of gentlemen who were known to dress frogs for dinner in their own lodgings whenever they could get them. On comparing notes, it was found that the corvine tribes were as much objects of loathing to the French, as the batrachia were to the Scotch; so, the two portions of the company had to acknowledge, that, in this respect, their several countries were quits.

I return to my rookery, only to suppose the survivors of the new generation to have left it, and followed their parents to the fields. There, for some time longer, their screams of satisfaction may be heard, as they either get an occasional dole of food from their parents, or pick up an unfortunate larva for themselves. At last all is silent; and crows are only to be met with during summer in large convocations, consulting, no doubt, for the good of the community, or planning projects of future improvements. When harvest is over, and the days and nights are again equalised,

"Down comes a deluge of sonorous crows."

There they are seen about the beginning of November surveying their old residence, and, in some instances, commencing the operation of nest-building, with all the suitable accompaniments of crowing, croaking, and quarrelling. They manifestly have mistaken the thing, and because the temperature, and the length of day, and the general aspect of matters over the earth's surface, correspond with the month of March, they are resolved to improve the appointed season. But snow, and frost, and shortened days, at last convince them of their mistake, and they return reluctantly to such shelter and such supplies as plantations, shores, and fields supply.*

Thus have I traced the history of "my little rookery" from spring to spring, and if anything I have observed and stated shall impart a deeper interest in this much-injured and ill-used bird, I shall be amply rewarded. Rooks are long-lived. Many of those with which we hold daily intercouse, were the intimate acquaintances of our grandfathers; and it ought certainly to have its weight, that, during so long a period, they have kept up a friendly intercourse with succeeding generations; and that, when we who now discuss their merits shall long have ceased to occupy place and portion in this lower world, many of these rooks, which witnessed our first sports, will still enliven with their awakening clamour the habitations of our distant descendants.

* The writer of this paper labours under the prevailing Scottish prejudice against poor-laws. The rooks here did exactly what the enlightened advocate of poor-laws wishes by these laws to effect, but in a way which shall burden the whole community alike, and which shall be sure and regular in its operation.—Ed.

* "Among the favourite articles of their food is the grub of the chafer or dor-beetle, which, if allowed to multiply unchecked, would lay waste whole meadows and corn-fields. It must not be dissembled, however, that rooks themselves are sometimes very injurious to new-sown wheat, just when it begins to germinate. The severity of winter, when accompanied by a heavy fall of snow, sometimes drives them down to the sea-shore, when they are observed to feed on shell-fish, particularly the common periwinkle. Having raised these last into the air, to about the height of fifty feet, they let them fall among stones, stooping instantly after their prey. If the shell is unbroken, they lift it again and again; and when the wind happens to carry it out of the perpendicular direction, they toil much and gain little. Frauds in the mode of procuring their livelihood, as well as in that of building their nests, are sometimes attempted among them, but which, when discovered, meet with instant and condign punishment."—*Edin. Encyclopædia.*

ACTION OF WATER UPON LEAD.

The mode employed to convey water into houses for domestic purposes is, almost universally, by means of leaden pipes, and it may startle our readers to learn that this plan—persevered in for years without apparent injury—is, in reality, fraught with a certain degree of danger to life. The researches of Professor Christison have proved, that water which is exposed to the action of lead by continually running through pipes of that metal, becomes impregnated with a carbonate of lead, to an excess which, when the water is habitually made use of, exposes the drinker to a disease called the lead-colic. If it be asked, how it is that so many persons are daily partaking of the so-called "harmless beverage," without experiencing any ill effects? the answer is, that it is only very pure water which is liable to deteriorate; that the impure water, which is decidedly in most frequent use, generally carries a protection in certain neutral salts containing saline matter, which prevents the lead from impregnating the water in proportion to the quantity of acid contained in the salts. Thus, the greater the original purity of the water, the greater its danger of developing carbonate of lead.

The proof of these statements is contained in two circumstances, minutely detailed by Dr Christison in a paper read before the Royal Society of Edinburgh, and published in vol. xv. of their "Transactions:"

"A few years ago," he says, "the water of a spring was introduced into the mansion of Dalswinton in Dumfriesshire, by a lead-pipe, from a distance of three quarters of a mile. While on a visit there in the autumn of 1834, only a few days after operations were finished, and the water was flowing into the great cistern for supplying the house, my attention was called one morning, by one of the guests, to the water-bottle on his dressing-table, and a tumbler of water which had been poured from it. The bottle was lined with a thin white incrustation of a pearly lustre; and the water, which had stood some time exposed to the air, presented a thin film of the same appearance over its whole surface. The cause being at once suspected, we proceeded with our host, Mr Leny, to examine the great cistern into which the water was discharged directly from the pipe. Here we found the water entirely covered with a similar film, and the bottom and sides of the cistern lined with a loose pearly white incrustation, in such quantity as to appear as if painted with white paint. It was also remarked, that water fresh drawn from the pipe was perfectly transparent at first, but, on exposure to the air, quickly presented the white film seen in the tumbler. It need scarcely be stated, that the appearances now mentioned were recognised as the result of the action of the water on the lead of the pipe. And it may be added, that the white substance was afterwards ascertained to be a carbonate of lead."

After stating, as the result of experiment, that upon water left at rest on lead no ill effect is produced, and that a certain degree of exposure to the atmosphere is necessary to indicate the presence of the carbonate when the fluid *has* imbibed it, the learned professor proceeds to give an account of the remedy applied in this case:

"When a similar instance happened at Tunbridge, in 1814—with the additional circumstance, that its nature was not discovered till lead-colic began to appear among the inmates of the houses supplied with the water—the only satisfactory remedy which could be thought of, was the expensive one of removing the pipes, and replacing them with others of cast-iron. This was accordingly done. Reflecting, however, upon what I had observed in many experiments with weak solutions of neutral salts, and remembering, that, in general, after the action had gone on slowly for some weeks, it gradually became less and less, while, at the same time, a firmly-adhering film formed on the lead, consisting of carbonate mingled with a salt of oxide of lead in union with the acid of the salt in solution, and that, when lead so lined was transferred even into distilled water, no action seemed to take place, I conceived that an effectual remedy might be provided by producing, in like manner, an incrustation of the same kind on the inside of the pipe. For this end, it was proposed to leave the pipe for some months filled with a weak solution of phosphate of soda, in the proportion of a 25,000th part, which is somewhat stronger than what had seemed sufficient to prevent the action of distilled water on the small scale. It was hoped that a fine film of mixed carbonate and phosphate of lead would thus be formed while the water was at rest, which would adhere so firmly as not to be swept away when the water was allowed to flow, and which would serve as a lining to prevent the contact of the running water with the metal. Circumstances prevented this plan being tried at once; and, in the mean time, it was judged right to try the effect of forming a lining of carbonate of lead, by leaving the water at complete repose in the pipe, so as to allow the carbonate to crystallise slowly and firmly on its interior. This experiment was attended with complete success. The pipe was kept full of the spring-water, and without water being drawn from it, for four months. The pipe was then found to flow without any impregnation of lead, and has done so ever since."

The other incident puts the case in a stronger light. It occurred at Buchan-ness Lodge, the cottage residence of the Earl of Aberdeen:

"In the beginning of June last, Mr Johnston of Peterhead was requested to visit professionally the housekeeper of the Lodge, who was affected with indigestion and constipation; from which, however, under his directions, she speedily recovered on this occasion. Six weeks afterwards, he was requested to visit her again, and found her then affected with vomiting, constipation, severe spasmodic pain at the pit of the stomach, retraction of the umbilicus towards the spine, great weakness of the limbs, and other symptoms of less note, which it is scarcely necessary to particularise in this communication, but which are proper to the severe form of colic occasioned by slow poisoning with lead. After treating the case judiciously for three days, Mr Johnston was surprised to find that, notwithstanding frequent temporary benefit, no permanent amelioration had taken place. At last, on the third day, while considering the circumstances of his patient's illness, his attention was drawn to the water-bottle on her dressing-table. It was lined with a white shining incrustation, and the surface of the water was covered with a film of similar appearance. On inquiry, he learned that the water always presented this appearance after being exposed for some time, but that it was quite transparent when first drawn; and he afterwards personally verified these facts.

Being well aware of the action of water on lead, and of the consequences of the insidious introduction of the compounds of that metal into the human body, Mr Johnston, with much discernment, although he had never seen a case of lead-colic before, was strongly inclined to believe that he had to deal with that disease. He suspended his ultimate decision, however, until he had an opportunity of examining chemically the substance deposited by the water. This he found to be soluble in weak acetic acid; and the solution gave a white precipitate with sulphuric acid, a white one with carbonate of potash, a yellow one with iodide of potassium, and a black one with sulphuretted hydrogen. The last test, an extremely delicate one, likewise made the water itself brown. As these results left no doubt whatever of the presence of lead in the water, he could as little entertain any doubt of the nature of the housekeeper's illness. She was treated accordingly, recovered slowly but steadily, and in October was quite well. She had resided in the house, and constantly used the water for eight months before her final severe illness; but for some months previous to that attack, she had been often annoyed with stomach complaints and constipation. Her niece, a girl of twelve, who had been residing with her for a few weeks only, was also attacked with these premonitory symptoms of lead-colic; but she soon recovered under Mr Johnston's care. No other person had resided for any length of time at the Lodge during the period in question. Lord Aberdeen had been there with some friends for a few days only.

Mr Johnston, with whose approbation, as well as the sanction of Lord Aberdeen, the facts of this incident are made public, consulted me respecting it about the middle of September, and afterwards communicated much additional information—partly, indeed, in reply to suggestions made by me. The following is a short narrative of the whole particulars:—The water was first introduced into the house in the summer of 1840, by a lead-pipe from a spring at the distance of rather more than half a mile. The spring was purchased for the purpose, as it had been represented to be of fine quality; and an analysis, by a chemist in the neighbourhood, appeared to show that it was of unusual purity, and contained very little saline matter. This will presently be seen to be by no means the case.

The pipe had been in use for several months before the housekeeper went to reside at the Lodge. When Mr Johnston first examined the water, it had been in constant use for twelve months. And yet it continued to impregnate itself with lead to the last. In the water, when fresh drawn, he could detect lead by sulphuretted hydrogen, even without concentrating it."

Dr Christison caused some of this water from the spring to be transmitted to him. Though clear, colourless, and without taste, he found it to be by no means so pure as the water of Dalswinton; but minute examination proved, that its impurities were of a nature to afford little protection from the influence of the lead, inasmuch as the salts they partly consisted of contained but little acid; hence it was found that the protective power resides in the acids alone, and not in the bases of the salts.

"When," he continues, "the fact of the water being

poisoned with lead was clearly ascertained, it was at first proposed at once to substitute iron pipes for those of lead. But Mr Johnston suggested that a trial should be made of a weak solution of phosphate of soda, as explained above, and recommended in 1836 in my 'Treatise on Poisons.' The experiment was accordingly tried by keeping the pipes constantly full of a solution containing a 27,000th of phosphate of soda. For three weeks no improvement took place; but it was found that, owing to a leakage in the pipe, the solution required to be constantly renewed, and was therefore never completely at rest. As it appeared essential to secure this last condition, the leak was found out, though not without difficulty, and was properly stopped. Fourteen days afterwards the spring-water was re-admitted, and a manifest improvement was ascertained to have taken place, although lead was still contained in the water. The solution being replaced, another trial was made in the course of six weeks more; and sulphuretted hydrogen then barely tinted the water. A third examination was made fourteen days later; and after the water had been running for some time, sulphuretted hydrogen did not in the slightest degree affect it. The last report I have from Mr Johnston, dated the 27th of January, states that the solution had been withdrawn for a month previously—that the water had been kept running constantly for several days before it was subjected to examination—and that no trace of lead could be detected in it by careful analysis."

These facts, together with the results arising from them, are, perhaps, of greater importance at the present time than they would have been formerly, from the wholesome taste for pure unalloyed water which is happily spreading far and wide. So that all interested in the progress of temperance, will feel not a little indebted to the learned professor for his well-directed researches.

A SCENE AT THE AREOPAGUS.

A LETTER FROM AN ANCIENT ROMAN, TRAVELLING IN GREECE, TO A FRIEND AT ROME.

In attempting to furnish you with an account of the judicial system of Athens, it may appear strange that I should pass over the minor courts, and commence with the Areopagus. But my mind is so totally engrossed with what I lately witnessed at this remarkable tribunal, that I cannot resist beginning where I more properly should have ended. This most august of Athenian judicatories, composed of archons of the most approved character, is traced to the age of Cecrops. For its present constitution, however, it is mainly indebted to Solon, who invested it with the superintendence of morals, subjecting to its decisions every species of immorality, as well as crime. As it displays the most unrelaxing vigilance in reforming manners, and the greatest firmness in suppressing delinquencies of an aggravated character, it never applies punishment until slighted admonition and menaces call for the exercise of more coercive restraints. From its strict and acknowledged adherence to justice, it acquires the love and esteem of the Athenians, even when it exerts the most absolute and irresponsible authority. Innocence, summoned before it, approaches without apprehension, and the guilty, convicted and condemned, retire without daring to murmur.

The origin of the name is involved in considerable obscurity. Some affirm that it has been so denominated from the Amazons—the daughters of Ares, who encamped in this place when they attacked the Cecropian citadel; while others assert that this designation arose from its being the place where sacrifices were anciently offered to the god of war. But the truth or falsity of these and similar conjectures is of inferior moment; for the celebrity of the Areopagus depends on more important considerations—the character of the judges, the equity of their decisions, and the unlimited confidence reposed in them by their countrymen.

This far-famed seat of justice occupies a rocky eminence, separated from the western end of the Acropolis by a hollow, forming a communication between the northern and southern divisions of the city. The area of the court is of a quadrangular form, and large enough to contain a vast crowd of spectators. It is sunk a few inches lower than the rest of the craggy elevation out of which it is excavated. Massy equidistant pillars are placed around its entire extent, intended to support a temporary covering, should the inclemency of the weather render such a protection requisite. The seats of the Areopagites, fifty-one in number, are also scooped out of the rock, in that part of the area which overhangs the city.

A few nights ago, my long-cherished desire of witnessing a capital trial at the Areopagus was gratified. It was, no doubt, the ideas of justice, integrity, and awe, associated in my mind with the name of this venerated judicatory, that led me to remark a sombre stillness pervading the entire day, ominous of the distressing scene with which its duties were likely to terminate. I could read, moreover, an expression of thoughtful seriousness in the countenances of the Athenians, darkening and deepening as the eventful hour approached. About sunset, individuals from all parts of Athens could be seen slowly directing their steps towards the winding stony stair that leads to Mars' Hill. Business of every description became suspended by edict. One subject formed the conversation of all. The loungers abandoned their favourite haunts in the streets and market-place. The curious and interested were all proceeding to the place of trial; and I, although in violation of my better feelings, soon found myself moving along in the silent and gradually increasing stream of human beings. Ere I reached the summit, the last faint streaks of the sun had for some time faded on the horizon, which now appeared of the same deep blue tint with the rest of heaven. The moon moved high in the serene sky of Athens in unclouded brilliancy. My eyes never rested before on so magnificent a spectacle. Around me in every direction, as far as my glance could pierce, stood citadels of massive strength, or, in lighter architecture, more graceful structures, indicating science, elegance, and ease. To the west, and in close proximity to where I stood, arose the Acropolis, Propylæa, and Erectheium, with their gigantic colonnades and domed roofs bathed in the moonlight. Through the plain of Athens, the Ilissus in a flood of light, fantastically interrupted by the lofty trees which at intervals interlace their boughs across its current, rolled its winding volume to the sea. At a distance somewhat greater could be seen the three Athenian harbours, still crowded with the fleets that had won for Attica the empire of the sea. Immediately below lay fair Athens herself, with her rows of palaces and costly temples; whilst here and there could be seen the statue of a god or godlike hero, exciting mingled feelings of patriotism and veneration, as they presented themselves successively to my view, dimly discovered in the silvery radiance. As I was contemplating this diversified prospect with intense emotions of wonder and delight, the stern voice of a herald dissipated the spell. This officer, in accordance with a custom long established in Athens, announced to the assembled multitude that the Areopagites had left the Temple of Truth, where they were wont, on such occasions, to assemble, and were on their way to sit in judgment. The former hum of mingled voices was instantly succeeded by the deepest silence. The spectators, who, in groups, were eagerly discussing the probabilities of condemnation and acquittal, immediately separated, and falling back towards the sides of the area, left for these venerable functionaries a free uninterrupted passage. The Areopagites, walking in single file, with their heads uncovered, soon after appeared, preceded by the eldest of their number, for whom a central seat is by law assigned. Up to this hour, I must confess that I remained comparatively unimpressed by the gloomy preliminaries which had already been performed around me; but now the grave demeanour of the Athenians, the increasing solemnity of the scene, and the appearance of these venerable and inflexible ministers of justice, advancing with slow step and uncovered heads, indicating, as it were, a consciousness of being under the immediate inspection of the tutelary gods of Athens, awoke within me feelings kindred to those of the multitude with which I was mixing, and suited to the consecrated locality on which I stood. There is a principle of gross curiosity in our nature, which delights in the contemplation of the awful and terrific; and these, when neither we nor ours are endangered, sway our feelings and judgments no less powerfully than the beautiful and the sublime. How often do the more material elements of our moral nature hurry us eagerly along to gaze on spectacles, at which our finer sensibilities are revolted; and how frequently, when our more elevated sympathies regain their rightful influence, do we feel ashamed of the callous unimpressibleness that induced us to regard with selfish apathy what we should feelingly commiserate! Remorseful thoughts of this description were passing through my mind as the Areopagites silently and devoutly took their seats, from which they were likely not again to arise until they had fixed the irreversible destiny of a fellow-mortal.

In front of the Areopagites, and at the distance of a few feet, stand three small pillars; on the central one, which is somewhat higher than the others, are inscribed the crimes of which the court takes cognisance, and the penalties annexed to each. The remaining two are the seats of the pursuer and the pursued. Midway between the seats of the judges and these pillars, there stands a tabular mass of stone, on which the urns are placed, in which, when giving judgment, the Areopagites deposit their suffrages. One of these is termed the Urn of Mercy, the other the Urn of Death. Whilst these things were being explained to me, the parties—the impeacher and the impeached—appeared at the top of the flight of steps that leads to the Areopagus. They had no sooner entered the court than they proceeded to the seats already mentioned, as by law and custom assigned them. Timarchus, the criminal, was to be tried on a charge of murder. He had faithfully and successfully discharged the various civil and military duties which entitled him to the archonship, and had begun, consistently with his right, to sue for that distinguished office. Timon, an influential archon at the time, had rendered his canvass unsuccessful by a wide and active circulation of calumnious reports. Timarchus, writhing under the chagrin of disappointment and defeat, rushed upon him, it appears, in a moment of frenzied excitement, and deprived him of life. Clearchus, the brother of Timon, took up the cause, and arraigned Timarchus as an assassin before the Areopagus.

The more important preliminaries now commenced. The aged priest of the Temple of Faith led forward a victim, among the torn and bleeding members of which he placed the parties, who, after imprecating the most fearful curses on themselves and their children, in attestation of their innocence, swore solemnly to the truth of their respective asseverations. The horror of the oath was augmented by their calling mutually to witness the inexorable Furies, who, from a neighbouring temple, seemed listening to their invocations, and ready to punish the perjured. The parties were no sooner seated, than the eldest of the Areopagites placed the urns before them, which were soon to declare an absolving or condemnatory verdict. But why do the Areopagites deliberate and decide under the bare canopy of heaven, and in the silence of night? These arrangements are characterised alike by an exalted love of purity, and a scrupulous regard to unbiassed justice. So strongly is murder execrated by the Athenians, that they would consider the very walls of a court polluted, had they but received an assassin within them, and themselves tainted with his crime, if they inhaled the air which his breath had infected. They meet and adjudicate in the night-time, lest the appeals made to their feelings by the supplicating glances of the culprit himself, and the silent yet powerful eloquence of the tears and sighs of relatives, may sway their judgment, and lead them to sacrifice to false sentiment what is justly due to impartial justice. The mode of conducting a trial in the Roman Forum and in the Athenian Areopagus is widely different. At Rome, the speakers are allowed to avail themselves of all the power of eloquence; they may resort to every persuasive wile and rhetorical artifice. At the Areopagus, eloquence is no less dreaded than falsehood. The advocates must banish from their harangues all exordia, digressions, perorations, and ornaments of style; nay, even the language of feeling is rigorously interdicted, lest it may operate on commiserating minds.

The speaker for the pursuer now entered on the business of the trial, by a simple well-arranged statement of facts. There was no colouring, no intentional exaggeration, no assertion but which the most irrefutable evidence seemed to corroborate. The pleader for the defender pursued a course exactly similar. A little mystery, it must be admitted, hung over the whole case, and the judges, no less than the spectators, seemed divided in opinion. The friends of the different parties at length concluded, and the portentous silence that prevailed, broken at intervals by a sigh, or the stifled expression of more significant sorrow, seemed to anticipate the nature of the verdict. During this period of painful uncertainty, Sophroniscus, the eldest of the Areopagites, arose, and in the following words, couched in the usual form, proffered the criminal a choice of alternatives:—"Timarchus, the laws of thy country now empower thee to withdraw from the trial if thou fearest the result; but a withdrawal convicts thee of the revolting crime for which thou art impeached—strips thee of all thy honours and possessions—banishes thee for ever from Athens and her soil, and subjects thee, shouldst thou hereafter be discovered lurking within her territories, or detected as a spectator at her festivals or games, to the most ignominious death at the hand of any—even the meanest of her sons. How sayest thou, Timarchus; dost thou retire, or do we proceed to judgment?" Timarchus retired not. Sophroniscus now, as his duty required, proceeded to distribute to each Areopagite a black and a white pebble, the former to condemn, the latter to acquit, and demanded of his fellow-judges, in a firm authoritative voice, to throw their suffrages into the urn of Death or Mercy, according as their convictions dictated. The Areopagites were proceeding to vote; but ere they began, I observed—for I stood near—a venerable old man, one of their number, station himself before the urns. Night prevented me from tracing distinctly anything in his countenance that might account for such unusual conduct. I thought, however, that I observed a keen anxious wistfulness glistening and trembling in his eye; for his fellow-judges shunned his glance, either struck with horror, or melted into pity. He seemed wishful to conceal his sorrow; for, as the pale light fell on his hoary head, I could see the decayed remnants of his silvery locks, now tossed about in the breeze, as if they had been intentionally thrown over his features. He stooped much under his heavy load of years, and as he often raised his hand to his face, I thought he wept. With the most eager vigilance he counted each successive pebble as it dropped in the urn of Death. The votes were at last all tendered save his own, and it, if thrown into the death-decreeing urn, would equalise the numbers. The final decision would consequently devolve on Sophroniscus; and his unbending integrity, and general leaning to the side of severity, left the nature of that decision no longer doubtful. And why, it may be asked, did the aged Areopagite hesitate? I shudder while I explain the cause. He was the father of Timarchus, who was an only son. The rest had fallen gloriously in the service of their country, and now, in the waning evening of his existence, a doom of the direst disgrace was to dissever him for ever from the only object that gave declining life a charm, and leave him alone in a dreary, friendless, companionless world. Thrice in the heart of the bent, frail, weeping old man, did the agonised feelings of the father prevail, for a time, over the rectitude of the judge; thrice did his withered trembling hand essay the terrific duty; thrice it instinctively recoiled. Memory was busily crowding into his mind her gathering hosts of mellowing melting associations. All that was bright in his past, and gloomy in his future existence, intermingled their joys and terrors, and for a little his

resolution wavered; but at last, and as if the genius of Athenian justice had whispered a chiding remonstrance in his ear, an effort that tore asunder the very heart-strings of the holiest sympathies, and a revulsion of feeling that uprooted the most deeply-seated elements of parental affection, raised him erect, and fired, as he seemed, with a suddenly-inspired enthusiasm, he advanced with unfaltering step, and threw the destiny-fixing pebble in the urn of Death. Brutus, I exclaimed, no longer enjoys the undivided glory of the high-souled patriotism that adjudged death to his sons for their attempted restoration of the banished Tarquinii; and Justice, thought I, dwells no longer at Rome alone; she is a denizen of the world.

At this moment, when all eyes seemed fixed on Sophroniscus, the priest of Minerva, advancing rapidly from the body of the court, approached the Areopagites, and thus addressed their leader: "Sophroniscus, the numbers are equal; they have not been so before in the memory of the oldest man in Athens. There is an ancient custom, instituted by Minerva, now fallen into desuetude; the propriety of which, however, has never been questioned. When Orestes was tried at this court, the pebbles placed him in the present condition of Timarchus. The goddess suddenly appearing, overruled the decision of the president, recorded a casting vote, and turned the scale of justice in favour of Orestes. By the precedent thus established, she invested my office with a discretionary power of acquitting, but never of condemning the culprit, should a like emergency again occur. As one of the duties, therefore, attaching to my priesthood, I give the suffrage of Minerva in favour of Timarchus." The applauding shout ascended to the ears of the goddess, and the late funereal silence was followed by prolonged and deafening acclamations.

THE BOORS OR DUTCH FARMERS OF SOUTH AFRICA.

WHOEVER has read the History of New York by Washington Irving, under the assumed name of Knickerbocker, will have obtained a not exaggerated notion of the Dutch emigrant, wherever settled. As he was in the days of the renowned Wouter-von-Twiller of New York, so he remains at the present time in the Cape Colony, notwithstanding that he exists under an English government, and might have profited by the example of our more energetic fellow-subjects. The same love of idleness still possesses him. "What," said a Dutch farmer to Mr Latrobe, "would you have us do? Our only concern is to fill our bellies, and to get good clothes and houses; to say to one slave, 'Do this,' and to another, 'Do that;' and to sit idle ourselves and be waited upon; and as to our tillage, or building, or planting, our forefathers did so and so, and were satisfied; and why should not we be the same? The English want us to use their ploughs, instead of our heavy wooden ones, and recommended other implements of husbandry than those we have been used to, but we like our old things best."

This class of agriculturists has been traced from the Dutch East India Company having originally formed a settlement at the Cape of Good Hope, merely as a place of refuge and refreshment for their spice fleets trafficking to and from the eastern islands. By degrees, however, the few servants the company placed in their garrison entered into barter with the Hottentots; and, finally, by means of spirits and tobacco, they contrived to juggle the natives out of the whole of their flocks and herds. The company, placing no value on the land, particularly such parts as lay behind the mountains, dealt it out to the boors, or agricultural emigrants from Holland, with a liberal hand; as much as 5000 acres of it being granted upon a perpetual leasehold for about L.5 per annum. Attracted by this promising mode of colonisation, other farmers emigrated from Holland, and spread themselves over the country, which they continue to occupy in a large majority over the English settled in the colony since the period of its conquest.

The three staple commodities of South-African production are wine, wheat, and wool, so that there are three different kinds of Dutch farmers, the *wyn-boor*, the *koorn-boor*, and the *vee-boor*; in other words, the wine-grower, the corn-grower, and the grazier. The best wine grounds lie northward of the Cape, and those inherited from the early Dutch settlers are the most extensive and fruitful. The establishments of the wyn-boors are generally large, their dwellings more resembling villages than homesteads; for, being in many cases far remote from a town, mechanics of all descriptions are kept on the spot, for the construction and supply of implements of husbandry, furniture, clothes, &c. In describing one of these comfortable retreats, Lichtenstein says, "Its situation directly under the lofty, steep, and craggy mountains, the bright green of the broad avenues of old oak, the excellently husbanded pastures and corn-fields, the nice-dressed vineyards, orchards, and orangeries—the sight of numberless well-fed cattle, and the widely-extended circle of neat buildings for barns, stables, wine-presses, and workshops—formed altogether a most delightful assemblage of objects. Easy affluence, rational utility, prudent caution, and useful attention to everything being kept in the most exact order, were everywhere conspicuous throughout this little domain."

Their horses and cattle, of which they have generally a sufficient stock for the supply of their numerous families, are usually kept at some distant loan-farm, held by them in addition to their freeholds, which are generally about 120 English acres. They visit their friends, or go to church or market, in waggons covered with tents, and drawn by six or eight horses, which they drive, sitting on the front seat, more by the exercise of a long whip than by the rein, guiding them with wonderful dexterity on a full gallop, over heathy and deep sands, or up and down the steep and stony passes of high and rugged hills. The wealthiest gentleman-farmer in England cannot be more independent than one of these old family freeholders of the Cape of Good Hope.

The corn-boors chiefly inhabit that part of the country which lies more to the north-eastward, and although some of them are able to send from four to five thousand bushels of wheat annually to market, yet their circumstances seldom appear so comfortable as those of the wine-boor. Their houses are mostly inferior, and may be recognised by a row of six or eight trees, generally oak, planted before them. The corn-grower usually cultivates a little wine for the use of his own family, and for sale among his more distant neighbours. His vineyard is the only patch that is enclosed, unless he should have, which is not often the case, a small garden with a few straggling cabbages, or, as is still more rare, an orchard of oranges, peaches, and the more common fruits of the country. Generally speaking, these farmers are extremely unskilful; the richness of the soil, and their natural disinclination to exertion, preventing them from making any advance in agricultural art. The chief drawback to the cultivator in these latitudes is the want of rain; yet, by a little extra skill and labour, water might, in many instances, be raised to irrigate the land from the rivers, which generally run in deep chasms. On one occasion, Captain Andrews offered to lead the water of two copious springs into the grounds of a Dutch boor, which would then be available for the growth of corn; but the man shrugged his shoulders, and coolly observed, "that it was not worth while, as he could purchase what flour he wanted from his neighbour, who lived *only* five days' journey off." It may be mentioned here, that the distance intervening between the farms in this country is to be accounted for from the terms of the original grant. The farmer having selected an unoccupied spot, fixed a *baaken*, or landmark, upon it, on a spot most convenient to become the centre of his territory, the boundaries of which could never be within an "hour's walk" (three miles for a Dutchman) of the limits of an occupied tract. Hence it happens, that the nearest neighbours were, some years ago, five or six miles apart, and in some places, particularly in the grazing districts, a whole day's journey.

The vee-boors, or graziers, may be looked upon as a distinct class from the other two; their character, habits, and mode of life, are altogether different. Far removed from the seat of authority and civilisation—generally to the east of Cape Town—they have always been troublesome subjects, both to the Dutch and English governments. Under pretence of seeking game beyond the limits of the colony, and of exploring grazing-grounds for his cattle in the dry season, when his farm is exhausted of fodder, the vee-boor commits unequalled cruelties on the unoffending Hottentots. In the former case, he often sets out alone to kill time, and break the tenour of a lazy life. His enormous *roer*, or musket, is his inseparable companion, and with it he travels with confidence; for so expert is he in hitting the mark, that he seldom fails to bring down his object with a single ball, whether it be a Hottentot or a wild beast—a sort of skill which seems to be essential to existence in all the remote parts of this region; for even the most peaceful farmer occasionally receives unwelcome visits from lions and elephants, who seldom fail to commit the most frightful ravages. When the near advance of such an enemy is suspected, the whole establishment turn out with every kind of weapon to engage in a regular hunt, and hair-breadth 'scapes of the most romantic kind are recorded by nearly every South-African traveller. The following poetical summons to one of these hunts, is by the late much lamented Pringle, and gives a more lively impression of such proceedings than the most detailed prose narration:—

"Mount—mount for the hunting—with musket and spear!
Call our friends to the field, for the lion is near!
Call Arend, and Ekhard, and Groepe, to the spoor;
Call Muller, and Coetzer, and Lucas Van Tuur.

Ride up Eildon-Cleugh, and blow loudly the bugle:
Call Slinger, and Allie, and Dikkop, and Dugal;
And George with the elephant-gun on his shoulder—
In a perilous pinch none is better or bolder.

In the gorge of the glen lie the bones of my steed;
And the hoofs of a heifer of fatherland's breed;
But mount, my brave boys! if our rifles prove true,
We'll soon make the spoiler his ravages rue.

Ho! the Hottentot lads have discovered the track—
To his den in the desert we'll follow him back;
But tighten your girths, and look well to your flints,
For heavy and fresh are the villain's foot-prints.

Through the rough rocky kloof into grey Huntly Glen,
Past the wild olive-clump where the wolf has his den,
By the black eagle's rock at the foot of the fell,
We have tracked him at length to the buffalo's well.

Now mark yonder brake where the blood-hounds are howling;
And hark that hoarse sound—like the deep thunder growling;
'Tis his lair—'tis his voice!—from your saddles alight;
He's at bay in the brushwood, preparing for fight.

Leave the horses behind—and be still every man:
Let the Mullars and Rennies advance in the van:
Keep fast in your ranks;—by the yell of yon hound,
The savage, I guess, will be out with a bound.

He comes! the tall jungle before him loud crashing,
His mane bristled fiercely, his fiery eyes flashing;
With a roar of disdain, he leaps forth in his wrath,
To challenge the foe that dare 'leaguer his path.

He couches—ay, now we'll see mischief, I dread!
Quick—level your rifles—and aim at his head:
Thrust forward the spears, and unsheath every knife—
St George! he's upon us!—Now fire, lads, for life!

He's wounded—but yet he'll draw blood ere he falls—
Ha! under his paw see Bezuidenhout sprawls—
Now, Diederick! Christian! right in the brain
Plant each man his bullet.—Hurra! he is slain!

Bezuidenhout—up, man!—'tis only a scratch—
(You were always a scamp, and have met with your match!)
What a glorious lion!—what sinews—what claws—
And seven-feet-ten from the rump to the jaws!

His hide, with the paws and the bones of his skull,
With the spoils of the leopard and buffalo bull,
We'll send to Sir Walter. Now, boys, let us dine,
And talk of our deeds o'er a flask of old wine."

The domestic life of one of these boors is infinitely less civilised than that of the wine and corn growers. "His hovel, generally perched on an eminence that no hostile attack may be made on it unperceived, whether by man or beast, has neither tree, nor shrub, nor blade of grass near it. A few straw huts, with a number of Hottentot women and children, naked or half-clothed in sheep-skins, are the principal objects that attract the eye. Between these huts and the boor's house, and immediately in front of the latter, surrounded by withered bushes of the thorny mimosa, is the pen, or *kraal*, in which his cattle and his sheep are shut up at night, to protect them from the wolves and hyenas, or to prevent their straying. The dung of these kraals, the accumulation of years, sometimes rises to the very eves of the house; this, however, gives no concern to the boor, who would probably see it overtop them with equal apathy. The only chance, in fact, of its ever being cleared away, is its taking fire, which, in damp weather, sometimes happens. The lambing season in this country is the season of rains, and it generally happens that not a few of the little ones, on being dropped, are smothered in the bog; a fate which sometimes attends the young calves; and this takes place within reach of woods or thickets of natural growth, where poles for constructing sheds might be had without trouble or expense! But a suggestion of this kind, leading to a deviation from the good old rule of doing exactly what *vader* had done before him, would be lost on the Cape boor."

Latrobe, in his Travels, gives the picture of an interior, which fully bears out the above description. Having heard that the wife of a vee-boor, a lady of enormous bulk, had a desire that he and his friends should visit her, they "went in a body to pay the lady a morning visit, at her own house, if the hovel she inhabited may be dignified by that name. It consists of an oblong square, enclosed in a wall of unburnt bricks, one-half of which was covered with a roof of rushes. The entrance was through the uncovered part. In this vestibule three or four naked slave-children were crawling about; a woman, partially clothed in rags, with a child strapped to her breast, was cooking some victuals at a fire, and dirt, guts, old shoes, rags of sheep-skins, and other filth, occupied every part of the premises, out and inside. On entering the main apartment, the first thing that met the eye was the carcass of a sheep just killed, hanging from a cross-beam, with a pool of blood on the clay floor, under the head; five fox-coloured cats were sitting round, watching for their share of the spoil: a milk-pail, churn, and some other kitchen utensils to the right; and to the left, the lady herself, who kindly invited Sister Schmitt to come and sit down on a stool, between her and the pendant carcass. Her husband, a very civil old man, with a grey beard, and a large straw hat, sat at the table, and a bench was placed for us between the carcass and the door. The lady herself entered freely into conversation, told us, that notwithstanding her enormous bulk, she was only forty-three years old, and good-humouredly observed, that Sister Schmitt looked now only like a little girl, passing several jokes on the difference between them. Her face still retained some vivacity and comeliness. Her body entirely filled the vast chair she sat in, on the arms of which her elbows rested. She intended soon to remove to another habitation on Serjeants Revier. When once hoisted into the waggon, she can no more quit it till she arrives at the place of her destination. From her wooden throne, she issues her commands to her slaves, Hottentots, and brutes, with the same shrill voice for which the African ladies are noted. Close to the dwelling was the beast-kraal, and the surrounding premises exhibited a congeries of lumber, rags, ruin, and disorder, not to be described. Through all this chaos ran a small stream of spring-water, clear as crystal, in vain offering its aid to cleanse the Augean stable. The lady, however, conscious of mortality, had already provided herself with a coffin of immense size, which, with her gigantic bed, is screened off the apartment by a bulk-head of matting."

In their earlier years, before attaining the unwieldy size, which generally distinguishes them, the boors spend much time, as above described, in the chase of wild animals; but there is a more atrocious species of hunt, to which they are addicted. Placed, many of them, at the very edge of the colony, and some even beyond its limits, they too often exercise an authority independent of the government, and

make war upon the neighbouring natives, whom they kill, and then drive away their cattle. The latter sometimes attempt reprisals; and thus, from the earliest date of the colony, a constant border warfare has been kept up; for, upon the least alarm of the Caffres or the Hottentots, the vee-boors are ready to assemble in *commandos*, or fighting-parties, and attack or repulse the natives with every circumstance of ferocious cruelty. In short, from the time of the first settlement down to the recent Caffre war under our own government, the colony has been kept in a continual turmoil by these Dutch graziers.

The most recent of their exploits rose to the consequence of a political rebellion. A community of vee-boors, having attracted the notice of the Cape government by their lawless depredations upon the surrounding natives, retired to Natal, to establish themselves as an independent people, and made terms with the Zoolu chief for that purpose. When this became known, a party of British soldiers were despatched to bring them to their allegiance, which, after some hard fighting, and severe privations endured by the gallant little band of soldiers, was fortunately accomplished.

It appears that these rebels had made a judicious choice of the locality for their new state. Natal, which had been already colonised by English settlers to a small extent, is favourably situated both as regards climate and conveyance by sea, besides possessing, in several parts, a productive soil. It extends along the coast of the eastern side of the African continent, commencing at the northern boundary line of the Cape Colony, and ending at Delagoa Bay. Its shores are low and sandy for some miles inland, when the land rises abruptly, till, farther west, the country attains an average elevation of nearly a thousand feet above the sea. There are numerous rivers, which, after a limited course, fall into the sea along the shores of Natal. Their beds being narrow and deep, cause them, in the wet season, to rise with great and sudden rapidity, and to bring down quantities of sand, which is deposited at their mouths to form bars across the stream, that diminish the general facilities of navigation. The elevated country is always covered with grass—a tempting advantage to the graziers—as the want of rain is seldom felt there. A few missionary stations have been established, and the missionaries have introduced several European exotics, which thrive extremely well in the rich soil of the country. It is not unlikely that this tract will be, after a time, included within the jurisdiction of the Cape local government, when it will offer a new and tempting field for emigration.

MISS MARTINEAU'S "RIOTERS."*

All who are acquainted with the powers of Miss Martineau, and the peculiar tone and temper of her works, will be glad to learn that she has turned her attention to the subject of the late riots in England. She is just the person, every one will say, to draw an impressive lesson from these unhappy events, and to convey it in a style combining interest for the general reader with the fullest possible measure of practical advice for the parties more deeply concerned. Miss Martineau has re-produced a little work calculated not to disappoint such expectations. As far as she could do so, without incurring the risk of being charged with writing fiction, she has given her account of the riots in the shape of a story; or, rather, she relates what is to appearance a real case, in a style mingling dialogue with description. A commercial traveller is the party supposed to be the narrator, and probably he was such to Miss Martineau. He comes to Manchester on one of his frequent business-journeys, and finds the shops all shut, and the people in great alarm, the rioters being actually in the place, and engaged here and there in demolishing the obnoxious factories. The traveller left his inn, and went to the streets. "I went," he is made to say, "through several by-streets, where not a man was to be seen. But I observed here and there a woman, standing in the cold and rain, at the door of a hovel, and looking anxiously up and down the street. One of these, a young woman, with a child in her arms, was standing so that the light of a lamp fell upon her features, which were so pinched by cold and misery, that I could not help stopping to speak to her. 'My good woman,' said I, 'surely your child would be better in bed than out of doors this cold night?'

'If you'll find a bed for it, and welcome,' was the answer.

'Do you mean that you are without a bed?' I inquired.

'Look in and see, if you don't believe me,' said she, stepping back. 'Here's a place for Christian people to live in. This is the way we work-people starve, while the masters get wood and iron to do their work for them. Here we sit perishing with cold and hunger, and our children dying before our faces, while they set up their machinery, and pocket the wages we ought to have.'

I followed her into the house, as she made way. It was only a small room, without any article of furniture but two old chairs. There was a grate, with no signs of fire in it, the floor was damp and dirty, and the whole appearance was as melancholy and desolate as can be imagined.

'Is this where you live; your only room?' I inquired.

'This is where we live—where we shall soon die,' answered she. 'That bit of bread,' pointing to half a loaf which lay on one of the chairs, 'is all the food we are to have till next Saturday.'

'Your husband, yourself, and your child, I suppose?'

'And my two boys. Fine boys they were, sir, six months ago; but they are so changed! I thought they had been too old for mischief; but the times have crazed them, I think; and that's my worst trouble.'

'Where are your husband and your sons?' I inquired, suspecting her meaning.

'They are where all the weaving lads are, I suppose,' said she; 'at least I have not seen them since the morning. I was looking out for them when you passed; I had nothing else to do with myself. Sir, you won't let this child die of cold before the morning? to say nothing of myself?'

'I was thinking,' said I, 'what I can do to help you. I have left my purse behind me; and, besides, money would be of no use to-night. It is too late for you to buy fuel or food. Have you any neighbours better off than yourself, who would take you in for the night?'

'There's a woman I know, who lives up those stairs opposite. She has got a fire, I see, by the light in the window. She would take me in for the night, I daresay, if you would please to ask her. But she's badly off too.'

'She shall not lose by it,' replied I. 'Let us go and ask her.'

We climbed up the steep stairs, and soon made our arrangements with the old woman, who readily consented to make up a brisker fire, to warm some broth, and to give up half her bed, on my promising to come again in the morning to pay her for her services. Before I quitted the room, I inquired the name of the poor creature whose destitute state had so deeply moved my compassion. Her name, she said, was Mary Brett."

The narrator left this poor woman, whose family fortunes form the main thread of the subsequent story, and again went to the streets, where he saw the riots in full action, and the rioters, till checked by the soldiery, wildly destroying property. Their main excuse, such as it was, was to be found in their famished faces. "Kill me at once," said one to the soldiers, "for I am dying of starvation already." He again went to give some help to the Bretts next morning, and a neighbour thus described them:—"She told me the Bretts had been very industrious, respectable people; but that, since the distresses of the times had begun, they had sunk lower and lower, till they were so changed, their neighbours scarcely knew them. Mary used to be a kind-hearted, civil-spoken woman as need be; but now she was soured by want, and was never asked a question but she answered roughly. Her sons used to be quiet, orderly, steady youths; but since they had been forced to be idle, they had been sadly apt to get into mischief. Sometimes they did not come home for three days together; their neighbours never knew what they had been after, and often prophesied that they would come to no good end."

The elder Brett ascribed all the existing mischief to the power-looms, saying that if wood and iron did the work of men, men *must* want work and starve; whence he, like others, conceived the destruction of power-looms to be essential to the relief of the prevalent distress. His kind visitant thus reasons with him:—"If the power-looms are destroyed, the masters lose all the money that was spent in setting them up; and the less money the masters have, the fewer men they will be able to employ; so that the rioters who destroy their masters' property, are actually throwing away the money that would pass through their own hands when better times come. If the masters are rich enough to build up their machinery again, the money which they would have spent in employing weavers, goes into the hands of engineers and carpenters. If they are *not* rich enough to repair the damage, they will, of course, be unable to carry on their trade; so the weavers will be ruined either way; and will find out, too late, that they brought the ruin upon their own heads." The same friendly reasoner adds, that, to check the use of inventions being impracticable, if it were even advisable, the sole and true preventive of distress to the workman was the cultivation and extension of trade, and that to impede that object by destroying machines, was a step fatal to the operatives themselves.

Still, when the narrator of our story went out to visit the father of Mrs Brett, a labourer or farmer on a small scale, he met a riotous crowd, from whom the cry arose, "Down with the looms!" The soldiers dispersed them after a painful scene, and Miss Martineau's traveller rode on to the house he sought, and found out the old man, who, in consequence of the statements made to him, carried to town some provisions for his poor daughter and family. But, alas! the two sons of the Bretts were in prison, and our traveller found, on inquiry, that two young men, whom he had noted as peculiarly desperate in the factory-attacks, were these very lads. Food was given to the Bretts and their younger children, and knitting-work was provided; but these sad circumstances formed a bar to returning hope. In answer to a question from the elder Brett, "The law must take its course upon them," I replied. "All that you can do now is, to beg of them, and to try yourself, to submit without complaint to the sentence of the law on them, and to take care that you never again do anything to the injury of public justice. If, besides this, you can preserve any misguided neighbour from crime and destruction, I am sure you will exert yourself to do so. Tell him what I have told you. Tell him that, by rioting, he sins against himself, by endangering his life and liberty; he sins against his family, by exposing them to misery and disgrace; he sins against society, by violating public order, and invading the security of property; he sins against the state, by despising its laws; he sins against his king, by denying his authority and disobeying his commands; he sins against God, by breaking his solemn oath of allegiance to his sovereign, and by neglecting the sacred precepts, 'Be subject to them that are in authority. Submit yourselves to every ordinance of man, for the Lord's sake; whether it be to the king as supreme, or unto governors as unto them that are sent by him. Fear God; honour the king.'"

Our traveller left Manchester, but had returned at the time of the Lancaster assizes, at which the rioters were to be tried. He went, of course, to see the Bretts, and found the wife anxious and pale, but not in starvation, as formerly. She had done her knitting-work, and had been paid for it; and her husband had had a little work, though the regular weaving-trade was as low as ever. It was the fate of her boys, however, that made Mary Brett pale and anxious. She exclaimed, "'Oh, sir! you have been so kind to us, I am ashamed to ask for more. But if you could lend us some money to pay a lawyer, it would be doing what we most want. My husband will pay you when better times come, and the lads themselves, if they get off, will work their fingers to the bone for you. Sir, I would lay down my life for theirs, if I could; and think what it is for me to be sitting here, unable to do anything for them, and forced to see them go to destruction for want of timely help. Think, sir, 'tis not as if they had murdered or robbed, though rioting is a crime. They knew little of what they were doing, and I am sure they will repent as soon as they do know; and then they may get up their characters again, and work for us, and be a comfort and pride to us again. Oh, sir! if you would'——

'I will take care, Mary, your sons shall not suffer for want of counsel. I am going over to Lancaster to-night, and I will see about it.'

'God bless you, sir!'"

The traveller went over to Manchester, and found the poor lads sincerely penitent. They were found guilty. On being called on in form, the elder of them, before sentence, stood up, and said, "'Please your worship, I have only one thing to say, and that not so much on my own account, as for a warning to others. I was led away by some bad people, who came among us to delude us by saying what was false about the laws. I don't say but what I did very wrong, particularly as I have a younger brother who was led into trouble at the same time; and, between us, we have almost broken our father and mother's hearts, just at the time when they most want us to comfort them, for they are very poor. If, on their account, or on account of my sorrow for what I have done, your worship could have mercy on me, I solemnly promise not to break the laws any more, and to do all I can to prevent others breaking them. That's all I have to say.'"

The elder, George, got three years' imprisonment; the younger, whose chief crime was a bold attempt to rescue his brother, was sentenced to but six months' confinement. The meeting between father and sons is most affectingly pictured. "Poor George was leaning over the table, with his face hid, when we entered the cell; and he did not look up till I spoke to him. He then started, and was going to speak, but seeing his father, he turned his back to us, and leaning against the wall, sobbed aloud.

'George, my boy,' said the old man, 'don't turn from me. Why should not you speak to your own father?'

'Don't come near me, father; don't speak kindly to me; I can't bear it, when I have almost broken your heart.'

'No, George, no. Consider, I did as wrong as you, and at the very same time; it was both for want of knowing better. Though you have met with punishment, and I have escaped it, you did no worse than I, and so I cannot reproach you, even if I wished it. But I had rather bear your punishment for you, if I could, than reproach you with it, except on your mother's account. It's well for her that I got off.'

'To think of her!' said George; 'so fond and so proud as she was of us! And now to see us both disgraced, and put into prison, to waste our best days, when we ought to be working for her.'

'How I wish,' thought I, 'that the mischievous leaders of the mob, and the poor deluded creatures that are led astray by them, could see all that I have seen, and learn the consequences of their unlawful violence! I have seen the produce of ingenuity and industry destroyed; I have seen the wealthy brought down to poverty, and the poor to starvation; I have seen alarm and distrust spread over the whole face of a populous and once happy country; the minds of the

* The Rioters; a Tale, by Harriet Martineau. London: Houlston and Stoneman. 1842.

young perverted and corrupted; the hearts of the old wrung with sorrow; I have seen children bring anguish on their parents, and parents compelled to behold the best years of their children's lives wasted in a prison. What poverty, what violence, what ruin, what grief, what remorse, have I beheld! These are the consequences of rioting.'"

Of the important lessons conveyed in the dialogues of this little work, we have been unable to give anything like a fair specimen. But we have perhaps given enough to attract that attention to this new token of Miss Martineau's philanthropy and talents, which it so well merits.

THE ROUND TOWERS OF IRELAND.

THE twenty-third number of Mr and Mrs Hall's beautiful and most interesting work on Ireland brings the subject of the celebrated Round Towers prominently into notice, and suggests our giving our readers some general account of those extraordinary and mysterious buildings.

For the benefit of those who never have heard of the subject of this paper, let us explain that the Round Towers of Ireland are ancient structures, of a peculiar and striking form, scattered all over the sister island, with no distinct record of their original use or purpose. The number formerly existing was much greater than it now is, when only about eighty-three can be enumerated, of which little more than twenty are entire. As may well be supposed, they are objects of no small degree of popular wonder, and a highly interesting study for the local antiquary. And, indeed, they are not unworthy of attention beyond the shores of Ireland; for, overlooking for the meantime two specimens in Scotland, there is no example of the same class of buildings in any part of Christian Europe. They clearly bespeak an age far beyond the dawn of history in our portion of the world, and in this respect are scarcely less remarkable than those wondrous and forlorn cities of central America, with which Mr Stephens has of late made us so well acquainted.

One peculiar and unvarying figure attaches to all the Round Towers of Ireland, as well as to the two which exist in Scotland. They are in every instance tapering as well as round, generally about a hundred feet in height, having a conical cap on the top. The diameter at the bottom varies between eight and fifteen feet; the door is generally ten or twelve feet above the ground; there are usually appearances of three or four floors having been placed in them, each provided with a small window; and, generally, close under the cap, there are four small windows corresponding to the cardinal points (only two towers having six in this situation). Though a hundred feet is about the average height of the perfect towers, there are some considerably shorter (one at 84, another at 60), and some considerably taller, one being imperfect at 110. The variations of form are very limited: the tower at Kinneagh is hexagonal at the base, and rotund above; Ardmore has three external belts, Dysart one, and Devenish presents a belt of sculptured work under the cap. The door is in some instances arched, in others a plain oblong. The masonry is, in all cases that we are acquainted with (and this description includes the two Scottish towers), composed of regular courses of freestone, neatly laid and finely joined, while the interior is rougher, the mortar invariably appearing of the finest and firmest consistence. It may therefore be readily imagined that the Round Towers do not appear the production of a rude people. They bear evidence, on the contrary, of having been reared by a nation which had made considerable advances in the arts, and perhaps also in science. On this last point, the arrangement of the windows seems to afford strong proof. The entireness of so many of these buildings after a lapse of centuries, probably not less than twelve, but probably several more, and the neatness of the workmanship, strike the mind very forcibly. It has been stated, with respect to that at Brechin in Scotland, that its upper part is observed to bend backwards and forwards in a high wind, and we have no doubt that such is the fact. One peculiarity of position is also attached to all these structures—they are invariably situated in the close neighbourhood of churches.

It was not till a very recent period that the Irish antiquaries first turned their attention to the Round Towers. In the absence of all record of their origin, conjecture has been busily employed respecting them, and they have been represented by different writers as belfries—as beacons—as penitentiaries—and as anchorite stations analogous to the pillars of the eastern saints. In 1830, the Royal Irish Academy proposed a prize for a satisfactory essay on the subject, and ultimately gave prizes to two gentlemen who advocated different views with superior ability, Mr O'Brien and Mr Petrie. The former has since published his essay, and that of the latter gentleman is, we understand, about to appear. By Mr O'Brien, the Round Towers are represented as the production of a heathen people, and connected with the East. Mr Petrie considers them as of less remote origin, as in fact built by the early Christians in Ireland as belfries and places in which to store valuables belonging to churches and monasteries.

We suspect that Mr Petrie's theory only proceeds from a wish to diminish the sense of wonder respecting the origin of the Round Towers. Such a wish is generally laudable, but it should not be carried too far. If the Round Towers were of Christian origin at all, it is incomprehensible that the history of the early priesthood of Ireland says so little about them, and does not speak of the building of a single individual of the number. The few notices of them obtained in early Irish history mention them under the names of *Turaghan* and *Feidh nemedh*, but make no mention of their *erection, era*, or *use*—thus seeming to show that they were ancient buildings of unknown origin a thousand years ago, as they are now. One of the earliest events of Irish history, the overthrow of the Firbolg power by the Danaans, is stated to have occurred at a place called, from the vicinity of towers, *Muigh Tuireth na bh Fomorach* (the plain of the Fomorian Tower). *Tor inis* (Tory Island), the Island of the Tower, is also noticed at a like early period, and so is the Tower of *Temur* or Tara, &c. The annals of the four Masters, at 898, mention the Turaghan Ancoire (the Fire Tower of the Anchorite) at Inniscailtre, or Holy Island, already mentioned. The Ulster annals at 996 say that lightning destroyed Armagh, sparing neither the infirmaries, the cathedral, the *Erdam*, nor the *Fedneamead*. The same has Tigernach at that year, except for *Erdam* he substitutes *Cloichteach* (a belfry). Of the erection of churches we have abundant mention in these annals, whilst of the towers we have only those just given; and comparing the magnitude and importance of the respective buildings, we may reasonably suppose that, did these towers appertain to the same era with the churches, the annals would not have been so silent regarding them—a further evidence, in our estimation, of their extreme antiquity.

We must confess that at one time our own opinion was in favour of their being anchorite establishments; but against this and the belfry theory alike, very strong objections are adduced. If they had been designed for anchorites, "there was no necessity for raising them to so great a height, and of such materials; whilst the adjoining churches were low and small, and many of them of *timber*. It is true that Anchoritism did greatly prevail in early Ireland, but the recluse selected far humbler retreats than lofty towers. We have still near many of our older churches small cells, which served them as hermitages, as at Ardfert, Scattery, and Glendalough. The cell of Declan at Ardmore—his residence in life, his grave in death—still subsists, and is called the *Bonachan*. The cell of Marianus Scotus was a similar lowly building. But although the towers were assuredly not erected for the reception of Anchorites, yet in after ages some few of them may have been used by these people for their penitential abodes. Such was the case with the *Turaghan Ancoire* (the Fire Tower of the Anchorite) on Holy Island, in the Shannon. The name refers at once to its original Pagan, and subsequent Christian use. Harris mentions the tradition, that an Anchorite lived at the top of the tower of Drumlahan, in Cavan, which on that account retained the name of *Cloich-Ancoire*, or the stone building of the Anchorite.

Probability is not in favour of their having been originally raised as belfries; their *form*, as well as their *separation* and *distance* from the church, being so unlike to the belfries of all other countries. As at periods long subsequent to their foundation, in some few instances they may have been availed of by hermits, so in others a bell may have been suspended; this has been the case at Cloyne for the last 150 years, and at Castledermot. In the Irish annals, after the introduction of belfries into Ireland at the close of the ninth century, we have frequent notices of the Cloichteach, or Campanile. It is expressly distinguished from the *Turaghan* or *Fidneimhedh*. The Cloichteach, or Clochier, seems to have been generally of timber, as mention occurs of some of them having been consumed by fire. These buildings, so recorded, are placed in localities where no round tower appears to have ever been; as at Slane, Clonard, Emly, Telcha, &c. We have still subsisting two specimens of the Cloichteach at Cashel—the earliest structures of the kind probably in Ireland. They stand at either side, and form part of Cormac's chapel, a structure of the ninth century; are square, and built with well cut stones. A round tower, of very different stone and architecture, built in layers not horizontal, stands several yards north of these structures. If its purpose had been that of a belfry, there was scarcely any necessity for building the two towers just mentioned. A similar instance of a round tower near a square steeple occurs at Swords, and at Devenish. We have, adjoining several other towers, old churches with bell gables; as at Donaghmore, Killicullen, Tulloherin, Kilree, Fertagh, &c. These would not have been thought necessary if the round tower had been a belfry.

Their situation next to churches (keeping out of view, however, their severance and isolation from them) it is which has mainly led into the error of supposing that they were the works of Christian ecclesiastics. But, as remarked by Mr Weld, 'it might be stated conversely, perhaps with as much propriety, that the churches were built contiguous to the towers;' and he illustrates this by the well-known disposition manifested by the early Christian missionaries to accommodate their worship to that of their Pagan proselytes; amongst many evidences of which was the eager appropriation of heathen temples and places consecrated to their gods, to Christian uses."

One thing contends strongly against any supposition of their being of Christian origin—they are unlike any structure in use by the Christian clergy of any other country. It is most unlikely that this peculiar form of building would be invented by the missionaries who Christianised Ireland and Scotland; for, if such had been the case, we might have expected that some of the holy men of Ireland, who became distinguished on the continent, would have transferred the same form of building thither, which in no instance have they done. Three of the towers, it is true, namely, Donaghmore, Antrim, and Brechin, have Christian emblems on the doorways; but in two instances these have been shown to be modern. "It is certain that the early ecclesiastics, in appropriating to themselves the old Pagan places of worship everywhere, took care, very generally, to impose emblems of their religion on the converted structures." Supposing, then, that the round tower was not an invention of the Irish missionaries, we are forced to presume for them an origin in some earlier heathen system, and perhaps a different race.

The opinion of Mr Windele, author of "Historical and Descriptive Notices of Cork," who seems to have furnished the materials for Mr and Mrs Hall's treatment of this subject, is that the round towers were temples used in the system of fire-worship, which anciently prevailed in Ireland. The arguments by which he supports his hypothesis are very plausible. It appears that in India there still are similar round towers, formerly used by the fire-worshippers. "Lord Valentia was particularly struck by the resemblance which he observed between two round towers at Bhangulpore, in India, and those of Ireland. The doors were elevated; there were four windows at top, and the roofs were arched with stone." "Pennant, speaking of the Polygars of India, says that they retain the *old religion;* and he describes their pagodas as buildings of a cylindrical or round tower shape, with their tops either pointed or truncated, frequently ornamented with a ball or spike, intended to represent the sun—an emblem of the deity of the place." "Hyde has given a drawing of one of the Eastern structures, with its four upper windows emitting volumes of smoke." Caucasus, the country of the ancient Iberians, of whom were the first colonists of Ireland, still abounds in round towers; and in Sardinia, which was colonised by Iberians, such structures are numerous under the name of *nuraggi*. Some countenance is afforded to this view by the vernacular name given to the round towers of Ireland, *cillcagh* or *golcagh*, a compound of two sacred words meaning fire and divinity. The particular names of several bear, likewise, allusion to fire. It is also to be remarked that "the worship of fire by the ancient Irish is a fact sufficiently vouched by the Irish annals and saints' lives, as well as by existing practices on the eves of May, Midsummer, &c. Its votaries were divided into two sects, one which lighted the sacred fire in the open temple, as at *Gall-ti-mor* (the flame of the great circle), *Gall-Baille* (the flame of the community), &c.; and the other which enclosed it in the *Sun-Tower* (*Turaghan*) or in low over-arched buildings, such as the *Boens*, the cells at *Gall-erous*, &c. The tower and low square temple were equally common to the Persians, with whom, as well as, indeed, with most of the other early Pagan nations, fire or the sun formed a main object of adoration."

"The researches conducted in 1841 by Messrs Odell, Abell, Hackett, Wall, Horgan, and Windele, by which nine of these structures have been examined, have established the sepulchral character of many of the Irish towers. In the base of the Tower of Ardmore the remains of two skeletons were found deposited in a bed of sifted earth. Above this was a floor of concrete, over which were four successive layers of large stones, closely fitted to each other, and over these was laid another floor of smoothed concrete. Here a care and precaution were displayed indicating the importance of the personages interred, whilst the absence of any remains of coffin, or crosier, or ring, or other ornament, afforded a fair presumption that the deceased were not Christian. Three skeletons have been found in the base of Cloyne Tower. Human remains were also discovered in the Tower of Ram Island (Antrim). Similar discoveries have been recently made in the Tower of Roscrea, by E. Wall, Esq., of that town. The Tower of Dromboe has been submitted to a like examination. In this, at several feet below a deposit of rubbish, earth, human bones, horns, and stones, which had undergone the action of fire, a concrete floor similar to that found in the towers of Ardmore, Cloyne, Roscrea, &c., was reached. Beneath this was found a stratum of dark loamy earth, under which, even with the foundation of the building, lay a skeleton nearly perfect. Of the skull, a cast has been taken for the Belfast Natural History Society. But what beyond all question decides the Paganism of these buildings, is the discovery of an *urn*, in the Tower of Timahoe, and of fragments of others in those of Brechin and Abernethy, in Scotland; in the latter, beside a portion of an *urn* of *green* clay, Mr Black, the author of a "History of Brechin," says that bones were got laid below flat stones; thus in the same sepulchre exhibiting cremation and inhumation together, as has been found in Etruscan tombs. These discoveries justify the name of one of the Irish towers, *Fertagh*, the sepulchral fire-tower; and clearly assimilate those structures to the Nuraggi, the Gozo Tower, the Dagobas of Ceylon, and other most ancient structures appertaining to sun worship."

It may be remarked, in connexion with this subject,

though not in illustration of it, that the Irish have a mythic hero of the art of architecture, to whom, in their popular legends, they attribute many of these curious buildings. They call him the Goban Saer, and allege that he was employed in his professional capacity in other countries besides Ireland. The name of this imaginary being, observes Mrs Hall, "will live while the Irish race shall retain their vernacular tongue, or his maxims of wisdom are the oracles of unlettered instruction. I have not learned the particular period at which he flourished, but tradition says that he was superior to all his contemporaries in the art of building; even in that dark age, when so little communication existed between countries not so remotely situated, his fame extended to distant lands."

SCHOOL FOR RECLAIMING BOYS.

In October 1841, an institution of a somewhat peculiar nature was opened in Aberdeen, its object being to reclaim the most destitute children from a life of crime, or at least of street vagrancy and wretchedness. In its character, the institution, which is connected with the House of Refuge, partakes of the nature of an asylum and a school. It feeds and educates, but does not lodge or clothe, leaving these duties to the parents of the children. No money has been laid out in erecting a building for the institution, but a place is hired for its accommodation, which answers every desired purpose. For all who are admitted, the entire cost of management and education is L.103 a-year, exclusive of the expense of food, which is about 3d. per day for each boy, or L.4, 10s. per annum. To meet the general expenditure, the inmates are required to give their labour, such as it is. By working at net-making, picking oakum, hair, and senna, each boy earns at least 1d. a-day, or 30s. a-year. It is expected that the profits from the labour will in future exceed this sum, as the children are now partly trained, and a plentiful supply of work has been procured. The routine of a day's employment embraces five hours for work, four hours for instruction in reading, writing, arithmetic, geography, and singing, and three hours for meals and play. On Sundays, the pupils attend for religious instruction. Another important fact connected with the institution is, that the benevolent founder of the school, Mr Sheriff Watson, has, at his own expense, hired a garden containing about an acre and a half, for which he pays a rent of L.9, 15s. a-year; and it is believed that from this field of labour no small benefit in many respects will be derived.

In the lately issued Prison Report for Scotland, in which these particulars are enumerated, a statement respecting the progress of the institution is given by its superintendent, Mr Reid, from which we make the following extract:—"The number of names on the roll is about sixty, and the average attendants fifty. This state of matters is accounted for, by observing, that attendance is quite voluntary, and that many of those who have been brought forward by the police officers and others, as proper objects of the charity, preferring their old ways, have, after a very limited period (say two or three days), left us. Those, however, who have continued any time, have in general been most regular, and their conduct deserves marked approbation. These appear to be making very considerable progress in education and good order. To speak definitively of the effect of the school scheme from so short an experiment, seems unadvisable; good, doubtless, in various ways has resulted from the means used, but the permanence of the effect produced has yet to be seen. Indeed, it would scarcely be fair to expect, taking all the circumstances into consideration, that a very distinct and lasting impression should be produced by a period of training so brief. It may be mentioned, by way of encouragement, in passing, that of the boys brought forward by the police officers at the opening of the school, two have got employment, and two boys, very unpromising in appearance, have continued in attendance during the eight months with the greatest regularity. The one has not been absent a single day, and the other only twice or thrice. The former is a good scholar, attentive and very industrious at work, although very untidy in his habits; in these, too, a slight improvement is apparent; the latter is more backward at his lessons, and more thoughtless in every way, but still, from his steady attendance, improvement in due course may reasonably be expected. A boy, who had been thrice convicted of theft, attended with considerable regularity for six months, and then obtained a small piece of work; but, as his character was very unsettled, it is to be feared that little durable effect can have been produced in his case. As, however, he has gone on hitherto pretty well, it may be hoped good advice has not altogether been thrown away on him.

Another boy, who had a very bad character also, when brought forward by the police officers, and who was one of three found pilfering from the school (the only cases known since the commencement), has seemingly become much more steady, and is making improvement in knowledge and good conduct. Two brothers may also be mentioned, who had no means of living but by begging. Nothing bad was known of their character. These boys and their mother appear very grateful for the privileges of the school, by which they are saved the necessity of asking charity from door to door, and are enabled to do a little for their own maintenance. These appear good docile boys, rescued, for the present, from a degrading occupation.

Some boys who had been inmates of the House of Refuge, but who, according to the determination of the committee of management, could not be continued longer, were transferred to the school, by which means their previous training is continued, and their steadiness put to the test. In their case, it is surely of great importance that the connexion which had been of advantage to them has not been entirely severed; their continued improvement is confidently looked for.

In conclusion, there cannot be a doubt of the utility of the scheme. It has hitherto wrought much more pleasantly than was anticipated; and while there has been little to discourage, there has been much, very much, which can be better felt than expressed by those who come in contact with these poor children, to animate to still greater exertions for their advantage. Without being over sanguine as to the effects that may flow from this and similar schemes, looking with confidence for the Divine blessing, we hesitate not to believe that the beneficial results will be, ultimately, fully commensurate with our largest expectations."

The following encouraging statement is from the report of the superintendent of police in Aberdeen for the year 1841, and was written when the Industrial School had been opened three months:—

"In the cases of theft for the by-past year, the property stolen was, for the most part, of very trifling value, and consisted principally of small sums of money taken from the person, and articles of wearing apparel; and it may be mentioned, that, in many of the cases, the offenders were wives who had been deserted by their husbands; boys and girls deserted by their parents; and, in many cases, by boys and girls who were known to have been sent out by their parents to beg, and, as is suspected, in many instances, to steal.

During the last three or four months, however, thefts by these juvenile offenders have been less frequent than during the previous months of the year; indeed, I may say that, during the former period, only three boys, two of whom were previously known to the police, have been convicted of that crime; and I am only able to attribute this state of things to the School of Industry, in connexion with the House of Refuge, lately established under the superintendence of Mr Reid. There are upwards of sixty boys at present attending that institution, from 9 in the morning until 8 in the evening, a great number of whom, previous to their being admitted into it, had no visible means of earning a livelihood, unless by begging or stealing; and whose parents, from their situation and habits of life, were unable to render them assistance, but, on the contrary, sent them out to beg, or at least under that pretence.

Previous to the opening of this establishment, numerous complaints were made at the watch-house by families in town regarding these young offenders, and on market-days in particular, by country people, as well as the inhabitants, of having had money or other articles stolen from their baskets or persons. These complaints, however, during the period alluded to, have not been so frequent.

It is much to be regretted that a similar establishment has not been set on foot for the reception of young girls, a number of whom are constantly prowling about the streets, under the pretence of begging, but who generally avail themselves of every opportunity to steal. Unless they be secured in some way against bad example and advice, their reformation will be in a great measure hopeless.

In addition to the above, it may be stated that no boys were tried at the last circuit, except two, who had been committed before the Industrial School was opened, and that not a single boy has been brought before the sheriff for trial since that period. That the local authorities think the Industrial School serves to diminish crime, is shown by the fact, that the town council have contributed L.20 to it out of the fund used for the prosecution of offenders (called the Rogue Money fund), and by the Commissioners of Police having given 20 guineas out of their funds."

Mr Hill, the framer of the Report, concludes the subject with the following judicious observations:—"Although the foregoing report cannot be regarded as highly satisfactory, and although I am convinced that such an institution as the Industrial School of Aberdeen is productive of a large balance of good, it must not be forgotten, that any institution, which, like this school, is open only to the destitute, is attended with danger, and that unless great caution be taken, such an establishment may silently be weakening the motives to industry and providence among the working-classes, and thereby impairing the general framework of society. Parents who have brought children into existence, whom, from their own idleness, drunkenness, or improvidence, they are unable to maintain, and whom they cast as a burden on others, ought, in my opinion, themselves to be placed in a state of discipline and restraint, so that the evil may at least be stopped. But the double object of training neglected and destitute children aright, and of putting their parents under control, can scarcely be attained in the present state of the Scottish poor law."

A PROFESSOR OF MINERALOGY AT CHRISTIANIA.

I found the learned gentleman in a low room about ten feet square, at the end of a dark covered way, which was entered from the street, and across which was a gate with broken hinges; the window of this apartment looked on a dirty courtyard lumbered up with tubs, an old cart, and a barrel or two of earth containing ore to be analysed. But the room itself was even worse than its situation, and its multifarious contents more difficult to analyse than the ore. It contained in one corner a small dirty bed; and on one side was a book-case, from the dusty top shelf of which, by mounting upon one of the three old crazy chairs, he handed a book down to me. On another side stood an antique clock, its face covered with figures and divers circles, emblematic, no doubt, of the mystic religion of Norway. On the wall were hanging thermometers, barometers, and hydrometers, and every other sort of *ometer*, numberless, dusty, and mysterious; loadstones with weights attached to them: scales, pendulums, and an endless *et cetera*. Opposite to these was an old bureau full of mineralogical curiosities, among which he showed me an earth previously unknown, which he had lately discovered, and a crystal not yet observed by any other person, and such like marvels. All these were lying in confusion confounded, amidst pots and pans, basins, crucibles, receivers, retorts, bottles of every sort, shape, and size, and flanked with glasses of every kind and form. His large table, covered with tablets, manuscripts, and books, cups, funnels, and every denomination of vessels, baffled all description. When I disturbed him, he was engaged in analysing some specimens of minerals; but, to my taste, he was by far the most extraordinary specimen of all. Fancy a little dirty old man, with blear eyes, whose face looked as if it had not been washed any more than his originally white, now dark brown, night-cap, since his spectacles were made; and the furrow they had worn upon his nose showed their use had been of some years' standing: and to augment his beauty, a huge black plaster was stuck on one temple. He wore a dirty shirt crusted with snuff, a gay coloured waistcoat reaching over his hips, a brown coat and trousers far too wide for his shrunken shanks, while a pair of immense slippers completed the costume of this subterranean octogenarian, or, I may say, Mediterranean prodigy. Despite his rough and unpromising exterior, his manners were not only agreeable, but polished; and he very kindly showed me his collection of minerals, which is valuable and well arranged. He was a pupil of Werner's, and is a man of considerable talent.—*Milford's Norway.*

CONDITION OF WEAVERS IN AMERICA.

[From Thomson's *Travels of a Tradesman.*]

THERE are numerous handloom weavers throughout all these [Western] states, who make a very comfortable living. The way they carry on their work is pretty much the same as that of the country weavers in Scotland, only they have longer webs, and are rather better paid. The kind of work most common is wincey, satinets, and flannel; the latter article is very generally used by the country people for shirts to the men and petticoats to the women. It is always woven white, and the yarn is very good. An ordinary hand with the fly-lay can weave ten or twelve yards easily; the usual price is about sixpence sterling per yard; no allowance for warping or gearing. In the agricultural districts, any man that can do this kind of work may get through the world very easily. Many of the farmers have looms in their own houses; but this is more a matter of necessity than choice, and they consider a weaver in the neighbourhood an acquisition; will help him to build a house, sell him a few acres of land, and take an interest in his success. I have been told by weavers and people about the mills, that a good many leave their places and buy—even sometimes get—a few acres of land, and commence in this way.

Emigrants of the handicraft class come crowding to the manufacturing towns and well-known districts, where they frequently cannot get work until their means are expended: besides, they glut the labour market, when other places are in want of them; instead of which, if they would just shut their eyes, and walk twenty miles straight into any ordinary well-settled district, they would find profitable employment in this and many other ways.

A number of weavers find employment in all the cities and towns, weaving clouty carpets; but this field is pretty well occupied. Still, there are hundreds in New York, Boston, Baltimore, Philadelphia, &c., who make a living in this way.

I wrought at two carding-mills in Canada, and had twenty dollars a-month in both places, and boarded. These establishments are of great value to the farmers, many of whom have looms in their houses, from which they have a supply of home-made stuffs; and here, too, as in the States, there is a numerous class of country weavers, who make a very good living, working for the farmers, and cultivating a piece of land for themselves. There was one of these, in the last-named township, that I used to visit, of whom I shall take particular notice, as he is a fair example of this class of tradesmen. His name was John Kelly, an Irishman: he came out here five years ago, and all the knowledge he had of the business was learned in weaving linen dowlas at a factory near Belfast. He had a wife, two children, and five sovereigns when he arrived in Toronto. He said himself he had only thirty shillings, but his wife told me he had five pounds, and I believed her; besides, he had some friends to advise and assist him. Now he has a nice little frame house, with a *butt and a ben*, and a stair leading between the apartments up to a roomy garret, where he has his warping stakes. He has also a cow and a calf, two swine, lots of cocks and hens, four children, with dogs and cats, and all the et ceteras of a thriving household. His loom was in a corner of the apartment they lived in, just beside the fire-place, and all around were heavy bundles of woollen yarn. He

wrought with the hand-shuttle; his children filled the *pirns*, and he taught them to read while at work. He has four acres of cleared land, plenty of potatoes, oatmeal, Indian corn, &c. The wife said, such a thing as wanting provisions for themselves or children never came into her mind, for John had more work than he could do; and she would be perfectly happy if she could just see *Ould* Ireland once more before she died.

I often thought it a pity that so many of my countrymen, who have been brought up to the weaving business, should have to labour twelve or sixteen hours a-day for the privilege of being half-starved, and brought to a premature grave, when there is such a wide and continually increasing field open to them all over Canada and the northern and western states of the Union; although Lower Canada is probably not the best place to emigrate to. The condition of the customer weavers all over the States and Canada is equal, if not superior, to that of the country weavers in Scotland some forty years ago, when every one had a cow and a little bit of land, and when they spent the long winter evenings as often by the fireside as they did between what is now appropriately called the "four *stoops* o' misery." But although there are as good prospects for this class of tradesmen, both in the United States and Canada, as for any other, I feel great hesitation in advising any to emigrate; so much depends on individual courage, perseverance, tact, and management. Their previous habits, too, are much against their chance of comfort and success, in beginning a comparatively new mode of life; but the greatest difficulty of all is in the want of means. I cannot conceive how a weaver, with even a small family, could leave this country and commence as a customer weaver in any part of America, unless he could raise some L.30 or L.35 at the least; and where is he to get it?

WEEDS.

[From the "Gardeners' Chronicle."]

Is there any manure that will kill weeds? is a question that is not unfrequently put to us. Will nitrate of soda, or nitrate of ammonia, or guano, or urates? That such questions should be asked proves one thing at least, that there is a general desire to know how to extirpate weeds. We wish we could add, that they also indicate some acquaintance with the rudiments at least of vegetable physiology.

Weeds, like other plants, have each their peculiar constitution, prefer certain kinds of food, and perish upon the application of others. We have seen a pound of nitrate of soda administered to a seakale plant without visible effect; half an ounce would probably destroy a rhododendron. Common stable manure is prejudicial to coniferous plants, and in over doses will kill them; an oak feeds greedily upon it. So it is with weeds. Excessive doses of salt will destroy all ordinary vegetation, weeds included, but promote the growth of asparagus in a most remarkable degree, as has been shown by one of our correspondents; thus proving itself to be a poison to one plant and a nutritious food to another. But salt cannot be used in large doses to extirpate weeds generally, because some may imitate the asparagus, and may flourish under its action, and most crops will certainly be destroyed by it. Professor Henslow succeeded in destroying moss and weeds on gravel walks by means of corrosive sublimate, green vitriol, and blue vitriol, especially the last. But corrosive sublimate destroys every living form of vegetation as well as the weeds; and the two sorts of vitriol have no permanent action, encouraging the subsequent growth of many plants, and so promoting the vegetation of weeds rather than destroying it.

In practice, these chemical agents can only be employed for the destruction of weeds in certain special cases, such as the asparagus, which thrives under doses of salt which kill most other plants; or as seakale, which seems to be affected in the same way; or as tobacco, which feeds greedily upon quantities of nitrate of soda which would destroy any ordinary vegetation. In general, we must look to other means for ridding ourselves of troublesome weeds, and we shall find those means in industry and common sense. The two, separate, are good things, but they are better mixed together.

Among the more troublesome weeds are common annuals, such as chickweed, groundsel, sowthistle, and fat hen. In slovenly gardens they are abundant; in a well-kept garden they are unknown; in neglected places they overrun everything for a time. It is discreditable to a gardener that any one of them should ever be seen upon the premises bigger than a seedling; in that state they must be found, because their seeds are brought from a distance by the air, by manure, and by other means. Yet we do see them, far too often, in full bloom, and in places where better things should be expected. When the slovenly gardener is remonstrated with for their presence, his answer usually is, "Why, I am always hoeing them up; but they breed so fast, that there is no keeping them down." To be sure they do. They were created to produce food for small birds, and an unusual power of reproduction is given them, in order to furnish such creatures with a constant supply of seed. But there is no occasion to make a garden into a bird-farm; the woods and the fields afford ample space for the harvest of our feathered friends. "But," says the slovenly gardener, "I am always hoeing them up; what can I do more than that?" and this, he thinks, settles the question. If, however, we cast only a glance at the sloven's proceedings, we find those weeds which he is always hoeing up lying on the ground in full flower, ripening there, and scattering all around them a new crop of seedlings; so that the sloven, by his own act, is perpetually renewing his labour. The ancients had a fable of a hero, named Sisyphus, a great freebooter, who, for his misdeeds, was condemned by Pluto to the punishment of pushing to the top of a mountain a large stone, which, as soon as it reached the summit, rolled back into the plain below, whence the unlucky Sisyphus had to push it up again. Now, our gardener, who cuts up his weeds just in time to let them sow themselves again, is only a Sisyphus in a small way; with this difference, however, that he rolls his stone at his master's expense, and not his own. When the master complains of the scandalous state of his garden, our horticultural Sisyphus bustles about; exclaims, "I'll put it all to rights directly, sir;" plies the hoe and rake, and, presto, the garden is clean, and, in seeming, what it should be; but the first shower of rain brings up all the seeds that have been sown, and there is a green carpet of groundsel, chickweed, and their fellows.

There is no excuse for this sort of mismanagement, because it costs less to destroy such weeds in the right way than in the wrong. The plain and obvious rule is to pull them up as they appear, and while still in the state of seedlings. Then, every plant that is removed is effectually destroyed, and leaves no young ones behind it. Any boy, at half-a-crown a-week, can be taught to distinguish them; and if the plan is persevered in, there will very soon be nothing for the boy to do. Strict attention must, however, be paid to their thorough extirpation when young; it will not do to pull up almost all, and to leave the remainder to seed; for in that case the labour has to be all gone over again, just as if a gardening Sisyphus had been at work.

People are hardly aware of the rate at which such a plant as groundsel increases. A little calculation will make that evident. Each flower-head of the groundsel produces about sixty seeds, furnished with feathery wings, whereon to fly from place to place. A very moderate specimen of the plant bears twenty heads capable of producing ripe seeds at the same time, even when cut up; therefore, every neglected plant of the groundsel, even if eventually destroyed, fills the soil with twelve hundred seeds, every one of which will in all probability grow. This, however, is a very low computation; and if a single plant, instead of being pulled up, is allowed to stand and flourish, and scatter its seed abroad upon the wings of the wind, twelve thousand, or even ten times twelve thousand, seedlings will be produced; and that is a pretty considerable stone for a garden Sisyphus to roll up-hill again. Every precaution should therefore be taken to prevent one single specimen of the groundsel producing even its flowers, not to say seeds, in a well-managed garden.

What is true of groundsel is equally true of sowthistle, chickweed, shepherd's-purse, sun-spurge, and the whole race of weeds, whether annual or perennial, multiplied by seeds. A little labour, well applied at first, and steadily persevered in, will save a large amount of it at last, and is the only effectual means that exists of extirpating this large class of plants.

Perennial weeds, which multiply by their creeping stems, or their roots, require special considerations, which we must defer till another opportunity.

ON SEEING A CHILD FALL ASLEEP AMID ITS SPORTS.

BY MISS PARDOE.

WEARIED with pleasure! Oh, how deep
Such slumber seems to be—
Thou fairy creature! I could weep
As thus I gaze on thee;
Ay, weep, and with most bitter tears,
Wrung from the spirit's core,
To think that in a few short years
Thou'lt sleep that sleep no more.

Wearied with pleasure! what a sound
To greet a world-worn ear!
Can we who tread life's giddy round,
Sleep like the cherub here?
Alas! for us joy's brightest hours
All fever as they fly,
And leave a blight—as sun-struck flowers
Of too much glory die.

Wearied with pleasure! Does the wing
Of angels fan thy brow?
Sweet child, do birds about thee sing,
And blossoms round thee blow?
Is thy calm sleep with gladness rife?
Do stars above thee shine?
Oh, I would give whole years of life
To dream such dreams as thine!

EXTRAORDINARY MECHANIC.

In the town of Alyth, there lived a man of much provincial celebrity, of the name of James Sandy. The originality of genius and eccentricity of character which distinguished this remarkable person have rarely been surpassed. Deprived, at an early age, of his legs, he contrived, by dint of ingenuity, not only to pass his time agreeably, but to render himself a useful member of society. He soon displayed a taste for mechanical pursuits, and contrived, as a workshop for his operations, a sort of circular bed, the sides of which being raised about eighteen inches above the clothes, were employed as a platform for turning-lathes, tables, vices, and for tools of all kinds. His genius for practical mechanics was universal. He was skilled in all sorts of turning, and constructed some very curious lathes, as well as clocks and musical instruments of every description, no less admired for the sweetness of their tone than the elegance of their execution. He excelled, too, in the construction of optical instruments, and made some reflecting telescopes, the specula of which were not inferior to those furnished by the most eminent London artists. He suggested some important improvements in the machinery for spinning flax; and we believe he was the first who made the wooden-jointed snuff-boxes, generally called Laurence-kirk boxes, some of which, fabricated by this self-taught artist, were purchased and sent as presents to the Royal family—one, in particular, was returned from Brighton to the maker, with a request to be opened. To James's other endowments, he added an accurate knowledge of drawing and engraving, and in both of these arts produced specimens of the highest excellence. For upwards of fifty years, he quitted his bed only *three* times, and on these occasions his house was either inundated with water or menaced with danger by fire. His curiosity, which was unbounded, prompted him to hatch different kinds of bird's eggs by the natural warmth of his body: and he afterwards raised the motley brood with all the tenderness of a parent, so that, on visiting him, it was no uncommon thing to see various singing birds perched upon his head, and warbling the artificial notes he had taught them. Naturally possessed of a good constitution and an active mind, his house was the general coffee-room of the village, where the affairs of both church and state were discussed with the utmost freedom. This singular man had acquired by his ingenuity and industry an honourable independence, and died possessed of considerable property. He married about three weeks before his death. From the brief history of James Sandy, we may learn these very instructive lessons, that no difficulties are too great to be overcome by industry and perseverance; and that genius, though it should sometimes miss the distinction it deserves, will seldom fail in the end, unless by its own fault, to secure competency and respectability. —*Perth Courier.*

ASTRONOMICAL CLOCK AT STRASBURG.

An astronomical clock, of remarkable ingenuity, has lately been constructed at Strasburg, by a M. Schwilgué. It is composed of three parts, respectively indicating the time of the day, the day of the month and year, and the movements of the constellations. The central moving power, which is another and very exact time-piece, shows on the face the hour and its subdivisions, strikes the hours and the quarters, and puts in motion several curious allegorical figures. The cock-crow, which had been mute since 1789, has been reproduced, and a procession of the apostles takes place daily at noon. The calendar shows the months, the days, and the dominical letter, as well as the Catholic calendar, showing every saint's day in the year. The plate or face on which these figures and signs appear, makes one revolution in 365 days for the common, and 366 for the bissextile year, always reproducing the irregularity which takes place three times in every four secular years. The moving fasts and feasts are shown by an extremely ingenious process. On the 31st of December, at midnight, Easter-day, and the other moving feasts for the year, appear in the calendar. The third division is the triumph of the artist's skill. A complete orrery, after the Copernican system, is produced. The movements of all the planets, visible to the naked eye, are represented. The earth is shown accompanied by her satellite the moon, which accomplishes her revolution in one month. The different phases of the moon are represented on a different and separate globe. Another globe represents the apparent movement of the heavens, making one revolution in the sidereal day. This movement is subjected to that almost imperceptible power, known by the name of the procession of the equinoxes. The mechanism, besides many other things, shows the apparent movements of the sun and moon with wonderful precision, and for an indefinite period, so that the rising and setting of the sun, its passage to the meridian, the eclipses of the sun and moon, &c., are all represented on the face of the apparent time in a most ingenious manner.—*Newspaper paragraph.*

GAMBLING IN MANCHESTER.

In an article in the North of England Magazine for December 1842, pointing out the impropriety of detaining young shop-assistants till a late hour, the following observations are made on the appetite for gambling which prevails among this order of persons:—"There are about 143 houses in Manchester, where public gambling of some sort is carried on; there are three or four men, known to the police, each of whom makes in this town at least L.1000 a-year by betting, and an immense number who, from the same source, add considerably to their income. Those who are fleeced by them, or the 'pigeons,' as they are sportingly and sportively termed, are principally young men who have charge of the property of their employers, and three out of five embezzlers have betting books found on their persons. Now, of 357 persons taken into custody for gambling (and 'principally young men who have charge of the property of their employers'), *not one* has received a good education. We might, did the nature of the subject permit, pursue such inquiries further, and prove that, in other departments of vice, with a minute reference to which we will not sully our pages, the educated employés of Manchester are equally conspicuous above their uneducated brethren; from the facts above given, the conclusion, we think, is undeniable, that *it is the direct interest of the employer to give to his dependents full opportunity for instruction.*"

We do not doubt that much petty gambling is caused by lack of education; but as it is notorious that well-educated persons gamble to a greater extent than those in inferior stations, the conclusion of the writer is illogical. To root out the practice, severe police regulations ought to be enforced, and the higher classes should cease to set that example of betting and gambling—at horse-races, for example—by which they systematically corrupt the morals of the humbler orders.

THE HELPFUL AND HELPLESS.

"OH! if I had but the power—if I were but rich—I would do so much good, I would be so charitable!" is a phrase, if not exactly expressed, very often implied, in the conversation of well-meaning people; and undoubtedly wealth is a possession for the use of which we are accountable in exact proportion to the extended range of action it affords. Still, few individuals are so unhappily placed as not to have in some degree the power of benefiting their fellow-creatures; and as a long list of insignificant items will make up a large sum, so is it astonishing how large an amount of happiness arises from the small charities and trifling kindnesses of life. The sphere may be limited; but for those who really take pleasure in doing "a good turn" to a fellow-creature, the opportunities are innumerable; and despite the dark colours in which some writers love to paint human nature, we believe the proportion who do take such pleasure to be a very large one. "Ah, but there is so much ingratitude in the world!" exclaims some reader; "to be a philanthropist is one of the 'young dreams' of early life, which we wake from at the touch of the rough teacher—experience. There is so much ingratitude; and even if you do not mind this, your efforts are often in vain, for you cannot help people *if they will not help themselves*." Exactly so, and herein lies the pith of our argument. Benevolent persons who, lacking judgment, indiscriminately bestow their money or time—the latter often the more generous gift—not only frequently meet with ingratitude, but find their kindest intentions prove abortive. There is little wonder that such results sour the temper, and wither up the best feelings of the heart; and it is to avoid them, as well as to increase the amount of good that would be effected, that, on the one hand, we urge the expediency of helping those who are willing to help themselves, and, on the other, the desirableness, or rather *necessity*, of the helpless becoming equally helpful.

In the little town of Sinton lived two ladies, almost equally noted for their charitable and amiable dispositions; and certainly there never beat two warmer hearts, or existed two better-intentioned persons; and yet were they in almost every other attribute very different characters. As the perfect metals come undefiled from the furnace, so are the nobler characters strengthened and purified by the fire of adversity; and so had Margaret Bromley been tried, and *not* found wanting. To be sure many people would say that a little old maid who told the year she was born, and so allowed the inquisitive to calculate that she was far advanced on the shady side of forty—who retained, save in a soft but lustrous eye, no traces of beauty, and yet called in neither rouge nor false hair to her assistance; and, moreover, had neither high connexions nor a large fortune, must be a very uninteresting person; but we know that there is yet in Sinton many a heart that thrills at the mention of her name, and many an eye that moistens at the recollection of her goodness. Miss Bromley's own history may be told in few words. She had been left a portionless orphan, or dowered only with a good education, and on that was she thrown, when under twenty, for her support; and the next fifteen years of her life she passed as a governess in different families. For the last seven years of that period, however, she had given her affections to one who was in every respect worthy of her, but, unfortunately, he, too, was poor; and when, after long years of patience and toil in a foreign land, he came into the possession of a few thousand pounds, bequeathed to him by a cousin, and hastened to England to claim his bride, his death, only one week before the marriage was to have taken place, dashed from her the cup of happiness which had lately seemed so brimming. Among his papers, however, a will was found, dictated by tenderness and affection, and rendered doubly prudent by the consciousness he felt that his constitution had suffered from the wear and tear of a hot climate. His lately acquired three hundred a-year thus passed to Miss Bromley, and, in the bereavement of a really widowed heart, she received an independence not only as a consoling proof of his love, but, after long years of suffering and dependence, as a talent for which she must henceforth be accountable. She longed for leisure and retirement, and the opportunity of doing good; and nowhere could she have found them more pleasantly than in the picturesque neighbourhood of Sinton.

Her friend, Mrs Greville, was a widow lady, some few years her junior, who, reared in the lap of affluence, and surrounded for many years with the blessings that affection scatters, had known no real trouble, until deprived, by death, of her husband. She was childless; and by some of those accidents which often befall the most estimable, she had, within a few years, gradually become separated from her dearest associates. Bowed down by an affliction so similar to that of Miss Bromley, and choosing Sinton for a residence from motives very like her own, there is little wonder that the two ladies soon became intimate. At the time, however, to which this sketch refers, ten years had poured their healing balm upon the two sorrowing hearts; and though they were allowed to be equally amiable and benevolent, ten years had presented many opportunities of contrasting the schooling of adversity with that of prosperity.

"If I were inclined to be superstitious, my dear friend, I should consider you a very *lucky* person," said Mrs Greville, as the two ladies were sauntering down one of the green lanes near Sinton, in the "incense breathing" month of May. "Every one you assist or advise," she continued, "seems from that day forward to be successful; while I am constantly discovering that my humble attempts at assistance produce, after all, no good result. Do counsel me, my dear Miss Bromley, how I had better act with regard to the Smiths. I have promised that they shall not want; and though I do not wish it talked about, you know, when I took them from the workhouse, I furnished the cottage for them, clad the mother and children from head to foot, and recommended Smith himself to farmer Wilson, and so procured a regular employment for him. When I returned from my trip to Brighton last month, I suspected, from the appearance of the children, that there was something wrong, but could get no direct answer to my questions; and only yesterday did I find out that Smith lost his situation while I was away; and as nobody in the place would trust them for a loaf of bread, they have been selling the furniture bit by bit, till they are just as destitute as when I found them in the workhouse."

"Why did farmer Wilson discharge him?" asked Miss Bromley.

"Why, I am sorry to say, I am almost afraid it was from—because he was found tipsy," replied Mrs Greville, in a hesitating tone, almost as if the kind-hearted lady were confessing some offence of her own.

"If I remember rightly," said Miss Bromley, "it was drunkenness that brought him to his former destitute condition?"

"Yes; but I really believed he was quite reformed, or, of course, I would not have recommended him to Wilson."

"Dear Mrs Greville, will you let me tell you where I think you erred?"

"Pray do, for I only wish I knew how to do as much good as yourself."

"Well, then, I must tell you that you were wrong in surrounding Smith and his family *all at once* with the comforts of which his own faults had deprived him. It would have been wiser to have, in the first place, ascertained whether he was willing to help himself properly, if put in the right track; and at least to have bestowed assistance by degrees, and made him feel that continued aid depended on his own good conduct. Things too easily obtained are little prized; and I think you were wrong in recommending him to Wilson, until the certainty of his reformation had been tried by exposure to temptation."

"That is what pains me. I feel that, in trying to serve Smith, I have injured the honest farmer. And yet, Miss Bromley, only last year you saved from destruction that poor Williams who had actually been confined in the penitentiary for some petty theft."

"True; but though the offence seems greater, and the consequences were more dangerous, yet, in my humble opinion, the cases bear no comparison."

"Why not?"

"In the first place, I ascertained that, before the offence for which he was punished, he had borne an excellent character, and that the bread he stole was literally to save a young wife and her infant from starvation. It appeared to me precisely the case in which a helping hand should be stretched forth to reclaim the offender. Yet I acted very cautiously. I first found him some trifling employment in the garden, paying him but a very trifle for his services; yet I remarked that he was early and late at his work, assiduous to please, and grateful even for the poor earnings, which yet kept actual starvation from his door. I next admitted him occasionally into the house, leaving little articles of plate or of small value, unprotected by lock and key; and when this state of things had lasted for a few weeks, I chose him to be the bearer of my watch, the spring of which I had broken, to W——, where I had it repaired. I shall never forget the morning I intrusted him with this commission. While I was giving him the message he was to deliver, the tears sprang to his eyes, though he checked rather than made any parade of his emotion; and when he wiped them away with his rough sleeve, and murmured in a husky voice, 'God bless you, ma'am,' I felt certain that he was not only thankful for the confidence I placed in him, but that he understood the value of it the better from having won it by degrees; and that he had recovered in some degree that proper feeling of self respect, which is no mean aid in keeping people from crime or error. In short, before I procured Williams the situation of trust he now fills, I assured myself, as far as human reason could be assured, that he was worthy of confidence, and willing to *help himself;* and by leading an honest and industrious life for the future, make the best atonement for the past. But here I am at home; do walk in, dear Mrs Greville, and see some finery I received yesterday from London."

The "finery" consisted in dresses, bonnets, and other articles of ladies' attire, which, according to her request, a friend of Miss Bromley's had selected for her; and with kind thoughtfulness, several paper patterns of new-fashioned capes, sleeves, &c., which Miss Bromley had not ordered, were packed up also. In a little out-of-the-way country place, this was quite a valuable acquisition; and the possessor, with her usual kind consideration, had bethought her that the new patterns would be of great service to a certain Mary Allan, who was endeavouring to establish herself, and support her mother, as a humble village dress-maker.

Accordingly she had been sent for, and Mary was awaiting Miss Bromley's return home, when the two ladies entered the house. Her pretty face sparkled with pleasure and animation as the all-important papers were unrolled; but just as, with much dexterity, she was on the point of cutting their precise shapes, it occurred to Mrs Greville that she should very much like to have them herself, as she had a workwoman at home making up some summer dresses, and she thought she might just as well have them made in the fashion as not. Perhaps Mary Allan, in her heart of hearts, was not quite pleased to think that a rival should also have the advantage of the new patterns; but her good sense reminded her that they were given to herself only by an act of kind condescension, and she cut the paper double without any visible signs of regret. When this was done, however, a difficulty beset her, for two or three of the patterns were very complicated, and she could not understand how they were to be put together; a certain sleeve, especially, on which was written "very pretty"—as if to make the case more vexatious and tantalising—baffled her comprehension completely. Still, she was not daunted, but packed up her treasures, with hearty and sincere thanks to Miss Bromley for her acceptable gift.

The next day Miss Bromley paid Mrs Greville a visit, and in her turn was shown some recent purchases of the latter. "Miss Gibbons, dress-maker," as she styled herself on the brass plate which ornamented her door, "not being," as she said, "very busy just then," had condescended to come to Mrs Greville's house to make the dresses, instead of working at home. It was quite true that she was "not busy," for, somehow or other, she had latterly failed in giving her employers perfect satisfaction. It was not that they found any great and prominent faults with her, but the truth was, she was more prone to be satisfied with, and adhere to her own notions of things, than follow out the wishes of her patronesses. She referred everything to the "time when she was apprenticed," and instead of cheerfully striving to keep up with those changes of fashion which she could not, in her humble sphere, control, either from indolence, or a dogged self-sufficiency, she had fallen sadly behind in the race; and dress-making is not by any means the humblest occupation — though, from its peculiar subjection to change, it is well suited for the illustration of the fact—in which, in an age essentially progressive, constant watchfulness, and an active spirit prepared to advance, are necessary to maintain a fortunate position, even if it be once achieved. The portals to every arena are thronged with eager aspirants, ready to rush in and take the place of the faltering; and many there are who are made painfully conscious of this truth, although they do not perhaps pause to reason on cause and effect.

"After all, I have been obliged to have the old make," said Mrs Greville, in a slight tone of regret; "Miss Gibbons could not understand the pattern at all."

"But you have been in a sad hurry about it, my friend," exclaimed Miss Bromley, who saw, at a glance, that, from the advanced state in which the new dress was, that very little time could have been spent in *trying* to overcome the difficulty: "perhaps Mary Allan could have assisted you, for she is very persevering, and if she should have succeeded in finding out what seems such a riddle, I am sure she is good natured enough to tell you; at least I think," continued Miss Bromley, after a pause, and then broke off abruptly, for she did not feel quite sure that, under all the circumstances, she had a right to demand, even if Mary had the power to grant it, such a concession to her rival. Miss Gibbons, however, had no idea that this could possibly be the case, for she replied in a manner that, considering all things, might have been a little more respectful. "It is not very likely, ma'am, that Mary Allan should understand those Frenchified patterns; for you know she never regularly served her time, and the little she has learnt she has picked up nobody can tell how."

It was precisely because Mary had the habit of "picking up" information, and making good use of it when acquired, that Miss Bromley had a strong hope she would overcome the present difficulty; and as, on her return home, she must pass the door of her protegé, she determined to call and inquire. It was not till after she had entered the cottage, that Miss Bromley discovered what it was that had made the exterior wear a strange appearance, but she felt there was something to which her eye was unaccustomed. The scantily-furnished room in which the lady found herself was scrupulously clean, and perfectly neat, save in that sort of litter which more or less must accompany the handicraft of the sempstress, though Mary seemed recently to have finished some employment, instead of being at that moment occupied. She looked rather paler than usual; and her hair, which commonly fell in two or three curls from under her neat cap, was braided straight across her forehead; nevertheless, her face lighted up when she recognised Miss Bromley, and it did not seem to have been either sickness or sorrow which had paled her cheek.

"Oh, ma'am," exclaimed Mary, "I was just coming to your house, to show you the beautiful patterns—they are *so* beautiful, now they are made up; and so simple too; do look how *lovely* this sleeve is!" and continuing with all the enthusiasm of a *modiste* to indulge in strong terms of panegyric, she removed from their imposing situation at the window the all-important sleeves and capes made up in some cheap material. No wonder Miss Bromley had failed to recognise the results of her gift, though these appendages, suspended by almost invisible twine within the bright little window, which never before had been graced by anything but a white curtain, produced the change in the exterior of the cottage which Miss Bromley had noticed, without being able to define in what it consisted.

"You see, ma'am, the mistake was in thinking this was the front, though it really looked so in the flat paper pattern. Seven times did I put it together, making some alteration every time, but always finding something more like a bag than a sleeve, before I thought of twisting it round; but then I had got the top wrong; however, I persevered, for I was determined to try *every possible* way. I think that it was the twelfth or thirteenth time that I made it as you see, and I am sure it is right, it is *so* beautiful. I wish I could remember whether it was the twelfth or thirteenth, for I am sure it was a lucky number."

"*Merited success* and *luck*, Mary, are sometimes confounded," said the lady, with a smile. Mary blushed at the implied praise, and Miss Bromley continued—"You must have worked very hard; when did you find out the right method?"

"She has scarcely been in bed at all, ma'am," said Mary's mother, who had hitherto remained silent, but who had stood listening with a sort of tearful pleasure; "it was late last night before she succeeded; and notwithstanding my intreaties that she would take proper rest, she was up again at four o'clock this morning."

"Mother, I was afraid of forgetting," interrupted Mary, as if rather ashamed of her own perseverance; "besides, I thought it would be a great thing to have the patterns in the window to-day, because, as Miss Gibbons also"—— and here the young sempstress stopped abruptly, fearful that she had said something which might offend. Miss Bromley, however, had too much sense to misconstrue her words, and good naturedly supplied their meaning, saying, with a smile, "The truth is, you were afraid Miss Gibbons should be beforehand with you—was it not so?"

"Yes, Miss Bromley, that is the real truth; not that I wish to injure her, but I have nothing to look to but my own industry, and I must do the best I can for myself; indeed, ma'am, I think you wished to be of service to me when you sent for me yesterday."

"You are quite right, and I must commend you for your exertions. I am afraid, however, you are tempting me to a piece of extravagance, for I really must have another new dress, if only for the sake of wearing your beautiful sleeve. I am going to spend Friday evening with some friends; if I purchase the material to-day, can you make me a dress by then?"

Of course a grateful promise was given, and the kind-hearted lady selected a dress on her road home. We are afraid she had reason to plead guilty to the charge of extravagance, inasmuch as she stood in no need of a new dress; but it occurred to her that she could not more appropriately assist Mary Allan, and reward her perseverance, than by giving her the opportunity of displaying her skill. The event proved her judgment, and was even more fortunate for Mary than her patroness could have expected. The company who composed the tea-party she graced with her presence, were quite astonished at the stylish appearance of the usually plainly-dressed little old maid; for a decidedly new mode in a lady's dress, particularly if it be graceful and becoming, strikes the eye very forcibly, and often gives an air of fashion, although the fabric may not be costly. The few strangers who were in the room admired in silence, but her intimate acquaintances ventured openly to express their approbation, and to inquire of Miss Bromley the name of her dress-maker. Briefly, then, to shorten a long, and perhaps a trifling, story, Mary Allan obtained two fresh employers from the admiration bestowed on Miss Bromley's dress, who, on her part, felt quite repaid by such a result, for having submitted for a whole evening to be "the observed of all observers."

A scene which might have been witnessed late in the autumn of that year, will perhaps afford some clue to Mary Allan's future fortunes. She and her mother had formerly occupied but two rooms (the cottage consisted of four); now, however, the whole was at their disposal. One room was exclusively used as, and called the work-room; and on the present occasion, Mary being extremely busy, Miss Gibbons had been engaged to assist her. Whatever feeling of rivalry had once existed, it was now apparently over; for though it is probable that Miss Gibbons never forgot that Mary had once condescended to be her assistant, she now quietly submitted to receive instructions from her, and execute the work under her direction. Certainly she often felt astonished at the daring manner in which the inexperienced Mary slashed the rich silks and satins with which she was now not unfrequently intrusted; nay, she had even had "a wedding outfit," a lucky hit, as Miss Gibbons remarked, which had never fallen to her own lot. Altogether, the cottage was pervaded by an air of comfort which is more easily felt than described. The fire burnt brightly, and a sleek well-fed cat purred lazily before it. As Puss seemed to be well taken care of, it is probable her mistresses were able to take care of themselves; in short, that they were prosperous, as the industrious deserve to be.

The pleasing consequences of well-directed industry which have been exemplified in the preceding sketch, may be taken to heart by all who are seeking the path to competence. It is clear that success, though often promoted or retarded by adventitious circumstances, is, in the long run, chiefly dependent on circumstances under one's own control. How impossible it is to assist beneficially those who take little pains to help themselves, is painfully evident to many who almost may be said to spend a fortune in the exercise of a boundless philanthropy. The very assistance which we afford is often calculated to make the helplessness more fixed and ineradicable. Either incompetent or unwilling to think and act determinedly for themselves, they fondly cling to all sorts of aid held out to them, and, if left but for a short period to their own resources, are full of complaints that friends do so little when they could do so much for them. While, therefore, to many, all that is done in a spirit of benevolence seems to be little better than thrown away, the amount of good is quite incalculable which often results from a slight but timely aid to those who are eager and ready to make stepping-stones of the opportunities which present themselves. These mount to fame, honour, fortune, or competence, as the path or their own powers may lead; while the former remain at or near the starting-place. To the benevolent mind, it is the highest pleasure to do good to others; but in the one case, the kind and charitable seem to sink capital—in the other, to make a lucrative investment. We cannot wonder that the wise prefer helping those *who are willing to help themselves.*

"RURAL AND DOMESTIC LIFE IN GERMANY."*

THE indefatigable William Howitt, husband of our amiable and gifted friend Mrs Mary Howitt, has presented to the world a new and goodly specimen of his literary industry, in the form of the elegant volume whose title heads the present article. Resident for some years at Heidelberg with his family, and occasionally making excursions into southern and northern Germany, Mr Howitt has been afforded ample means for investigating the national manners of the great Teutonic family of central Europe, and of picking up characteristic sketches of its cities and its scenery. Germany has been so frequently written about, that to many the subject may seem hacknied; but innumerable points of an exceedingly pleasing and instructive kind, as it is now seen, have remained to be gathered, and we can conscientiously say, that a more agreeable book of fire-side gossip than that of Mr Howitt, has not appeared during the present season.

But such books as these effect, beyond their amusing qualities, higher objects. By affording an intimate insight into the domestic state of foreigners, they furnish tests by which to compare our own social condition. Every-day habit blinds us to the defects, and causes us to undervalue the benefits, of our native social manners. Such works are as mirrors in which we see our own features reflected by the side of those of another people, with whose help we can perceive, by comparison, our own deformities or excellences. Nor do books of this kind give—like some of higher pretension—distorted views of what they pretend to reflect. The man who goes to a country, and places himself for two or three years in continual intercourse with its people—who eats, drinks, talks, lodges, bargains, and enters into amusements with them; and then gives a faithful and plain account of what he has seen and heard, and will keep his own opinions as much as possible in the back-ground—is, of all others, the person to write a useful and instructive book on foreign countries. The present is essentially a work of this class, and for faithful delineation, may be placed alongside Lane's "Modern Egyptians," Davis's "Chinese," and Kohl's "Russia," all of which give a clear, because plain and unsophisticated account, of what the authors saw and experienced. This it is which creates the charm of Mr Howitt's sketches of German life. Upon every page truth is legibly stamped, and, lest the reader or the writer himself may be led away from it, even unintentionally, the first chapter commences with an essay on a principal source of error. This should be perused not only by every writer, but by every reader of travels. It is entitled,

FIRST IMPRESSIONS.

"It is only in the first moments in which you witness something which is entirely new to you, that you feel that novelty in all its vividness, and perceive really how widely divided is the nature and aspect of what you then contemplate from the objects of your former knowledge. Every hour that you continue to regard what strikes you with its newness, carries off that newness, and your impressions fade and bedim themselves in proportion. You are soon surprised to find how little there is to surprise you; how familiar all about you is become, as if you had conversed with it all your life. This is especially the case in regard

* Rural and Domestic Life in Germany. By William Howitt. 1 vol. 8vo. Embellished with wood engravings. London: Longman and Co. 1842.

to the novel aspect and manners of a foreign country. It is only by noting down on the spot, and at the moment, what strikes you, that you can secure the force of these first impressions; and when you afterwards refer to these notes, you are often no little astonished to find amid what really curious people and things you are existing, and yet how completely all the strangeness has vanished from your consciousness."

First impressions will be, of course, most vividly made by those objects or manners which differ the widest from the national habits or customs of the traveller. Mr Howitt, a wanderer from England, where the public ways are the best paved and best kept in the world, is sorely perplexed by the

STREETS OF GERMANY.

"As you proceed through the streets, you find around you gabled and picturesque white buildings, old squares and markets, with avenues of limes, or of dwarf acacias; people, many of them in the garb of centuries ago; and dreadful pavements. Coleridge has celebrated the six-and-thirty stenches of Cologne, and the invention of Cologne water to cover them; but a wide acquaintance with German towns leaves me the conviction, that Cologne can boast no more queer odours than any other of the towns of the nation; for in most of them, as we shall have to show, every street, almost every house, and every hour, has its own appropriate, peculiar, and by no means enviable smell. The pavements, with a few exceptions, are of the most hobbly and excruciating kind. There appears no evidence of any systematic attention to them, or management of them. To pass through a German town or village in a carriage is one of the most rib-trying events in this life. But to walk through one is not much less hazardous. Russell, in his day, tells us, that to avoid being run over on the pavé by a barrow, you often step into the peril of getting your head split with an axe, or your arm torn off by a saw, from the people who are cutting up piles of firewood before the doors. This is pretty much the case yet. The pavés, where there are any, seem appropriated to every purpose but that of walking. There is a bit of pavement here, a bit there, or rather not a bit there. It looks as if the causeway was left entirely to the care, or want of care, of the householders. Here is a bit of good pavement; in a few yards is a piece of the worst and most uneven pitching, evidently done ages ago. Here you go up a step, and there you go down one. If an Englishman, accustomed to his well-paved and well-regulated towns, was suddenly set down in a German town at night, he would speedily break his neck or his bones, put out an eye, or tear off a cheek. The towns, and that only on dark and moonless nights, are badly lit by lamps, hung, as in France, from a rope across the street. Here one twinkles, and at a vast and solitary distance, glimmers another. Even Vienna is lighted up with oil; and Dresden, and one or two other towns, are the only ones where we have met with gas. All manner of trap-doors, leading down into cellars, are in the pavés, and none of them very carefully levelled with the flagging or pebbles. Their covers often cock up their corners, faced with iron in such a way that you strike your toes most cruelly against them. All manner of flights of steps, from shops and houses, are set upon the pavement, are pushed out one-third of the width across them, and sometimes wholly across them, so that a man, whom daylight and a few trips over them had not made aware of them, would blunder headlong. As he fell, a strong iron bar, about a foot long, sticking out of the wall of the house, would probably strike his face, and give him a desperate wound. These bars of iron are what the worthy shopkeepers rear their shutters upon in the day-time; and at night, when the shutters are put up, they stand out naked from the wall about the height of your face or shoulders, and give you the most horrid shocks as you inadvertently strike against them. Then, every hundred yards, you are stopped by a great wood-heap, and its busy sawers and cleavers, or by a wagon, or a carriage, which is set on the trottoir to be out of the way. These nuisances, which would not be tolerated in the worst-regulated country towns of England for a single week, here remain for ages. The Germans, accustomed to them, avoid them as we should avoid walking into a fire or a horse-pond; and when you point them out, are not at all surprised that such things should be, but that you should think them anything extraordinary."

Though the Germans might take a lesson from us in the management of their streets, we may derive another from them in providing wholesome and necessary recreation for the people. This they do by means of

PUBLIC GARDENS.

"There is one advantage that their towns universally possess over ours; and that is, in the abundance of public walks, and public gardens and promenades, where every citizen can wander, or can sit and rejoice with his family and his friends. All round their towns, in general, you find these ample public walks and promenades planted with trees and furnished with seats. The old walls and ramparts, which formerly gave security to the inhabitants, are now converted into sources of their highest pleasures, being thus planted and seated, and made scenes of the gayest resort, and whence the finest views are obtained over the surrounding country. The suburbs and neighbourhood of all large cities, again, are full of public gardens; with alleys and extensive woodland walks, where the people all summer flock out, and find refreshments at coffee-houses, and bands of music, presided over by the first masters in Germany. The cities being seldom very large, the people thus enjoy a sort of half city half rural life, but refined and beautified with social and artistical influences, of which ours is too much stripped. In England, every man takes care of himself, and makes his own nest snug; besides lighting and paving, little seems done for the public in our towns. Here, on the contrary, the public enjoyment seems to be the favourite and prevailing idea, and you see around you perpetual evidences of its working. The people have in the outskirts of their cities their vineyards, and their summer-houses in them, where they can go with their families and friends. But they have, again, their great public gardens and woodlands all round their large towns, to ten or a dozen miles' distance. They have similar places of more rustic resort, often on the most beautiful mountain heights, and in mountain valleys, to which they pour out on Sundays and leisure days, in carriages and by railroads, by thousands. Here they have wine, and curds, and often dinners. Here they even come with their families, taking whole troops of children with them; and there you find them in old orchards, amid castle ruins, under the trees, and, in short, through all the surrounding hills and valleys. They dine in great family groups, the men sitting often in their shirt sleeves; the children rolling in the grass; and the landlords hurrying about, dealing out plates and viands to hungry people, in a broil of what seems hopeless hurry. They afterwards smoke their pipes, drink their coffee, and go home at an early hour as happy as this earth can make them.

In every country town and village it is the same. You can go into few or none of the former, where you will not find public walks and gardens; and will not hear of charming places, some four, six, or ten miles' distant, where all the world goes in the summer, in parties, to walk about, to drink coffee, to pic-nic in the woods, and so on. There is not a country inn in a pleasant place, but it has its orchard and its garden fitted up with seats and tables for this simple rural festivity. There is not a ruin of a castle, or old jäger-house, where you do not find walks and seats, and every provision for popular enjoyment. Everywhere the Germans have seized on all those picturesque points and scenes of rural beauty which afford means of carrying out and cultivating this mingled love of nature and of social pleasure. You come upon seats in wild spots, where you would otherwise never have dreamed of many besides yourself coming, and there you are sure to find that before you lies a beautiful view.

All royal gardens, too, are open, and the people walk in them, and stream round the palaces, passing, in many instances, through their very courts and gateways, just as if they were their own. Nay, the royal and ducal owners walk about amongst the people with as little ceremony as any of the rest. The emperor of Austria, or the king of Prussia, does the very same. You may meet them anywhere; and little more ceremony is used towards them than is used towards any other individual, simply that of lifting your hat in passing, which is done to all your acquaintance, and is returned as a mark of ordinary salutation. You will see princes sitting in public places with their friends, with a cup of coffee, as unassumingly and as little stared at as any respectable citizen. You may sometimes see a grand-duke come into a country inn, call for his glass of ale, drink it, pay for it, and go away as unceremoniously as yourself. The consequence of this easy familiarity is, that princes are everywhere popular, and the daily occurrence of their presence amongst the people prevents that absurd crush and stare at them which prevails in more luxurious and exclusive countries."

Though the subject of appropriating open spaces for promenades has long occupied public attention in this country, yet the plan has not been carried out so successfully or extensively as it might have been. The causes to which this might be traced present a strong and unfavourable contrast in the English character to that of the German. This arises in a great measure from the horror evinced by the wealthier classes of mixing with the so-called "vulgar"—an evidence of *real* vulgarity, which goes by the name of "exclusiveness." It is this unworthy selfishness which keeps out the English commonalty from many places to which they would otherwise be admitted. It is at the same time to be acknowledged, that when parks and suburban plots *have* been thrown open, they were made but little use of. We are all creatures of habit, and English artisans are especially so. It is not till they have become accustomed to a recreation that they will indulge in it; yet if opportunities were given more generally for healthful exercise, the custom would gradually increase. Again, a poor person, used all his life to the humblest scenes, often feels himself uncomfortable and out of place in an elegantly laid out park or an aristocratic promenade. So that the repellant principle which keeps the high from the low is not all on one side: it is in many cases mutual. The masses feel equally uncomfortable in the presence of the higher grades as the latter do in theirs, because neither have been accustomed to mix even in public. Hazlitt relates, in one of his essays, having overheard a London working-man say to his wife, as they were walking amidst a host of well-dressed passengers in Regent Street, "Oh, this place is too fine for me; let's walk down some comfortable alley!" If all classes in this country were to mix as freely as the above passage describes them to do in Germany, the tastes and manners of the lower orders would refine and improve.

In a book of this kind, which touches upon every variety of topic, it is difficult to select passages for extract. We cannot resist, however, amusing our readers with the following incident which occurs in a journey made by the author:—

CHEAP JUSTICE.

"We dined at the house of the forstmeister, near which is also an inn, and were waited on by his pretty and merry daughter; and on leaving, experienced a striking instance of good sense in a village bürgermeister. The man with the vorspan had contrived, while we were looking at the castle and dining, to persuade our kutcher that we had another hill to ascend, and that it would be impossible for him to reach the next village without taking him farther.* The forstmeister's daughter said, 'Nothing of the kind; it was all descent, and most of it steep.' Still the kutcher was so much frightened, that he would not go on without the man. I therefore told the man that he might go on at a fixed price, and if there proved to be up-hill, I would pay him; if nothing but down-hill, I would not. He went on, and all was rapid down-hill. When, therefore, he took off his horses at the point where his homeward way diverged, I refused to pay him, and he became very violent and menacing. I told him, that, if he insisted on the payment, he must come to the next village to the bürgermeister, and ordered the coachman to drive on. He attempted to stop the horses, the coachman appeared frightened, and it seemed likely in that wild spot to be a troublesome affair. My firmness, however, prevailed; the coachman drove on, and the man followed. At the village inn I inquired for the bürgermeister, and the wirth cried out to a servant, 'Hole den schmied'—fetch the blacksmith. I replied I did not want the blacksmith, but the bürgermeister. 'It is the same man,' said he. Presently appeared the blacksmith in his shirt-sleeves, and tolerably smutty, from the forge. When he had heard the case, and the man was running on very volubly in his Swabian dialect—'Stop!' said the worthy welder of iron. 'There needs only one word. Did you put your horses before the carriage or behind it?' 'Before, to be sure,' replied the man, very confidently. 'Then,' answered honest Vulcan, 'you can go about your business. Everybody knows that it's all down hill from Lichstenstein hither, and who wants a vorspan to pull him down hill? Had you put your horses behind to drag, I would have awarded you your money.' A number of people in the inn before which this primitive administration of justice took place, and amongst them some genteel-looking travellers, all applauded this judgment. Not the highest minister of the realm could have given a more prompt and better one, and certainly not a cheaper; for the good man refused to receive anything for his trouble, even to partake of a bottle of wine; but wiping his mouth on his shirt-sleeve, drank a glass of beer at his own cost, expressed his satisfaction in being able to prevent imposition on a stranger, and only begged, that if we saw a countryman of his in similar need, we would help him if we could."

THE MAID OF ORLEANS.

JOAN OF ARC, the Maid of Orleans, was a person of so much distinction in her own times, and has been so often named in song and story, that the details of her career must possess interest for the majority of general readers. She was born about 1410 or 1412, at Domremy, a village situated in a smiling valley, watered by the Meuse, on the border-lines of Champagne and Lorraine. The father of Joan was a humble peasant, named James d'Arc, and her mother was Isabel Romé, which latter designation applied to the daughter in youth, according to the custom of the country. The education of Joan corresponded with the scanty resources of her family and the unenlightened habits of the time. She was taught neither to read nor to write. Sewing and knitting, the care of cattle, and the labours of the field, formed the occupations of her youth. She was trained up in virtuous principles, and showed a marked tendency to devotion from her earliest years, shrinking from the sports of her equals in age, and preferring to spend her hours in solitary prayers and meditations.

Such were the habits which nursed in the mind of Joan d'Arc the flame of religious enthusiasm; and the miserable condition of her native country at the time of her rising into youthful womanhood, was sufficient to mingle with it the fire of patriotic zeal, in a mind so ardent and susceptible. The English held a great part of France, retaining the conquests of their recently deceased king, Henry V. Charles VII., commonly called the Dauphin, from being yet uncrowned, in vain strove against the English; he could scarcely maintain a footing anywhere with his party; and at length his main stronghold of Orleans was besieged, and hard pressed by the Earl of Salisbury. Joan d'Arc was at this period about eighteen years of age. For some time previously, she had been haunted by dreams and visions, which in that age it was not unnatural

* It may be necessary to observe, that the *vorspan* means additional horses attached to a carriage to draw it up steep hills.

for herself and others to regard, with perfect sincerity, as direct revelations from heaven. And here a remark may be made, once for all, on this point—"That Joan believed herself inspired, few will deny; that she was inspired, no one will venture to assert." Such are the words of Mr Southey, who also points out the strong improbability that she was, as she has been called, the tool or puppet of a party.

After in vain attempting for some time to repress the promptings of her visionary fancy, the friends of Joan at length carried her to Baudricourt, governor of the neighbouring town of Vaucouleur; and that personage, impressed by her manner, consented to send her to the dauphin himself, in order that the latter might hear from her own lips the revelation which she professed to have to make to him. We may well suppose that the proffered aid of a poor peasant girl, without power, friends, or influence, would seem no great matter to Charles, apart from that supernatural aid which men would naturally hear of, in the first instance, with doubt and discredit. The prince, accordingly, when he assented to her being brought before him at Chinon, which Joan reached through the midst of enemies, resolved to test her penetration by a simple expedient. He put on a comparatively humble dress, and made some of his courtiers attire themselves in splendid robes. Before the circle thus prepared Joan was led. She wore a warlike masculine garb, assumed by her for secrecy and security on her journey. In looks, to use the words of Holinshed, "she was counted likesome, and of person strongly made;" and the glow of excitement and devotional fervour gave an additional interest to her appearance. A courtier was indicated to her as Charles, but Joan disregarded him, and kneeled before the true prince. "I am not the king," said Charles. "Gentle prince," said she, "*thou art he*, and none other." She then addressed him in a lofty tone, announcing herself as divinely commissioned for the relief of France, and assuring him that he should be crowned and consecrated its independent sovereign in the city of Rheims. To test her still further, Charles took her apart, and put some questions to her. The result was, that he declared her to have communicated things known but to himself and to heaven.

All this made a deep impression on the adherents of Charles, and the high tone of Joan's general speech and conduct strengthened them in the belief that a divine communication had been accorded for the relief of the suffering land of France. Yet Charles dared not to accept her proffered aid without consulting the church, since the idea that Joan was inspired, not by good but by evil spirits, might have been spread abroad, to the ruin of his general interests. He therefore caused her to be examined by an ecclesiastical conclave, and the issue was, that they pronounced her mission to be a true and heavenly one. Her main professions were, that if a body of soldiers were put under her charge, she would relieve the city of Orleans, then reduced to the last extremity, and would accomplish the coronation of Charles at Rheims, as the full and lawful sovereign of France. So, she said, her "voices" or visions had assured her. The doubters demanded a sign or miracle from Joan; she told them that the relief of Orleans would be sign and miracle sufficient. However, she *did* give something which the people believed to be a direct proof of her supernatural prompting. A small force was granted to her, with a white banner, made and consecrated according to her own instructions, and she arrayed herself in complete armour for the enterprise; but a sword for her use was still wanting. She desired those around her to go and bring her the sword which lay buried behind the altar of the church of St Catherine of Fierbois; and she described certain marks upon it, which were found to exist when the sword was searched for and discovered.* Armed with this weapon, she set out for Orleans, and was received with enthusiasm by the besieged citizens. A proof of the reality of her enthusiasm is found in the fact, that her first step, in accordance (as she said) with the revelations made to her, was to summon the English peaceably to give up their conquests, and quit the land of France. It may well be supposed that men, triumphant over their adversaries in every quarter, scorned such a summons. But they, and the world at large, were destined to see how vast an influence imagination may exercise over human doings. On the 29th of April, 1429, Joan of Arc, mounted on a white horse, armed at all points, and preceded by her snow-white standard, had entered Orleans, and soon afterwards she commenced a series of attacks upon the enemy. The confidence exhibited on the part of the French produced a corresponding depression among the English. The superstition of the times came into play; and the spectacle of Joan, mounted on her white charger, with her standard in hand, struck her foes with mysterious affright. Several direct attempts were made to cut off the enthusiast on her first entrance into the field, but it was noticed that, with a small battle-axe, she warded off with seeming ease the strokes of her opponents. Though foremost in the ranks of her party, she showed also an anxious desire to save lives and check the effusion of blood. From the moment of her entrance into Orleans, the English began to lose ground. They had been in possession of the greater number of the forts and outposts of the city; but, one by one, Joan took these from them, and at length left them masters of but one tower, that of the "Tourelles," the strongest around the place. The French captains wished to wait for succours ere they attacked this stronghold, but Joan of Arc pressed an immediate assault, and her assurances of victory inspired the French soldiery with similar confidence. When the attack of the Tourelles occurred, the English fought with desperation, and their opponents were again and again repulsed. Joan seized a ladder, and in person attempted to scale the walls; but she was struck down, seriously wounded. A gloom spread over her party, and the leader Dunois, commonly called the Bastard of Orleans, ordered a retreat. But when Joan heard of this, she summoned up her strength, and again mounted her horse. The sight of her, with her standard waving in her hands, reassured her friends, and they renewed the siege of the fort with a degree of spirit which overwhelmed all resistance. In an hour, Orleans, and all its fortifications, were in the possession of the French, and Joan entered the streets of the city amid the triumphant shouts of the inhabitants, having fulfilled her promise of the morning, that Orleans should, ere night, be free.

The Maid of Orleans, as she may now be rightly termed, continued her career of victory. She had announced that Charles should be crowned at Rheims; but ere that could be done, it was necessary to free Champagne from the presence of the enemy, the city of Rheims being the capital of that province. Aided by the French generals, Joan accordingly attacked various places of strength, and took all of them in succession, defeating and capturing the renowned warrior Talbot, and other distinguished soldiers of England. Finally, Charles entered Rheims in triumph, the English garrison disappearing at his approach; and he was anointed with the holy oil of Clovis in the famous cathedral of Rheims, Joan of Arc standing by his side the while, clothed in complete armour, and holding aloft her victorious banner.

Joan was now rendered famous over all Europe by the part which she had thus played in the struggle between its two most powerful nations. The discomfited English accused her of deriving her aid from demons, and ascribed to her all manner of personal vices. Their most impartial historians, though not sanctioning, of course, the first charge, have spoken with little respect of the character of the Maid of Orleans; and even Shakspeare, a century and a half later than her era, seems to have found it necessary to flatter the prejudices of his countrymen by a similar course of disparagement. In reality, however, Joan of Arc, if we may trust to the best informed annalists, merits a high place among the pure and patriotic heroines of the human race. Though foremost in the attack, and continuing to take that position in spite of bodily wounds, which should have quenched the ardour of any woman of common mould, she ever retired with humility from the public gaze, when the time of service had ended. Much of her leisure was spent in prayer and other pious exercises; and she was often observed to rise from her couch by night, and address herself to these tasks. She sought the company of those of her own sex wherever it was procurable, and shared her couch with them. When such companions were not beside her, she lay down to sleep without undressing. She greatly improved the morals and the manners of the French army, discouraging all license, and prohibiting pillage. Of the blood both of friends and foes, she was to the last degree sparing.

Joan showed the purity of her motives at the close of the coronation ceremony of Rheims. She there fell on her knees before the king, and, with tearful eyes, begged permission to retire to her humble home and occupations, since her mission had been accomplished. "If it please heaven," she said, "I would now abandon arms, and, returning to my father and mother, serve them by tending their flocks, as I did before." But Charles and his captains had felt the advantage of her aid too strikingly to assent to this lowly request, and Joan was prevailed upon to continue with the army, until the English should be completely expelled from France. At the same time, the king granted the only other request made by her. This was, that the villages of Domremy and Greux, her native scenes, should be exempted from taxes in time to come; and the privilege remained in force till the subversive days of the Revolution. Charles also ennobled Joan and her whole family, men and women.

New enterprises were set on foot after the coronation at Rheims, and were for the most part eminently successful. The towns of Laon, Neufchatel, Soissons, Crespi, and others, were wrested from the English, but an attack made on Paris proved fruitless. On this occasion, the Maid of Orleans would not fly with her repulsed friends. Wounded severely, she preferred to lie down and meet her death rather than retreat before the enemy; but the Duke of Alençon persuaded her to depart from that resolution. Again, however, she in vain sought leave to return to her home. It is remarkable, that after Charles was crowned, she no longer made herself responsible, as she had done, for the events of the war. She showed no diminution of courage, but she conducted herself like a common adherent of the army. After consenting to remain in the field, she took the town of St Pierre-le-Moutier, and engaged a noted partisan leader, Franquet d'Arras, who, being defeated and taken, was executed against her most earnest solicitations. Joan was then sent, at the head of a force, to defend Compiegne against the English and Burgundians. Not contented with throwing herself into the town, the heroine of Domremy attempted, by a sortie, to cut off her adversaries. She was intercepted in her return, and fell into the hands of the English. Before she was made captive, however, though left alone by her party, she performed prodigies of valour. Clothed in armour, and holding her white standard, she was well-known to the enemy; but several of those who sought to seize her fell beneath her hand ere she was ultimately made a prisoner.

The unfortunate end of the Maid of Orleans is well-known in history, and the affair reflects no credit on the English name. The regent, Duke of Bedford, brought her to trial, before an ecclesiastical commission, for the crimes of sorcery and impiety, and obtained the countenance of the clergy and university of Paris to the prosecution. She was also charged with the death of Franquet d'Arras, and other secular acts of presumed criminality. For four months, she withstood all that the malice of her enemies could inflict upon her. But at length human nature gave way under the trial, and, deserted apparently by her friends, she endeavoured to avert the cruel fate with which she was menaced, by confessing her revelations to be fanciful. Her sentence was then mitigated to perpetual imprisonment; but this issue of the affair did not satisfy her adversaries. They insidiously placed in her apartment the suit of masculine armour in which she had gained so much glory. Tempted by the force of inspiring recollections, Joan put on the suit laid in her way. Her jailors were on the watch. They seized her in the attire of manhood, and her assumption of it was interpreted as a relapse into her former errors. She was condemned to die; and in June 1431, suffered at the stake in the market-place of Rouen. All her courage revived in the last hour; and she died with a noble constancy, which drew tears from the eyes of her persecutors.

Joan of Arc has been honoured by statues and monuments in her native country; and to this day, the people of Orleans hold an annual fête in her remembrance. If patriotism be a virtue in man or woman, the memory of Joan of Arc is not undeserving of such testimonials of respect and admiration.

* Such is the tale, scarcely credible, told by historians.

THE ARMENIAN PELISSE-MAKER.

BY MISS PARDOE.

Assuredly the Arabian Tales are much nearer to the truth in their details, and their authors have less imaginative merit, than we, in our sober English judgments, have been accustomed to cede to them. Remove the superstitions—the peri, geni, and enchanters of the "Thousand and one Nights"—and they are faithful and lively pictures of every-day life among the orientals. The wonderful mutability of fortune, the precarious tenure of life, the incongruous mingling of the mean and the magnificent, all the distinctive features which stand out in broad contrast from our own more methodical usages, rather prove the wonderful accuracy of the artist's perception, than the power of his fancy—a fact which substantially increases the value of that most extraordinary production. Nothing, perhaps, can more fully act as a demonstration of this assurance on my part, to such as may be inclined to doubt its exactness, than the narration of an incident which took place during my own residence in Constantinople, and which created much mirth among the Franks at the time.

The pelisse-maker to the palace had completed a garment for one of the court-buffoons, which he sent to the individual for whom it was designed by an Armenian apprentice—a simple-hearted, timid young man, of two or three and twenty—to whom the dwelling of the Grand Seignior was an object of trembling admiration, a species of gilded bastile. On his arrival, the facetious followers of the eastern emperor proceeded to exercise their wit upon the unlucky messenger; and oriental wit is about as practical, as uncompromising, and as inconvenient, as anything intended for pastime can well be. One plucked him by the hair, another seized him by the throat, a third lifted him from his feet by a strong grasp of his ample trousers, a fourth thrust his fingers into his ears, and then wrung them so violently, that they appeared likely to remain in his hand as trophies of his prowess; and, in short, their mirth became at length so vehement and so agonising, that the poor fellow threw himself on his knees before his tormentors, and begged them, for the love of their prophet, to have mercy upon him; but when was mischief ever merciful? His humility and terror only afforded fresh food for sport; and in the intensity of his suffering, he at last found energy to declare, that, should he ever have the good fortune to encounter the sultan, either in the streets of the city, or in any of the avenues of the palace, he would throw himself at his sublime feet, and ask for justice on his persecutors. His threat was received with shouts of laughter; and the victim only escaped when the imperial idlers became wearied by their own follies.

On the entrance of the sultan (Mahmoud)—to whom the absurdities of the official buffoons afforded so much amusement, that he occasionally spent several consecutive hours in their company—they detailed to him, with much unction, the diversions of the morning; enlarging on the terror-stricken agony of the poor tailor, and his pain-wrung threat, with such exquisite humour, that his sublime highness became infatuated

by the narrative, and anxious to share, in his turn, in so delightful a diversion. An excuse was accordingly found to bring the laughter-moving apprentice once more to the palace; the pelisse, of which he had been the bearer, did not fit, and it was the will of its wearer that it should be reclaimed by the same individual by whom it had been delivered. The palace messenger once despatched, the sultan, concealed by the tapestry which veiled the entrance to an inner apartment, was enabled, on the arrival of the victim, to enjoy at his ease the right regal spectacle that he had been promised; and long did he stand behind the screen, admiring the dexterity of the tormentors, and making merry over the groans, and expostulations, and terror, of the tormented; until at length the intreaties of the poor youth once more changed, in his despair, as on the former occasion, into a threat of appeal to his imperial master. The words were no sooner uttered than the sultan emerged from his concealment, and presenting himself in all the awfulness of frowning majesty, declared his identity to the trembling tailor, affected extreme indignation at his temerity in threatening the officers of his household, and desired him to proffer his petition upon the spot, and without the delay of a moment. The panic-struck Armenian, to whom the Padishah had ever hitherto been a fearful idea rather than a palpable reality, instantly fell prostrate; and when his tormentors sought to raise him from the earth, it was discovered that he was senseless. Nothing flatters the great so much as an unequivocal demonstration of this description; and accordingly the terror of the tailor served him well in his emergency; every care was taken to restore him to animation, the sultan himself standing by, in order to mark his emotion on awakening from the faint.

Joyful was the greeting which accompanied his convalescence, for it was an assurance from the "Lord of the Three Seas," that his physiognomy pleased him (a common expression among the Turks), and that, moreover, he was indebted to him for a hearty laugh—always a weighty obligation to an Osmanli—a fact which must not pass unrewarded; and thus he declared him to be from that moment his *pelisse-maker-in-chief*, a post of high honour and infinite profit. He was, with all celerity, sent to the bath, invested with an official costume, and his head covered by a cap bearing the insignia of his office, consisting of a needle threaded with coloured silk, and a small fur-brush, neatly wrought on the right side.

Only a few days elapsed, ere the fortunate Armenian found himself not merely the possessor of a spacious shop filled with merchandise, but also so thoroughly the fashion as to be overwhelmed with business, and placed in a position to secure great profit and honour, and to supply the exigencies of his parents and brethren. In another fortnight, he had laid in a handsome stock of pipes for the accommodation of his customers, and, through the energetic agency of his mother, provided himself with a wife, young, pretty, and obedient; who, with her two female slaves, composed his modest harem. In short, long before we left the city, the cidevant-butt of the imperial buffoons was a prosperous and busy merchant, to whom many a head was bent as he threaded his way, gravely and silently, as became the importance of his calling, through the thoroughfares of Stamboul.

AMERICAN CURIOSITY.

[From M. Lowenstern's "Les Etats Unis et Le Havane."]

When ascending the Delaware in a steam-boat, I had the honour to excite the attention of one of these inquisitive gentlemen. As soon as he had discovered that I was a stranger, he began by standing in front of me, and examining me from head to foot.

"A foreigner, no doubt," he began; "but from what country?"

This was the grand question, but I left him to ponder on it. He continued his survey; I changed my place; he followed me; I looked hard at him to express my dissatisfaction at his staring. Far from understanding me, he avails himself of this to come up and address me. Putting on as agreeable an expression as his pinched-up features would allow, he abruptly began in a snuffling drawling tone—

"Sir?"—then, after a pause—"Where do you come from?"

I replied, as sternly as possible, "From Europe."

"Yes, I know; but from what part?"

"Pray, sir," said I, in my turn, "where *do you* come from?"

"I! oh, I am from Connecticut; I am an American."

"I have not the least doubt of it."

"Yes, sir; but what country in Europe do you come from?—that is what I wanted to know."

"Exactly, sir; but allow me to inquire, are you in trade?"

"Yes, sir, I am a merchant; but I was asking"——

"Ah, you are a merchant; business pretty good in Connecticut, eh?"

"Pretty well, sir; but may I?"——

"How many miles from here to Philadelphia?"

The American scratched his head vigorously with his right hand, raising the left side of his hat a little.

"Twelve miles, sir. But, sir, you were forgetting. I asked you"——

"I am delighted to have made your acquaintance, sir."

Then politely turning from him, I exclaimed, "I beg your pardon, but I see a friend below," and I left him completely bothered.

Forthwith a crowd of Americans fell upon the unhappy inquisitor.

"What's the gentleman's name?"

"Who is he?"

"Where is he going?"

"He wears mustachios. Is he a colonel?" &c. &c.

The American, No. 1, recovering from the astonishment occasioned by my escape, replied, "I know nothing about him, but I soon shall."

Act II.—I am seated in the saloon of the cabin, reading. My American friend, No. 1, descends, escorting a friend. They place themselves opposite me, and unrol on the table a map of Europe. Silence for a quarter of an hour, during which time they are apparently occupied in examining the map, but in reality looking at me. At length they took courage, and the American, No. 1, exclaimed, "Shocking state of things in Italy." The friend—"Yes, shocking indeed." They both stare at me. I read. They examine the map again. American, No. 1, breaks silence again—"Queer matters in Hanover." The friend—"Yes, very queer." Another scrutinising examination from two pair of eyes. I turn over a leaf. Five minutes elapse. The American, No. 1, again raises his voice. "Dreadful war in Poland." "Yes, dreadful indeed," replies his echo. Then, turning to me with dignity—"Have you been in this war, sir?" I raised my head from my book. Their eyes are fixed upon me with ludicrous anxiety. I cough. They exchange glances. I open my mouth. Their eyes gleam with pleasure. I answer slowly, in a deep base, "No—o!" I rise—I shut my book. They remained with their mouths half open, lost in amazement at the utter discomfiture of all their manœuvres.

OVERLAND ROUTES TO INDIA.*

As the British empire in the east increases in extent, so the subject of transit thither increases in importance. Hence we find that extraordinary efforts have recently been made to lessen the time and inconvenience of the journey. So well have these efforts succeeded, that, instead of a tedious, sometimes dangerous voyage of from six to ten months, the English traveller may now reach Bombay, the nearest station in India, in from forty to fifty days; seeing in his way some of the most interesting objects in the civilised world.

Putting the old sea voyage out of the question, there are several other routes by which British India may be reached. Of these we purpose, with the help of the works now before us, giving some account. The first route takes the traveller through the heart of France, for he enters that country at Calais or Boulogne, on the shores of the British channel, and leaves it at Marseilles on the Mediterranean. He is thus afforded an opportunity of visiting Paris, which, if he have started from England in good time, he may allow himself leisure to explore. He can then travel direct thence to Marseilles, but as that is by far the most fatiguing and least interesting plan, shorter stages are generally preferred; and it is better to proceed to Chalons, where he can catch a glimpse of the Alps, although they are one hundred miles distant. He is now on the banks of an important French river, the Soane, and embarks on board a small steam-boat for Lyons, at which place the Soane flows into the Rhone. The short rest allowed here (from two in the afternoon till five in the morning) may be usefully employed in seeing as much of this great manufacturing town as possible. He will be struck with the ancient and gloomy look of the houses, which are in many streets six and seven storeys high; but the quays enclosing the town (for they face both rivers) will be seen to present a fine appearance. Though the cathedral is well worth a visit, the town-hall is considered the finest building in the place. It is in Lyons that nearly all the silk produced in France is woven. He next embarks on the Rhone, whose rapid current takes the steamer to Avignon, a distance of 150 miles, in eleven hours. This is one of the most ancient and picturesque towns in France, and if the traveller be of a poetical temperament, he may visit the tomb of Laura de Sade, the lady to whom Petrarch addressed his celebrated sonnets; which will be found in the church of the Cordeliers. Instead of proceeding down the Rhone to its mouth in the Gulf of Lyons, and so round to Marseilles, the journey is continued to that place from Avignon by coach. It is necessary to be here on the first, eleventh, or twenty-first of the month; for on those days the French steamers take their departure for Alexandria.

Should the voyager have time to deviate from his direct route, he should here make arrangements for one of the finest tours in the world. These steamers call in their way at Leghorn and Civita Vecchia, in Italy, and by landing at the latter place, the traveller will be within forty-five miles of Rome. Having received from this visit the greatest gratification it is possible for the lover of antiquity and history to enjoy, he can return to the coast at Naples, taking in his way Mount Vesuvius, Stromboli, with the half-excavated ruins of Pompeii and Herculaneum. It will be necessary to be in Naples by the fifth, fifteenth, or twenty-fifth of the month, as the steamers continue their voyage thence on those days. Nor do the charms of the voyage end here. After passing through the Strait of Messina, a panoramic view is obtained of the eastern coast of Sicily, including Mount Ætna. The next place of rest is Malta, where the packets remain twenty-four hours. This island, though rendered historically celebrated by the frequency with which it has changed hands, contains little to interest the stranger, except what he will see passing before him in the streets. Situated in the centre of the Mediterranean, Malta has either permanent inhabitants, or occasional visitors from almost every nation of the eastern hemisphere, and a motley assemblage of costumes is to be seen in its public places, unequalled for variety in any other part of the globe. From Malta, the traveller is conveyed direct to Alexandria. Should, however, time press, it is possible to go direct from Marseilles to Alexandria by a British steamer, which leaves the former port on the fourth of every month. A new line of French packets is also established, to perform the same voyage three times during every month.

The traveller is now in one of the ancient capitals of the "Land of Egypt," and though he have but little time to inspect its curiosities, yet some of them will force themselves upon his notice in his passage from the harbour, where he lands, to the great square. Here "he will have ample opportunity," says Mr Parbury, "to admire its spacious area, the beauty and great size of the buildings in it, and the picturesqueness of the inhabitants and their costume. It is the situation, also, of the residences of the various consuls, many of which have elegant spiral staircases rising far above the roofs, whence fine views of the surrounding country can be obtained, and vessels be descried very far off at sea. By proceeding, also, but a very short distance from the square, he will find himself amidst the hillocks and ruins of Old Alexandria, where excavations are constantly going on, and fresh discoveries of interesting objects of antiquity as frequently being made. A few steps farther onward, and he is at the foot of Cleopatra's needle (two granite obelisks, the one standing, the other prostrate), after inspecting which, he may return to his hotel with the consciousness that he has seen almost everything of interest that Alexandria can furnish." Pompey's pillar—the pedestal and shaft of which are composed of single masses of granite to the height of 117 feet—may also be viewed, for it is in the outskirts of the old town, through which it is necessary to pass to get to the canal station, whence the journey is to be resumed. Being only three miles from Alexandria, this forms a most interesting walk, though, if preferred, carriages are provided. The baggage is conveyed on the backs of camels. The Alexandria canal affords communication between that city and the Canoptic, or western branch of the Nile. It was originally dug under Alexander the Great, but was subsequently closed up. Mehemet Ali, the present ruler of Egypt, determined to re-open it; and, with a despotism peculiar to him in carrying on public works, ordered 20,000 men, from all parts of the country, to meet at Atfé on the Nile by a particular day. Not daring to disobey, the multitude assembled, were set to work, and in six weeks this canal, though 48 miles long, was completed. All then returned to their homes. The passenger to India derives great benefit from this act of tyranny; for he is towed, or tracked by horses in an iron boat, down to the Nile in eight or ten hours. Here a steamer is boarded, which completes the distance (164 miles) to Boulac, the port of Cairo, in about twenty hours. It is, during this voyage, that the active observer may obtain, by a careful scrutiny of the canal and river banks, a notion of the condition of the Fellah or Egyptian peasant mode of existence. Miserable huts, and agricultural operations of a most contracted and primitive nature, may be continually observed. He will also perceive at Babn-el-Bakarah the fork or point where the Nile diverges into two great arms by which it is emptied into the sea, having flowed from Ilak in Nubia, a distance of 1350 miles, in solitary grandeur, unaided by a single tributary stream during its course—"an unexampled instance," exclaims de Humboldt, "in the hydrographic history of the globe." He will also have caught a first glimpse of the mighty pyramids, which, although at a great distance, will, from the extreme clearness of the air in these latitudes, appear to be within a mile or two of him.

Landed at Boulac, and having threaded its busy wharfs and narrow streets, the stranger proceeds through Fostat, or Old Cairo, to New Cairo, the modern capital of Egypt, which, by the aid of one of the extraordinarily swift donkeys that this country is famed for, may be explored in a short period. The great pyramids of Gizeh are only ten miles south-west of Cairo, and may also, under ordinary circumstances, be easily visited.

The passenger will next have to prepare for his journey—across the eastern desert of Egypt—to Suez, situated at the northern extremity of the Red Sea. This, though a tedious and monotonous journey in itself, is, from the associations connected with it, one of absorbing interest. The road lies, for a considerable distance, upon the track taken by the Israelites in their flight from Egypt. Birket-el-Hadj (Pilgrim's Pool), which is passed about twelve miles from Cairo, is conjectured to be the Succoth of Scripture, where

* I. Hand-Book for India and Egypt, &c. By George Parbury, Esq., M. R. A. S. Second Edition. London: W. H. Allen and Co., 7, Leadenhall Street.

II. Messrs Waghorn and Co.'s Overland Guide to India, by Four Routes to Egypt. London: J. Madden and Co., Leadenhall Street.

the Jews first encamped (Exodus, chap. xiii. v. 37). It is still a place of rendezvous for the pilgrim caravans from Cairo to Mecca. These caravans, or assemblies of travellers upon camels and dromedaries, have always travelled exactly in the same manner as when the "company of merchants" rescued Joseph from the pit into which his brothers had thrown him, and there was no other mode of travelling till the adoption of the present method. The desert between Cairo and Suez is eighty-four miles across, and is traversed in seven stages, where stables and resting-rooms have been built. Double that number have, however, lately been provided by means of a tent pitched between each of the station-houses. These tents add a singular feature to the scene, being no other than those used at the Eglintoun tournament. Thus a relic of a late masquerade in Scotland is presented in juxtaposition with the monumental remains of the Pharaohs and Ptolemies! The sort of vehicles provided for the modern traveller are thus enumerated in Waghorn and Company's pamphlet:—"For this part of the journey there are coaches drawn by four horses, each capable of taking eight passengers; ditto, carrying six passengers each; two-wheeled vans, with a sort of tilt cover, carrying four persons each, and drawn by two horses; also donkey-chairs, a kind of light sedan, slung upon poles, and carried by two donkeys to each, one before and the other behind. These are by far the easiest conveyances, and well-suited for ladies, children, and invalids. Those who prefer riding, may be accommodated with either saddle-horses or donkeys, the latter most to be depended on, being of a much superior description to those of Europe, very easy in their paces, and capable of great fatigue, as one, if a good one, will perform the whole journey from Cairo to Suez with but little nourishment. For carrying the luggage, dromedaries are employed."

Supposing the traveller to have entered the desert, the subjoined passages from Mr Parbury's pen will show him what kind of journey he may anticipate:—

"The route is almost level throughout, and two of the station-houses can at times be seen at the same moment. It is perfectly adapted for wheeled carriages, and nine-tenths of the distance may be termed a capital gravelled road, the remainder being occasionally sandy, and at parts rocky; a very trifling outlay might make the whole line available for a rapid coach transit, and, with relays of horses, the mails might be transported across in ten hours with the greatest ease, instead of occupying nearly forty-eight, as they did on this occasion. But very few hills, either to the right or left of the course, diversify the sameness of the journey. There is only one large tree, situated about two miles from the centre station; but small bushes are more frequent; and there is a moderate-sized specimen of the babul, or acacia, two miles from the fifth station on the Cairo side.

Rats are the only animals that cross one's path; they burrow in the sand everywhere, feeding upon the camels which too often perish by the way; the detached bones and perfect skeletons, indeed, of the latter, being of themselves almost sufficient to indicate to a stranger the correct line of march. The delusive mirage may constantly be witnessed by travellers in the desert."

The disagreeable romance of a robbery has often been added to the traveller's other annoyances. But latterly, the Bedouin Arabs have been kept in too effectual dread of the awful pasha to venture on any such molestation, and the road is now deemed as free from brigands as that between London and Richmond. Suez need not be dwelt upon much, nor abided in one hour longer than necessary. "Its wretchedness has often been described," remarks Mr Parbury, "but never in terms too severe." Not far from this once flourishing, but now utterly decayed seaport, is the village of Aljeroud, represented in the Bible by Etham, "on the edge of the wilderness" (Exodus, xiii. v. 20). At Suez, the voyager bids adieu to land-travelling till arriving at his Indian destination, and boards one of the government steamers which is to convey him the entire length of the Red Sea through the Arabian ocean to Bombay. The first thing by which his attention will most likely be attracted, will be the extreme clearness of the waters upon which he is now embarked. On looking over the sides of the vessel, he will perceive, at a great depth, the bed of the sea, consisting almost entirely of immense reefs of red coral, from which its name is derived. Once in motion, new scenes of interest present themselves in quick succession. The Egyptian mountains, skirting the whole of the western shores of his track, present a panorama of bold alpine scenery scarcely equalled elsewhere. But it is the eastern side which, during the early part of the voyage, will occupy him more fully. Mount Sinai, towering above the lesser Horeb, rises upon the promontory formed by the division of the sea into the gulf of Suez and that of Akaba.

The steam-boat generally calls at the ancient port of Kosseir in Egypt, to take up those passengers who have, instead of leaving Cairo by the route here described, preferred continuing up the Nile to Thebes, to view its stupendous remains of antiquity. These travellers cross the desert between Thebes and Kosseir in the ancient mode, upon camels' backs. Continuing from the latter port, the mountains on each side recede from the coast, and neither the Arabian nor Nubian scenery is so striking as that already passed. At length the Abyssinian shores are gained, and they, pressing closely upon those of Arabia, form the narrow strait of Babelmandeb. But before exit is here made from the Red into the Arabian Sea, a good view of Mocha will have been obtained. This place, the name of which is so often taken in vain by dealers in coffee, is rendered conspicuous from "a tall minaret towering amidst the white houses of the town; date trees flourish to the southward; a white tomb and fort are in view to the northward; while in the rear of all, are ranges of hills of different elevations."

A half-way station is established at Aden, twelve hours' run eastward of Babelmandeb, on the Arabian Sea. Here the vessel puts in and receives a supply of coals. From this place its onward course is but seldom enlivened by the sight of land, and the voyager at last arrives at Bombay, having seen some of the most remarkable places and antiquities in Europe, Africa, and Asia.

The second route finds, perhaps, more favour from lovers of the picturesque. It commences by a voyage to Ostend, in Belgium, and an embarkation on the Rhine to Basle. The south-western corner of Germany is then crossed, and Switzerland is entered. Having passed over the Alps, the traveller gains the shores of the celebrated Lake Como, and arrives at Venice. Here he will find steamers to Trieste, in Austria, whence, on the 1st and 16th of every month, there are vessels to Syra, which effect a junction at that place with the French steamers to Alexandria. The journey from Egypt to India is then completed as above. Several other roads may be taken across the continent to Trieste.

A third route takes the traveller to Constantinople; a fourth through Greece; in short, a person bound for India, and not pressed for time, has only to consult his tastes, and he may have them gratified by visits to *any* of the interesting places on the continent of Europe. But in nearly all cases, the grand gathering place is Alexandria. Beyrout is sometimes preferred, but in that case a tedious journey across Syria into the Persian Gulf must be encountered. By far the best, and therefore most frequented route, is that we have described at length. The most direct course is, however, to embark at Southampton by one of the Peninsular and Oriental Company's packets, which leaves that place on the 1st of every month for Alexandria direct.

In reference to the books to which we are indebted for some of the information here presented, we should say that both are almost necessary to those who contemplate taking the overland journey. Some suspicion may attach to the impartiality of the Messrs Waghorn's pamphlet, as being avowedly issued by transit agents, who, of course, recommend their own modes of conveyance; but this, if any exists in the reader's mind, may be set at rest by the clear and evidently unprejudiced statements of Mr Parbury. It is, however, fair to state, that to Mr Waghorn the public is mainly indebted for the opening up of this new road to India, and we cheerfully reprint Mr Parbury's testimony on that point:—

"The incidental introduction of Mr Waghorn's name cannot fail to remind the reader how much he is indebted for the present successful prosecution of steam navigation to India to that individual. The obstacles and difficulties which for a long series of years were thrown in his way, while so ardently and energetically carrying out his favourite project, are too well-known to need remark; and it is satisfactory to notice, that the present government have, to a certain extent, testified their appreciation of his services by giving him his commission as lieutenant in her majesty's navy."

The expense of the most direct of these journeys falls very little short of L.100 each person, for the mere transit of himself and a certain allowance of baggage.

WORKING OF THE POOR LAW IN IRELAND.

We are happy to observe from a late number of Mr and Mrs Hall's work on Ireland, that these intelligent writers, after a careful and practical examination in various parts of the country, give their cordial approval of the Irish Poor Law, whether as regards its influence on the parties who receive relief, or its actual bearing upon the character and condition of the country. A few passages, condensed from the valuable testimony which they offer on this important measure, including one or two of those agreeable anecdotes with which they illustrate the subject, may not be unacceptable to the friends of social improvement.

The principle of the Irish Poor Law, it will be recollected, is to give relief only in workhouses; a workhouse being established in the centre of a union of town-lands. The number of houses declared fit for occupation is 100, out of 130, the total number in Ireland; and these are variously capable of accommodating from 200 to 2000 inmates. Eighty-four houses are already occupied, and the remaining sixteen are receiving their stores. The number of individuals, old and young, in the eighty-four houses, is 27,537. The total amount of accommodation which the 130 houses, when finished, will be capable of affording, is for 92,860 persons; and, in case of pressure, the capability of the houses may be considered to be from ten to twenty per cent. beyond this number: included among these there is accommodation for upwards of 2000 idiots, or harmless lunatics—the buildings being provided with wards for persons of this class. All the buildings are large, substantial, well-ventilated, and furnished with airy court-yards.

The clothing of the adult male inmates consists of a coat and trousers of barragon, cap, shirt, shoes, and stockings. The female adults are supplied with a striped jerkin, a petticoat of linsey-woolsey, and another of stout cotton, a cap, shift, shoes, and stockings. The male children have each a jacket and trousers of fustian, a shirt, and woollen cap. The female children have each a cotton frock and petticoat, a cap, and linsey-woolsey petticoat. Each bed is supplied with a straw mattress, with blankets, bolsters, &c. The able-bodied women and children sleep in double beds; the sick, the infirm, and the male persons, sleep in single beds. It is an established rule (except in special cases), not to admit children without their parents, if dependent on them; nor a man without his wife, nor a wife without her husband. The sexes are completely separated.

The diet varies in particular unions, chiefly depending on the condition of the poor in the neighbourhood, the object being to give such diet to the inmates of the workhouse as shall not be superior to that obtained by the independent labourer. A common dietary for adults is—for breakfast, 7 ounces of meal made into porridge, 1 pint of butter-milk, or half a pint of new milk; for dinner, 3½ lbs. of potatoes, and 1 quart of butter-milk. Children five to fourteen—3½ ounces of oatmeal for breakfast; dinner, 2 lbs. of potatoes; supper, 6 ounces of bread, and 1 pint of new milk, daily. Animal food, not being part of the regular diet of the independent peasantry in Ireland, is not given in the workhouses, and the want is not complained of. The dietary has hitherto been found to give general satisfaction.

The expense of maintenance is levied by rates on the country at large; and now, for the first time, *all* will be taxed alike. Formerly, the burden of supporting the poor, as is the case, in a great measure, till this day in Scotland, fell upon the generous, and relieved the mercenary. "All who know Ireland, know that there was no district in which there did not exist two distinct classes—those who gave much to the poor, and those who never gave anything. In fact, the gate or house of 'the hard man to the poor' was familiar to all 'the wandering train,' and as much so to the respectable and generous collector of charitable gifts—it was avoided by both. We could easily name individuals, of large properties, who did not bestow a shilling in the year, either by giving food or money—individuals who are now forced to pay, in many instances, one or two hundred pounds per annum. It follows, as a matter of course, that the really charitable have experienced a corresponding relief; and it can scarcely be doubted, that, although the necessity for occasional collections has by no means ceased, this class, the really charitable, are now taxed less heavily than they were before the introduction of the Poor Law into Ireland. It should also be borne in mind, that, by this tax, the *absentee* is effectually reached. We do not mean to say that the Poor Law has removed, or that it ever will remove, entirely, the necessity for private and voluntary charity; or that it has cleared, or ever will clear, the streets and roads of beggars; but most certainly it has already greatly lessened the former, and diminished the latter, evil. It has induced the charitable to institute more minute inquiries before giving relief; it has justified greater care in the distribution of charity; and it has removed out of sight the disgusting objects, the idiotic, the diseased, and the maimed, who have been in a manner forced into the shelter of the workhouse. To those who now visit Ireland for the first time, the amount of misery will appear frightfully large; but a vast diminution of it will be perceptible—on the highways, that is to say—to those who were familiar with the country ten or twenty years ago. 'Why do you not go to the workhouse?' is now a common query to every beggar. Until very lately, the question could not be asked.

Not the least of the improvements which the law will induce, is the certainty that, when public sympathy is withdrawn from the profession of begging, and the beggar finds that there are no 'wages' to be obtained by pursuing an unprofitable trade, those who can work *will work*. There is no locality in Ireland that could not furnish scores of strong and able hands unused to labour, only because labour has been less agreeable than wandering from place to place subsisting by charity.

A striking illustration of this fact was related to us by a friend at Lurgan. A strong able-bodied woman, who was both the amusement and terror of the gentry, from her ready wit and bitter tongue, and who levied contributions something after the manner of black mail, after abusing the 'new gaol,' as she termed the workhouse, from the laying of the first stone to its completion, when it came to be occupied, presented her bronzed face, as usual, at every house, as if no asylum had been provided for the poor. The gentry, however, had come to a resolution not to give her anything whatever, but to afford her the means of employment, if she desired it. Accordingly, Kitty was told, that in future she must either work, or go into the poorhouse. In return for this information, Kitty stormed at and rated, first one, and then another, of all her former friends, who stood out firmly; for Kitty was the very queen of the beggars: and if they yielded to her, they must yield to all; whereas, if Kitty was withstood, the others would know they

could have no chance whatever. Nothing could exceed the virago's indignation at being, as she termed it, 'cast off' by the quality, after spending her time up and down with them for a matter of thirty years, and never bringing shame to their door, but being as honest as Saint Bridget, or any other holy saint; and this was her return; 'she didn't know how they could look her in the face after it!' Kitty fared badly; she knew the dinner-hour of every family in the county; but instead of the well-piled plate of 'pork and cabbage,' the 'double handful of meal, and dish of potatoes,' Kitty found the back doors locked, and the families remaining quite inattentive to her eloquence, which certainly was more powerful than elegant. After, according to her own account, 'going through' as much trouble as would break a heart of stone, she suddenly made her appearance before one of the poor-law guardians, whom she had repeatedly offended, but whom she still considered her friend. There she stood, her empty wallet slinging by her side, her battered straw hat flapping over her face, and her brawny arms folded one within the other. 'Here I am, noble colonel!' she exclaimed; 'the supplies are stopped, my lord, and poor Kitty must yield to the articles of war!' 'I thought,' he replied, 'I should have been obliged to commit you as a ——' 'Don't spake the word, yer honour; there's no use in insulting a dead soldier; it's only mee shadow that's in it. I'm pickt to an atomy; the crows don't think me worth flying away from, and the dogs that I've known the last ten years, bark at me. I never quartered meeself on a cabin-keeper yet; I'd scorn it! I'd not take from worse than meeself; and now you see I'm driven hard; yet bad as they've used me, my heart's with the gentry of the county Armagh still. We can't forget the friends of our youth, noble colonel; and it's sorry I'd be to turn mee back on my ould friends; and it's lonesome the roads will be without me, and they used to me so long; but, still, needs must when the devil (saving your presence) drives. And so, if yer honour will just answer a few questions, which I'll put ye, to my satisfaction, why, I'll be thinking about renouncing the pomps and vanities—taking the veil, my dear! What else can I call it? Devoting meeself for the ase and pace of the counthry, inside them four heart-breaking thick walls—putting the prime of mee valuable life into a stone jug.' 'I suppose,' said the colonel, 'you are going into "the house" at last.' 'That's what I'm thinking of,' she replied; 'only my feelings war too tender to say it.' 'Well,' he answered, laughing, 'you know, Kitty, we have all come to a determination that you must all either go into "the house" or work—one or the other. We offer you work and good wages, Kitty, or "the house."' 'May the devil!' —— shouted Kitty, but, recollecting herself, she paused, and dropping her voice to a whine, she continued: 'Noble colonel, the little kwestions I was going to ask you, my dear gentleman, that's all, before I'll devote myself—just—is it quite an unpossibility to get the drop of whisky in it?' 'Quite.' 'Glory be to God! well, I've had a thrial at the could water, to oblege Father Mathew, so I know that it is possible to do without whisky, so I'll drop it; but the grain of tay, colonel—sure you'd manage to let me have that on *the sly*, and me so ould, and broken down?' 'No, Kitty, no!' said the inexorable son of Mars. 'No, no, Kitty; no favour to one more than to another; that would be unjust.' 'Sure, it's the strength of justice to favour friends.' 'Not in my opinion; have you any other question to ask?' 'Bedad I have, though your answers ain't no ways plasing to me. Sure, yer honour wouldn't deprive me of a shock, or maybe a draw, of the pipe, a few times in the day?' 'Not a single leaf of tobacco must enter the gates.' 'But they are light enough to fly over the walls,' persisted Kitty. 'No, not a drop of whisky, nor a grain of tea, nor a leaf of tobacco.' 'And it's cruel enough to be in airnest you are, is it?' 'Quite; will you go in?' The gentleman and the woman looked at each other fixedly for a moment; Kitty untied her empty wallet, grasped it in her hand, and then, as she flung it from her, exclaimed, 'Tatteration to me, colonel dear, *but I'll work first!* and for every sixpence any woman in the place airns, I'll airn two.' And so she does, and will continue to do—never idle; and not having time to be abusive, she is far more popular than she had ever been before. We saw her, ourselves, as busy as a bee.

A very limited acquaintance with Ireland will serve to prove that out-door relief would be attended with incalculable evils. In Ireland the accepting eleemosynary aid is scarcely considered derogatory; old custom has made the taking of alms anything but a degradation; it is assumed to be given as it is asked, 'for the love of God,' and a sense of shame seldom accompanies the acceptance. Consequently, thousands, who would as soon enter a jail as a workhouse, would have no sort of hesitation in asking and receiving from a state charity, donations of food or money. There can be little doubt, that if out-door relief were granted, the whole population of Ireland, under a certain grade, would be periodical applicants for it; and at the 'starving seasons,' there would be substantial reasons for their being so. It is well-known, that during the months of June, July, and August, of every year, a partial, sometimes indeed a general, famine exists in Ireland; the store of old potatoes has been consumed, the new potatoes are not yet fit for food, and the condition of the peasantry, meanwhile, is in the highest degree frightful. At such times no fund could be sufficient to relieve the universal distress; but, assuredly, if any such could exist, it would work incalculable mischief, by encouraging, instead of checking, the grand fault of the Irish character—want of forethought, the habit of never caring for the rainy day, but exhausting present means without thinking of the morrow.

During our two latest tours in Ireland—the one in 1841, the other in 1842—we had many opportunities of inspecting the workhouses in the northern, western, and, partially, the eastern, districts of the island. We entered the greater number of them suddenly and unaccompanied, and not upon 'show-days,' when preparations might have been made, so that disagreeable features were concealed, or rendered less than usually repulsive. We found them invariably clean, well-ordered, and with evidence of good and steady discipline; the masters and matrons, as far as we could judge, intelligent, kindly, and considerate. The various regulations appeared to have been framed with judgment and a due regard to the comforts of the inmates; and the poor people domiciled therein, seemed, for the most part, not only satisfied and contented, but grateful, and sensible that they had been in reality 'relieved.'

Of able-bodied paupers, such as we see far too often in the workhouses of England, we saw few or none—literally none of the male sex; and where we noticed women capable of labour, we found that their children were generally inmates of another ward. Cleanliness we saw not only inculcated as a duty, but rendered imperative; and out of this must arise immense benefit, if not to the present, certainly to the after generation. Ventilation is made to contribute to health, and to give the valuable influence of example. Decent beds, in place of miserable heaps of wet and filthy straw, not only contribute to existing comforts, but they become necessaries—necessaries that will be procured hereafter by those who have had experience of their advantages. Wholesome food, poor as it would be considered by the English pauper, and in sufficient quantities, instead of food insufficient in amount, and of bad quality; shelter from the weather; warm and comfortable apartments, both by day and night; good and ample clothing; habits of cleanliness, decency, and order; such are, in brief, the advantages which the workhouse presents; if they are advantages to be described and treated as the *rights* of the English poor, they are, in truth, 'novelties' with which the Irish poor have been ever utterly unacquainted. In Ireland, therefore, we consider these public establishments not only as pregnant with immediate good to the suffering, but as rich in promise of future improvement to the whole population of the country; not only as taking away a national reproach—as providing an asylum for the destitute, as removing wretchedness from the highways and byeways—but as laying the foundation of a sound and wholesome state of society, in lieu of one that has been for centuries an anomaly in civilisation."

AMPUTATION IN THE MESMERIC SLEEP.

THE following account of a case of successful amputation of the thigh, during the mesmeric sleep, without the knowledge of the patient, was read to the Royal Medical and Chirurgical Society of London, on Tuesday the 22d of November, 1842, by W. Topham, Esq., the gentleman who induced the mesmeric state in the patient:—

"James Wombell, aged forty-two, a labouring man, of a calm and quiet temperament, had suffered for a period of about five years, from a painful affection of the left knee. On the 21st day of June last, he was admitted into the District Hospital at Wellow, near Ollerton, Notts; no longer able to work, and suffering much pain. It was soon found that amputation of the leg, above the knee-joint, was inevitable; and it was eventually proposed that it should be performed, if possible, during mesmeric sleep.

I saw Wombell, for the first time, on the 9th of September. He was sitting upright upon a bed in the hospital; the only position which he could bear. He complained of great pain from his knee, and of much excitability and loss of strength from his constant restlessness and deprivation of sleep; for he had not, during the three previous weeks, slept more than two hours in seventy.

In the first attempt to mesmerise him, which occupied me thirty-five minutes, the only effect produced was a closing of the eyelids, with that quivering appearance peculiar to mesmeric sleep; and, though awake and speaking, he could not raise them, until after the lapse of a minute and a half.

My attempt the next day was more successful, and in twenty minutes he was asleep. I continued to mesmerise him every day, except the 18th, until the 24th of September; his susceptibility gradually increasing, so that, on the 23d, the sleep was produced in four minutes and a half. The duration of this sleep varied; continuing generally for half an hour, sometimes for an hour, and occasionally for an hour and a half. But, with two exceptions (attempts to converse with him), I invariably found him awakened, though without being startled, by the violent pain from his knee, which suddenly recurred at uncertain intervals.

The third time I saw him, he was suffering great agony, and distressed even to tears. I commenced by making passes, longitudinally, over the diseased knee: in five minutes he felt comparatively easy, and on proceeding further to mesmerise him, he was sleeping like an infant. Not only his arms were then violently pinched, but also the diseased leg itself, without his exhibiting any sensation; yet this limb was so sensitive to pain, in his natural state, that he could not bear even the lightest covering to rest upon it. That night he slept seven hours without interruption. After constantly mesmerising him for ten or twelve days, a great change was observed in his appearance. The hue of health returned; he became cheerful; felt much stronger; was easier both in mind and body; slept well; and recovered his appetite.

On the 22d of September, he was apprised of the necessity of an early amputation. The communication seemed almost unexpected, and affected him considerably. I this day tried the experiment of mesmerising him against his will; proceeding by contact with the hands, charging him, particularly, to exert his mind to prevent my affecting him. During the process, he occasionally glanced at those near him, moving his eyes as he felt inclined, and in twelve minutes and a half passed into mesmeric sleep. The two or three previous days, it had been effected in six minutes. He informed me, subsequently, he had repeatedly called to mind the intelligence just received, and the torture which he must endure; but he soon found the influence irresistible, and presently lost all consciousness. The anticipated loss of his limb, however, that night destroyed his *natural* sleep. Next day, though found still fretting, restless, and in consequent pain, he was yet, by my touch, asleep in four minutes and a half.

[Mr Topham proceeds to say, that he mesmerised the patient several times by way of trial, and was now convinced that the operation might be safely performed while he was in the mesmeric sleep. When the day appointed for the operation arrived], we proceeded to Wombell's room to make the necessary arrangements. From the suffering inflicted by the slightest movement, it was found impossible, without needless torture, to place him upon a table. The low bed, on which he then lay, was therefore lifted upon a temporary platform. Ten minutes after being mesmerised, he was drawn, by means of the bed-clothes beneath him, towards the end of the bed. The movement, however, excited that pain which had so often aroused him before; and now it did so again. There was something quite excruciating in the suffering which the state of the knee produced; for I had seen him, whilst in mesmeric sleep, pricked to some little depth, in other parts of the diseased limb, without being disturbed or conscious of it. To preclude the necessity of any further movement, his leg was now placed in the most convenient position which he could bear. Shortly afterwards, he declared that the pain had ceased; and I again mesmerised him in four minutes. In a quarter of an hour I informed Mr Ward that he might commence the operation. I then brought two fingers of each hand gently in contact with Wombell's closed eyelids; and there kept them, still further to deepen the sleep. Mr Ward, after one earnest look at the man, slowly plunged his knife into the centre of the outer side of the thigh, directly to the bone; and then made a clear incision, round the bone, to the opposite point, on the inside of the thigh. The stillness at this moment was something awful; the calm respiration of the sleeping man alone was heard, for all other seemed suspended. In making the second incision, the position of the leg was found more inconvenient than it had appeared to be; and the operator could not proceed with his former facility. Soon after the second incision, a moaning was heard from the patient, which continued, at intervals, until the conclusion. It gave me the idea of a troubled dream; for his sleep continued as profound as ever. The placid look of his countenance never changed for an instant; his whole frame rested, uncontrolled, in perfect stillness and repose; not a muscle or nerve was seen to twitch. To the end of the operation, including the sawing of the bone, securing the arteries, and applying the bandages—occupying a period of upwards of twenty minutes—he lay like a statue. Soon after the limb was removed, his pulse becoming low from the loss of blood, some brandy and water was poured into his throat, which he swallowed unconsciously. As the last bandage was applied, I pointed out to one of the surgeons, and another gentleman present, that peculiar quivering of the closed eyelids already alluded to. Finally, when all was completed, and Wombell was about to be removed, his pulse being still found very low, some sal volatile and water was administered to him; it proved too strong and pungent, and he gradually and calmly awoke.

At first he uttered no exclamation, and for some moments seemed lost and bewildered; but after looking around, he exclaimed, 'I bless the Lord to find it's all over!' He was then removed to another room; and, following immediately, I asked him, in the presence of those assembled, to describe all he felt or knew after he was mesmerised. His reply was, '*I never knew anything more, and never felt any pain at all; I once felt as if I heard a kind of crunching.*' I asked him if this were painful. He replied, '*No pain at all! I never had any; and knew nothing till I was awakened by that strong stuff*' (the sal volatile). The 'crunching,' no doubt, was the sawing his own thigh bone. He was left easy and comfortable, and still found so at nine o'clock that night, about which hour I again mesmerised him (in a minute and three quarters), and he slept an hour and a half. I may further add, that, on the Monday following, the first dressing of his wound was in mesmeric sleep. Of this dressing, usually accompanied by much soreness and smarting, he felt nothing; slept long after it was completed; was ignorant of Mr Ward's intention; and, after awakening, remained unconscious of its having been done. Mr W. S. Ward's own statement, in accordance with his personal observation and care, prior and subsequent to the operation, he has kindly permitted to be appended to my own; and thus to render complete the narrative of this case, which I leave without a syllable of comment."

The statement of Mr W. S. Ward, the operator above alluded to, was next read; and besides corroborating, in every particular, the account of Mr Topham, some other circumstances were added, bearing on the surgical part of the case. Mr Ward concludes in the following words:—

"I need only add, that the extreme quivering, or rapid

action of the divided muscular fibres, *was less than usual;* nor was there so much contraction of the muscles themselves. I must also notice, that two or three times I *touched the divided end of the sciatic nerve without any increase of the low moaning* described by Mr Topham; and which, to all present, gave the impression of a disturbed dream.

The patient is doing remarkably well, and sat up on Sunday last to eat his dinner, just three weeks from the operation; and he has not had a single bad symptom, none even of the nervous excitement so frequently observed in patients who have undergone painful operations, and who have suffered much previous anxiety in making up their minds.

Although the single experiment we have detailed to the society is scarcely sufficient to set the question completely at rest, is it *not* of a sufficiently encouraging nature to demand an immediate repetition, by those of my professional brethren to whom the splendid institutions of the metropolis offer such frequent opportunities?"

CONDUCT WORTHY OF IMITATION.

During the disastrous retreat of General Moore's army from Spain, an officer of one of the British regiments, overcome with fatigue and hunger, had dropped behind. He espied a tuft of trees in a field adjoining the road, towards which he crawled with the view of resting his weary limbs, secure from the sabres of the pursuing enemy. On his coming near to the trees, he perceived a woman, seemingly a soldier's wife, stretched upon the ground, and a little infant lying near her. He approached to administer such assistance as was in his power. It was too late; the hand of death was upon her; and she was scarcely able to utter these words, "God bless you! it is all over!" when she expired. The officer sat down beside her; he felt her hand; it was clay cold; he had nothing to succour her with; a brook was near; he filled his hat with water, and besprinkled her face and hands; all was in vain, and he was convinced she was utterly gone. Having rested himself so as to be able again to go on, he tied the little infant in the poor woman's handkerchief, and having fastened it to his back, he pursued his march; in this condition, procuring what sustenance he could for himself and the little orphan, he at last, after a long and wretched journey, reached the port of Vigo, which at that time happened to be unoccupied by the French; there he got on board of a transport, and reached at last England with his little charge. His regiment (or rather the remnant of it) had arrived before him, and he joined it, still accompanied by the infant. He has it (it is a boy) always with him, and has one of the women of the regiment to nurse it; and he declares that this little orphan, whom heaven threw upon his protection, shall, let his fortune through life be good or bad, share it with him.—*Flowers of Anecdote.*

JOHN JAMES AUDUBON.

A few days ago, there arrived at the hotel erected near the Niagara Falls an odd-looking man, whose appearance and deportment were quite in contrast with the well-dressed and polished figures which adorned that celebrated spot. He seemed to have just sprung from the woods. His dress, which was made of leather, stood dreadfully in need of repair, apparently not having felt the touch of the needlewoman for many a long month. A worn-out blanket, that might have served for a bed, was buckled to his shoulders, a long knife hung on one side, balanced by a long rusty tin box on the other; and his beard, uncropped, tangled, and coarse, fell down upon his bosom, as if to counterpoise the weight of the dark thick locks that supported themselves on his back and shoulders. This strange being, to the spectators seemingly half-civilised, half-savage, had a quick glancing eye, an elastic, firm movement, that would no doubt cut his way through the cane brakes both of the wilderness and of society. He pushed his steps into the sitting room, unstrapped his little burden, quietly looked round for the landlord, and then modestly asked for breakfast. The host at first drew back with evident repugnance at the apparition which thus proposed to intrude its uncouth form among the genteel visitors; but a few words whispered in his ear speedily satisfied his doubts. The stranger took his place in the company, some staring, some shrugging, and some laughing outright. Yet, reader, there was more in that single man than in all the rest of the throng. He was an American woodsman, as he called himself; he was a true, genuine son of nature, yet who had been entertained with distinction at the table of princes; learned societies, to which the like of Cuvier belonged, had bowed down to welcome his entrance; kings had been complimented when he spoke; in short, he was one whose fame will be growing brighter, when the fashionables who laughed at him, and many much greater even than they, shall have perished. From every hill-top, and every deep shady grove, the birds, those blossoms of the air, will sing his name. The little wren will pipe it with her matin-hymn about our house; the oriole carol it from the slender grasses of the meadows; the turtle-dove roll it through the secret forests; the many-voiced mocking bird pour it along the air; and the imperial eagle, the bird of Washington, as he sits in his craggy home, far up the blue mountains, will scream it to the tempests and the stars. He was John James Audubon, the ornithologist.—*American paper.*

LODGING-HOUSE SERVANTS.

It would frighten any servant, but a real London Cinderella, to go down into the kitchen in a morning, and see the work those little hands have to do. The rows of boots and shoes to clean—the candlesticks to rub bright—the dishes to wash up—the pots and pans to scour—the rugs to shake—the washing about of her own, all the week, although she is always adoing. Then the number of times she goes in and out in a day—now off for tea—then butter—next time for a chop—then a bottle of soda water for the gentleman who had drank too much over night—again for the newspaper—a letter to the post-office—a pair of shoes to mend—a bundle to be carried to the laundress—a quartern of gin for the landlady. As she is ever taking down her little bonnet, which she never ties, and throwing on the half shawl she never pins—then with the latch-key in her hand, pointing her head twenty different ways—going—returning—then diving into the kitchen for a few moments to do her work—then up again to answer the bell; and never executing a single command of the lodgers' without being called into the parlour to tell the landlady what it was.—*Godfrey Malvern.*

THE RHINE SONG.

[The French, under a very convenient assumption, that the Rhine is the *natural* boundary of their country, have ever been eager to appropriate the Low Countries as far as the left bank of that river. On the other hand, the Germans are inspired with an enthusiastic attachment to this famous stream, in all respects their own. Last year, when the bellicose press of Paris was full of threatenings on this subject, a young German composed a song, embodying the popular sentiments of his country, and with such success, that the verses were sung in every company, and the king of Bavaria sent the poet a letter of thanks in his own hand, and a present of a silver cup. The following is a translation of this song.]

No! France shall ne'er obtain thee,
Thou free and German Rhine!
Though, thirsting to regain thee,
Her eagles scream, "Thou'rt mine!"
No! ne'er while gently gliding
Between thy margins green,
Ne'er while one prow dividing
Thy placid waves is seen!

No! she shall ne'er possess thee,
Thou fair and German Rhine!
So long as free hearts bless thee,
And quaff thy generous wine!
Ne'er while thy murmuring waters
Yon rocks eternal lave,
Ne'er while proud scenes of slaughter
Are mirror'd in thy wave!

No! she shall ne'er surround thee,
Thou free and German Rhine!
While warriors brave around thee
With beau'eous maids entwine!
While on thy banks still hover
Our bards' enchanted strains,
Ne'er till thy depths close over
The last man's bleach'd remains!

THE CAPTAIN'S PUDDING.

The following story is told of a Yankee captain and his mate:—"Whenever there was a plum pudding made, by the captain's orders all of the plums were put into one end of it, and that end placed next to the captain, who, after helping himself, passed it to the mate, who never found any plums in his part of it. Well, after this game had been played for some time, the mate prevailed on the steward to place the end which had no plums in it next to the captain. The captain no sooner saw the pudding than he discovered that he had the wrong end of it. Picking up the dish, and turning it in his hands as if merely examining the china, he said, 'This dish cost me two shillings in Liverpool,' and put it down again, as though without design, with the plum end next to himself. 'Is it possible?' said the mate, taking up the dish, 'I shouldn't suppose it was worth more than a shilling,' and as if in perfect innocence, he put down the dish with the plum end next to himself. The captain looked at the mate, the mate looked at the captain. The captain laughed, the mate laughed. 'I tell you what, young one,' said the captain, 'you've found me out, so we'll just cut the pudding lengthwise this time, and have the plums fairly distributed hereafter.'"—*Newspaper paragraph.*

THE KING'S COCK-CROWER.

Amongst the ancient customs of this country which have long sunk into disuse, was a very absurd one, and which, however ridiculous, was continued so late as the reign of George I. During the season of Lent, an officer, denominated the "King's Cock-Crower," crowed the hour every night within the precincts of the palace, instead of proclaiming it in the ordinary manner. On the first Ash Wednesday after the accession of the House of Hanover, as the Prince of Wales, afterwards George II., was sitting down to supper, this officer suddenly entered the apartment, and proclaimed, in a sound resembling "the cock's shrill clarion," that it was past ten o'clock. Taken thus by surprise, and very imperfectly acquainted with the English language, the prince mistook the tremulation of the assumed crow as some mockery intended to insult him, and instantly rose to resent the affront; nor was it without the utmost difficulty that his interpreter could make him understand the nature of the custom, and assure him that a compliment was intended according to the court etiquette of the times. From that period, however, the custom has been discontinued.—*Newspaper paragraph.*

VARIATIONS OF TIME.

Amongst the various matters introduced incidentally at the last meeting of the British Association, was the subject of the propriety of adopting a uniform scale of time along the different lines of railway in the kingdom, by the adoption of the time of the Royal Observatory at Greenwich. It was considered that this would probably lead to the adoption of a uniform rate of time throughout the United Kingdom. Some curious observations were adduced by Mr Dent, from which it appeared, that the difference of longitude causes a very considerable deviation of time even in counties, being the results of ninety-one chronometrical measurements. The counties east of Greenwich, in which time is fast, are Cambridge, Essex, Norfolk, Suffolk, and Sussex, whilst in all the other counties lying to the west, the time is of course slower. In Middlesex, the variation from Greenwich time at St Paul's is 23 seconds slower, and at Hampton Court, 1 minute 20 seconds. In Kent, the time at Dover is 5 minutes 16 seconds too fast; and at Tunbridge Wells, 1 minute 1 second. In Lancashire, the time at Manchester is 9 minutes slow; at Liverpool, 11 minutes 30 seconds; and Lancaster, 11 minutes 20 seconds. In Lincolnshire, the time at Louth is the same as that of the Royal Observatory at Greenwich, being in the same parallel of longitude; whilst at Lincoln, the clock is 2 minutes 4 seconds too slow. In Hampshire, the time at Southampton is 5 minutes 36 seconds slower than at Greenwich; and at Portsmouth, it is 4 minutes 24 seconds. At Brighton, it is 32 seconds too fast; and at Hastings, 2 minutes 30 seconds. In Westmoreland, the clock at Appleby is 10 minutes; and at Kendal, 11 minutes faster than the London time. At Chester, it is 11 minutes 32 seconds; whilst the variation at Falmouth is 20 minutes 12 seconds; and at Truro, 20 minutes 6 seconds also too slow. At Northampton, the clock is 3 minutes 36 seconds too slow; and at Peterborough, 58 seconds; at Shrewsbury, 10 minutes 56 seconds; Oswestry, 12 minutes 8 seconds; Warwick, 6 minutes 20 seconds; Birmingham, 7 minutes 23 seconds; and Coventry, 6 minutes 1 second. In Yorkshire, at Beverley, it is 1 minute 42 seconds; York, 4 minutes 24 seconds; and Leeds, 6 minutes 4 seconds. In North Wales, at Holyhead, 16 minutes 36 seconds; and Bangor, 16 minutes 14 seconds; and in South Wales, at Cardigan, 18 minutes 40 seconds; and Carmarthen, 17 minutes 16 seconds. At Edinburgh, the clock is 12 minutes 43 seconds; and Dublin, 25 minutes 31 seconds too slow; whilst at Paris, it is 9 minutes 21 seconds too fast.—*Railway Times.*

SINGULAR PROPERTIES OF THE FIGURE NINE.

Multiply 9 by itself, or by any other single figure, and the two figures forming the product will, in each case, if added together, amount to 9; for example, 9 multiplied by 9 is 81, and 8 and 1 added together make 9; so on with the other figures. The figures forming the amount of 1 2 3 4 5 6 7 8 9, added together (viz. 45), will also, if added together, make 9. The amount of the several products, or multiples of 9 (9, 18, 27, 36, 45, 54, 63, 72, 81), namely 405, and the figures forming either the dividend or the quotient, added together, make 9. Multiply any row of figures, either by 9, or by any one of the products of 9, multiplied by a single figure, as by 18, 27, 36, 45, 54, 63, 72, or 81, and the sum of the figures of the product, added together, will be divisible by 9. Multiply the 9 digits in the following order—1 2 3 4 5 6 7 8 9, by 9, or by any one of the products of 9 mentioned in the last sentence, and the products will come out all in one figure, except the place of tens, which will be a 0, and that figure will be the one which, multiplied into 9, supplies the multiplier; that is, if you select 9 as the multiplier, the product will be (except the place of tens) all ones; if you select 18, all twos; if 27, all threes; and so on. Omit the 8 in the multiplicands, and the 0 will also vanish in the product, leaving it all ones, twos, and threes, &c., as the case may be.—*Newspaper paragraph.*

The present number of the Journal completes the eleventh volume of the work, for which a title-page and copious index are prepared, and may be had on application to the Publishers or their Agents, at the usual price of a number. Any odd or past numbers of the Journal can also be had for the purpose of completing sets.

END OF THE ELEVENTH VOLUME.
